over into the urine, giving the 2 cardinal signs of *D. mellitus*—hyperglycaemia and glycosuria. *D. mellitus* is a chronic, often inherited, disease and may show itself at any age. When it starts in childhood it is apt to be progressive because the process of growth throws greater demands on metabolism and hence on insulin requirements. Until the discovery of insulin by Banting and Best in 1922 (see MEDICAL RESEARCH) and its production for therapeutic purposes, *D. mellitus*, except in the milder cases, terminated fatally, the average expectancy of life being about 10 years. With modern methods of treatment the expectancy of life may well remain unchanged. The symptoms of *D. mellitus* are increasing hunger and thirst, polyuria, and progressive loss of weight. In untreated cases or cases which are being treated but not under proper insulin control the disease progresses to the state of ketosis. Ketones, the poisonous products of abnormal fat metabolism, are formed in the body by a disturbance of the normal oxidation of fats that, in turn, is dependent on normal carbohydrate metabolism. Loss of appetite, nausea, vomiting, abdominal pain, shortness of breath, drowsiness, and a smell (like pear drops) of acetone in the breath are symptomatic of the onset of ketosis in a case of *D. mellitus*. In the absence of treatment the next, and terminal, stage is coma and death. Ketosis may occur rapidly when an otherwise well controlled case of *D. mellitus* is complicated by the intervention of another complaint. Acute infections such as gastroenteritis, pyelitis, tonsillitis, or pneumonia, or septic conditions such as boils and carbuncles (to which diabetics are unduly susceptible), disturb the insulin-carbohydrate balance and may precipitate a ketotic crisis. Treatment consists in reducing the strain on the already strained metabolism by reducing the amount of carbohydrate in the food and giving insulin by injection to fortify the body's own deficiency. At one time carbohydrate in the diet was reduced almost to the point of elimination and insulin, when it became available, was used as sparingly as possible. The more satisfactory policy now is to allow the patient a more liberal diet and so a more interesting and satisfying one, and to give insulin in doses sufficient to render the urine nearly sugar-free. The patient is instructed in diet and insulin dosage and in how to test the urine daily for the presence of sugar. Provided the patient is intelligent and strictly follows the rules, a well-balanced control of the disease is maintained. Ketosis and coma should not occur unless the patient neglects the warning signs, and provided, of course, that an intercurrent disease (see above) does not supervene. Blood sugar estimations are necessary at regular intervals to provide a more accurate check on the disease than is given by the rougher method of urine analysis. Much research has been done trying to find a form of insulin which can be given effectively by mouth. Insulin is destroyed by the

gastric juices, and no means of overcoming this obstacle have yet been found. However, Dr F. Sanger and his colleagues at the dept of biochemistry at Cambridge Univ. succeeded in 1955 in discovering the nature of the insulin molecule. It is comprised of no less than 777 atoms. It may be that some synthetic rearrangement of these atoms to form a 'near insulin' that will still be therapeutically effective and yet unaffected by the gastric secretions may now be possible. But this is by no means certain. Another line of research is being done into the possibility of grafting healthy pancreatic tissue into diabetics. Meanwhile progress has been made in the production of better and longer-acting insulins, notably the recent insulin zinc suspensions (lente, semi-lente, and ultra-lente) from Denmark. *D. insipidus* is a disease characterised by excessive output of urine and thirst. It is due to a failure of function of the posterior part of the pituitary gland (q.v.) due to disease of that organ. One of the functions of the posterior pituitary gland is to secrete a hormone (the anti-diuretic hormone) which reduces the quantity of fluid output through the kidneys. *D. insipidus* may be distinguished from *D. mellitus* by the absence of sugar and the low sp. gr. of the urine. See R. D. Lawrence, *The Diabetic Life*, 1955; O. Leyton, *The Diabetic's Vade Mecum*, 1937; R. D. Lawrence, *The Diabetic A.B.C.* (11th ed.), 1955.

Diablerets, noted mt. or secondary mt. group of the Bernese Alps, Switzerland, situated between the cantons of Vaud and Valais. The highest point reaches 10,650 ft. It consists of 4 peaks composed of limestone resting on soft shale beds, which easily become disintegrated, and fall.

Diacetylmorphine, see HEROIN.

Diadom, an older word for tiara (q.v.).

Diadochi, Wars of the (323-281 bc), arose over the problem of dividing Alexander's empire among the D. (or Successors)—former generals and companions of Alexander. The chief among them were Antigonus, whose ambition was to rule the whole empire, Antipater, regent of Macedonia, Lysimachus, Seleucus, satrap of Babylon, and Ptolemy of Egypt. After Antipater's death his son, Cassander, murdered Alexander's widow, Roxana, and her infant son. Each of the D. then assumed the title of king, and the wars between them were resolved into a coalition of Seleucus, Ptolemy, Lysimachus, and Cassander against Antigonus and his son, Demetrius. Demetrius was successful in Greece, but Antigonus was finally defeated and killed at the Battle of Ipsus (301 bc). Later Cassander d., and Demetrius became king of Macedonia. Lysimachus, king of Asia Minor, was betrayed into believing his son, Agathocles, a traitor, but by murdering him he involved himself in a war with Seleucus, and was defeated and killed at Corupedium (281 bc). Ptolemy had d. in 283, and Seleucus, the last of the D., relinquished his possessions, but was assassinated.

Diadumenianus, Marcus Opilius Av-

tonius, son of the Rom. emperor Macrinus (q.v.). In AD 218 his father conferred upon him the title of Caesar; both were put to death by Elagabalus (q.v.) in June of the same year. Owing to his title, which occurs on certain coins, D. is sometimes reckoned among the emperors.

Diageotropism, see GEOTROPISM.

Diaghilev, Serge Pavlovich (1872-1929), impresario of Russian ballet, b. Perm in Novgorod prov. He studied law and music, and especially interested himself in old Russian art. In 1899 he founded the magazine *Mir Iskusstva* (the World of Art). D. held an exhibition of Russian painting and sculpture in Paris in 1906. In 1908 he was in Paris giving concerts and opera, but it was his return there in 1909 to present a mixed season of opera and ballet that first gained him international renown. Thereafter he devoted himself exclusively to presenting ballet, and his company had a tremendous influence on the development not only of ballet but also of the allied arts as a result of the collaboration of such artists as Benois, Bakst, Derain, Picasso, and Cocteau, and musicians like Stravinsky, Auric, Satie, and Milhaud. During the existence of the D. Ballet (1909-29) he raised ballet to a major theatrical art, and the lasting nature of his legacy can be detected in every important ballet company to-day outside Russia. He d. in Venice, 1929. See lives by A. Haskell, 1935; S. Lifar, 1940; S. Grigoriev, *The Diaghilev Ballet*, 1953.

Diagnosis, in medicine, the methods employed to identify a disease.

Diagonal Scale, a mathematical scale consisting of a set of parallel lines drawn on a ruler with other lines crossing them at right angles and at equal distances from each other. The extreme div. of the divs. so formed is then further subdivided into a number of equal parts, and other lines drawn obliquely across the parallels through the points of intersection. With the aid of compasses, lines can be laid down by such a scale of any required length.

Diagoras, of Melos, surnamed the Atheist, a Gk poet and sophist of the 5th cent. bc, said to have been a pupil of Democritus of Abdera. He was accused of impiety, more especially of criticising the Mysteries, and in 411 bc was condemned to death in Athens (Aristophanes, *Clouds*, 830). He fled to Corinth, and probably d. there. Besides his work on the Mysteries, he wrote hymns, dithyrambs, and some philosophical treatises, none of which is extant.

Diagram, in mathematics, is a figure serving to illustrate a definition or to aid in the proof of a proposition. In its more general sense it is a drawing to illustrate the structure of scientific apparatus, engines, machines, buildings, and so on, as opposed to a 'picture' to which emotional significance or artistic value is attached. The value of a D. lies in its power of conveying essential information at a glance; when the D. is drawn to scale, this information may be quantitative as well as qualitative. Weather charts, temp.

and pressure curves, road maps, etc., are very largely diagrammatic. An *indicator diagram* shows the effective work done by an engine. Constitutional formulae in chem. are conventionalised D.s of what is believed to be the corresponding molecular structure. Biological D.s bring out the features of biological importance in the objects drawn.

'*Dial, The*,' literary organ of the Transcendental Club of New England, in the formation of which Emerson took a leading part. Sarah Margaret Fuller (q.v.) was the first editor after it was founded in 1840, with George Ripley as assistant editor. It was a periodical for cultured readers, discussed questions of theology, philosophy, music, art, and letters, and its pages contained much verse. Among its best-known contributors were Emerson, Thoreau, and Bronson Alcott. The public, however, disliked the peculiar and abstruse opinions, especially those in the *Orphic Sayings* of Alcott, and though Emerson succeeded in keeping the paper alive for a short while after Sarah Fuller relinquished it, it ceased to exist in 1844.

A modern jour. of the same name was founded at Chicago in 1880. First a monthly, then a fortnightly, it was an important organ of literary criticism, having among its contributors Conrad Aiken, Randolph Bourne, and Van Wyck Brooks. In 1918 it moved to New York, and became the leading literary periodical to support modern artistic movements. It printed work of distinguished authors from many countries, including Thomas Mann, T. S. Elliot, James Stephens, and Paul Morand. It was ed. by Marianne Moore (q.v.) after 1926. In 1929 it ceased pub.

Dialect (Gk *dialekto*s, conversation, or manner of speaking), in its widest sense the name applied to forms of speech springing from a common root. But the term is popularly used to express the divergence of some local form of speech from the generally accepted or 'literary' form. It is quite wrong to speak of such local forms as 'corruptions' of the accepted forms. The anc. Gk tongue was divided into Attic, Doric, Ionic, Aeolic, and Achaean D.s. Modern Greek is derived from the Attic form, in which the works of Thucydides were written, while Herodotus wrote in Ionic; no one will say that the tongue of Herodotus was a corruption of that of Thucydides. The origin of D. is not in corruption at all, but is the result of descent from a different form and of different developments: in old England, as in old Greece, the country was inhabited by different races; the dispossessed Celts were driven into the mts, while the Saxons, Jutes, and Angles spread over the land. From a variety of causes the D. which survives as modern literary Eng. is the Midland, that spoken by a branch of the Anglian tribes. The D. forms are not corruptions of the Midland D.s, but the direct descendants of the Celtic, the Saxon, the Northumbrian, and other forms of speech. Eng. itself, for that matter, is merely a D. of the Teutonic

tongue, modified and enriched by Norman-Fr., Lat., and many later additions from classical and scientific sources. After the A.-S. settlement of Britain, the language of the country was roughly divided into 6 main forms of local speech, or D.s, the S. W., E., Midland, N., and Lowland Scots, again divided into many small groups, which still prevail with characteristic variants from the accepted language. Modern prov. Eng. has been carefully studied, its origin, where possible, traced, and its locality recorded in the papers of the Eng. Dialect Society (1873-96). Upon these papers Prof. Skeat, of Cambridge, largely based his Eng. dialect dictionary, the 1st vol. of which appeared in 1898. He was assisted by Prof. Wright, of Oxford, who classified the various D.s and obtained a unique collection of phonograph records to preserve the idiom, with its correct accent and intonation, of Eng. rustic speech in different localities. Sir J. A. H. Murray has done a similar work for the D.s of Lowland Scotland, in *Dialect of the Southern Counties of Scotland*, 1873. For further information, see A. J. Ellis, *Existing Phonology of English Dialects*, 1889; the works of Prince Louis-Lucien Bonaparte on Eng., Basque, Fr., and especially It. D.s; J. Winkler, 1874, for Low Ger. forms; and, for hybrid D.s, S. Haldeman, *Pennsylvania Dutch*, 1872.

Dialectic, a term in logic generally applied to verbal fencing and abstract arguments without practical value, and frequently merely the clever statement of fallacies to make them pass for truth. The term was used in the Socratic philosophy to show the inadequacy of popular beliefs; Plato used it for the highest kind of thought connecting itself with the true nature or idea of things, while Aristotle limited it to a probable deduction from probable reasoning, as opposed to a scientific or demonstrative reasoning or proof. The Stoics divided logic into 'D.' and 'rhetoric,' and from their time D. is sometimes used as synonymous with logic. In modern philosophy the name has been used in sev. senses. Hegel uses it in its original Socratic sense, while Kant uses it in general for the doctrine of fallacies, for the uselessness of the attempt of reason to overcome the principles which govern phenomena.

Diallage, one of the pyroxene group of minerals characterised by its lamellar or foliated structure. The name formerly included 'bronzite,' from which it is very hard to distinguish it. Its colour is generally brown, but sometimes grey or green, and there is a metallic lustre on the surface of the broken crystals.

Dialogue, a conversation between 2 or more persons, reported in literary form and with a greater unity and continuity of subject than characterise an ordinary conversation. When joined to action the D. becomes a drama. It has always been a favourite mode with writers who, wishing to convince their readers of the truth of an argument, present both sides of a question in the mouths of 2 characters, and conduct the conversation in such a way that one is finally convinced of the

correctness of the other. The D. is of GK origin, having been adopted by the GK philosophers as the best way of conducting their investigations and conveying their instructions to their pupils. The D.s of Socrates took the form of question and answer, so that the master by means of questions led the pupil himself to originate the ideas which he, the master, wished to convey to him. The form of D. adopted by Plato was modelled on the 'mimes,' little 2-character plays which were popular before his time, and which survive in the works of Herodas (q.v.). Plato simplified it to pure argumentative conversations, or philosophical dramas, and used the form for all his philosophical writings except the *Apologia*. One of the greatest masters of this form of literature was Lucian (2nd cent. AD), the title of whose celebrated *Dialogues of the Dead* was borrowed by 2 great Fr. masters of the form, Fontenelle (1683) and Fénelon (1712), in their *Dialogues des Morts*. It has also been used by Erasmus in Latin; Wieland, Herder, and Lessing among the Germans; Petrarch, Tasso, and Leopardi among the Italians. In England the most famous writers of non-dramatic D. are Berkeley in *Hylas and Philonous*, 1713, and Landor in his *Imaginary Conversations*, 1821-5. See G. Lowes Dickinson, *Plato and his Dialogues*, 1947; A. R. Bellinger, *Lucian's Dramatic Technique*, 1938.

Dialysis, term in chem. for the process discovered by Thomas Graham (1804-69), by which 'colloids,' such as silicic acid, can be separated from 'crystalline' substances, such as salt or hydrochloric acid. He found that if a solution of a crystalline substance, salt for instance, were placed in a 'dialyser,' a vessel provided with a bottom made of parchment or animal membrane, and the dialyser placed in a larger vessel of water, the salt would permeate the parchment, whereas a similar solution of a 'colloid' would not diffuse, remaining intact in the original solution. The process is performed more rapidly with an increase of temp.

Diamagnetic, see INDUCTION, MAGNETIC.

Diamantina, until 1838 **Tejuco**, mining tn in Minas Gerais state, Brazil, built on a steep hillside some 4140 ft above sea-level. It is the centre of a diamond dist. and gold is mined in its neighbourhood. It has tanning and textile industries. D. is the seat of a bishopric, and is the centre of a large commercial dist., famous for its wealth during the 18th-cent. diamond rush. There is a fine cathedral. Pop. 9700.

Diamantina, riv. of Australia, also called Mueller's Creek, flowing from the high ground in the N. of central Queensland in a S.-westerly direction into S. Australia. In the dry seasons it dries up in the interior, but during the rains it flows into the N. end of Lake Eyre.

Diameter, a term in geometry for the line which passes through the centre of a conic section or any other figure, and which is terminated at either extreme by the curve.

Diamond, a form of crystallised carbon

of very high value, which is usually regarded as the most precious of all stones. It is, however, not so valuable as the ruby. The D. is always found in crystals of the cubical system, and is found most frequently in the form of octahedrons, or rhombic dodecahedrons. The crystals are strongly striated and the cleavage is perfect. Contrary to general opinion, the D. is rather brittle and can be injured by the slightest fall. The stone has a lustre peculiarly its own, termed adamantine lustre. It has high refractive powers, the index for refraction being 2.4, and the angle of total reflection about 25 degrees. The stone is highly phosphorescent, and will, after exposure to brilliant light, emit the rays to which it has been exposed and become self-luminous in the dark. Its sp. gr. is just over 3.5, and its hardness is far greater than that of any other stone, and is indicated by 10 in the mineralogical scale. The chemical character of the D. was for a long time uncertain. During the 17th cent. it was held to be inflammable. Robert Boyle proved that when subjected to a high temp. part of it was dissipated, and finally, at the expense of Duke Cosimo of Tuscany, the Florentines proved it was combustible. Lavoisier later showed that the product was carbonic acid gas; finally, Smithson Tennant (1761-1815) demonstrated that the amount of carbonic acid gas produced equalled oxygen consumed. The composition of the D. was therefore determined to be pure carbon in a crystallised form. Experiments have also been made as to the action of heat on D.s, and Gustaf Rose showed that under certain conditions D.s when subjected to a great heat were gradually converted into graphite. For a long time India was regarded as the only D.-producing country, and it is certain that the Indian gem was the only stone known to the ancients. The chief D. dists. of India are: the Golconda dist. in Andhra Pradesh, the Sambalpur mines of Orissa, and in Bundelcund (q.v.). The D. production of India at the present time is not large. Brazil was not regarded as a great D.-producing country until 1727, when the D.s were first noticed, having been used by the natives as counters in certain card games. These D.s were, without reason, for a long time regarded as inferior to the stones of India. Formerly the state of Minas in Brazil was a famous centre of D. production, and it has been estimated that stones to the value of £12,000,000 have been taken from the D. fields since 1727. The states of Matto Grosso, Goyaz, and Bahia are now the chief centres of D. mining in Brazil, but the industry has suffered since the advent of mining in S. Africa. The black D. of Brazil is, however, largely used for D. drills. In Europe D.s have been discovered, but in no great quantity. Australia has also produced some, but these again are not of great importance. The most important D. fields are those of the Belgian Congo and of Kimberley, S. Africa, which were discovered quite by accident. Chief among the Kimberley mines are those of the De Beer, the Du

Toit's Pan and the Ragfontein, all controlled by the D. Corporation, Ltd., also the largest buyer of rough stones in the world. The largest individual mine, however, is the Mwaduli, in Tanganyika (owned by Dr J. T. Williamson), which employs 5000 Africans and 100 Europeans, and was discovered in 1940. In the S. African D. mines the average labour employed, including alluvial digging, was (1953) about 3193 Europeans and 12,300 natives and coloured. There are

S. African Gov.

PREMIER DIAMOND MINE, PRETORIA

also valuable D. mines in Ghana, the Congo, Sierra Leone, and Angola. The most recent returns give the ann. production in metric carats (goms and industrial stones) as follows (1946): Congo, 6,033,000; Gold Coast, 700,000; Union of S. Africa, 1,281,787; Sierra Leone, 559,229; Angola, 808,000; Tanganyika, 119,446; Brazil, 325,000. The value of D.s owned throughout the world was stated to be £600,000,000 in 1918, one-half being owned by residents in the U.S.A. A number of the D.s in existence at the present time have remarkable histories. The largest of all known D.s is the

Cullinan D. found near Pretoria early in 1905. It weighs 3032 carats, or more than 3 times the weight of any other known D. It is at present in the Brit. regalia. Another fine stone is the Orloff D. which figured in the sceptre of the Russian regalia. It was purchased by Count Orloff for Catherine II of Russia, and is supposed to have been the eye of an Indian idol. The Pitt D. holds the second place. It was brought back from India by the grandfather of the famous Eng. statesman, Wm Pitt, and sold by him to the Regent Orleans for £130,000. It is held to be the most perfect D. in the world. Amongst other famous stones may be mentioned the Florentine (133 carats) and the Koh-i-noor, the most famous of all the stones belonging to the Brit. Crown. This stone, which weighs 106·5 carats, has a long and romantic hist., and came into the possession of the Brit. Crown in 1850 after the annexation of the Punjab. Others are the Hope Blue and the Star of the South. The 'Vargas' D. (named after the President of Brazil, and said to be the third largest known in the world) was found in Minas Gerais in Oct. 1938. It was sold to a Dutch firm at 700,000 guilders. The chief centres of the D. cutting and polishing trade are Antwerp, Amsterdam, and Palestine. When the Low Countries were invaded by Germany early in the Second World War, machinery and skilled craftsmen were brought to England at the last moment and a D.-cutting industry was estab. there. Cutting and polishing are still done in London, though the majority of finished stones are imported. D.s are much used in jewellery manu. It is estimated that 350 tons of gravel and rock must be mined and brought to the surface to produce a fine cut gem of 1 carat. Gemstones are always priced per carat; a normal stone of 1 carat measures about 6·2 mm. diameter by 4·05 mm. deep. Very small stones having all the properties of a true D. have been produced in the laboratory (see GEMS). See B. W. Anderson, *Gem Testing for Jewellers*, 1942; R. Webster, *Gemmologists' Compendium*, 1947; F. J. Sperisen, *Art of the Lapidary* (U.S.A.), 1950; A. Selwyn, *Retail Jeweller's Handbook*, 1955.

Diamond Necklace. The, piece of jewellery made in Paris by the court jewellers, Boehmer and Bassenge, in 1775, and allegedly intended for Madame du Barry, the favourite of Louis XV. Louis XV d. before the necklace was completed, and its price was beyond the reach of any purchaser (1,600,000 livres). Cardinal de Rohan, duped by an adventuress (calling herself Comtesse de Lamotte-Valois and pretending to be in the service of the queen) into believing that Marie Antoinette had expressed a desire for the necklace, bought it on credit. De Lamotte then obtained the necklace from the cardinal, on the pretext that she was going to give it to the queen, and then her husband went abroad and sold the separate D.s. When the first instalment on the necklace became due, the jeweller obtained an

interview with the queen and the whole truth was exposed. De Rohan was thrown into the Bastille, but acquitted after a sensational trial. De Lamotte and her husband were captured, the former branded as a thief, and the latter sent to the galleys for life. The question whether the queen and de Rohan were entirely innocent in the matter and merely the dupes of de Lamotte was much debated, and resulted in an increased unpopularity for the queen. In her *Memoirs* de Lamotte accused Marie Antoinette of being deeply implicated in the affair. See T. Carlyle, *Miscellanies*, 'The Diamond Necklace,' 1837; A. Lang, *Historical Mysteries*, 1904; F. Funck-Brentano, *The Diamond Necklace* (Eng. trans.), 1911.

Diana, anct It. goddess; probably in origin a woodland deity who became associated with the peasant family, and thus became a fertility goddess. Perhaps as a result of Etruscan influence, she was early identified with the Gk Artemis (q.v.), many of whose attributes she consequently assumed. The most famous shrine of D. was at Aricia, in the Alban hills, where she was worshipped with curious rites in conjunction with a woodland god called Virbius. Her cult was believed to have been introduced upon the Aventine at Rome by Servius Tullius.

Diane de France, Duchesse de Montmorency et d'Angoulême (1538-1619), natural daughter of Henry II and Filippa Duca. She was twice married, first to Orazio Farnese, 2nd son of the duke of Parma, and then to François, Maréchal de Montmorency. She was formally legitimised in 1547. She had great influence with her brother Henry III, whom she succeeded in reconciling to Henry of Navarre.

Diane de Poitiers (1499-1566), mistress of Henry II of France. In 1515 she married Louis de Brézé, Grand Seneschal of Normandy. Left a widow in 1531, she gained the affections of the king's son. On his accession to the throne as Henry II, in 1547, she exercised almost unlimited power, and was created by him Duchesse de Valentinois. On the king's death she was expelled from court by Catherine de' Medici, and d. at the Château d'Anet.

Dianium, see DENIA.

Dianthus, a Caryophyllaceae genus of about 300 species which occur in temperate parts of Europe, Asia, S. Africa, and N. America; ann. or perennial herbs; distinguished from allied genera by the bracts under the calyx. *D. caryophyllus* is the progenitor of carnations (q.v.); *D. armeria*, the native Deptford pink; *D. barbatus*, the sweet william; *D. chinensis*, the Indian or Chinese pink; *D. deltoideus*, the maiden pink; *D. granatopolitanus*, the Cheddar pink; *D. plumarius*, parent of garden pinks; and *D. knappii*, a yellow pink. There are many hybrids of which *D. × alwoodii* is important, and alpine pink species.

Diapason, an anct Gk term for the musical interval of an octave. The name is given to the 2 foundation stops of an organ, the open and stopped D.; it is

used by the Fr. in 'diapason normal' as equivalent to 'pitch.'

Diapensiaceae, a family of dicotyledonous plants found in cold regions. Chief genera are *Diapensia*, *Galar*, and *Shortia*.

Diaper: 1. In textile fabrics, the name given originally to a rich silken fabric with a pattern of the same colour embroidered on it. It is now restricted to linen or cotton material with a simple pattern woven in it, generally of a geometrical design, and used for towels.

2. In Gothic architecture, a small pattern of a conventional nature, generally geometrical, but sometimes floral in design, used for the surface decoration of stone. The idea was probably taken from the diapered pattern of Byzantine silks, and was also used in glass painting and illuminated manuscripts. There are good examples at Westminster Abbey and at Bayeux Cathedral.

Diaphoretic, measures taken to promote perspiration. The function of perspiration is to carry away waste products of metabolism through the skin and to keep the body cool. In some feverish conditions perspiration often ceases, so that the skin becomes dry and the internal temp. is not prevented from rising. It is advisable in some of these cases to promote perspiration by means of hot air, as in the Turkish bath; hot vapour, as in the Russian bath; by taking hot drinks and by diaphoretic drugs.

Diaphragm, a partition with a hole in it which is used in landscape and portrait lenses as well as all optical instruments, such as the telescope, microscope, etc. It controls the amount of light passing through the lens.

Diaphragm, or **Midriff**, the partition which divides the thorax from the abdomen. It is in the form of a muscular dome with a central tendon; it is concave towards the abdomen and convex towards the thorax, where the central tendon forms a floor for the heart. It arises in front from the posterior surface of the ensiform cartilage; at the side from cartilages connected with the lower 6 ribs; behind from the lumbar vertebrae. It has 3 large openings: one for the oesophagus and pneumogastric nerves, one for the aorta, thoracic duct, and large azygos vein, and one for the inferior vena cava. When the muscular fibres of the margin contract, the convexity of the D. is lessened and the size of the thorax is increased, intra-thoracic pressure being thereby diminished. Air flows in to fill up the additional space, and this, together with other muscular movements, comprises the action of inspiration.

Diarmid, or **Diarmait**, the name given to 3 Irish kings: the first was ruler over Níu Neill, and his father was called Fergus MacCabeill. He was slain in 555 by Columcille's kinsmen in revenge for his having hanged the latter. D. the second reigned from 658 to 665, whilst the third reigned over Leinster.

Diarrhoea, frequent loose or watery evacuations of the bowel. D. is a symptom and not a disease in itself. It occurs when peristalsis (q.v.) is increased,

or when fat digestion is faulty, or in inflammatory conditions of the intestinal mucous membrane, with consequent excessive secretion of mucous (see ENTERITIS and COLITIS). Sometimes 2 or all 3 of these factors operate at the same time.

Infantile D., see GASTROENTERITIS.

Diarthrosis, term in anatomy applied to joints which have the power of free movement, such as the socket joint of the hip, or the hinge joint of the elbow.

Diary (Lat. *diarium*, from *dies*, a day), the book in which a daily record of events or observations made by an individual is written. The 'ephemeris' of the Greeks, which was the original name of the 'diarium,' consisted usually of memoranda of military records, tables of the heavenly bodies, or money accounts; it was not until after the Renaissance that the D. came to have any literary value. Since then it has often been of service to the historian, not only in its supply of facts often unrecorded in historical chronicles, but as a picture of character and of the daily life of its writer's time. Among the most famous D.s of Eng. literature are those of John Evelyn for 1624-1706; Samuel Pepys (1660-69), perhaps the most valuable and minute record in existence; Swift's *Journal to Stella*, 1710-13; John Wesley's *Journal*, 1735-90; and Fanny Burney's *Diary*, 1778-1840. The D. of the Russian, Marie Bashkirtseff, created a great sensation in 1887, and that of Jules and Edmond de Goncourt in Paris in 1888. See A. Ponsonby, *English Diaries*, 1923.

Diastase, a species of ferment found in barley, oats, wheat, and potatoes after germination. It can be procured by placing a certain quantity of freshly germinated barley or ground malt in a mixture of 3 parts of water and 1 of alcohol, heated to 113° F. When obtained separately D. is a solid, white, tasteless substance, soluble in water and in weak alcohol. In solution at a temp. of 150° F., D. is powerful enough to break up starch, first into dextrin and then into sugar, particularly the variety called 'Maltose.'

Diastole, see HEART.

Diastylis, the typical genus of the Diastylidae, a crustacean of the order Cumacea. *D. arenarius*, about one-fifth of an in. long, is found on the coasts of Georgia and Florida.

Diathesis, a constitutional predisposition to a particular disease. The term is particularly applied to inherited or congenital predispositions which may, however, become observable only at a late period of life. Increasing knowledge of the causes of disease and of natural resistance has led to some extent to the discarding of the older theories of D. Thus a person contracts tuberculosis not necessarily because of a constitutional predisposition but from exposure to infection at a time of lowered resistance. The same applies with rheumatic infections. Cancer often runs in families, but whether from inherited predisposition or from other factors, such as exposure to similar hazards, cannot be proved until more is known of the aetiology of the disease. The body is endowed with an

ability to resist the stresses of faulty function whether these are induced from within or are the effects of external agencies. There is no doubt that some inherit weaker powers of resistance than others, while the normal power of resistance of others is strained by an inherited functional fault. An inherited insufficiency of the islets of Langerhans, giving rise in due course to diabetes, is an example of the latter. Such a person might be said to have a diabetic D.

Diatomite, rock composed almost entirely of silica, SiO₂, and made up of the accumulated shells of the microscopic plants known as diatoms. Diatomaceous ooze, contaminated by inorganic mud, is formed on the floor of the deep sea in the polar regions. Pure D. is deposited on the floors of some fresh-water lakes.

Diatoms, microscopic plant organisms of the Diatomaceae, a family of one-celled algae with siliceous cell-walls. These minute plants are invisible to the naked eye, and were first discovered by Leeuwenhoek in 1702. Since then no fewer than 10,000 species have been discovered. The D. exhibit a great variety of form, being either circular, disk-shaped, oval, or cuneate. They thrive best where they can obtain plenty of light and moisture, and are to be found in shallow seas and mixed with other organisms on the surface of moist rocks.

Diatonic, musical term derived from the Gk use. In modern music it denotes the notes and intervals of the normal major or minor scale, and the harmonies built on them, as distinguished from the 'chromatic.'

Diavolo, Fra (1771-1806), nickname given to Michele Pezza, It. brigand and patriot, a famous outlaw, originally a monk, appointed by Cardinal Ruffo to help recover Naples, which had been invaded by the Fr. in 1799. D. became one of the leaders of the 'bands of the Holy Faith'; these bands consisted of peasants, convicts, and brigands, and they were a source of considerable trouble to the Fr. Upon the accession of Joseph Bonaparte to the throne of Naples, a price was placed upon D.'s head, and he was eventually captured and shot. Auber's opera *Fra Diavolo* has immortalised the name of the brigand.

Diaz, Armando (1861-1928), It. soldier, b. Naples. Colonel in Tripoli war. Major-general, 1914. Director of military operations on outbreak of First World War. Lieutenant-general, 1916. In 1917 commanded 23rd Corps on the Carso. After Caporetto, succeeded Cadorna as chief of staff. Victorious at Vittorio Veneto, Oct.-Nov. 1918. After armistice, inspector-general. Made Duca della Vittoria, 1921. Minister of war on estab. of Fascism. Resigned in 1924 with new rank of marshal. D. in Milan. See life by Gen. A. Baldini, 1935.

Diaz (or **Novaes**, or **Dias**), **Bartholomeu** (c. 1455-1500), Portuguese navigator, famous chiefly for his discovery of the Cape of Good Hope. He resided at the court of King John II, where he came into contact with many scientific men.

Eager for adventures, he was sent by the king on a further voyage of discovery along the W. African coast. On this journey he rounded the Cape of Good Hope and discovered Algoa Bay; he succeeded in finding 1260 m. of unexplored coast, but met with little recognition for his pains. He accompanied Vasco da Gama on one of his voyages.

Diaz, José de la Cruz Porfirio (1830-1915), president of the Rep. of Mexico, b. Oaxaca, 6th child and eldest surviving son of José de la Cruz Diaz, a labourer, probably of mixed Sp. and aboriginal strain, who d. in 1833. Porfirio's mother was half-blood Indian. At 15 he was placed in the local seminary to train for the priesthood; but in 1849 he refused to take orders, entering the legal profession instead. Took part in the 'War of Reform' set on foot by Benito Juárez, governor of Oaxaca. Also took part in resisting the invasion of the Fr. and the Emperor Maximilian, and succeeded in entering Mexico City in 1867, when he resigned his command of the army and retired to his own native city. Disturbances soon arose in Mexico City, and at last D. was forced to come and set matters right. He entered Mexico City triumphantly in 1876, and was unanimously elected president, which post he held for 8 terms; but in April 1911 he was deposed by the successful revolution of Maderó, who succeeded him in the presidency. He d. in Paris.

Diaz, Don Juan Martin, see EMPECINADO.

Diaz de Gámez, Gutierre (c. 1379-1450), Sp. writer. His prin. work is *El Victorial*, first pub. with omissions in 1782 under the title *Crónica de don Pero Niño*.

Diaz de la Peña, Narcisse Virgile (1808-1876), Fr. painter, b. Bordeaux of Sp. parents. He first began painting on porcelain in a studio at Sèvres, and from 1840 painted landscapes in the forest of Fontainebleau with others of the Barbizon group. Among his masterpieces may be included 'La Fée aux Perles,' 'Sunset in the Forest,' and 'The Storm.'

Diaz del Castillo, Bernal (1498-1593), b. Medina del Campo, wrote a most faithful account of the conquest of Mexico under Hernán Cortés. Was himself one of the small band of faithful followers, and was consequently an eye-witness of the deeds of glory and brigandage he narrated.

Diazo-compounds, a family of carbon compounds the first of which to be discovered was obtained by Peter Griess of Burton-on-Trent in 1858. They are characterised by the presence in them of the $-N_2-$ group of atoms (hence the name, from the Fr. *azote*, nitrogen). The

constitution of this group is $-N=N-$ and the compounds are known as *diazonium* compounds. D. are most common in the aromatic (q.v.) sense, but aliphatic (q.v.) examples are known. Aromatic D. are prepared by the action of nitrous acid upon cooled acidified solutions of primary aromatic amines. In the solid state they are frequently very explosive, but this instability is less marked in solution, though even here they enter readily into

numerous reactions and are therefore of great importance in synthetic chem. They are also used largely in the manuf. of drugs and azo-dyes.

Diazotisation, the reaction of a primary aromatic amine, at a low temp., with nitrous acid in the presence of a mineral acid, leading to the formation of a diazo-compound. Discovered in 1858 by Peter Griess, this reaction is of great importance in dyestuff chem., since diazo-compounds will readily react with, e.g., naphthols to give azo-dyes. This is known as the coupling reaction. An example of D. and coupling is the formation of Para Red from *p*-nitroaniline and β -naphthol. See also DYE.

Dibdin, Charles (1745-1814), actor, dramatist, and composer, principally remembered to-day as a writer of sea-songs. He received his musical training as a chorister at Winchester Cathedral, but was otherwise self-taught. He had various theatre engagements, but after 1789 he made his success with table entertainments, at which he sang his own songs. Between 1764 and 1811 he produced a vast number of musical plays, for 46 of which he wrote the words as well. The tunes of the sea-songs, of which *Tom Bowling* is the most famous, have an excellent lilt and the words have found their way into anthologies.

Dibdin, Charles Isaac Mungo (1768-1833), dramatist, b. London, an illegitimate son of Charles D. (q.v.). Known as Charles D. the younger, he produced his plays for the most part at Sadler's Wells, of which theatre he was proprietor. He wrote over 200 pieces, including melodramas, farces, and pantomimes, but only a few were printed. He also wrote a *History of the London Theatres*, 1826.

Dibdin, L. O., see CHANT, L. O.

Dibdin, Thomas Frognall (1776-1847), Brit. bibliographer, b. Calcutta, nephew of Charles Dibdin (q.v.). Orphaned at the age of 4, he came to England and was adopted by an uncle, who sent him to St John's College, Oxford. His works include *Introduction to the Knowledge of Rare and Valuable Editions of the Greek and Roman Classics*, 1802, *The Bibliomania or Book Madness*, 1809, *Bibliotheca Spenceriana*, 1814-15, *The Library Companion*, 1824, *Reminiscences of a Literary Life*, 1836, and *A Bibliographical, Antiquarian, and Picturesque Tour in the Northern Counties of England and Scotland*, 1838. The famous Roxburghe Institute was founded by him (see BOOK-CLUBS).

Dibdin, Thomas John (1771-1841), illegitimate son of Charles D. (q.v.), and, like his father, a writer of plays and songs, of which he is said to have written about 200 and 2000 respectively; but he was not a composer. The best-known among his works were: *The Cabinet* (an opera), 1805;

Past Ten O'Clock (a farce); the pantomime of *Mother Goose*; *The High-metled Racer*, an equestrian piece for Astley's. He pub. his *Reminiscences* in 1837.

Dibon, or **Dhibān**, cap. of the Moabites, 840 bc, near the shore of the Dead Sea, renowned for the discovery of the famous Moabite stone of King Mesha.

Dibothriocephalus **Tapeworm**, or **Bothriocephalus**, genus of Cestoda, or tapeworms, which belongs to the *Platyhelminthes*. The species have 2 weak and flat suckers, the body is segmented, and the head has no hooks. *D. latus* is parasitic on man, and as its first stage occurs in fish it is found in countries where fish is not thoroughly cooked, as in Russia, Poland, Switzerland, and S. France. It may attain a length of 30 ft. *D. liquidoides* occurs in China and Japan and grows to a length of 8 in.

Dibranchiata, order of molluscs including all existing Cephalopoda except the pearly nautilus; it is subdivided into the Decapoda, with 8 arms and 2 tentacles, e.g. cuttle fish; and Octopoda, with 8 arms only.

Dicaearchus (fl. c. 320 bc), Gk peripatetic philosopher, pupil of Aristotle and a friend of Theophrastus. He was b. at Messina in Sicily. He wrote on hist., geography, and philosophy, but only a few fragments of his works remain. The most important of his writings were *Life in Greece*, discussing the moral, social, and political condition of the people, and *Lebiamor*, in which he tried to prove that the soul is mortal. The best ed. of the fragments of his work is by M. Fuhr, 1841.

Dicast, in Attic law a juror. Six thousand were chosen annually from citizens of 30 years of age and upwards, and they served in panels called dicasteries. D.s were judges of both law and fact; from the time of Pericles they were paid for their services. The manner in which they were swayed by party feeling and personal prejudice is referred to by Aristophanes in *The Wasps*.

Dice is the plural of the word 'die,' and comes from the Lat. *dare*, to give. They are small ivory or bone cubes, the 6 sides of which are marked with black dots from 1 to 6. These dots are so arranged that any 2 opposite sides on the cube always make up the number 7. Two D. are called a pair. They are used chiefly for gambling purposes, but they are also employed in backgammon and other games. D. boxes were made in ant. times of leather or wood or some equally suitable material, and so constructed that no trickery could be resorted to in the throwing of the D. Palamades is said to have invented D. about the year 1244 bc, but we have still earlier evidences of their use in Egyptian times. In the Brit. Museum, in one of the cases in the Egyptian gallery, is to be seen an ivory astragal, which belonged to the Queen Hatesu, 1600 bc. The astragal, or knuckle, or hucklebone, was the name given to the bone in the hind leg of cloven-footed animals such as the sheep, goat, or antelope. D. corresponding to ours have also been discovered at Thebes. The astragal undoubtedly corresponds to the

hucklebone which was used in the game of 'chance bone,' which was played by children in former times. Again, this game of 'chance bone' finds a striking parallel in the game of hazard played by means of 2 D., in which the player who first throws is called caster, while his opponent is called setter. This game with D. was declared to be illegal in the reign of George II. By 13 Geo. 2. c. 19, 'all games invented or to be invented with one or more die or dice' were forbidden, backgammon or games on a backgammon board being sanctioned. The reason of this prohibition was not far to seek: D. throwing had singular attractions for a certain class of swindlers, and it was a very common practice to use loaded D. This trick consisted in slightly weighting the sides of the D. bearing a small number. Gambling has existed among all nations in some form or another; the Gks and the Roms. made use of the astragal or talus, and loaded D. have been unearthed in Pompeii. The use of D. in England can be traced back to the earliest times, when the Britons learnt the practice of gambling from their conquerors the Roms. and the N. nations.

The most popular modern D. game is the Amer. one of 'craps'. Each player stakes. The first to throw may back himself against any or all of the stakes; he then rolls 2 D., scoring a 'natural' and winning the stakes if their sum is 7 or 11. If their sum is 2, 3 or 12 he scores a 'crap' and loses. Any other number is a 'point' and the player rolls until he either rolls the same number again, in which case he wins, or a 7, in which case he loses.

There are sev. games played with 5 poker D., each inscribed A, K, Q, J, 10, 9. These include 'aces' (each player rolls all 5 D. at once, laying aside each ace as it appears, and continuing to roll the remaining D. until he has scored 5 aces, when the other players follow; 5 aces in fewest throws wins): 'D. poker' (with a scoring system based on the card game) and 'liar D.' (in which the 5 D. are rolled, hidden, called truly or falsely and passed on, unseen by the receiver, who can accept or challenge the call. If he accepts he must call higher. If he challenges and the caller exposes the combination he called or a higher one, the challenger pays; if the caller exposes a lower combination than he announced, the caller pays. The values of combinations are as in poker.)

Dicentra, genus of Papaveraceae, consists of 15 species of N. Amer. and Asiatic herbaceous perennials. Favourite garden species are Amer. *D. cucullaria*, or Dutchman's breeches; *D. formosa*, and *D. oregana*; and Asiatic *D. spectabilis*, bleeding heart.

Dicey, Albert Venn (1835-1922), jurist, b. Claybrooke. In 1854 he entered Balliol College, Oxford, and was called to the Bar 1863. In 1890 he was appointed Q.C. His prin. works are: *Lectures Introductory to the Study of the Law of the Constitution*, 1885, *England's Case against Home Rule*, 1886, *Lectures on the Relation between Law and Public Opinion in*

England during the Nineteenth Century, 1905.

Dichlorodiphenyltrichloroethane, commonly known as D.D.T., a synthetic insecticide of the formula $\text{C}_{12}\text{H}_7\text{Cl}_5$ ($\text{C}_6\text{H}_4\text{Cl}_2$). It was first prepared in 1874 but its insecticidal powers were not observed until 1939. D.D.T. was widely used during the Second World War and was instrumental in preventing or checking typhus and other insect-carried diseases. It still finds extensive employment, but is being superseded by even more powerful insecticides such as Gammaxane (q.v.).

Dicholophus, see CARIAMA.

Dichroism, a property possessed by some doubly refracting crystalline substances of appearing of different colours when viewed in polarised light, the difference of colour depending upon the direction in which the luminous vibrations take place. The D. of crystals can be observed or tested by means of a simple instrument called a dichroscope or 'dichroscope.' It is simply a cleavage rhombohedron of Iceland spar with a weak magnifying lens. The crystal is held in a good light opposite one end of the instrument and on looking through it 2 images of the square hole are seen just touching each other. If the crystal is dichroic these will be of different colours and the colours will change if the dichroscope is rotated between the fingers. The most remarkable dichroic substances are the magnesian mica from Vesuvius, the tourmaline and ripidolite, also the sapphire and ruby. The phenomena of D. are best seen in crystals with 2 axes of double refraction, notably in iolite which crystallises in 6- or 12-sided prisms; these prisms, when seen along the axis, are of a deep blue colour, but when viewed in a direct-on perpendicular to it assume a yellowish-brown colour. Tourmaline is another notable example, being blood-red when viewed along the axis, but yellowish-green when viewed at right angles to it.

Dick, James (1743-1828), philanthropist, b. Forres, Morayshire. At the age of 19 he went to the W. Indies, where he acquired a fortune, the chief portion of which he left for the benefit of parochial schoolmasters of Moray, Banff, and Aberdeen. The 'Dick Bequest' was reorganised in 1890, and placed under the management of 13 governors.

Dick, James (1823-1902), b. Kilmarnock, Ayrshire. He invented gutta-percha boots, and with his brother, Robert, set up a factory at Greenhead, Glasgow, for the purpose of making and selling boots and shoes. He also manuf. the balata belts which were used by the gold diggers in Johannesburg. He reaped a fortune, and gave a park to Glasgow and the Elmbank Institute to Kilmarnock, besides other benefactions.

Dick, Sir William Reid (1879-), sculptor, b. Glasgow. He studied at the Glasgow School of Art and in London, and first exhibited at the Royal Academy in 1908. In 1933 he became president of the Royal Society of Brit. Sculptors, and from 1934-41 he was a trustee of the Tate Gallery. His work includes a large

number of portrait heads and busts, notably the bust of King George V in the Mansion House, London, and of Lord Kitchener in St Paul's Cathedral, also King George VI, and Mr (now Sir) Winston Churchill. Of other work by him mention must be made of his Bronze Eagle for the R.A.F. Memorial in London, the Lion on the Menin Gate at Ypres, and the statue of President Roosevelt in Grosvenor Square, London. His statue of King George V stands in Westminster, and at Coventry there is an equestrian statue of Lady Godiva by him. Since 1923 he has been a member of the Royal Fine Art Commission; K.C.V.O., 1935; King's Sculptor in Ordinary for Scotland since 1938.

Dickens, Charles John Huffam (1812-1870), novelist, b. Portsea, a dist. of Portsmouth (the house at which he was born was opened as a D. Museum in 1904). His father, John D., a clerk in the navy pay office, was then stationed at Portsmouth, where he lived in very

CHARLES DICKENS

precarious circumstances. Charles was the 2nd of 8 sons. In 1816 the family moved to Chatham, remaining there for some 5 years. About particular details of these early periods of his life but little is known. In *David Copperfield*, however, the sketch of David's boyhood is in many points similar to his own, and Micawber is usually recognised as a sketch of his father. His education was of a most elementary nature, but fortunately his father possessed a small collection of the works of the old novelists, Smollett, Fielding, Goldsmith, and Defoe, together with *Don Quixote* and *Gil Blas*. The family fortunes soon began to decline. The father was careless and impecunious, and the family settled in a poor part of Cunden Town. Then even the little education Charles had been getting came to an end, for his father's creditors refused to delay any longer, and consigned John D. to the Marshalsea Prison. His mother tried to support herself for a time by teaching children, and young Charles was sent to work in a blacking warehouse at Old Hungerford Stairs. The description

of this period of his life is given in *David Copperfield* with a clearness and bitterness which showed how deeply these 2 years of humiliation affected the sensitive boy. He spent Sundays with his parents at the Marshalsea. These years, however, supplied him with much of that wealth of knowledge of low life, of the street, of the prison and the poor, of which he was afterwards to make such marvellous use. In 1824 his father was enabled to pay his debts and Charles spent another 2 years at school, a private estab. at Hampstead, parodied as Salem House. In 1827 he entered the office of Mr Blackmore, a solicitor, where he remained for over a year. His early ambition was still active, and his application great. He spent hours in reading at the Brit. Museum and in mastering Gurney's shorthand. His natural powers of observation were also used to the best advantage, as his delightful sketches of legal dignitaries of all ranks clearly show. His father was still in difficulties, but Charles now managed to make his entry into journalism as a parliamentary reporter.

In 1833 he made his first appearance as a creative genius. In the *Monthly Magazine* for December of that year appeared the first of those sketches of contemporary manners collected in 1836 under the title of *Sketches by Boz*. He also made some contributions to the *Evening Chronicle*. About this time the issue of sporting novels of a humorous character, embellished with plates far more important than the books, was popular. Chapman and Hall, the publishers, were about to prepare a book of this kind dealing with the adventures of a club of Cockney sportsmen. Seymour, the famous rival of Cruikshank, had been engaged to provide the drawings, and D. was asked to write the letterpress. He pleaded his total ignorance of sport, and the plan was then changed to that of the Pickwick Club. On the suicide of Seymour, the sporting element was entirely dropped, and with 'Phiz' (Hablot K. Browne) as illustrator D. succeeded in making *The Posthumous Papers of the Pickwick Club* an immortal work. The introduction of Sam Weller marks the beginning of his success. From the advent of this character the monthly parts were awaited with feverish anxiety, and even the adverse *Quarterly Review* was compelled to admit that the whole reading world was discussing the Pickwickians. In 1837 the work appeared in book form, and in the same year the new novelist set to work on the grim satire of *Oliver Twist*. It may be noted that thus early in his career D. laid his hand to the 'novel with a purpose,' and that here, as always, he uses the method of gross caricature, making use of satire which ever remains too ludicrous to become ill-tempered, and which, however true the note of indignation may be, never loses sight of the humorous element. Here too appears the pathos, inclined to sentimentality, and the deep melodrama which was to be a fault of so much of his later work.

At the beginning of the year 1838, while

Oliver was not yet half finished, D. began the pub. of *Nicholas Nickleby*, a picturesque story pub. on the same lines as *Pickwick*, and commenced writing *Barnaby Rudge*. Much of the former is melodramatic, but some of the sketches are only a little short of his highest work. Mrs. Nickleby, partly drawn from his own mother, is one of the best characters, and the sketches of Dotheboys Hall and the travelling theatre are also noteworthy. On the completion of this work (1839) D. started a weekly periodical to be known as *Master Humphrey's Clock*, where *Pickwick* and the Wellers are again brought to life. In this periodical began *The Old Curiosity Shop*. In spite of the highly complicated plot this is one of the richest mines of Dickensian characterisation. The humorous sketches of Dick Swiveller and his bizarre surroundings are unexcelled, but, in spite of Landor and Jeffrey, the over-drawn pathos of Little Nell is almost universally condemned by critics. *Barnaby Rudge*, 1841, under the influence of Scott, appeared in the same publication. Here again the plot is complicated, and the work is also noteworthy as being, with the exception of *A Tale of Two Cities*, the only one in which D. dealt with the past. *Master Humphrey's Clock* then came to an end, and in Jan. 1842 D. started on his first Amer. tour. He was received everywhere with acclamation, so that his visit became a veritable triumph. However, he deeply offended transatlantic feeling by the pub. of *American Notes*, 1842, and on his return home he satirised Amer. democracy far more freely and effectively in *Martin Chuzzlewit*, 1843-4, which is generally regarded as his greatest humorous work since *Pickwick*. It closes the great period of his observation and external caricature. Henceforward, almost all of his good work is autobiographical. Here, however, his delineation of London, particularly at Tudgers's, forms an incomparable work, with Pecksniff, Mrs. Gamp, Betsey Prig, and the Literary Ladies. Melodrama is again present with Jonas Chuzzlewit. In 1844 he paid a long visit to Italy.

At the beginning of 1846 he took up the editorship of a newspaper, the *Daily News*, but after a few weeks relinquished this uncongenial post, and went to Switzerland, where he commenced *Dombey and Son*. This work, pub. in 1848, was a great success, and entirely re-established his fortunes. It marks, however, the beginning of his falling powers, and contains in the death of Little Paul the great monument of D.'s sentimentality. In 1849-50 appeared *David Copperfield*, favourite of D. and of most of his readers. The earlier portions are best, for here the autobiographical note is the stronger. In 1850 D. started a weekly paper, *Household Words*, designed to form a training ground for aspiring authors, which was later continued under the title of *All the Year Round*. In 1852-53 came *Bleak House*, where he satirises the Courts of Chancery. It contains the figure of Harold Skimpole, drawn from Leigh Hunt. Two years later came *Hard Times*, where D. violently

opposes the industrial doctrines of the Manchester school. It is clearer and more connected than its predecessor, but does not rank high among his works. Between these two, in 1853, had been pub. the vol. of *Christmas Stories*, containing 'A Christmas Carol,' 'The Chimes,' and other short works written at various times. To these must be ascribed much of the conventional idea of the secular or mid-Victorian Christmas, which is peculiarly English and Dickensian. It is important to notice that D. was the creator of this type, for he is generally associated with descriptions of Christmas. From 1855 to 1857 *Little Dorrit* appeared, and here the loss of the old animal spirits and the spontaneous humour is marked. By this time D. had finally taken up his residence at Gad's Hill in Kent, and an improvement is shown in *A Tale of Two Cities*, 1859, which is genuine and powerful tragedy. It is the least characteristic of all his works, and is appreciated by many who do not relish his other books. Two years later comes *Great Expectations*, which Swinburne and many other critics have judged the best of his works. His own life again furnishes many of the incidents, but the most notable thing is the improvement in technique. His mastery of the difficult art of sustaining an atmosphere is also shown in his next work, *Our Mutual Friend*, published in parts during 1864-65. In spite of brilliant effects of characterisation, as in the case of Silas Wegg, failing powers are shown here, and the work has never been a popular one. In 1858 he had begun a series of paid public readings of his works, and in 1867, under pressure of money difficulties, he continued these during a tour of America. A further series was carried out in England and Scotland in 1868. Though financially a success, they were very exhausting and injured his health. He then retired to Gad's Hill, where he engaged himself on *The Mystery of Edwin Drood*, a work which he left unfinished. He died at Gad's Hill on 9 June 1870. The letters of D. to his wife, which number 136, were donated to the Brit. Museum in 1899 by Mrs. Perugini, a daughter of D., on condition that they were not to be pub. during the lifetime of any of the children of D. The death of Sir Henry D. in 1933, following a street accident, released the museum authorities from this stipulation. The letters are now bound and available for public inspection. Other letters were ed. by Georgina Hogarth and Mamie Dickens, 1882, 1893, and by W. Dexter, 1938. See J. Foster, *Life of Charles Dickens*, 1872-4, 1928; G. K. Chesterton, *Charles Dickens*, 1906; Sir W. Robertson Nicoll, *Dickens's Own Story*, 1927; R. Strauss, *Dickens, a Portrait in Pencil*, 1928; Sir H. F. Dickens, *Memories of my Father*, 1928; E. Wagenknecht, *The Man Charles Dickens*, 1929; Osbert Sitwell, *Dickens*, 1932; Una Pope-Hennessy, *Charles Dickens*, 1945; M. Pearson, *Dickens*, 1949. See also G. Gissing, *Charles Dickens: a Critical Study*, 1898; Sir J. A. Hammerton, *The Dickens Companion*, 1910; G. K. Chesterton, *Criticisms and*

Appreciations of the Works of Charles Dickens, 1911; W. G. Wilkins (ed.), *Dickens in America*, 1911; J. W. T. Ley, *The Dickens Circle: the Novelist's Friendships*, 1919; J. B. van Amerongen, *The Actor in Dickens*, 1926; F. Delattre, *Dickens et la France*, 1927; and H. House, *The Dickens World*, 1941.

Dickens, Monica Enid (1915-), novelist, a great-granddaughter of Charles D., best known for her series of autobiographical books, *One Pair of Hands*, 1939, *One Pair of Feet*, 1942, and *My Turn to Make the Tea*, 1951. Her novels include *Mariana*, 1940; *The Fancy*, 1944; *Thursday Afternoons*, 1945; *The Happy Prisoner*, 1946; *Joy and Josephine*, 1948; *Flowers on the Grass*, 1949; *No More Meadows*, 1953; and *The Winds of Heaven*, 1955.

Dickens Fellowship. The, founded in 1902 to encourage the study and discussion of D. works, to help to remedy those social evils which would have provided subjects for exploitation by D., and to assist in the preservation of buildings associated with his name. It issues a magazine, *The Dickensian*, the 1st editor of which was R. W. Matz, who was succeeded by Walter Dexter, and (in 1945) by Leslie C. Staples. D.'s children, Sir Henry F. D. and Mrs. Kate Perugini, were both life presidents of the F., while many eminent men and women of letters to-day are members. The F. was installed in 1925 at The Dickens House, 48 Doughty Street, London, W.C.1., where D. once lived and wrote. The house was acquired by the F. as a permanent D. library and museum and is vested in a trust in which the London Co. Council, the Corporation of London, and the D. F. all participate.

Dickinson, Emily (1830-86), Amer. poetess, b. Amherst, Massachusetts of an old-estab. Massachusetts family, of original Yorks stock. Her father, Edward D., a lawyer by profession, was of stern, jealous disposition, and remained an abiding influence in E. D.'s life until his death in 1874. She was, however, much in sympathy with him. She was educ. at the Amherst Academy and the Mount Holyoke Female Seminary, and in 1854 visited Washington and Philadelphia. Soon after this, however, she became a voluntary recluse, never, save on 2 occasions, setting foot beyond her garden gate, and her renunciation is commonly supposed to have been caused by her father's opposition to her marriage. Her lover is unknown, although legend has been busy with his name, but it is now almost certainly authenticated that he was George Gould, a theological student, who 5 years after Emily's renunciation married another, and in 1862 was ordained. Having a sensitive mystical nature, E. D. composed her poetry in secret, and its existence was all but unsuspected. After her death a collection of manuscripts was discovered by her sister Lavinia, and some unfortunately destroyed. The remainder were pub. in 1890 and were an immediate success. Her poems are short epigrammatic lyrics which may be grouped under such heads as Life, Love

Nature, Death. The verse has an exquisite and unusual music; her rhythms and her sensitive manipulation of words are peculiar to herself, and these qualities are combined with a rare sensibility and an original mind. In her perception of life emotion was at once followed by a newness of thought. With Emerson, whom she resembled in method, E. D. ranks as one of the greatest Amer. poets of the 19th cent. Her collected letters were pub. in 1894 and *Complete Poems* in 1925, ed. by M. D. Blanchi; *Further Poems* appeared in 1929 and a revised *Complete Poems* in 1937; also *Bolts of Memory, New Poems*, ed. by M. L. Todd and M. T. Bigham, 1945. See M. D. Blanchi, *The Life and Letters of Emily Dickinson*, 1924; J. Pollitt, *Emily Dickinson*, 1930; G. Taggard, *The Life and Mind of Emily Dickinson*, 1930.

Dickinson, Goldsworthy Lowes (1862-1932), author, b. London, son of Lowes D., artist. He was educ. at Charterhouse and at King's College, Cambridge, where he later became a fellow. He was also a lecturer at the London School of Economics and Political Science. His works include: *The Greek View of Life*, 1896; *The Meaning of Good, a Dialogue*, 1907; *Justice and Liberty, a Political Dialogue*, 1908; *Appearances, being Notes of Travel*, 1914; *The European Anarchy*, 1916; *The Choice before Us*, 1917; *War: its Nature, Cause and Cure*, 1923; *The International Anarchy, 1904-1914*, 1926; *Goethe and Faust* (with F. M. Stawell), 1928; *After Two Thousand Years*, 1930.

Dicksee, Sir Francis Bernard (Frank) (1853-1928), painter, b. London. Studied painting under his father and at the Royal Academy; gained the gold medal of that institute for his 'Elijah confronting Ahab and Jezebel in Naboth's Vineyard', 1876. He became A.R.A. in 1881; R.A. in 1891; and P.R.A. in Dec. 1924—when he was knighted. He belonged to the school of painters specialising in 'romantic and sentimental illustration' and of this school was a late survival. Among his best works may be included 'Evangeline', 'The Symbol', 'Romeo and Juliet', 'Funeral of a Viking', 'The Magic Crystal', 'Paolo and Francesca', 'The Passing of Arthur', 'La Belle Dame sans Merci', and 'The Ideal'.

Dickson, Carter, see CARR, JOHN D.

Dickson-Poynder, Sir John, see ISLINGTON, 1st BARON.

Dicotyledons, the larger of the 2 great groups of Angiosperms (q.v.), monocotyledons being the lesser; characterised by having 2 cotyledons or seed-leaves in their embryos. D. are subdivided into (1) Monochlamydeae, the members of which have flowers with a sepaloid perianth or absent altogether, and often unisexual: to this belong the Urticaceae, Amelantaceae, and other orders; (2) Polypetalae, in which the flowers are hermaphrodite (i.e. contain both stamens and pistil), the perianth usually consists of calyx and corolla and the petals are free from one another; (3) Gamopetalae, with hermaphrodite flowers, and petals joined.

Dietamnus Albus, Burning Bush, Dittany, Fraxinella, E. European perennial herb, only species of its genus, with glands in the upper part giving off a fragrant, volatile, inflammable oil, which can be ignited on a hot still day.

Dictaphone, see AUDIO-TYPIST.

Dictator (Lat. *dictare*, to command), the title given to an official of the Rom. rep. whose earlier title was *Magister populi*. The office, as the earlier title suggests, was originally instituted in times of military crisis; the first D. was appointed in 501 bc, according to Livy, during a crisis in the war with the Latins. Later a D. was appointed in times of constitutional crisis and for criminal jurisdiction; this was the 'administrative' D. In early times the D. had absolute power over the life and death of the citizens, but that power was limited by the *Lex Valeria* (300 bc). From the beginning his absolute power was checked by his having to apply to the senate for money, and having no authority outside Italy. Originally the office was confined to the patricians; C. Marcus Iulius was the first plebeian elected, in 356 bc. The last regular D. elected was M. Junius Pera in 216 bc. The office, as revived by Sulla in 82 bc, was only similar in its bestowal of almost absolute power. He had himself elected 'for the establishment of the Republic', and he held the office for 3 years. The dictatorship of Julius Caesar was even less provisional and constitutional. In 43 bc he was appointed for 1 year, in 46 bc this period of office was extended for 10 years, and in 45 bc for life. After his death the office was abolished by Marcus Antonius in 44 bc.

In later times the titles and powers of D.s have been seized by usurpers and the heads of revolutionary movements, notably in the S. Amer. states, in Haiti, San Domingo, and Mexico. It might have been thought that the steady advance of democracy along constitutional lines would have precluded the possibility of a D. to bless or burden mankind. Yet in Europe the period between the First and Second World Wars may justly be known as the age of the D.s. In 1922 Mussolini rose to supreme power in Italy and Mustafa Kemal in Turkey. Mussolini's example was followed in Spain by Primo de Rivera in 1923. In Soviet Russia, on the death of Lenin, chief power passed to Stalin. It was largely by exploiting the fear of Bolshevism in W. Europe and appealing to nationalist sentiment that Mussolini in Italy and Hitler in Germany consolidated and maintained their power. Lesser D.s of the period were Marshal Pilsudski in Poland, Dollfuss in Austria, and Adm. Horthy in Hungary. The Fascist and Nazi dictatorships of Italy and Germany were swept away by the Second World War. Only Stalin in Russia and Franco in Spain survived as D.s in Europe. On the death of Stalin in 1953 Malenkov succeeded, but as head of the new system of 'collective leadership' Malenkov was replaced by Bulganin and Khrushchev in 1955, again as leading members of a

group all the members of which shared in ultimate power. Mao-tse-tung and Chou En-lai were estab. as president and prime minister of China on the victory of the Communists over the Nationalists under Chiang Kai-shek in 1949, but their democratic titles concealed dictatorial powers. See articles on those mentioned.

Dictatorship of the Proletariat, in Marxist theory the state power during the transition from capitalism to socialism. In Russia the Communist rule from 1917 till the adoption of the Stalin Constitution, 1936, was officially termed the D. of the P., exercised through the Soviets (see SOVIET).

Dicte, mt in Crete, 7166 ft high.

Dictionary, in its proper sense, is a book containing a list of the words of some language arranged in a definite order, usually alphabetical, together with explanations of these words. For a mere word-list without explanations the term *onomasticon* is now used; a glossary, on the other hand, is a partial D., dealing with some section only of a language, or with a special author; while the term *lexicon* is usually reserved for Gk, Heb., Syriac, or Arabic D.s. In a complete D. information is also given on the etymology of each word, and the correct pronunciation is indicated by some kind of symbols.

Lexicography, like most other sciences, goes back to the ancients, and the earliest lexicographer of whom we have record is Aristophanes of Byzantium, who was head of the great library of Alexandria at the beginning of the 2nd cent. BC. Julius Pollux, who made a list of Attic words with explanations in the 2nd cent. AD, was followed some centuries later by Hesychius, whose work was used in the 10th cent. by the most famous of Gk lexicographers, Suidas; his lexicon contains not only a list of words with their meanings and illustrative quotations, but a number of informative articles. The first Gk D. in modern times was the *Thesaurus Graecae Linguae* which the Fr. scholar and printer Henri Estienne, known as Stephanus, pub. in 5 vols. in 1572; it was revised in 1831 by a Parisian scholar, Ambroise Firmin Didot, and is still a standard authority. The standard Gk-Eng. lexicon is that of H. G. Liddell and Robert Scott, first pub. in 1843 and completely revised by Sir Henry Stuart Jones and Roderick Mackenzie in a 2-vol. ed. which appeared in 1940. For Late Gk the standard work is the *Greek Lexicon of the Roman and Byzantine Periods* of E. A. Sophocles, 1887.

In Lat. the 2 chief early philologists were Marcus Terentius Varro (q.v.), who wrote a vast work, *De Lingua Latina* (On the Latin Tongue), and Verrius Flaccus, whose encyclopaedic *De Verborum Significatu* (On the Meaning of Words) was abridged in the 2nd cent. by Sextus Pompeius Festus. In 1532 Robert Estienne (Stephanus), father of the Henri Estienne mentioned above, pub. his *Thesaurus Linguae Latinae*, which was the best Lat. D. of its time. It has been superseded by the great Ger. *Thesaurus Linguae Latinae*, which was begun in 1900 and though interrupted by the war is now

again in progress. Apart from this, the most important Lat. D. is the It. *Lexicon Totius Latinitatis* of J. Facciolati, A. Forcellini, and J. Furlanetti, revised by F. Corradini in 1864. The most comprehensive Lat.-Eng. D. is that of C. T. Lewis and C. Short, first pub. in 1879, but it will be superseded by the *Oxford Latin Dictionary* now being compiled by the Oxford Press; arranged on historical principles, it will cover the language from the earliest times to the 2nd cent. AD. For later Lat. there is the *Glossary of Later Latin to 600 A.D.* by Alexander Souter, pub. in 1949, and for medieval Lat. the standard work is the *Glossarium Mediae et Infimae Latinitatis* of Charles du Fresne, Seigneur du Cange, first pub. in 1678, latest ed. 1887.

Lexicography in England may be said to begin about 1440 with Geoffrey the Grammarian's *Promptorium Parvulorum*, the first Eng.-Lat. vocabulary, but the first D. specifically so termed was made by Sir Thomas Elyot in 1538. All the early D.s dealt with foreign or difficult words only. 1604 saw the first real Eng. D., still of this type, Robert Cawdrey's *Table Alphabetical of Hard Words*, which explained 'inkhorn terms' that had been introduced from other languages; a similar work was Thomas Blount's *Glossographia*, 1656. A definite stage in progress was marked by Nathaniel Bailey's *Universal Etymological English Dictionary*, 1721, which was the first to include all Eng. words—a necessary innovation since it was giving their derivations. It also won distinction as the work on which Dr Johnson based his famous *Dictionary of the English Language*, 1755. Johnson's definitions and illustrative quotations are excellent, but his work had the defect that it went no further back than the time of Sidney and also suffered from the limitations of 18th-cent. etymological knowledge.

The *Oxford English Dictionary* marked the furthest advance yet made in the science of lexicography when it introduced historical principles and traced the development of each word from its first appearance. Begun in 1858 with Herbert Coleridge and after him F. J. Furnivall as its first editors, it took 70 years to compile. The first 20 were occupied in gathering material, and it was not until Dr (afterwards Sir) J. H. Murray became editor-in-chief that an actual start was made with articles, the first part being pub. in 1884. Three more editors (with, of course, a numerous staff) were concerned in its compilation—Dr H. Bradley, Sir Wm A. Craigie, and Dr C. T. Onions. The D., which in its later format runs to 13 vols., defines 414,825 words, illustrated by 1,827,306 quotations. A supplementary vol. appeared in 1933, and there are a number of abridgements, including the 2-vol. *Shorter Oxford Dictionary*, ed. by C. T. Onions, and the *Concise Oxford Dictionary* of H. W. Fowler and F. G. Fowler, the 4th ed. of 1951 being revised by E. McIntosh; this is commonly accepted as the authoritative working D. for everyday use. But many leading

publishers have brought out D.s, among the best known being *Chambers's Twentieth Century Dictionary*, *Nuttall's Standard Dictionary*, and the *Everyman's English Dictionary*.

In addition to those comprehensive Eng. D.s there are also specialised works which deal with separate stages or aspects of the language. O.E. is treated in the *Anglo-Saxon Dictionary* of Joseph Bosworth, revised by T. N. Toller, 1898; and M.E. in F. H. Stratmann's *Middle-English Dictionary*, revised by H. Bradley, 1891. A new *Middle English Dictionary* is also in progress in America under the editorship of Profs. Hans Kurath and Sherman Kuhn. Other specialised D.s are the *Etymological Dictionary of the English Language* compiled by W. W. Skeat in 1882, and the monumental 6-vol. *English Dialect Dictionary* of Joseph Wright, 1898. The standard work on pronunciation is the *English Pronouncing Dictionary* of Daniel Jones (latest ed. 1955). A massive *Dictionary of Slang* (latest ed. 1949) was produced by Eric Partridge, and distinctively Shakespearean words are dealt with in Dr Onions's *Shakespeare Glossary*, 1911. Rhyming D.s date back to Peter Levin's *Manipulus Vocabulorum*, 1570, which had many successors.

While the *Oxford Dictionary* is the accepted authority in Britain, in the U.S.A. the standard work was the *American Dictionary of the English Language*, first compiled by Noah Webster (q.v.) in 1828, which has now expanded into the 2-vol. *Webster's New International Dictionary*, 1936. A distinctive *Dictionary of American English*, compiled by Sir Wm Craigie, 1936-44, deals with the language down to 1900, and in 1951 there was pub. *A Dictionary of Americanisms on Historical Principles*, by Mitford M. Mathews, which contains all words of Amer. origin down to 1950.

For many years the authoritative Scots D. was the *Etymological Dictionary of the Scottish Language* by John Jameson, revised by John Longmuir and David Donaldson, 1879, but it is now being gradually superseded by 2 great new D.s which are in progress. Sir Wm Craigie's *Dictionary of the Older Scottish Tongue* covers words and usages down to the end of the 17th cent., while the *Scottish National Dictionary*, begun in 1928 by Dr Wm Grant and carried on from 1946 by David D. Mursion, deals with the later development of the language, including Burns.

There are, of course, innumerable D.s of other modern languages, with or without Eng. equivalents for each word, and the term 'dictionary' has also come to be used of any work of reference (usually explanatory) which is arranged alphabetically. Hence we have D.s of botany, of dates, of heraldry, of medicine, of music, of proper names, of proverbs, of synonyms. The list could be extended to cover almost every dept of human knowledge. See James A. H. Murray, *The Evolution of English Lexicography*, 1900; J. R. Hulbert, *Dictionaries: British and American*, 1955.

Dictys Cretensis (of Crete), a native of Cnossus who is reputed to have followed Idomeneus to the siege of Troy and to have written an account of it. Lucius Septimius in the 4th cent. pub. an *Ephemeris belli Trojani*, which purports to be a Lat. trans. of the Gk of Dictys. See N. E. Griffin, *Dares and Dictys*, 1907.

Didactic Poetry (Gk *didaskkein*, to teach) is poetry which openly expresses its intention of conveying knowledge or instruction. Aristotle considered that a didactic poem was no more than a treatise; but there are so many degrees of didacticism in poetry that while most didactic poems are very inferior as poetry some are great in spite of the didactic element, e.g. *Paradise Lost* is didactic in so far as it sets out with the dogmatic aim, 'to justify the ways of God to man.' The majority of notable Eng. didactic poems have a theological aim, e.g. the *Faerie Queene*, which is essentially a vindication of Protestantism and Puritanism; and much of the poetry of Cowper, who fancied that the vehicle of verse might bring many to listen to truths (as he held them) which they would be disinclined to have stated to them in simple prose, is directed to theological tenets. The same poet's *Tirocinium* or *Review of Schools* is yet more obviously didactic, being written to 'recommend private tuition at home.' Thus poetry of very varying merit may be in greater or lesser degree didactic; but in a more restricted sense D. P. is rather that in which the precepts or teachings are not merged in accepted flights of poetic imagination but are set out dogmatically, as, e.g., Tusser's (q.v.) *Five Hundred Poymes of Good Husbandrie*. In anct Gk poetry the most famous example is Hesiod's *Works and Days*, a practical treatise on farming. In Lat. the *De Rerum Natura* of Lucretius (q.v.), an exposition of Epicurean philosophy, is the D. poem *par excellence*; and the *Georgics* of Virgil are also replete with precept, the Third Georgic containing practical precepts for farmers, and the Fourth giving much information about bees; but in both poets, though far more markedly in Virgil, the teacher is often dropped by the poet for the natural philosopher, speculating on the hidden reason of nature's operations. Bagehot, voicing the common opinion, thought that it was not the object of poetry 'to chill you with didactic icebergs,' but rather to select, idealise, purify and intensify the great features and peculiarities which make society as a whole 'remarkable and fancy-taking.' As poetry, J. P. is often commonplace, the matter not lending itself to the mode of expression which most appeals to the true poet.

Didcot, vil. of Berkshire, England, 7 m. S. of Abingdon; an important railway junction and an ordnance depot. There is an atomic energy research station 4 m. away. Pop. 11,000 (1954).

Didelphia, see MARSUPIALS.

Didelphys, see OPOSSUM.

Diderot, Denis (1713-84), Fr. philosophical writer and critic, b. Langres in Champagne. He was educ. at the Jesuit

College at Langres and the Collège d'Harcourt at Paris. He was intended for the Church, but on his expressing a distaste for it he was placed with a procureur in Paris to study jurisprudence. Evincing an equal distaste for the law, and refusing to return to his father's home, he was left in Paris to live by his wits. He tried many occupations, but continued at none—only defying starvation with his pen. He wrote anything and everything, indices, catalogues, advertisements, sermons, and trans. from Eng. His first important original work was *Pensées philosophiques*, 1746, in which he set forth the doctrine of the band of free-thinking philosophers who arose at about this time. Their doctrine is summed up in his own dying words: 'The first step towards philosophy is incredulity.' For his *Lettre sur les aveugles*, 1749, he was imprisoned at Vincennes by order of the gov. On his release D. collaborated with D'Alembert as editor of a *Universal Medical Dictionary*, a scheme which later grew into the *Encyclopédie, ou Dictionnaire Raisonné des Sciences, des Arts, et Métiers*. The work was enormous, and owing to the retirement of D'Alembert D. was sole editor for the greater part of the time. The first vol. was pub. in 1751, and the remaining 16, as well as 11 vols. of plates, in the years between 1751 and 1765. He embodied in his encyclopædia the philosophy which he had foreshadowed in the *Pensées philosophiques*, the dreary, rebellious philosophy of Atheism and revolt, which he shared with his friend and great contemporary, J.-J. Rousseau, and which was to inspire the Revolution. Among D.'s other works were the *Essay on Painting*, trans. and praised by Goethe; *Lettres sur les sourds et muets*, 1751; *Pensées sur l'interprétation de la nature*, 1754; *Code de la nature*, 1755; the tales of *Jacques le Fataïste* (inspired by Sterne), 1897; and *Le Nereu de Rameau*, 1805, the finest of his imaginative productions. This last is a didactic novel profoundly criticising human nature and social life. *Les Bijoux Indiscrets*, 1747, is an extreme example of the coarser style which he sometimes affected; he also wrote *La Religieuse*, 1790, a novel directed against convent life; *La Promenade du scripteur*, 1747; *La Réce d'Alcibiade* (c. 1755, not issued till 1830); *Lettres* to his mistress, Mlle Voland; and his last work, *Essai sur la vie de Sénèque*, 1778. The *Salons* (pub. variously 1759-1857) gave a strong impulse to art criticism in general, by establishing relations between art and literature, which previously had been largely dissociated. D.'s literary significance does not depend on any great work or works, but upon his versatility and universality, and on that account he is of the highest importance in the hist. of 18th-cent. literature. In his last years he sank into a state of extreme poverty. Catherine of Russia, to relieve him, bought his library, but appointed him custodian and paid him 50 years' salary in advance. In 1773 D. visited St Petersburg to thank the empress and returned to Paris only 12 days before his death.

Collections of D.'s works were pub. by Naigeon in 15 vols., 1798; reprinted in 22 vols., 1821; and by J. Assézat and M. Tournoux in 20 vols., 1875-79. See H. de Sainte-Beuve in *Portraits littéraires*, 1844; J. Morley, *Diderot and the Encyclopaedists*, 1886; A. Collignon, *Diderot, sa vie, ses œuvres, sa correspondance*, 1895; J. Le Gras, *Diderot et l'Encyclopédie*, 1928; A. Billy, *Vie de Diderot* (with bibliography), 1943.

Didius Salvius Julianus, Marcus, Rom. emperor (28 Mar.-2 June, AD 193). After the death of Pertinax (q.v.) he purchased the empire, which had been put up for auction by the praetorian guards, but was murdered after a reign of only 2 months.

Dido, or Elissa, legendary daughter of Belus, king of Tyre, and sister of Pygmalion, his successor. Pygmalion murdered her husband, Acerbus or Sichæus (see Virgil). D. escaped with her treasures to Cyprus and N. Africa, where she founded Carthage on a piece of land bought from Iarbus, king of Libya. To escape marriage with Iarbus, she built a funeral pyre and stabbed herself before her people. Virgil in the *Aeneid* makes D. stab herself after her desertion by Aeneas, the hero of Troy, but more than 300 years intervened between the traditional fall of Troy (1184 BC) and the foundation of Carthage (853 BC).

Didon, Henri (1804-1900), Fr. Dominican preacher. In 1871 he delivered the funeral oration at the obsequies of Archbishop Darboy (q.v.). A keen student of St Thomas Aquinas, D. was interested in the reconciliation of religion and science; but his lectures on that subject brought him under suspicion, and he retired to Corsica. His most popular work was *Jésus Christ*, 1890, the outcome of a visit to the Holy Land.

Didot, François (1689-1757), founder of a family of famous Fr. printers. He started in trade as a bookseller and printer in 1713, and is noted for his collection of the travels of the Abbé Prévost in 20 vols., 1737. *François Ambroise* (1730-1804) and *Pierre François* (1732-93), his sons, made significant improvements in the arts of typefounding and paper-making, the former improving the point system of type sizes, originated by Fournier in 1737, which remains the standard adopted on the Continent of Europe under the name *Système Didot*. *Pierre l'aîné* (1761-1853), son of François Ambroise, and his brother *Firmin* (1764-1836) printed the notable Louvre eds. of the classics. Firmin also improved the stereotype method of plate-making (see GEN. W.), and invented the term. *Pierre François's* sons, *Henri* (1765-1852) and *St Leger* (1767-1829), added to the family's prestige, the former cutting a microscopic type which the latter used in a 64-mo ed. *St Leger* was the first to make paper in an endless roll. The 4th generation increased the prosperity and reputation of the business, which by 1840 included not only the publishing dept, but also printing works, foundry, paper mills, and ink factory. The

publishing was carried on by *Jules* (1794-1871) and *Henri II* (b. 1796), sons of Pierre l'aîné, until 1850 when it closed down. The other branch under *Ambroise Firmin* (1790-1876) and *Hyacinthe Firmin* (1794-1880), sons of Firmin, was in 1840 formed into the Fonderie Générale of Paris.

Didsbury, residential dist. of Manchester (q.v.).

Didymium, name given to a mixture of the 2 chemical elements *neo-didymium* and *praseo-didymium* before its dual nature had been ascertained.

Didymotichon, formerly called **Demotika**, tn of Thrace, Greece, near the R. Maritza and on the Sofia-Istanbul railway. Pop. 8500.

Didymus (1st cent. bc), nicknamed 'Chalcenterus' (Brass-guts) on account of his enormous output. He was an Alexandrian grammarian, and wrote no fewer than 3500 commentaries, lexica, etc., of which only fragments survive. See M. Schmidt, *Didymi Chalcenteri fragmenta*, 1854.

Die, see DROME.

Die Burger, S. African Afrikaans newspaper, estab. 1915, pub. in Cape Town, with great influence throughout the country as the largest and most important paper supporting the National party. It gives thorough coverage to all important happenings. Associated newspapers are *Die Volksblad* (Bloemfontein) and *Die Oosterlig* (Port Elizabeth).

Die Casting, see MOULDING.

Die-hards, nickname in Eng. politics current towards the end of 1918, when the coalition gov. under Lloyd George began to show signs of internal dissension, and to break up once more, as the electorate was already doing, into separate parties. Many Conservatives desired to return to the original party system. At first the leaders of this movement were few in number and small in influence, and they were called D. almost in derision. But gradually their influence increased until at an important party meeting they found themselves to be in a majority of nearly 3 to 1. The coalition gov. ceased to exist, and Lloyd George was succeeded in the premiership by Bonar Law. See also MIDDLESEX REGIMENT.

Die-sinking, used in the process of stamping an impression on coins or medals. The steel to be engraved for the die is at first carefully prepared and then subjected to a process which softens it. It is next given over to the engraver, who, by means of small hard implements of steel, cuts the design which he requires, and which must be a reversed one. When this is finished it has to be subjected to another process which makes it extremely hard. It is then ready for use, and is known as the matrix. As, however, the process of engraving is very expensive, it is seldom that the matrix is used for the actual stamping process. Instead of this the impression is produced by considerable pressure in relief on a block of soft steel, which is known as the punchon. The latter has to be hardened and it can then be used for conveying the design engraved on the matrix. Dies are also used in the

manuf. of many other articles besides coins or medals. They are used in the manuf. of jewellery and of clocks and watches, and also in stamping ornaments. The art of engraving dies dates from very early times, and very many ancient Greek coins survive as a record of the art.

Diebitsch-Zabalkanski, Hans Friedrich Anton, Count von (1785-1831), Russian gen. Made commander-in-chief of the Russian Army, 1829. (Chiefly famed for his passage of the Balkans, for which he received the titles of field-marshal and Count Zabalkanski.)

Dieburg, Ger. tn in the Land of Hessen (q.v.), 28 m. ESE. of Wiesbaden (q.v.). It has Rom. remains, a pilgrimage church, and an ancient fortress. Pop. 9000.

Diedenhofen, see THONVILLE.

Diefenbach, Lorenz (1806-83), Ger. linguist and ethnologist, b. Ostheim (Hessen). Wrote *Celtica* (2 vols.), 1839-42; *Glossarium latinogermanicum mediæ et infimæ ætatis*, 1857, a supplement to Du Cange's glossary (see DICTIONARY); and *Novum Glossarium latino-germanicum*, 1867; also a *Hoch-und-niederdeutsches Wörterbuch* (with E. Willeker), 1874-85; *Völkerkunde Osteuropas* (2 vols.), 1880; and other works, including a dictionary of the Gothic language and poems and novels.

Diefenbaker, John George (1895-), Canadian politician, and Prime Minister of

Karsh of Ottawa
JOHN DIEFENBAKER

Canada since 1957, b. in Grey co., Ontario, and educ. at Saskatchewan Univ. He served overseas in the Canadian Army, 1916, after graduation, and was called to the Saskatchewan Bar in 1919. He has

had a successful career as a barrister and has been counsel in many leading civil and criminal cases in Saskatchewan prov. He first stood as a parl. candidate in the general elections of 1925 and 1926, but was defeated. In 1940 he was elected for Lako Centre, Saskatchewan (and again in 1945 and 1949). He was the Canadian parl. delegate to the Brit. Parl. Association conference at Ottawa, 1943, and to the same association's conference in Bermuda, 1946, also to the Commonwealth Parl. Association conference in New Zealand and Australia, 1949; and he was chairman of the 1943 conference (the first at which representatives of the U.S. Congress met with Brit. Commonwealth and Empire representatives). He attended U.N.O. in San Francisco, 1945, as adviser to the Conservative party representative from Canada. He was a member of the N.A.T.O. parl. conference in Paris, 1955. In 1953 and 1957 he was elected member of parliament for Prince Albert, and became leader of the Progressive Conservative party in Dec. 1956. In June 1957 he was appointed Prime Minister of Canada, and immediately left for the Commonwealth Prime Ministers' conference in London to represent his country.

Dieffenbach, Johann Friedrich (1792-1847). Ger. surgeon, *b.* Königsberg in Prussia. First studied theology, then became a volunteer. Finally entered the medical profession, and became one of the most famous surgeons of the day; was appointed prof. of surgery in the univ. of Berlin, 1840; was particularly successful in the art of forming new noses, lips, and in other plastic operations. His many works include a great treatise on operative surgery, 1845-8.

Diégo García, is. dependency of Mauritius, in the Orléans group in the Indian Ocean, in 7° 20' S. lat. and 72° 26' E. long., about 12 m. long by 6 m. wide. Has a good harbour and exports coconut oil, coconuts, copra, guano, and salted fish. A large proportion of its 2800 inhabs. are labourers from Mauritius. Lying as it does on the direct route from the Red Sea to W. Australia it is proposed to equip it as a calling place for a Commonwealth Reserve air route. During the Second World War its excellent anchorage was used as a refuelling base for naval vessels.

Dielectric, non-conductor of electricity, or insulator. The name is applied particularly in connection with electrostatic induction and other effects transmitted through the substance. The force between 2 charged bodies depends on the D. between them. The capacitance of a capacitor depends on the D. between the plates. When the plates are connected by a wire, a discharge current flows in the wire and, according to Maxwell, the current circuit is closed by a 'displacement current' in the D. This current exists as long as the voltage between the plates varies, and is permanent when alternating voltage is applied.

Dielectric Constant or specific inductive capacity, now preferably called permittivity, ϵ (Brit. Standard 1991), a

material constant defined as the ratio of the capacitance of a capacitor with the material as D. to that of the same capacitor with a vacuum as D.

Dielectric Loss, leakage current through insulation, e.g. of cables (q.v.), due to the fact that no substance is a perfect insulator under all conditions.

Dielectric Heating.—If a D. is placed between, not necessarily in contact with, the plates of a capacitor and a high-frequency voltage is applied to the plates, part of the energy is converted into heat in the interior of the D. As a D. is also a non-conductor of heat, the method is useful for heating the bulk of plastics (q.v.) and for drying of porous materials, water being expelled from the hot interior. Heat applied to the surface of such materials would be ineffective. D. heating is also used in diathermic treatment of rheumatoid diseases (see **ELECTROTHERAPY**). See J. L. Langton, *Radio-frequency Heating*, 1949.

Dielectric Strength, see **ELECTRIC STRENGTH**.

See also **DISPLACEMENT, ELECTRIC**.

Diemen, Van, see **VAN DIEMEN**.

Diên-biên-phu, market in the valley of the Nam-Nhưn riv., about 1500 ft above sea-level and surrounded by mts, in W. Tonking (q.v.) close to the border of Laos (q.v.). Scene of the last and heaviest battle of the 1945-54 war in Viet Nam when the Viet Minh (q.v.) captured the big Fr. defensive position at a heavy cost to both sides.

Diepenbeek, Abraham van (1599-1675), Flem. painter, *b.* Bois-le-Duc. He became a pupil of Rubens (q.v.), and afterwards studied in Italy. His painting at its best is an imitation of Rubens, but he is known also as an engraver and glass-painter.

Dieppe, Fr. seaport and watering place, in the dept of Seine-Inférieure, on the Eng. Channel, at the mouth of the Arques, 33 m. N. of Rouen. There is a 15th-cent. castle, and a fine church of the 13th and 14th cents. The tn was occupied by the Eng. from 1420 to 1435 during the Hundred Years' War. In the wars of religion it was a Huguenot stronghold, and its prosperity declined after the revocation of the Edict of Nantes (q.v.) in 1685, and the Eng. and Dutch bombardments of 1694. Its people have an ancient sea-going tradition. There is a trade in fish, wines, and fruit and some industries, including ship-building, rope-making, and the manuf. of ivory and bone articles. There is a ferry to Newhaven. D. was considerably damaged in the Second World War, and was the scene of heavy fighting, notably during the famous raid of 1942 (see **DIETTE RAID**). It was the bp. of Duquesne (q.v.). Pop. 22,000.

Dieppe Raid, Combined Operations raid, carried out on the night of 18-19 Aug. 1942 by a force of 5000 Canadian troops, a detachment of Amer. Rangers, and some Brit. commando troops, embarked in naval vessels and transports and protected by warships and by a continuous fighter-plane 'umbrella' of the

R.A.F. Its purpose, according to Churchill, was to get information about the Ger. defences in the W. and on conditions to be expected in a large-scale assault on a strongly held Channel port. Among the objectives were 2 powerful batteries of 5.9 coast defence guns at Berneval on the E., and at Varangeville on the W., of Dieppe, and a radiolocation station which was used in Ger. attacks on Brit. Channel convoys. The plan was for landings to be made at over half-a-dozen points, preceded by a brief intense naval bombardment, followed by an attack of cannon-firing Spitfires and Hurricanes on the main defences. Tanks were to be put ashore to support the infantry in holding the garrison while the selected objectives were being destroyed. But the raid did not go 'according to plan,' though it was not entirely unsuccessful. The approach to the Fr. coast was betrayed through the ships running into some enemy armed trawlers which, soon reinforced by other enemy ships, opened fire. Sev. craft disembarked men near Berneval in broad daylight, nearly 30 min. late, and at once came under heavy fire. One commando made a sustained effort to destroy the heavy battery at Berneval but had to withdraw. At Varangeville, however, the assault parties succeeded in blowing up all 6 guns of the battery, but at great cost in casualties. Despite strong opposition landing forces destroyed one other battery and the radiolocation station, besides inflicting losses on the enemy. The 28 tanks which were landed could not give adequate support, since the anti-tank defences had not been overcome by the naval and air bombardment. While the prin. objective of the air operations was to support the landing parties, there in fact developed a great air battle in which nearly 100 Ger. aircraft were certainly destroyed, the total figure being probably much higher. Brit. land casualties were heavy. Of 5000 Canadian troops engaged 3372 were killed, wounded or missing. Such losses seem out of proportion to the value of the objectives desired or achieved, and the real reason for the enterprise is still difficult to discover. It occasioned acts of great gallantry and was acclaimed in Britain as a victory: the Germans stated next day that 'in our considered opinion the Brit. High Command did not even know what it hoped to achieve.' See R. W. Thompson, *Dieppe at Dawn*, 1956.

Diervilla, synonym: Weigela, a genus of deciduous shrubs, family Caprifoliaceae, about 12 species, native to E. Asia and N. America.

Dierx, Léon (1838-1912), Fr. poet of the Parnassian group, who is chiefly noted for the following works: *Poèmes et poésies*, 1864; *Lèvres closes*, 1867; *Les paroles du vaincu*, 1871; *Poésies complètes*, 1872. His *Oeuvres* were pub. in 2 vols., 1894-96. He was called the 'Prince of Poets' on Mallarmé's death.

Dies Irae (Lat. 'Day of Wrath'), a Lat. hymn on the Last Judgment (so called from its first words), based on Zeph. i.

14-18, written by Thomas of Celano (d. 1255), a friar belonging to the order of St Francis. This hymn was inserted by the Council of Trent as the sequence in the Requiem Mass. There are sev. Eng. trans, besides a paraphrastic rendering in Scott's *Lay of the Last Minstrel*. Its traditional plain-song melody is introduced into a number of musical compositions, notably Berlioz's *Symphonic fantastique*.

Diesel, Rudolf (1858-1913), Ger. engineer, b. Paris; prof. at Munich, inventor of the diesel engine—an internal-combustion engine using heavy oil as fuel. He disappeared from a Harwich steamer while travelling to London.

Diesel Engine, internal-combustion engine, using heavy oil as a fuel and introduced by Rudolf Diesel in 1897. Subsequently developed in various types by many engine manufacturers. It differs from other internal-combustion engines in the method by which the fuel is fed into the cylinder. In gas and petrol engines the fuel is drawn into the cylinder during the suction stroke as a combustible mixture with the air; but in the D. E. the fuel is injected separately at the end of the compression stroke and no sparking plug or other ignition is necessary. The D. E. greatly increased the range of liquid fuels which can be used in internal-combustion engines. See INTERNAL-COMBUSTION ENGINE; LOCOMOTIVES; MOTOR CARS.

Diesel Oil, see GAS OIL.

Diest, in the prov. of Brabant, Belgium, on the R. Demer. The duke of Marlborough took the tn in 1705. There are numerous breweries. Pop. 9500.

Diet (Lat. *acies*, a day), term originally applied to a session or sitting of a body of delegates or dignitaries, and afterwards transferred to the bodies themselves. The word applied to both legislative and eccles. meetings, hence the phrase 'diet of worship.' Compare also the famous 'Diet of Worms' held in Luther's time. Now the word is applied to assemblies held by the Ger. parliament.

Diet, see FOOD AND DIET; VITAMINS.

Diethylamine, 1 of the 3 types of amines (q.v.), produced by the action of ethyl halides on ammonia in alcoholic solution. It is colourless and inflammable, soluble in water, and boils at 57.5°. It is a basic substance and forms salts with acids. Formula: (C₂H₅)₂NH.

Dietrich, Johann Wilhelm Ernst (1712-1774), Ger. landscape and genre painter, b. Weimar. First instructed in the art by his father, then studied under Alexander Thiele. His pictures were exhibited at Dresden, Paris, and London; and he secured the patronage of the kindly Count von Brühl.

Dietrich, Marlene (real name **Maria Magdalene von Kosch**) (1904-), actress, b. Berlin, but now a naturalised American. She married Rudolph Sieber and has a daughter, Maria Riva, also an actress. She obtained her stage training with Max Reinhardt's school of drama and made her debut in the Viennese version of the play *Broadway*. She entered musical comedy, but it was the Ger. film *The Blue Angel* which led to fame and a Hollywood

contract. Her films include *Shanghai Express*, *The Scarlet Empress*, *Desire*, *The Garden of Allah*, and *Destiny Kides Again*. Although she now makes few films, she appears in cabaret, and with her apparently ageless beauty still remains the epitome of glamour.

Dietrich of Bern, see THEODORIC THE GREAT.

Dieuleft, Fr. tn. in the dept of Drôme, 50 m. S. by E. of Valence. It was famous in the 18th cent. as a resort of the Calvinists. There is a textile industry. Pop. 2400.

Dieuze, or **Duze**, Fr. tn in the dept of Moselle, on the Seille. An anc't salt mine near the tn is still active. About (q.v.) was b. here. Pop. 2400.

Diez, **Friedrich Christian** (1794-1876), Ger. philologist, founder of Romance philology. In 1818 he met Goethe who induced him to study Troubadour poetry. Also studied anc't Sp. literature and pub. *Altspanische Romanzen*, 1821, as well as *Beiträge zur Kenntnis der romanischen Poesie*, 1825; *Die Poesie der Troubadours*, 1826; and *Leben und Werke der Troubadours*, 1829. Appointed prof. of modern literature in 1830 at the univ. of Bonn. His other works are *Grammatik der romanischen Sprachen* (3 vols.), 1830-43; *Altromanische Sprachdenkmale*, 1846; and *Etymologisches Wörterbuch der romanischen Sprachen*, 1853.

Difference, see FINITE DIFFERENCES.

Differences, term used on the Stock Exchange to denote the amount of variation between the price at which it is agreed to buy or sell securities on a fixed day and the actual market price of the securities when that day arrives. Bargains for D. are not recognised by the rules of the Stock Exchange, being contrary to the law of wagering or betting contracts. It is not always easy to determine when an agreement with a broker is a mere betting contract or speculation on D., as in *bona fide* agreements the general practice is to carry over on every settling day and pay the D. only. The best test appears to be to ascertain whether each of the parties could in any event call upon the other to carry out his contract.

Differentia, the distinguishing characteristic which separates any 2 species of a genus. For example, the D. which separates the species man from the other species of the genus animal is the reasoning faculty.

Differential Calculus, branch of mathematics dealing with the rate of change of a function (q.v.) of 1 or more variables as the variables themselves change. Consider a function $y(x)$, of just 1 variable. The rate at which y changes as x changes is called the derivative (or differential coefficient) of y with respect to x , and is denoted by dy/dx (an alternative notation is $y'(x)$). The formal definition of the derivative is $\lim_{h \rightarrow 0} \frac{y(x+h) - y(x)}{h}$.

Here $y(x+h)$ is the value of the function y at $x+h$, where h is a very small increment in x . Then $y(x+h) - y(x)$ is the increase in the function y as x increases by h , and the quotient of the 2 can be considered as

the rate of change of y with respect to x for a small, but finite, increase in x . Since $y(x)$ is, in general, a continuously varying function of x , the rate of change will vary from point to point on the curve and must be specified at each point, not over a finite interval, however small. Thus, in the definition of the derivative, h must tend to zero. The derivative is therefore a function of x itself, and may also be differentiated. It is important to note that dy/dx must not be considered as the quotient of dy and dx , but as a symbol of the result of the limiting process described above. The process of finding a derivative is called differentiation.

An example will illustrate the process. Let $y(x) = x^n$. Then $y(x+h) = (x+h)^n$, which may be expanded by the binomial theorem (q.v.). Subtracting x^n and dividing by h one obtains $nx^{n-1} + \frac{1}{2}n(n-1)x^{n-2}h + \dots$ (higher powers of h). On letting h tend to zero all terms vanish except the first, and one has $dy/dx = nx^{n-1}$.

Sev. important laws of differentiation may be noted. They are: (i) the derivative of a constant is zero; if f and g are 2 functions of x , then, (ii) $d/dx(f+g) = df/dx + dg/dx$; $d/dx(fg) = f dg/dx + g df/dx$; and $d/dx(f/g) = 1/g^2(gdf/dx - f dg/dx)$.

If x and $y(x)$ are the co-ordinates of the point P on the curve, and $x+h$ and $y(x+h)$ are the co-ordinates of a neighbouring point Q on the curve, then $y(x+h) - y(x)$ divided by h is the tangent of the angle made by the line PQ with the x -axis, and as h tends to zero so Q tends to P along the curve. This limiting process will be recognised as just that used in constructing the tangent (q.v.) to the curve at P . Thus dy/dx , evaluated at the point P , is simply the value of the tangent of the angle made with the x -axis by the tangent to the curve at P .

Below is given a table of derivatives of some standard functions. For a detailed discussion of the methods and applications of the D. C. a standard textbook on the calculus should be consulted, for example G. A. Gibson, *An Elementary Treatise on the Calculus*, 1901.

$y(x)$	dy/dx
x^n	nx^{n-1}
$\log_e x$	$1/x$
a^x	$a^x \log_e a$
a^y	$a^y (\log_e a) dy/dx$
$\sin x$	$\cos x$
$\cos x$	$-\sin x$
$\tan x$	$\sec^2 x$
$\sin^{-1}(x/a)$	$(a^2 - x^2)^{-1/2}$
$\cos^{-1}(x/a)$	$-(a^2 - x^2)^{-1/2}$
$\tan^{-1}(x/a)$	$a/(a^2 + x^2)$
$\sinh x$	$\cosh x$
$\cosh x$	$\sinh x$
$\tanh x$	$\text{sech}^2 x$
$\sinh^{-1}(x/a)$	$(x^2 + a^2)^{-1/2}$
$\cosh^{-1}(x/a)$	$(x^2 - a^2)^{-1/2}$
$\tanh^{-1}(x/a)$	$a/(a^2 - x^2)$

Differential Equation. An equation between 2 or more variables that contains one or more differential coefficients is called D. E. The theory of D. E. deals with the solution of such equations, i.e. the elimination of the differential coefficients by integration, e.g. $\frac{dy}{dx} = 3x^2$ is a

D. E. and by integration with respect to the variable x we obtain the equation $y = x^3 + A$, where A is any constant. The latter equation is called the solution of the D. E. D. E.s are of considerable importance in all branches of science; they may be divided into 2 classes, viz. (i) *Ordinary differential equations* which contain only one independent variable,

e.g. $\frac{d^2x}{dt^2} = -n^2x$, where x is the dependent and t the independent variable. This D. E. is true of all types of simple harmonic motion of a particle in a straight line; x is the distance of the particle from the centre about which it oscillates and t is the time. The solution of this equation is $x = A \cos(\omega t + a)$, where A and a are constants determined by the particular conditions of the S.H.M. under consideration. Another famous ordinary differential equation is

$$LC \frac{d^2e}{dt^2} + RC \frac{de}{dt} + c = 0,$$

that is true for all cases of the discharge of a condenser of capacity C , through a circuit of resistance R , and self-inductance L . The solution of this equation determines the charge c on the plates of the condenser in terms of the time t . This solution and its subsequent experimental verification form the basis of modern wireless. (ii) *Partial differential equations* which contain 2 or more independent variables, e.g.

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0,$$

where u is the dependent, and x, y, z the independent variables. This equation is extremely important in the theory of electricity and in the theory of gravitational attractions. See H. T. H. Piaggio, *An Elementary Treatise on Differential Equations and their Applications*, 1928; N. Miller, *Differential Equations*, 1935; E. G. C. Poole, *Linear Differential Equations*, 1936.

Differential Geometry, geometry of the more familiar curves such as the straight line, the circle, the plane, ellipse, etc., together with surfaces such as the sphere and the ellipsoid can be dealt with by the analytical methods of algebraical geometry. In general, however, the geometrical properties of curves and surfaces vary continuously from point to point and when we wish to investigate such properties it is necessary to employ the analytical methods of the differential calculus (q.v.) that is capable of dealing with infinitesimal and continuous variations. D. G. is the branch of geometry that deals with such problems, just as algebraical geometry deals with geometrical problems that may be solved

by algebraic analysis. See J. E. Campbell and E. B. Elliott, *A Course of Differential Geometry*, 1926; E. L. Ince, *The Principles of Descriptive Geometry*, 1935.

Differentiation, see DIFFERENTIAL CALCULUS.

Differentiation, in biology, refers to the process in which the undifferentiated egg cell and embryonic mass gradually become more complex and *differentiated* as the cells multiply in number, become specialised in form and function, and appear as multicellular organs and tissues. The reverse process, *de-differentiation*, is also known, and is seen in cancer tissue. For further details and examples, see CELL.

Diffraction, In light, a modification which light undergoes in passing the edge of a body by which the rays appear to be bent and to invade the shadow. One of the strongest arguments considered by Newton in his discussion of the corpuscular theory of light transmission as opposed to the wave theory was that the latter did not explain shadows. If light from a small source is obstructed by an opaque body, it was said, a shadow with sharp outlines is produced, thus showing that light travels in straight lines. On the other hand, sound, which it was admitted travelled by waves, is only slightly affected by obstacles, as the impetus originated by the vibration makes its way round the edges of the obstacles. The argument fails because a small source of light does not produce a shadow with a well-defined edge, and, on the other hand, sound may be cut off by an obstacle, if the obstacle be large enough. The difference is accounted for by the fact that sound waves are often sev. ft in length, and are therefore not affected by small obstacles, while the mean length of light waves is about 1 fifty-thousandth of an in. Suppose a monochromatic light to proceed from a narrow slit towards a screen, and that an obstacle with a sharp edge be placed so that a portion of the light proceeding from the slit is cut off, it is found that, instead of there being a definite boundary line between illumination and darkness, a series of dark lines appears parallel to the edge of the geometrical shadow, becoming narrower and closer and more indistinct as they recede from the edge. At first these lines were explained by the interference of waves coming from the source with those reflected from the edge of the obstacle, but it was shown that the sharpness of the edge is immaterial. It was Fresnel who first proposed the theory of D., developed by Huyghens, which states that each element of any wave-front proceeding from a given source acts as a source of vibration itself, and sends out secondary waves. When the wave front reaches an obstacle, some of these secondary sources are destroyed and the resulting effects on the screen are due to the interference of the waves from the remaining sources. Some of the waves reinforce each other, and some, being in a different phase on account of the slight differences in distance of the screen from the point on the spherical

wave-front, tend to counteract each other. The resultant effect is a series of bands merging into each other, alternately bright and dark. When the source is red light the bands are relatively wide; when the source is violet the bands are narrower, owing to the shorter wave-length. When white light is used the bands are superposed, and a series of prismatic colours is produced. If light from a small source be allowed to pass through a narrow slit in an opaque screen, and then observed through a telescope behind the screen, a bright band of light will be seen, and on each side a series of alternately bright and dark bands gradually becoming less distinct as they recede from the middle band. If red light be used, the bands of illumination and of darkness will be relatively broad; they will be narrower if green is used, and so on. If white light is used, the colours are not exactly superposed, but a series of spectra will be seen, the violet being nearer the central band. If a grating composed of a parallel series of fine wires close together be used, the spectra will be seen with increased brilliance, and the closer such a grating can be made, the more brilliant will be the effect. D. effects by reflected light can be seen by cutting a series of fine grooves on a plane surface. The beautiful colours of mother of pearl are due to the striated nature of the surface and not to any absorptive powers inherent in the substance. Thus if a moulding of such a surface be taken in sealing-wax, the same colour effects are produced. D. spectra are preferable in many cases to prismatic spectra, as the nature of the material used is of no consequence, so that the bands of the spectrum take up their true position. *See also* LIGHT.

Diffusion, term in chem. applied to the mixture of 2 substances without chemical combination. Gases possess the property of D. more than liquids (e.g. diffusion of oxygen and nitrogen in the air), but some metals may be diffused under pressure at a high temp. *See also* CHEMISTRY and SOLUTIONS.

Diffusion Pump, a vacuum pump capable of producing much lower pressures than the mechanical pumps, e.g. the rotary oil pump. Hot vapour, of mercury or of a special oil, passes up a vertical tube and is deflected downwards through an annular nozzle into a water-cooled region where it condenses and returns to the reservoir of boiling mercury or oil. The jet of vapour from the nozzle drags with it any atoms which diffuse into it from the surrounding gas which comes from the vessel to be evacuated. This gas is pumped away by a mechanical pump, known as a fore pump, which is necessary to maintain a 'backing' pressure of about 10^{-3} mm. The earliest form was made by Gaede in 1915 and used mercury, but for most purposes modern pumps use low vapour pressure silicone oils which do not decompose or 'crack' during use and produce pressures of about 10^{-7} mm. of mercury, i.e. about 10^{-10} of an atmosphere. *See also* AIR PUMP.

Digamma (Gk *dis*, twice, and *gamma*), 6th letter in the anct Gk alphabet, found only in inscriptions. It was so called because of its likeness (*F*) to a double *gamma* (*Γ*). Its sound (a consonantal *w*) corresponded roughly to that of our letter *w*. It had disappeared from certain Gk dialects (e.g. Ionic) by the time of the Homeric poems; but although not written its influence can be traced in them, as, judging from the metre, some of the words (e.g. *ergon*) seem to have had a sound which was afterwards lost. D. survived, however, in other dialects till it was gradually discontinued in classical times, the sign itself surviving as the numeral 6. *See also* letter *F*.

Digby, Sir Everard (1578-1606), conspirator, was brought up a Protestant, and held office in Queen Elizabeth's household. He was converted to Catholicism by John Gerard, and was knighted by James I in 1603. Catesby (q.v.) persuaded D. to join in the Gunpowder Plot. D. was to have started a revolt in the Midlands on hearing of the plot's success. After its failure he was captured at Holbeach, Staffordshire, pleaded guilty to high treason at his trial, and was executed in St Paul's Churchyard.

Digby, Sir Henry (1769-1843), adm. He captured (1799) a Sp. frigate, a Fr. corvette, a privateer, and sev. other vessels, and at the battle of Trafalgar was in command of the *Africa*.

Digby, Sir Kenelm (1603-65), naval commander, diplomat, and writer, son of

SIR KENELM DIGBY

After van Dyck

Sir Everard D. (q.v.), educ. at Gloucester Hall, Oxford. In 1628 he set out for Gibraltar on a privateering expedition, capturing sev. ships and gaining a victory over the Fr. and Venetians at Scanderon. He was suspected of Rom. Catholic intrigues, was imprisoned by Parliament and later exiled to France, where he

became Henrietta Maria's chancellor. He retained this position after the Restoration even though he had indulged in dubious negotiations with Cromwell during a visit to England, 1654-6. D. wrote a number of philosophical and scientific works. Among them are *Observations upon Religio Medici*, 1643, and *Private Memoirs of Sir Kenelm Digby*, ed. by Sir N. N. Nicolas, and pub. in 1827. See E. W. Bligh, *Sir Kenelm Digby and his Venetia*, 1932; J. F. Fulton, *Sir Kenelm Digby*, 1937 (with bibliography).

Digby, William (1849-1904), journalist and E. India agent and merchant. He advocated an extension of self-gov. among Indians and founded the Indian Political Agency for distributing information in England about the Indians. His works include *The Famine Campaign in S. India, 1876-8*, 1878, and '*Prosperous*' *British India*, 1901.

Digby, co. and tn of Nova Scotia, Canada, bordering on the Bay of Fundy. The surface is varied with mts, rvs., and lakes. The cap., D., is a port, situated on D. Neck, 45 m. SE. of St John; there is a ferry connection between these ports. D. is noted for its herring fishery. Pop. of co. 20,000; of tn 2050.

Digest, see CORPUS JURIS CIVILES; JUSTINIANUS.

Digestion, process by which food is rendered soluble and diffusible, so that its nutrient constituents can be absorbed into the blood and lymph, and later assimilated by the tissues. D. takes place in the alimentary canal, which starts at the mouth, continues as the pharynx, oesophagus, stomach, intestines, and rectum, and ends at the anus. In the mouth occur mastication and salivation. The purpose of mastication is to crush and grind the food into small particles. The saliva is poured into the mouth from 3 pairs of glands named parotid, submaxillary, and sublingual. The parotid gland secretes a clear saliva, the other 2 a sticky saliva containing mucin. The saliva effects the solution of such substances as salt and sugar and moistens the food so that it can be rolled by the tongue and palate into a soft bolus. Saliva also has an important chemical action, for by means of an enzyme called *ptyalin* cooked starch in the food is converted into maltose, a kind of sugar. When the food is sufficiently masticated, it is pushed backwards by the tongue and urged rapidly into the gullet or oesophagus and thence into the stomach by a series of muscular movements known as peristalsis. The stomach is entered by the cardiac orifice which relaxes to admit the food and then closes. The mucous membrane of the stomach is lined with columnar epithelium, in which are embedded little pits called the gastric glands. From these glands gastric juice (q.v.) pours when they are stimulated by the approach of food. The muscular coat of the stomach (q.v.) produces movements which churn the food and tend to urge it towards the intestine. The pylorus (Gk, a gate-keeper), or orifice leading from the stomach, opens only in response to an acid stimulus, and as the

food received from the gullet is alkaline owing to the presence of salivary secretions, it remains in the stomach until thorough admixture with the gastric juice has rendered it acid. Gastric juice contains hydrochloric acid and an enzyme called *pepsin*, by which the proteins in the food are converted into peptones, and a second enzyme, *rennin*, which coagulates milk. The stomach proceeds to discharge its contents into the intestine about half-an-hour after the commencement of a meal, though it takes about 3 hours to empty itself. The intestine secretes a juice called *succus entericus* or intestinal juice; and 2 other secretions, pancreatic juice and bile, enter by their ducts, which open into the duodenum, or first part of the small intestine. Pancreatic juice contains 3 enzymes: *trypsin*, which attacks proteins more completely than gastric juice, converting them into amino-acids; *amyllopsin*, which converts starch into maltose, thus taking over the function of salivary juice whose activity is stopped in the stomach; and *lipase*, which splits the fats into glycerin and fatty acid. Bile by itself has no digestive action, but it aids the action of lipase. The intestinal juice contains the following enzymes: *enterokinase*, which is concerned in the production of trypsin; *crepsin*, which aids trypsin in the breaking up of peptones; and enzymes which convert maltose and other sugars into glucose. Covering the surface of the mucous membrane of the small intestine are a large number of small prominences called villi. These increase the surface for absorption by which the products of D. of protein and carbohydrate diffuse into small blood-vessels lying immediately under the epithelium. The glycerin and fatty acid are carried into the central lacteal or lymphatic vessel, and are again united into small globules of fat. The amino-acids from the proteins are carried in the blood-stream to repair and build up the tissues; any excess is converted by the liver into urea, which is sent to the kidneys to be disposed of. The tiny globules of fat pass into the thoracic duct, whence they find their way into the blood-stream and ultimately into the tissues, where they produce heat by oxidation or are stored up in the form of adipose tissue. The sugar is temporarily stored in the liver as glycogen and given out as glucose when required. The small intestine is about 22½ ft long and the passage of the food occupies about 4 hrs. It then travels more slowly through the 4 ft of large intestine, taking from 12 to 18 hrs to reach the rectum. During this time water is absorbed and the waste residue is gradually compressed as a compact mass into the rectum and finally is expelled by the anus. See also ENZYMES.

Diggers' Conference, body formed by the Bendigo gold-diggers of Victoria in Jan. 1854, which had for its object the supersession of the ordinary gov. The chief ground of complaint among the diggers was the licence system, and they also demanded representation on the Legislative Council of Victoria. When in Sept.

1853 the New South Wales Legislative Council seriously proposed to abolish the licence fees the miners of Bendigo naturally expected that Victoria would follow the lead. The Victorian Gov., however, instead of doing so passed a new Act greatly reducing the fees and legalising miners' customs. This partly satisfied the men, but it was evident the goldfields contained men who were opposed to any peaceable settlement. Hence the formation of the D. C. But though the movement for a congress came to nothing, the events of the next few months formed a crisis in the hist., not only of Victoria, but of Australia. The most notable of these events was the affair of the Eureka Stockade in the time of governor Sir Charles Hotham. This affair is sometimes described as the only 'battle' which ever took place on Australian soil. See further BALLARAT; EUREKA STOCKADE.

Digges, Leonard (d. c. 1559), mathematician, b. Barham, Kent, and educ. Univ. College, Oxford. He was the author of *A promiscuacion of right good effect*, 1555; *A Book named Tectonicon, briefly shewing the exact measuringe all manner lande*, 1562; *A Geometrical Practise, named Pantometria*, 1571; and *An Arithmetick Militare Treatise named Stratagickes for the Profession of a Soldiour* (with Thomas D.), 1572.

Digit (Lat. *digitus*, a finger), a word used to signify any number, from 0 to 9. Thus 4629 is a number of 4 D.s.

Digitalin, a poisonous steroid glycoside, is obtained from *Digitalis purpurea*, the foxglove and kindred plants. Deaths from overdoses of D. are rare since vomiting usually sets in early. Medicinally, D. is used in cases of heart disease, particularly in a condition known as auricular fibrillation in which the co-ordinating mechanism of the heartbeat is disordered. D. also stimulates the heart muscle, increasing the force of systolic contraction (see HEART), thus improving the circulation.

Digitalis, a European and Asiatic genus of Scrophulariaceae, is known in Britain chiefly by *D. purpurea*, the purple foxglove, from which the drug digitalin is prepared and used in medicine for heart complaints. *D. ambigua* is a cultivated species with yellow flowers; *D. lutea* grows in the woods of France and Germany, and *D. ferruginea*, with roundish rust-coloured flowers, in Asia and SE. Europe.

Digne, Fr. tn, cap. of the dept of Basses-Alpes, in the Bécône valley. It has a cathedral (15th-19th cents.), and a noteworthy Romanesque church, which was the cathedral until the 14th cent. There are hot springs at *Bains de D.*, 2 m. away. Pop. 9300.

Dignities, see NOBILITY; ORDERS OF KNIGHTHOOD; TITLES.

Digoin, Fr. tn in the dept of Saône-et-Loire, at the junction of the Loire with the Canal du Centre. It has pottery manufs. Pop. 6400.

Dihydroxysuccinic Acid, see TARTARIC ACID.

Dijon, Fr. city, cap. of the dept of Côte-d'Or, on the Burgundy canal at the confluence of the Ouche and the Suzon. It was the anct. cap. of Burgundy (q.v.). Known to the Romans as DIBLO, D. was joined to Burgundy in 1007. On the death of Charles the Bold (q.v.) in 1477 it went to France. It was taken twice by the Germans in 1870 (see FRANCO-GER. WAR). A bishopric and univ. tn, D. is rich in fine buildings. The former palace of the Dukes of Burgundy, now the tn hall, houses one of the most notable museums outside Paris. The 13th-14th-cent. cathedral of St-Bénigne, and the sev. other medieval and Renaissance churches, are all of interest, and there is a famous library in the former Jesuit college. St Bernard, Bossuet, Philip the Good, and de Brosses (q.v.) were b. here. D. is an important railway centre, and its main trade is in Burgundy wines (q.v.). It has metallurgical, foodstuff, printing, glass, chemical, and leather industries. It is famous for its mustard and spiced bread. Pop. 112,850.

Dikran, see TIGRANES.

Dikson, seaport at the mouth of the Venisey estuary, on the N. sea route (q.v.) 1246 m. from Archangel.

Dilemma, a predicament in which one is offered the choice between alternatives, both equally disagreeable. The 2 alternatives are called the 'horns' of the D., for if the victim escapes the one he will be caught on the other. A classical example of D. is shown in Aristotle's Athenian mother's advice to her son: 'Do not enter into public affairs: for if you say what is just, men will hate you; and if you say what is unjust, the gods will hate you.'

Dilettanti, Society of, club founded about 1733 by a number of gentlemen for the purpose of social intercourse and for the study, as amateurs, of antique art. Funds having accumulated, the society sent out in 1834 an exploring party (under Chandler, Revett, and Pars), and later a second expedition, to collect details and make drawings of the most important monuments of antiquity. These expeditions brought back material for sev. vols. pub. by the society: *Ionian Antiquities*, *Specimens of Ancient Sculpture*, *Unedited Antiquities of Attica*, *Portfolio of Greek Architecture*, etc.

Diligence, the name given to a public conveyance of the nature of a stage coach. See COACH AND COACHING.

Diligence: 1. In Scots law: (a) A term nearly equivalent to *execution* in the Eng. law. It includes the various means by which the person may be seized and imprisoned or the property attached and disposed of, for the purpose of enforcing payment of a debt or performance of any civil obligation. (b) A warrant to enforce the attendance of a witness, or the delivery to court of productions.

2. In Eng. law the term diligence may be used in the law of bailments to indicate the degree of care which a person to whom goods are entrusted must exercise in the custody of the goods to escape liability for loss or damage to them.

Dilke, Charles Wentworth (1789-1864), journalist, entered the civil service, in which he remained until 1836, but his main interests were literary. His connection with the *Athenaeum* began in 1829, and in the following year he became editor and proprietor. He was editor of the *Daily News*, 1846-9. See his collected papers, ed. by his grandson, 1875.

His grandson, **Sir Charles Wentworth Dilke**, 2nd baronet (1843-1912), was b. in London and educ. at Trinity Hall, Cambridge. In 1868 he entered Parliament as a Radical. An effective speaker, he soon became a prominent figure in the House of Commons. In 1880 he was appointed under-secretary of foreign affairs, and he conducted efficiently the business of his dept until 1885, when Gladstone was forced to resign. As a result of a citation in a divorce suit he had to retire from public life (1886), but from 1892 was again returned to Parliament. He was a recognised authority on foreign and imperial affairs, and pub. sev. books on these subjects. See life by S. Gwynn and G. M. Tuckwill, 1917.

Dilke, Lady, née Emilia Frances Strong (1840-1904), writer on art, daughter of Maj. Strong of Oxford, wife first of Mark Pattison, then of Sir Charles Wentworth D. On the advice of Ruskin she became a student at the Art School, S. Kensington, in 1859. She studied much in France, gathering material for her books, among which are: *The Renaissance of Art in France*, 1879; *Claude Lorraine* (written in Fr.), 1884; *French Painters*, 1899; *French Architects and Sculptors*, 1900.

Dill, Sir John Greer (1881-1944), soldier, b. Belfast, N. Ireland, educ. Cheltenham and Sandhurst. He served in the S. African war in 1902, and at the beginning of the First World War he was appointed a brigade major. He later served at the H.Q. of the Canadian Corps, and from 1917 onwards he was Chief of the Operations Branch with the rank of colonel. D.S.O., 1915; C.M.G., 1918. He was promoted to brigadier in 1928 when he went to India, and major-general in 1930. In 1931 he became commandant of the Staff College. Lieutenant-general, 1936. On the outbreak of the Second World War he went to France in command of the 1st Corps of the British Expeditionary Force, but returned to England in 1940 to become vice-chief, and later chief, of the Imperial General Staff. The formation of the Commandos (q.v.) in 1940 owed much to his inspiration and vision. In 1941 he vacated this post on reaching the age of 60, and was promoted to the rank of field-marshal. The same year he left for Washington for special duties on the Combined Chiefs-of-Staff Committee. He was present at the Casablanca Conference and also travelled in the Far E. on a special mission as representative of the prime minister. He d. at Washington, K.C.B., 1937; G.C.B., 1942. Awarded the U.S. Distinguished Service Medal.

Dill, *Peucedanum graveolens*, an aromatic, umbelliferous ann. herb. The fruit is employed medicinally as a carminative in the form of dill water, or *aqua Anethi*, and

is also used as a condiment. The sowa D., or *Peucedanum Sowa* of Bengal, has a fruit which is often used in curries.

Dilleniaceae, family of Dicotyledons, chiefly 12 genera of tropical shrubs and trees, most of which bear yellow flowers and have leathery leaves. The bushes help to form the Australian scrub, the trees are found in woods in tropical India, and the woods of Brazil have sev. kinds, usually of climbing or trailing habit. Typical genera are *Acrotrema*, *Curatella*, *Dillenia*, and *Hibbertia*, the latter containing *H. volubilis*, a showy twiner with offensive-smelling flowers.

Dillenius (Dillen), Johann Jakob (1684-1747), Ger. botanist who came to England on the invitation of Sherard, and settled in Oxford, becoming the first Sherardian Prof. of Botany. He ed. Ray's *Synopsis stirpium Britannicarum*, 1724, and wrote *Herbarium Illudensis*, 1732, *Historia Muscorum*, 1741.

Dillingen: 1. Ger. tn in the Land of Bavaria (q.v.), on the Danube (q.v.), 58 m. NW. by W. of Munich. It has a 13th-cent. castle, and sev. old churches and monasteries. There was once a univ. Pop. 10,000.

2. Tn of the Saarland, on the Prims, 15 m. NW. of Saarbrücken (q.v.). It is a railway junction, and has steel, engineering, and chemical industries. Pop. 13,000.

Dillmann, Christian Friedrich August (1823-94), Ger. orientalist and theologian, founder of the modern branch of Ethiopic studies. He studied under Heinrich Ewald at Tübingen. During 1846-8 he visited the libraries of Paris, London, and Oxford, studying their Ethiopic MSS.; those of London and Oxford he catalogued. Chief works: *Grammatik der äthiopischen Sprache*, 1857; *Lexicon Linguae aethiopicae*, 1865; *Chrestomathia aethiopica*, 1866; *Commentar zum Hiob*, 1869; historical monographs on Aksum and on Zara Jacob; and *Vorlesungen über Theologie des Alten Testaments*, 1895.

Dillon, John (1851-1927), Irish politician, M.P. for E. Mayo (1885-1918); one of the leaders of 'Young Ireland' (q.v.). He first entered the House of Commons in 1881 as member for Tipperary; he was then a supporter of Parnell (q.v.). In the same year he was twice arrested for inciting to boycotting. He was one of the pioneers of the 'Plan of Campaign' and the Land League. After 6 months' imprisonment in 1888 he went to Australia and New Zealand collecting funds for the National party, then was again imprisoned in 1891. He declared against Parnell in 1891 and became leader of the United Nationalist party and chairman of the Irish National Federation from 1896 till 1900—when John Redmond became leader of the re-united party. D., accompanied Redmond to Buckingham Palace in July 1914, on the occasion of the conference on the gov. of Ireland. When Redmond d. D. succeeded him as leader. His party was virtually extinguished by Sinn Féin (q.v.) in Dec. 1918. He d. in a London nursing home.

Dillon, Wentworth, see ROSCOMMON, W. D.

Diluvial Formation, name, now obsolete, applied to the deposits laid down by the Pleistocene ice sheets, under the impression that these deposits were the products of Noah's flood. See GLACIAL PERIOD.

Dime (Lat. *decima*, a tenth, through O.F. *disme*), a small silver coin of the U.S.A.; its value is 10 cents, or one-tenth of a dollar.

Dimension, in geometry, a direction or mode in which extension may be measured. A point, having no magnitude, has no D.; a line has 1 D., length; a surface has 2 D.s., length and breadth; a solid has 3 D.s., length, breadth, and thickness. The motion of a point generates a line, the motion of a line generates a plane or surface, and the motion of a plane generates a solid figure. Proceeding to an analogous motion of a 3-dimensional solid, the concept of a figure of 4 D.s. has been obtained, and by an extension of these ideas we arrive at n -dimensional geometries. An example is offered by the 4-dimensional space-time continuum occurring in the theory of relativity (q.v.), where the use of a 4th co-ordinate, specifying the time of an event, in addition to the 3 spatial co-ordinates, necessitates the use of a 4-dimensional geometry.

In algebra, terms formed by the multiplication of a quantity by itself are called 'squares,' and terms generated by the product of 3 similar factors are called 'cubes' by analogy from the geometrical concepts. Equations containing terms of 1 degree or D. are called linear, those containing terms of 2 degrees or D.s. are called quadratic, and those containing terms of 3 degrees or D.s. are called cubic. It is to be observed, however, that the symbol x^2 does not represent a surface, or x^3 a volume, and in graphical representation the functions x^2 , x^3 are represented by lines; x^2 , in fact, represents a number merely, but if a preliminary statement be made that x represents the number of units of length in a certain straight line, then obviously x^2 represents the number of units of area in a square, each of whose sides contains x units of length.

In physics, symbols are used to represent quantities measured in terms of units of length, area, volume, time, mass, velocity, force, etc. For the sake of brevity and simplicity, such equations as $s = vt$ (distance = velocity \times time) are used. The employment of such an expression does not mean, for instance, that velocity is multiplied by time, if that has any meaning at all, but that the numerical measure of the space traversed is obtainable by multiplying the numerical measure of the velocity in terms of the unit of velocity by the numerical measure of the time taken in terms of the unit of time. Of the units used in mechanics, those of length, time, and mass are fundamental, that is, we cannot explain them by reference to anything else. The units of area, volume, velocity, acceleration, force, etc., are derived units; that is, they can be explained by reference to 1 or more funda-

mental units. The quantities used as fundamental units are chosen arbitrarily. If we are speaking of an interval of 2 hrs. and use 1 hr as the unit of time, the interval will be represented by the number 2; if 1 min. were the time-unit, the interval would be represented by the number 120, and so on. Suppose $[X]$, $[Y]$, $[Z]$ be 3 units in which any physical quantity can be measured, and let x , y , z be the numbers of those units which represent a certain amount of the quantity, then $x[X] = y[Y] = z[Z]$, whence $x : y : z = 1/[X] : 1/[Y] : 1/[Z]$; that is to say, the number expressing the amount of any quantity is inversely proportional to the unit chosen for its measurement. Many writers use the centimetre as length-unit, the gramme as mass-unit, and the second as time-unit, but the foot as length-unit and lb. as mass-unit are still often employed. If m represents the number of grammes and m' the number of lb. in a given piece of matter, then $m[M] = m'[M']$, or $m = (M'/M)[M]$. The ratio $[M]/[M']$ is the number of grammes in a lb., or 453.59, and this ratio may be employed in transferring the measure of any mass from one system of units to the other.

The measure of density is indicated by the equation $d = m/v$, where m represents the number of units of mass and v represents the number of units of vol. If $[L]$ be the unit of length, and a rectangular parallelepiped be supposed whose length is $l[L]$, breadth $l'[L]$, and height $l''[L]$, its volume will be $l'l'l''[L]^3$. Now, if $[V]$ be the unit of vol., and if there be v units of vol. in the parallelepiped, then $[V]v = l'l'l''[L]^3$. But l , l' , l'' and v are mere numbers, therefore $v = l'l'l''$, and $[V] = [L]^3$. Now, returning to the equation for density, we get $[D]d = [M]m/[V]v$, or $[D]d = [M]m/[L]^3$, whence $[D] = [M]/[L]^3$. The ratio $[M]/[L]^3$ is the D.s. of the unit of density in terms of the fundamental units of mass and length. Again, for velocity we have the equation $s = vt$. This means $s[L] = v[V]/t[T]$, $\therefore v[V] = s[L]/t[T]$, where r , s , and t are mere numbers and $[V]$ is the unit of velocity. Therefore $[V] = [L]/[T]$. That is to say, the unit of velocity has D. 1 in length and D. -1 in time. Similarly from the equation $s = \frac{1}{2}ft^2$ we obtain $s[L] = \frac{1}{2}[F][T]^2$, where $[F]$ is the unit of acceleration and s , f , t^2 and $\frac{1}{2}$ are mere numbers. Therefore $[F] = [L]/[T]^2$ or $[L]/[T]^2$. The unit of acceleration has therefore D. 1 in length and D. -2 in time. The D.s. of other physical units may be similarly explained. See also METROLOGY; PHYSICAL UNITS.

Dimethyl Ketone, see ACETONE.

Dimidiation (Lat. *dimidiare*, to halve), in heraldry, term denoting the cutting of 2 coats of arms in half and joining the dexter half of the one to the sinister half of the other.

Diminishing Return. Law of diminishing return is one of the elementary laws of the science of economics (q.v.). John Stuart Mill said that this law was the most important and in its different phases perhaps the most commonly misapplied

law in political economy. In respect of a piece of land (say an ac.) the law states that after a certain point, other things remaining the same, the returns on successive applications of labour and capital will continuously diminish. The law is part of a larger principle: that returns on the varying factor first *increase* and then diminish; this is the Law of Variable Proportions. D. R.s apply after a point provided there is no change in the state of knowledge (inventions may put off diminishing returns indefinitely) or in the scale of operations (one more man may make it possible to use a combine harvester). The law applies, of course, to all other productive agents. Its peculiar value in the case of land arises from the fact that the quantity of land is limited and the better qualities still more limited; so that while capital and labour may go on increasing, land cannot so increase, and any increase of the produce must be at an increasing cost, or in other words the return per unit diminishes. The law of D. R. is of great value in its wider applications to the economic study of rent, population, value incidence of taxation, etc.

Dimissory, Letters (Lat. *dimittere*, to dismiss), a letter in which a bishop consents to the ordination by another bishop of one of his candidates for holy orders.

Dimorphism (Gk *dis*, twice, and *morphê*, shape or form): 1. A term applied in zoology and botany to the appearance of an organism in 2 different forms. The dimorphic organisms are fundamentally identical in structure and in origin. Thus, the bee is dimorphic in the female sex, the fertile queen and the barren worker presenting the 2 forms. The same phenomenon is seen in the 'nutritive' and 'reproductive' forms in colonies of hydroids. The 2 sexes present such widely different forms in some of the insects, crustaceans, and fishes that they seem to belong to quite different genera—this is sexual D. Butterflies are subject to 'seasonal' D. Among flowers, the varieties of the primrose offer good examples of dimorphic forms.

2. In the mineral kingdom a body is said to be dimorphous when it is capable of crystallising according to 2 different systems geometrically incompatible, the chemical composition of the dimorphic bodies being identical. Carbon, sulphur, phosphorus, calcium carbonate, and mercuric iodide are well-known examples. Carbon appears under one form as the diamond, and under another as graphite, with the following widely contrasting sets of properties: the *diamond* is colourless, transparent, has an adamantine lustre, is the hardest of all substances, a non-conductor of electricity, has a sp. gr. of 3.52, and crystallises as octahedra; *graphite* is grey, opaque, has a metallic lustre, is exceedingly soft, a fairly good conductor of electricity, has a sp. gr. of 2, and forms hexagonal crystals belonging to the rhombohedral system. Yet both have the same chemical composition, and both yield carbon dioxide when burned in

oxygen; the diamond becomes graphite if heated in the electric arc. The difference between them is caused by different arrangements of the atoms in the crystals, as was shown by the X-ray method of crystal analysis invented by Sir Wm Bragg and his son Sir Lawrence Bragg. Red mercuric iodide when heated changes into rhombic plates, which the slightest friction changes into octahedral crystals, the colour changing at the same time from yellow to a brilliant scarlet. Sulphur yields transparent amber-coloured octahedra under one treatment, prismatic crystals under another. The terms *trimorphism* and *polymorphism* indicate this phenomenon when the same organism or substance presents 3 or more different forms. See CRYSTALLOGRAPHY.

Dimsdale, Thomas (1712-1800), physician, b. Theydon Gernon, Essex. Work as an inoculator brought him world-wide fame; his *Thoughts on General and Partial Inoculation*, 1776, was trans. into many languages. The Empress Catherine of Russia bestowed upon him a barony, a fee of £12,000, and a life pension for the successful inoculation of herself and her son. He was M.P. for Hertford, 1780-90.

Dinan, Fr. tn in the dept of Côtes-du-Nord and cap. of the arron. of D. It stands on the Rance, 14 m. S. of St Malo, and is built on the summit of a hill at the spot where a high viaduct crosses the riv. It is a picturesque tn, and some of the old walls and gates, and the 14th-cent. castle, still remain, as do many old, winding, narrow streets with wooden houses. The church of St Sauveur contains the heart of Bertrand du Guesclin, who fought in single combat with an Eng. knight during the siege of D. by the Eng. in 1359. D. exports cattle, coal, and wood. Pop. 12,700.

Dinant, picturesquely situated in the prov. of Namur, Belgium, on the R. Meuse. Manufs. beaten copperwork, called Dinanderie, spiced bread called 'couques de Dinant,' woollen goods, etc.; quarries marble. In the early 15th cent. D. was one of the most prosperous tns in Walloon, Belgium, and had a pop. of about 60,000. It was sacked and destroyed by Charles the Bold in 1466, taken by the Fr. in 1554, and burnt and terrorised by the Germans in 1914. On 15 Aug. of that year the Ger. advance guards seized the citadel of D. and crossed to the l. b. of the Meuse. Two hrs later a Fr. brigade retook the tn and drove the Germans back across the riv. Pop. 6,800.

Dinapur, Dinapore, or Danapur, tn of Bihar State, India, which is now connected with and virtually forms part of Patna (q.v.).

Dinarchus (c. 360-c. 290 BC), last of the Ten Attic Orators, b. Corinth. As a metic he could not speak at Athens, but wrote speeches for others. Only 3 of these have survived and were ed. by F. Blass (1888); though of some historical interest, their style has little to commend them. See J. F. Dobson, *The Greek Orators*, 1919.

Dinard (ancient Dinard-Saint-Enogat), Fr. coastal resort in the dept of Ille-et-

Vilaine. It has 2 casinos, and is popular with Brit., Fr., and U.S. visitors. Pop. 8400.

Dinaric Alps, that part of the Alpine system which joins the Julian Alps with the Balkan range. The main chain lies NW. to SE. and divides Dalmatia from Bosnia-Herzegovina. It also separates the basin of the Sava from the dist. drained by the Neretva and other rivs. flowing into the Adriatic. The highest summits are under 7000 ft.

Dindigul, tn of Madras State, India. It is about 30 m. from Madura, and has a citadel on an isolated rock, from the top of which Hyder Ali threw his prisoners. There are sev. tanneries, a large cotton winding factory, and a tobacco factory.

Dindings, The, strip of land in the Malay Peninsula on the SW. coast of Perak, 22 m. long, and comprising also the is. of Pangkor. It lies between lat. 4° 20' N. and long. 100° 32' E. Formerly included in Penang, but retroceded to Perak, partly for convenience of customs collection and partly in recognition of the loyalty of the Sultan of Perak to the Brit. Crown. Pulau Dinding is covered with thick woods, and is noted for its great beauty.

Dindorf, Karl Wilhelm (1802-83), Ger. Hellenist and philologist, b. Leipzig. He resigned a professorship at Leipzig Univ. in order to give all his time to literary work, especially to the preparation (with his brother Ludwig and Hase) of a new ed. of Stephanus's *Thesaurus Linguae Graecae* (Paris), 1831-65. His philological researches into the text of the Gk classics, especially that of the dramatists, contributed greatly to its accuracy and clearness. He ed. a number of these classics, including an ed. of Demosthenes (7 vols.).

D'Indy, Vincent, see INDY.

Dindymene, see CYBELE.

Dingaan, see ZULU. See also DINGAAN'S DAY.

Dingaan's Day, 16 Dec., the anniversary of the decisive defeat of Dingaan, a Zulu chief, by a small force of Boers under Pretorius at Blood R. in 1838. The cause of the conflict thus brought to a close was the treacherous massacre by the Zulus of a party of 70 unarmed Boers under Piet Retief. D. D., now officially known as *The Day of the Covenant*, is looked upon as a day of thanksgiving for the spread of white civilisation in S. Africa.

Dingelstedt, Franz Ferdinand, Freiherr von (1814-81), Ger. poet, dramatist, and novelist. He became famous for his political satires. In 1867 he was made Director of the Opera, and later of the *Burghtheater* in Vienna. His *Lieder eines kosmopolitischen Nachtwächters*, 1840, caused a great sensation. He also wrote a successful tragedy, *Das Haus der Barnheide*, 1856; a society novel, *Die Amazone*, 1868; and some sketches of travel. His *Sämtliche Werke* (12 vols.) was pub. 1877-8.

Dingey, or Dinghy (Mahratta *dinge*), a small row-boat supplied to a ship as an extra, or a collapsible rubber boat carried by aircraft.

Dingle, par. and seaport in co. Kerry, Rep. of Ireland, situated on the N. side of D. Bay, 30 m. SW. of Tralee, and a flatfish and lobster fishing and agric. mkt. centre. D. harbour affords safe anchorage and is frequented by coastal vessels. D. is the most westerly tn in Europe, and the Mt Brandon (3127 ft) area is rich in monuments of great antiquity. D. grew up round a medieval fortress, received a charter in 1685, and has had political and trade connections with Spain from medieval times. Pop. 1540.

Dingley Tariff. The D. T. Act (U.S.A.), after Nelson D. (1832-99), Chairman of the Ways and Means Committee, was passed in 1897 in McKinley's first term. It embodied the Republican doctrine of high protection coupled with reciprocity. There were provisions for reciprocal arrangements with other countries which paved the way for possible reductions by a commercial treaty. In 1909 the D. T. was replaced by the Payne-Aldrich Tariff Act.

Dingo (*Canis dingo*), the warrigal, or wild Australian dog. It is a strong, short-legged dog, sandy-coloured, and not unlike the European fox, being about 40 in. in length, its tail measuring an additional 11 in. It works havoc upon flocks and poultry, and even after it has been tamed seldom abandons its predatory habits. Its fossilised remains have been discovered with those of kangaroos and extinct Australian mammals. This has given rise to the opinion, held by Sir Frederick McCoy, Ogilvy, and others, that the D. must be an indigenous species of Australian fauna. But the existence in Java and India of a pariah dog, very similar in character to the D., has caused others to think that the D. was originally introduced into Australia by Caucasians from Ceylon or Malaya.

Dingwall, royal burgh and tn of Scotland, and cap. of the co. of Ross and Cromarty, situated on Cromarty Firth, 18 m. NW. of Inverness. It is the centre of an extensive agric. area, with cattle and sheep markets, and an important junction to the N. and W., and to the is. of Lewis. Pop. 3503.

Dinka, large tribe of Nilotic Negro people living on both sides of the Nile in the S. Sudan. The chief source of their wealth is their cattle, and their mode of life is a transhumant one.

Dinkelsbühl, Ger. tn in the Land of Bavaria (q.v.), on the Wörnitz, 88 m. NW. of Munich (q.v.). It was once a free city of the Empire, and during the Thirty Years' War (q.v.) it resisted 8 sieges successfully before finally being taken by Gustavus II (q.v.) in 1632. It is a medieval tn with completely preserved walls, towers, moat, and gates. The church of St George is one of the best late Gothic buildings in S. Germany, and there are fine old houses and a castle of the Teutonic Knights (q.v.). Pop. 7500.

Dinnington, coal-mining tn of the W. Riding of Yorks, England, 8 m. SE. of Rotherham. Pop. 7000.

Dinocrates (4th cent. BC), Gk architect of the time of Alexander the Great, who

rebuilt the temple of Ephesus, and was also employed by Alexander in the building of Alexandria.

Dinornis, the Moa, a large extinct flightless bird from New Zealand. It ranged to over 10 ft in height, and probably became extinct after man reached New Zealand. Numerous remains have been found.

Dinosaur Park, gov.-owned area in Alberta, Canada, near the tn of Drumheller, comprising a deep valley some 2 in. wide and over 400 ft deep through which the Red Deer R. runs. The region is rich in fossils of prehistoric creatures and plants of all sizes, ranging from dinosaur skeletons and fossils to petrified oyster shells filled with pure white crystal, fish impressions, and evidence of tropical vegetation. About 60 varieties of prehistoric reptiles are found, preserved by quicksands, in Alberta, and at least 40 scientific expeditions have visited this remarkable area since 1918.

Dinosaurs, a group of fossil reptiles which were dominant during Mesozoic times, and became extinct at the end of that era. They were highly variable in size, some of them attaining enormous proportions (80 ft long, 40 tons in weight),

TRICERATOPS, A HORNED CRETACEOUS DINOSAUR

Reproduced with permission from Dr E. H. Colbert, *Evolution of the Vertebrates*, 1955, John Wiley & Sons, Inc., New York

while others were quite small. D. were mostly land animals, and there were carnivorous as well as herbivorous types. Early D. were bipedal, and some later forms reverted so, but many herbivorous forms returned to a quadrupedal gait.

D. are divisible into 2 unrelated stocks, the orders Saurischia and Ornithischia. Members of the former group possess a triadate reptile-like pelvis and are mostly bipedal and carnivorous, though some became giant amphibious quadrupedal herbivores. Members of the latter group have a tetradate bird-like pelvis, are mainly quadrupedal, and entirely herbivorous.

The Saurischia are divided into (1) Theropods, including all the bipedal carnivorous forms with long hind-limbs and short fore-limbs (e.g. *Tyrannosaurus*, *Megalosaurus*); and (2) Sauropods, including the large quadrupedal herbivorous and amphibious types with massive limbs, long tails and necks, and tiny skulls (e.g. *Diplodocus*, *Brontosaurus*).

The Ornithischia include a number of varied groups: (1) Ornithopods, Jurassic and Cretaceous bipedal forms (e.g.

Iguanodon), and Cretaceous hadrosaurs with duck-bills; (2) Stegosaur, Jurassic quadrupedal D. with a double row of triangular plates along the back and spikes on the tail (e.g. *Stegosaurus*); (3) Ankylosaur, Cretaceous quadrupedal forms, heavily armoured with bony plates (e.g. *Nodosaurus*); and (4) Ceratopsians, Upper Cretaceous quadrupedal horned D. with very large skulls bearing a neck frill and large horns (e.g. *Triceratops*).

See W. E. Swinton, *The Dinosaurs*, 1934; E. H. Colbert, *The Dinosaur Book*, 1945.

Dinotherium, extinct genus of proboscidean mammals. The lower tusk was well developed and curved sharply downward. The skull was more primitive, and the bulk much more vast, than in the living elephant. Dinotheres have been found in the Miocene and early Pliocene of Europe and Asia.

Dinslaken, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), near the r. b. of the Rhine (q.v.), 23 m. N. of Dusseldorf. It has iron, steel, and coal industries. Pop. 32,000.

Dinton, park in Wilts, England, 9 m. from Salisbury, on the N. slope of the Nadder Valley. Philipps House, owned by the National Trust, was formerly the house of the Wyndham family and was completed in 1815 by Jeffrey Wyatt in the neo-Grecian style, of which it is a very successful example. It stands on rising ground beneath a screen of fine beech trees. Hyde's House, close to the church, was built in the Wren manner, probably about 1725, and incorporates Tudor portions. It is in the older house on the site that Edward Hyde, afterwards Lord Chancellor Clarendon, is said to have been born.

Dinwiddie, Robert (1693-1770), Lieutenant-governor of Virginia. He entered into conflict with the Fr., against whom he sent Maj. George Washington. He built Fort Duquesne, on the site of the present Pittsburgh, Pennsylvania. His health ruined by his ceaseless exertions in connection with the Fr. and Indian wars, he left Virginia in 1758.

Diocesan Court, one of the eccles. courts, a consistory. In every diocese of the Church of England there is a D. C. presided over by the commissary or chancellor who acts as vicar-general for the bishop. Eccles. cases arising within the diocese are here tried. Their former jurisdiction in matrimonial and testamentary matters is now vested in civil courts. See DIVORCE; PROBATE, DIVORCE, AND ADMIRALTY DIVISION.

Diocese (Gk *diokēsis*, housekeeping, management, province), a dist. under the eccles. jurisdiction and care of a bishop. In Demosthenes the word is used for the treasury or finance dept. in Cicero it is applied to the 3 dists. of Cybira, Apamea, and Synnada (added to Cilicia, 56-50 bc); D., from its original meaning 'administration', coming to mean the part so administered. The term was primarily used in the civil administration of the Rom. empire, Constantine the Great

dividing it into 13 D.s. which were subdivided into 120 provs. These D.s. (of which Oriens was the largest, Britain the smallest) were governed by praetorian prefects, proconsuls, or vicars, the provs. by rectors or exarchs. The word in its present eccles. signification was not in common use till about the 9th cent., *parokia* (parish) being the more usual term up to that time. Constantine (AD 306-37) made the eccles. and political divs. correspond, the eccles. D.s. being under a patriarch, the political under a praetorian prefect. Later D. dwindled to mean a single metropolitanate or prov. instead of a group of them, and finally merely the sphere of jurisdiction of any one bishop. In England an Act of Parliament is necessary to create fresh D.s. In the Catholic Church D.s. are erected by the Pope in consistory. See BISHOP; see also J. Bingham, *Origines Ecclesiasticae*, 1840; P. Hinschius, *Das Kirchenrecht der Katholiken und Protestanten in Deutschland*, 1869-97; A. Baudrillart and others, *Dictionnaire d'histoire et de géographie ecclésiastique*, 1912-36.

Dioclea, see TITOGRAU.

Diocletian (Gaius Valerius Diocletianus) (AD 245-313), Rom. emperor, b. Dalmatia, the son of obscure parents; entered the army and served with much success under Aurelian and Probus, later accompanying Carus on his Persian expedition, and at his death in 283 becoming commander of the Imperial Guards of Numerian (q.v.). In the next year Numerian was assassinated by Aper, and D. was proclaimed emperor by the army of the E. at Chalcedon. Carinus had already been proclaimed in Italy, but was defeated and slain, and D. was recognised as sole emperor (285). In 286 he assumed as his colleague in the empire Marcus Aurelius Maximianus, and gave him the title of Augustus. Maximianus took charge of European affairs, and D. of the E. with his cap. at Nicomedia. In 292 Galerius and Constantius Chlorus were also adopted as colleagues, and took up the gov. respectively of Thrace and Illyria (Galerius) and Gaul and Spain (Constantius). D. superintending Asia and Egypt, and Maximianus Italy and Africa. D. retained supreme command. In 297 a peace was concluded with Persia. In 303 D., under the influence of Galerius, issued a severe edict against the Christians, the persecution of whom has left a stain on his memory. After a long illness in 304, he abdicated in favour of Galerius in 305, and retired to Salona in Dalmatia. His ranks high both as a gen. and a statesman. See also ROMAN HISTORY.

Diodati, Giovanni (1576-1649), Calvinist theologian, b. Geneva, whither his parents had fled from Lucca. He was distinguished as a preacher, and as a prof. of Hebrew and theology. Trans. the Bible into Italian and French. His nephew Charles, a schoolfellow and friend of Milton, wrote an elegy on the death of the poet.

Diodon, see GLOBE FISH.

Diodorus (surnamed **Siculus**), Gk historian, b. Agrigunt, Sicily, and lived in

the time of Caesar and Augustus. His work, entitled *Bibliotheca Historica*, consisted of 40 books in 3 sections, the 1st dealing with times previous to the Trojan war, the 2nd ending with the death of Alexander the Great, and the 3rd with Caesar's Gallic wars. Only books 1-5 and 11-20 have come down to us. The work, however, is characterised by a want of order and critical power. Misunderstanding and distortion of fact to adorn a tale, and often also to point a moral, have disguised the historical kernel of this great compilation, which, however, is valuable as a collection of materials the sources of which are lost. There is a text with trans. by C. H. Oldfather and R. M. Geer in the Loeb Library (12 vols., 1933 ff.).

Diodorus of Tarsus, biblical commentator, b. Antioch, where he was taught by the aged Eusebius of Emesa, pupil of Eusebius of Caesarea. D. became bishop of Tarsus, 378. He had great influence over Chrysostom and Theodore of Mopsuestia (q.q.v.).

Diogenes (c. 412-323 BC), Cynic philosopher of Sinope in Pontus. He was the son of Icesias, and on account of the latter's dishonest actions D. had to leave Sinope and take up his residence in Athens. After much persistence, in spite of constant harsh rebuffs he became the pupil of Antisthenes (q.v.), and laid down for himself an excessively austere rule of life, subjecting himself to every kind of self-mortification. Legend asserts that he lived in a tub, though the truth of this statement has been called in question. While on a voyage to Aegina, D. was seized and sold as a slave in Crete, and after being bought by Xenias he became the tutor of his children. It was during this time that he is reported to have met Alexander the Great, causing the latter to remark that if he were not Alexander he would like to be Diogenes. The philosopher is said to have d. at Corinth on the same day as Alexander. His system of philosophy had a practical basis, and he ridiculed all men whose pursuits were not aimed at some practical end.

Diogenes Laërtius, Gk author who lived probably towards the close of the 2nd cent. AD, though little is known about his exact date. He wrote *Lives and Opinions of the Eminent Philosophers* in 10 books (text with Eng. trans. by R. D. Hicks, 2 vols., Loeb Library, 1935), which has been of great value to later writers on the subject. At the same time he made bad use of his information, as his work is not a methodical compilation nor is it an authority on philosophy, though it has preserved some interesting facts. See R. Hope, *The Book of Diogenes Laërtius*, 1930.

Diogenes of Apollonia, Gk philosopher of the 5th cent. BC. He was a pupil of Anaximenes, whose doctrine, that air is the source of all being, he attempted to reconcile with that of Anaxagoras (q.v.). According to this philosophy, all other substances are derived from air—which gives also life and soul to all things—by a process of condensation and rarefaction,

in which mind and matter alike share. Considerable fragments of his work *On Nature* are extant.

Diognetus, *Epistle* to, incomplete Gk work of uncertain date and unknown authorship, but probably of c. AD 150 and addressed to the tutor of Marcus Aurelius. The last 2 chapters are by another hand, identified by Lightfoot as Pantænus (180-210). It is a brief and simple account of Christianity and its distinction from idolatry and Judaism with its sacrificial and legal requirements. It describes it as the self-revelation of God the Creator in his Son, who has come as man to save us and impart to us a new life as citizens of heaven, even while on earth, so that the Christian is to the world as the soul is to the body. It survived until 1870 in a single MS., which perished at Strasburg in the Franco-Prussian war; copies, however, had fortunately been made. It is customarily associated with the Apostolic Fathers (q.v.). See J. B. Lightfoot, *Apostolic Fathers*, 1891; L. B. Radford's annotated ed., 1908; K. Lake, *Apostolic Fathers*, 1913.

Diomede, or **Diomedes**, son of Tydeus. After the death of Adrastus, whom he succeeded as king of Argos, D. led 80 ships against Troy. Bold and enterprising, a favourite of Athene, with her help he wounded Ares and Aphrodite. With Odysseus he had many adventures, and stole the palladium (q.v.) from the acropolis of Troy.

Diomede Islands, group of 3 small is., situated in Bering Strait, about half-way between the 2 continents of America and Asia. The group consists of Ratmanov and Little Diomede Is. and Fairway Rock.

Diomeda, see ALBATROSS.

Dion Cassius (Cassius Dio Cocceianus) (c. AD 155-c. 235), Gk historian, b. Nicaea in Bithynia; settled at Rome in 180; praetor 194; consul c. 220 and 229, after which he returned to his native place, where he d. D. C. was the author of a valuable *Roman History* in 60 books down to AD 229. Of these only books 36-60 survive, covering the period 68 BC-AD 47. There is a text with trans. by E. W. Cary in the Loeb Library (9 vols., 1914-15).

Dion Chrysostomus ('the golden-mouthed') (c. AD 50-c. 115), Gk orator, b. Prusa in Bithynia. He received a good education and travelled considerably when young. After leaving Rome, owing to Domitian's hatred of philosophers, he is said to have visited Mysia, Thrace, and other places, disguised as a beggar. He returned under Nerva, and after revisiting Prusa went back to Rome, where he d. His 80 moral discourses have been ed. by J. W. Cohoon and H. L. Crosby (5 vols., Loeb Library, 1932-51).

Dion of Syracuse (408-353 BC), son of Hipparchus and brother-in-law of Dionysius the Elder (q.v.), who employed him on sev. confidential missions. When Plato visited the court of Dionysius, D. became an ardent disciple of the philosopher. On the succession of the younger Dionysius (367), D. summoned Plato once more to Syracuse to instruct the new

tyrant in the theory of gov.; and indeed Plato hoped that he might realise his dream of the philosopher king. Dionysius, however, had different inclinations; the undertaking failed, and D. was banished. In 357 D. returned at the head of an expedition, expelled Dionysius (356), and succeeded him as tyrant. He was assassinated in 353.

Dionaea Muscipula, the Venus' flytrap, a genus of Droseraceae. The leaves form a small rosette on the ground, and are composed of a lower winged part and an upper expanded part fringed with teeth. Inside the upper part are numerous tiny digestive glands, and 3 long, delicate, hair-like organs. If one of these organs be touched by an insect the sides of the leaf collapse, the teeth interlace, and as the captive decomposes its products are absorbed by the plant.

Dione, one of the Titans, mother by Zeus of Aphrodite. Homer represents her on Olympus welcoming and consoling her daughter when wounded before Troy.

Dionne, Narcisse Eutrope (1848-1917). Canadian historical writer, b. Saint-Denis de la Boutellerie. He was educ. at Sainte-Anne's College, the Quebec Grand Seminary, and Levis College, and obtained his medical degree at Laval Univ. in 1872. He abandoned his medical career to become a journalist and became famous as a historical writer and biographer. His works include a life of Jacques Cartier, 1889, and *Quebec et Nouvelle-France*, 1905-12; *Les Ecclesiastiques et les royalistes français réfugiés au Canada, 1791-1802*, 1905; *Les Canadiens-Français*, 1914.

Dionne Quintuplets, 5 children, Yvonne, Annette, Emilie, Cecile, and Marie, born to Mrs Elzire Dionne on 28 May 1934, at Callander, Ontario. Dr Allan Roy Dafeo (1883-1943) attended Mrs Dionne and achieved fame for his successful delivery of the 5 children. Marie d. in 1955.

Dionysia, festivals of Dionysus (q.v.), especially those held at Athens and elsewhere in Attica. (1) *Little or Rustic D.*, celebrated in many country places with antique rites in the month of Poseidon (Dec.). (2) *Lenaea* (festival of the Maenads), kept at Athens in the following month. Gamelion, with a procession and dramatic shows. (3) *Antheseria*, 11-15 Anthesterion (Feb.-Mar.), was marked by special commemorations of the dead, and at Athens by a symbolic marriage between the wine-god and the king archon's wife. (4) *Great or City D.*, in the month Elaphebolion (end of Mar.), was celebrated with a ritual procession and dramatic contests in the Theatre of Dionysus. (5) *Oschophoria* (i.e. carrying of grape-clusters) in the month Pyanepsion (late Oct.). See L. Deubner, *Attische Feste*, 1932.

Dionysius, patron saint of France, see DENIS, ST.

Dionysius (surnamed *Halicarnassensis*, from Halicarnassus, his bp.), Gk scholar of the reign of Augustus. He went to Rome about 30 BC, where he wrote a hist. of Rome down to 264 BC, with the express purpose of reconciling his Gk compatriots to the yoke of their Rom. conquerors.

The work is still a valuable source of information. The first 11 books have survived almost intact. The remaining 9 are available in fragments and an epitome.

Dionysius (surnamed *Periegetes*, 'the describer of the earth'), Gk poet who lived probably in the early days of the Rom. empire. He wrote a *Periegesis tes Oikoumenes* in 1186 hexameter verses. His work, founded on that of the first scientific geographer, Eratosthenes, caused him to be considered by the later Greeks as the geographer *par excellence*. His work was trans. into Lat. by Festus Avienus and commented by Eustathius. There are eds. in the *Geographi Graeci Minores* of G. Bernhardt, 1828, and by C. Müller, 1861.

E. Buchanan

THE THEATRE OF DIONYSUS AT
ATHENS

Dionysius (self-named in humility *Exiguus*, or 'the Little') (b. c. AD 500), Gk theologian. He went to Rome and became abbot of a monastery, where he made collections of the first 50 canons of the apostles, the canons of 10 councils, and of 38 decretals of the popes, all of which were recommended for use in 800 by Charlemagne. This was the origin of the Canon Law. He introduced the method of counting the years from the birth of Christ.

Dionysius Cato, *see* CATO, DIONYSIUS.

Dionysius Epiphanes, *see* ANTIOCHUS.

Dionysius of Byzantium, Gk poet of the 2nd cent. He wrote elegiac verses and an account of the navigation of the Bosphorus coast-line. Fragments of this work appear in various collections, e.g. in the *Geographi Minores* of Didot.

Dionysius of Colophon, Gk painter who lived about 500 bc. He was a contemporary and rival of Polygnotus of Thasos (q.v.), and was nicknamed 'Painter of Men' (*Anthropopographos*), because he aimed at portraying men as they really were, while Polygnotus gave his figures a touch of ideal or god-like beauty. He painted a portrait of Aristarchus carrying a figure of tragedy.

Dionysius the Areopagite, *see* DENIS.

Dionysius the Elder (c. 432-367 bc), tyrant of Syracuse, in which position he had estab. himself by 405. Apart from his encouragement of literature, the prin. features of his reign were 2 Punic wars (397-396 and 392 bc) and the capture of Rhegium (386), which made Syracuse the greatest power in Europe. His ambitions, however, were checked by his failure in a 3rd Punic war (383-378). In the year of his death he won the first prize with a tragedy at the Athenian festival of Lenaea.

Dionysius the Younger, tyrant of Syracuse, succeeded his father, D. the Elder (q.v.), in 367 bc. He was compelled to leave Syracuse in 356, and went to Locri, which tn he ruled as a tyrant for some years. He returned to Syracuse after the assassination of Dion, but was again driven out in 343, when he retired to Corinth. *See also* DION.

Dionysius Thrax, or the Thracian, Gk grammarian who lived about 100 bc. He taught for some time in Rhodes and then had a school in Rome. He wrote the first scientific Gk grammar, a work which was very popular, and highly valued in ant. times. The best ed. is that of G. Uhlig, 1844.

Dionysus (Bacchus, a Lydian name), ant. Gk divinity representing the productive and intoxicating power of nature. He is believed to have been originally a Thracian fertility god worshipped as a bull with orgiastic rites. The date of his introduction to Greece is uncertain; but his cult spread rapidly and in face of official opposition which is reflected in sev. cult-myths, e.g. that of Pentheus (q.v.). Under the influence of Apollo (q.v.) the orgies (*see the Bacchae* of Euripides) were gradually modified until D. became associated with Apollo at Delphi. Oriental contacts, however, tended to revive the licentiousness of Dionysiac worship in Hellenistic times.

The character of D. led to his early connection with the vine, thence with rites accompanying the grape harvest, and ultimately with tragic drama. The ann. dramatic contests held at Athens in the classical period took place during the Great Dionysia (*see* DIONYSIA) in the Theatre of D., where his priest occupied the presidential seat. For the legend of D. in classical mythology and Gk mystical religion *respectively see* SEMELE and ORPHISM. *See also* W. K. C. Guthrie, *The Greeks and their Gods*, 1950.

Diophantine Equations, so called after Diophantus, a Greek mathematician who lived at Alexandria c. 3-4 cent. AD. His pub. a work called *Arithmetica* that included arithmetic and algebra. His

name has been given to D. E., also known as *Indeterminate Equations*, the type of which is illustrated by the following example. In how many ways can a sum of £2 1s. 6d. be paid in florins and half-crowns? Let x be the number of florins and y the number of half-crowns, then, expressing everything in pence, we have the equation $24x + 30y = 498$, which reduces to the simpler form $4x + 5y = 83$. Dividing by the smaller coefficient 4, this reduces to $x + 1\frac{1}{4}y = 20\frac{3}{4}$, or $x + (y-3)/4 = 20$. Since x and y must be integers, it follows that $(y-3)/4$ is an integer which we can denote by p , and hence $y-3 = 4p$. Giving p the values 0, 1, 2, 3, 4, etc., we find $y = 3, 7, 11, 15, 19$, etc., but from the equation $4x + 5y = 83$ it is obvious that y cannot exceed 83/5 and hence 19 is excluded. Using for y the values 3, 7, 11, 15, the corresponding values of x are 17, 12, 7, 2. Hence there are 4 ways of paying the sum of £2 1s. 6d. in florins and half-crowns. See T. L. Heath, *Diophantus of Alexandria*, 1910.

Diophantus, see DIOPHANTINE EQUATIONS.

Diopside (Gk *dis*, twice, and *opsis*, appearance), a variety of pyroxene, containing no alumina. It is composed of silica (55.7), magnesia (18.5), and lime (25.8).

Diopbase, or Emerald Copper Ore, a rare ore of copper found by analysis to consist roughly of 38 per cent silica, 50 per cent copper oxide, and 12 per cent water. It occurs in beautiful green transparent or translucent crystals, similar in appearance to emeralds.

Dioptr, the unit of refractive power of a lens. The power of a lens in D.s is defined as $100/f$ where f is the focal length in cms, or as $1/f$ where f is in metres. A lens of +1 D. is a convex lens with a focal length of 1 metre. A concave lens has a negative power, e.g. a lens of -2 D. is concave with a focal length of -50 cms. When thin lenses are combined the power of the combination is the sum of the powers of the components. See LENS.

Dioptrics, that part of the science of optics which deals with the refraction of rays of light when passing through media such as glass and water. It treats particularly of the laws governing the refraction of light by lenses. See REFLECTION AND REFRACTION OF LIGHT.

Diorama, see PANORAMA.

Diorite, a granitoid rock found in abundance in Germany and N. America, rarely in England, but frequently in the Scottish Highlands and Galloway. D. is composed essentially of felspar and one or more of the ferro-magnesian minerals, such as hornblende, augite, biotite, or hypersthene. In colour it is greyish-white to almost black. D.s from Guernsey are much valued as a road-metal in the S. of England.

Dioscorea, the chief genus of Dioscoreaceae, is noted for its farinaceous tubers which are grown for food in the tropics and are known as *yams*. *D. batatas*, Chinese yam, is best known.

Dioscoreaceae, family of monocotyledonous plants. They nearly all grow in

the tropics, but *Tamus communis*, the black bryony, grows in Britain and Europe; many are nutritious and others are poisonous.

Dioscorides, Pedacius, or Pedanius, Gk physician, a native of Anazarba, Cilicia, who lived about AD 40-90. He was the originator of the *materia medica* (q.v.). His *De Materia Medica* described over 600 plants and plant principles and is the authoritative work on the *materia medica* of antiquity. It was pub. in Lat. in 1478 and in Gk in 1499; the first Eng. version appeared in 1934.

Dioscuri, see CASTOR AND POLLUX.

Dioscurides, gem engraver who lived about the time of Augustus, whose seal he engraved. He is one of the 4 engravers recorded by Pliny.

Diosgyör, tn of Hungary, a W. suburb of Miskolc (q.v.), in Borsod-Abaúj-Zemplén co. In the Middle Ages it was a tn of importance, and it has a remarkable 14th-cent. castle. There are extensive iron, steel, and engineering industries, and there are thermal springs and lignite mines in the dist. Pop. 27,000.

Diosma, genus of heath-like, evergreen, S. African shrubs, family Rutaceae, often confused with *Barosma*. *D. vulgaris* and varieties, and *D. ericoides*, with white or reddish flowers grow, in a cool greenhouse in Britain.

Dip, or Inclination, the angle which a magnetic needle makes with the horizontal when the vertical plane, in which it moves, coincides with the magnetic meridian (see MERIDIAN, MAGNETIC). The total magnetic force due to the earth acting upon a magnetic needle may be resolved into 2 components, one acting horizontally and the other vertically. When the needle is suspended so as to move in a horizontal plane, as in the magnetic or mariner's compass (q.v.), the horizontal force tends to make it lie along the magnetic meridian, but the vertical force has an inconsiderable effect. When the needle is suspended so as to move in a vertical plane at right angles to the magnetic meridian, the horizontal force can only act in the direction of the axis of suspension, and therefore the needle is only affected by the vertical component, and so stands vertically. When, however, the horizontal component is free to act, the needle takes up a position at an angle to the horizon which increases as the position of the needle approaches the magnetic pole. The D. is subject to secular variation and in London has decreased from a maximum of 74° 42' in 1723 to 67° 9' in 1900. At Abinger, the magnetic station of the Royal Greenwich Observatory, Herstmonceux, it was 66° 41' in 1953 and decreases by about 1' each year. See ISOCLINIC AND ISOCONIC; MAGNETISM.

Dip, in geology, the angle between the plane of an inclined stratum and the horizontal.

Dip-circle, an instrument to measure dip (q.v.) or magnetic inclination, consists of a magnetised needle pivoted on a horizontal axis through its centre of gravity so that it can rotate in a vertical plane. The ends of the needle move over

a vertical circular scale graduated in degrees. The instrument is rotated about a vertical axis so that the needle lies in the magnetic meridian (q.v.). The angle between the horizontal and the magnetic axis of the needle is the dip.

Diphtheria (Gk *diphthera*, a membrane), acute infectious disease caused by the *Corynebacterium diphtheriae*. It has been estab. that there are 3 types of *C. diphtheriae*, the *gravis*, *intermedius*, and *mitis*, so called from the degree of severity of the disease which they cause. D. is acute in onset and is characterised by the formation of a pseudo-membrane, greyish in colour and looking like sodden parchment, at the site of infection. The infection usually attacks the mucous membrane of the throat and upper respiratory passages. Rare cases have been known in which the site of infection has been an open wound or abrasion of the skin. When the larynx is involved the inflammation and oedema of the vocal cords may result in a complete blocking of the windpipe, which must be relieved by tracheotomy (q.v.) if asphyxia is to be prevented. *C. diphtheriae* produces a powerful toxin which is absorbed into the blood stream and is responsible for the more severe features of the disease, such as heart failure and paralysis, which result from its action on the central nervous system. Children are affected more often than adults, although people of any age are liable to be attacked. *D. gravis* is a dangerous disease unless diagnosed and treated early in its course. A certain number of sufferers continue to be carriers of the D. bacilli after recovery from the clinical attack, and these are an obstinate reservoir of infection. D. was first described and named by P. Bretonneau of Tours in 1826. He also introduced tracheotomy for laryngeal D. In 1883 Kelbs and Löffler identified the bacillus. Von Behring's great discovery of the principles of serum treatment in 1890 was quickly followed by the production of an antitoxin made from the serum of horses previously inoculated with an attenuated culture of living D. bacilli. Treatment with the new antitoxin immediately brought about a spectacular fall in the death rate. Antitoxin of a more refined and concentrated kind than the original product is still the main treatment for D. In 1908 Bela Schick introduced the skin test for susceptibility to D. The Schick test consists in the injection of a small amount of diluted diphtheria toxin into the skin: those who are susceptible develop an area of redness at the site of injection, whereas there is no reaction in those who are immune. The ability to distinguish between the immune and non-immune stimulated the search for a prophylactic vaccine that would give immunity to those shown by the Schick test to be susceptible. Earlier attempts to immunise by using small doses of toxin or bacterial vaccine had been unpromising. Von Behring, however, reported (1913) that a mixture of toxin and antitoxin, which the observations of Theobald Smith had previously

shown to be a good immunising agent, could be safely injected into children. W. H. Park, of New York, then became the leader in the campaign for the immunisation of children against D. Britain at first held back, then the experience of the city of Hamilton, Ontario, gave a lead which could not be ignored. After general immunisation had been started there in 1925 the incidence of, and mortality from, D. both fell so steeply that in this large pop. there have been no deaths from the disease since 1930 and no cases since 1933. A. T. Glenn, working in England, produced a series of powerful and concentrated antigens, based upon the toxin-antitoxin principle (the toxoid), finishing up with an alum-precipitated toxoid known as A.P.T. This has since been improved upon by various technical modifications. Although Britain was a late starter in large-scale immunisation against D., the national campaign started in 1940 has achieved phenomenal results. Some 60-70 per cent of school and pre-school children were immunised and cases of D. fell from an average of 60,000 with 2500 deaths in pre-war years to 3531 cases and 156 deaths in 1948. The national figures for 1954 showed an even greater fall, with 266 notified cases and 3 deaths. In London in 1938 there were 4559 cases and 205 deaths, and in 1954 4 cases and no deaths. This striking improvement, however, has done much to remove the fear of this once dreaded disease from people's minds, and as a consequence many parents are neglecting to have their children protected. Immunisation should be carried out soon after the 6th month, and unless the level of immunisations is kept at some 75 per cent of the child population (at present it is at 40-50 per cent) it cannot be long before D. again becomes a menace to the life of the children of Great Britain. See under PATHOLOGY and EPIDEMIOLOGY.

Diphthong (Gk *di*, double, *phthongos*, sound), a compound sound, composed of 2 vowel sounds joined to form 1 sound distinct from either of the 2 original. There are 4 sounds in Eng. which are pure D.s. These are *i* = *a* + *i*, as in the word *aisle*; *u* = *i* + *u*, as in the word *duke*; *oi* = *au* + *i*, as in *joist*; and *ou* = *a* + *u*, as in *south*. Many vowels written as double ones in Eng. are not D.s. in sound.

Diplegia, Infantile, see BIRTH-PALSY.

Dipleidoscope (Gk *diplos*, double, *eidos*, appearance, and *skopein*, to view), an optical instrument for indicating the passage of the sun or of a star over the meridian, used for the purpose of determining the correct time by transit observations. It consists of a triangular prism which has 2 silvered planes and one (in front) unsilvered; one of the silvered planes coincides with the plane of the meridian. The coincidence of the 2 images formed by a single and double refraction of the prism records the transit accurately if the adjustment is correct. Steinhell's 'transit prism' grew out of the work of Bloxam, Dent, and Plössel on the

Diplodocus, genus of Jurassic sauropod dinosaurs (q.v.) belonging to the order Saurischia. They were quadrupedal and herbivorous, 87 ft in length, with massive backbone and limbs, long neck and tail, and a tiny skull. They were probably amphibious, living in swamps, so that the enormous limbs were buoyed up by the water. The vertebrae were cavernous in order to reduce the weight of those parts above water.

Diplomatic Service, British. Great Britain is represented abroad in regard to its international interests by diplomatic agents and occasionally by consuls, though the latter are in general concerned exclusively with the interests of Brit. subjects resident abroad. The former include *ambassadors* or *envoys*, who are officials permanently accredited to a foreign state, and *chargés d'affaires*. A *chargé d'affaires* is either one who acts as deputy for an ambas. during the temporary absence of the latter, or one who is accredited as Brit. representative to some foreign country of minor importance. Ambas. are appointed by and derive their authority from sealed letters of credence (see CREDENTIALS) under the sign-manual addressed to the sovereign or president of the country to which they are accredited, and from instructions under the sign-manual to themselves personally. Ambas. are assisted by various attendants known as *attachés*. These latter have to serve a probationary period, after which they become eligible for appointment as third secretaries. First and second secretaries constitute an intermediate class. All members of the D. S. are expected to take their turn in whatever part of the world their services may be required. Women are now admitted to both the Diplomatic and Consular Services on equal terms with men. There is, however, a general marriage bar which the foreign secretary has power to waive in exceptional circumstances. See Harold Nicolson, *Diplomacy*, 2nd ed. 1950.

Diplomatics. The Gk word *diplōma* (a folded sheet) was used by the Romans first of a licence to travel by the public post, and then of any imperial grant of privilege. Scholars of the Renaissance and later extended it to cover all manner of legal and other official or semi-official documents. D. may therefore be defined as the science of the critical study of non-literary historical sources; and the immediate derivation of the name is from Dom Jean Mabillon's *De re diplomatica*, 1681, which first set forth its principles. D. originally included palaeography (q.v.), but is now restricted to the forms and structure of ant., medieval, and later documents, especially to the criticism and testing of them in the light of rules known to have been regularly observed by draughtsmen at different periods and places. Most of the forms occurring throughout Europe can be traced to those employed by the papal chancery; and these in turn owed much to the practice of the Rom. imperial court. The documents of which D. takes account are

classified as public and private. The former include all that are concerned with gov., e.g. laws, grants, proclamations, judicial records, and pleas. Private documents include charters, i.e. deeds emanating from individuals and such corporate bodies as municipalities and religious houses, as well as the records of manorial courts and other registers. Mabillon's work was followed in England by Madox's *Formulare Anglicanum*, 1702, and in Italy by Maffei's *Istoria diplomatica*, 1727. Another important pub., upon which later works were largely based, is the *Nouveau Traité de diplomatique* by Dom C. Toussaint and Dom D. Tassin (6 vols.), 1750-65. Great advances in the science of D. were made in France during the 19th cent., thanks to the Académie des Inscriptions and to the Ecole des Chartes. England has followed suit with numerous pub. of the Public Record Office (q.v.) and of the British Museum (q.v.) department of MSS. See B. Thorpe, *Diplomatarium Anglicum Aevi Saronici*, 1865; E. A. Bond, *Facsimiles of Ancient Charters in the British Museum*, 1873-8; G. F. Warner and H. J. Ellis, *Facsimiles of Royal and other Charters in the British Museum*, 1903; V. H. Galbraith, *Introduction to the Use of Public Records*, 1934.

Diplopia, see EYE.

Dipnoi (Gk *dis*, twice; *pnōt*, breathing), or **Dipneusti**, a sub-class of bony fishes, is of great interest for its many peculiar features, some of which are rather amphibian in nature. The D. are all extinct but for 3 genera, *Nepceorotodus* (q.v.) of Queensland, *Protopterus* of Africa, and *Lepidosiren* of America, but many fossils belonging to the group have been discovered, all either Palaeozoic or Mesozoic. The importance of the possession of a double-breathing apparatus is seen in all 3 living genera, which have gills as well as a lung-like swimbladder. They are mud-fishes which live in tropical swamps; when the water is adequately oxygenated they breathe by means of their gills, when it has become stagnant by means of their lungs. The D. are fringed-finned bony-fishes (Crossopterygii) and have a pair of tooth plates in the lower jaws which bite against an opposing pair in the roof of the mouth.

Dipole, see AERIAL.

Dipole Moment, see DIPOLES.

Dipoles. When a bond is formed between 2 identical atoms, e.g. X:X, the electron pair denoted by : is equally shared between the 2 atoms, but for unlike atoms, e.g. X:Y, the electrons are likely to be found nearer one atom than the other, depending on the electron affinities of the various elements. For example, chlorine has a greater affinity for electrons than has hydrogen, so that hydrogen chloride can be represented as H:Cl. Thus the electrical centre of the electrons may not coincide with the mass centre of the 2 atoms, leading to the existence of a small electrical doublet known as an electrical dipole moment. This is defined as the product of the electronic charge and the relative dis-

placement of the positive and negative centres, e.g.

H_2 or $H:H$ has zero dipole moment

 $\delta_0^+ \quad \delta_0^-$

HCl or H:Cl has a D. M. of 1.03D where δe represents a fraction of the full electronic charge e , which is 4.803×10^{-10} e.s.u.

NaCl or $\text{Na}:\text{Cl}$ has a D. M. of $(4.803 \times 10^{-18}) \times (2.81 \times 10^{-4})$ cm., i.e. 13.5×10^{-18} e.s.u. or 13.5D , where D is a Debye unit of D. M. of 10^{-18} e.s.u.

D. M. exist in all molecules, covalent and electrovalent, providing that these molecules do not possess a centre of symmetry. Thus a symmetrical molecule like carbon tetrachloride (CCl_4) has no D. M., although each carbon chlorine bond has an appreciable moment.

D. M. are thus due to permanent polarisation and act along the bond between the atoms or radicals and are additive like vector quantities, e.g. the D. M. of nitrobenzene and chlorobenzene in benzene solution are 3.9 and 1.5D respectively, viz.

in which the direction of the D. is marked by an arrow with its point towards the negative end. Hence the resultant D. M. of p-chloronitrobenzene should be 2.4D and this is in agreement with experiment.

viz.

Much valuable information has been derived from the study of D. M. and the data may be examined under the following headings.

Structure of molecules.—Zero D. M. has been found for the simple diatomic gases (e.g. H₂, O₂, N₂) and for symmetrical triatomic gases (e.g. CO₂, N₂O) showing both types to have a linear structure. Similar values have been found for tetratomic and pentatomic molecules (e.g. boron trihalides, tin and silicon tetrahalides), thus showing triangular and tetrahedral structures respectively.

Finite D. M. have been found for many unsymmetrical molecules like H_2O , which must be V-shaped, and for NH_3 , which must be pyramidal.

Geometrical Isomers.—Distinction between cis- and trans-isomers of simple ethylene derivatives is possible since the latter are symmetrical and have a zero D. M.

Also the D. M. of α -penta-acetyl glucose is

greater than that of the β -compound, thus supporting the chemical evidence that in β -glucose the H atoms and OH groups are arranged alternately above and below the plane of the pyranose ring.

Free rotation about a single bond.—The ethylene dihalides ($X.CH_2.CH_2.X$) have no D. M. in the vapour phase but have a finite D. M. under ordinary conditions, showing the possibility of varying configurations by free rotation about the C—C bond.

Coplanarity and collinearity of certain rings.—Zero D. M. were found for the 4:4'-dihaloeno derivatives of diphenyl, so that the original Kaufler folded formulae, which required large D. M., were incorrect, and replaced by the linear extended formulae.

The absence of a D. M. for 2:6-dichloro naphthalene shows the 2 rings to be coplanar.

Measurement of valency angles. The D. M. of hydrogen peroxide shows the OH bonds to be at an angle of about 106° .

Proof of resonance.---The original proposal that the nitro group should be

represented as $-N \begin{array}{c} \nearrow O \\ \searrow O \end{array}$ requires the p-dinitro benzenes to have a finite D. M.

The experimental value was zero so that the nitro group is a resonance hybrid, the extreme structures being

so that the real structure is the symmetrical form

Planar configuration of certain metal valencies.—Measurement of the D. M. of the 2 nickel benzyl methyl glyoximes shows one value to be zero, the other finite. This is explicable if the 2 structures are cis- and trans-isomers, thus requiring the nickel valencies to be planar.

Zwitterion structure of the amino acids.—The dielectric constants of aqueous solutions of amino acids were found to be greater than that of water, suggesting a D. M. for amino acids, so that the structure of an amino acid, $\text{R.NH}_2\text{CH}_2\text{COOH}$, at its isoelectric point is

Dipper, or Water-ousel, the popular term for passeriform birds of the genus *Cinclus*. Both wings and tail are short, the beak is fairly short and straight, and the general colour of the bird is brown, the throat and part of the breast being white. It inhabits streams of Europe, Asia, and America, feeding on molluscs and insects, and is a good diver. *C. cinclus* is the common dipper, found in parts of the Brit. Isles as well as in Europe, N. Asia, and NW. Africa.

Dippers (religious sect), see BRETHREN. CHURCH OF THE.

Diprotodon, a giant Australian Pleistocene marsupial, about the size of a large rhinoceros, with diprotodont dentition and a huge skull. It is the largest known marsupial.

Dipsacaceae, family of dicotyledonous herbs and sub-shrubs, mostly Mediterranean; with opposite leaves without stipules, 4 or 5 parted flowers in cymes or heads, inferior ovary, and fruit an achene. Genera include *Cephalaria*, *Dipsacus*, *Morina*, and *Scabiosa*.

Dipsacus, family Dipsacaceae, genus of prickly biennial herbs, native to Europe, Asia, and N. Africa. *D. fullonum*, the teasel; its 2 sub-species *sylvestris*, the wild teasel, and *fullonum*, Fuller's teasel, still grown as a crop for its persistent seed heads used for raising nap on certain cloths; and *D. pilosus*, the small teasel, are all found in Britain. A rosette of basal leaves the first year, the plants throw up prickly, angled stems, with blunt, conical purplish flower-heads, held erect.

Dipsas, genus of Amblycephalidae, are snakes which have much in common with the family Colubridae. The members of the genus are found in S. America and are harmless, though in appearance they resemble poisonous species.

Dip-sector, astronomical reflecting instrument, similar to the sextant in principle, for ascertaining the dip of the horizon.

Dipsomania, see ALCOHOLISM; DRUNKENNESS; INEBRIATES.

Diptera (Gk *di*, two; *pteron*, wing), large order of insects, of which over 40,000

species have been classified, but are not believed to nearly represent all of the species which are in existence. They are distinguished from other insects by the presence of 1 pair of wings, and the hind-wings are represented by 2 pin-like, knobbed processes called halteres. The wings are never very large, they are transparent and membranous. The flattened head is united to the body by a long and very flexible neck, the divisions of the thorax are greatly fused, the mouth-parts are adapted for piercing or suction, and often have a retractile proboscis. The metamorphosis of the flies is complete, the larva being usually a maggot which has no thoracic legs and only a minute head; the organs it contains differ completely from those of the mature creature, and in

DIPTERA

A, Egg, magnified 10 times; B, larva, magnified 4 times; C, puparium, magnified 4 times; D, horn-fly (*Haematobia serrata*), Europe, magnified 18 times.

undergoing its metamorphosis the contents of the body break down into a creamy substance from which the new organs of the adult are developed. It is usually only the females which have blood-sucking habits, and their larvae are nearly always aquatic. The D. are divided by zoologists into 2 suborders, according to the way the adult emerges from the pupa case. In the *Orthorrhapha* the case splits straight down the back, while in the *Cyclorrhapha* the case has a circular tip which is pushed off by an expansible sac on the head of the emerging fly.

Dipterocarpaceae, family of dicotyledons, contains over 300 species of evergreen Indian trees. The calyx enlarges greatly during the ripening of the fruit, which is usually a nut. All the species produce such substances as resin and oil: *Dryobalanops camphora*, a kind of camphor, and *Dipterocarpus trinervis*, a resin which is made into plasters for ulcers in Java. Many give valuable timber.

Dipterus, the oldest and most primitive genus of lungfish (Dipnoi), from the Devonian; it had a heterocercal tail, 2 dorsal fins, cosmoid scales, and internal nostrils comparable with those of the crossopterygians (q.v.). The characteristic tooth-plates are commonest as fossils.

Dipteryx (family Leguminosae), genus of tropical Amer. evergreen trees, of which *D. odorata* (*Coumarouna odorata*) yields the tonka or tonquin beans, used in perfumery, snuff, tobacco, etc.

Dipyah: 1. Two tablets made of carved ivory, etc., and united by leather hinges; their inner surface was covered with wax. The Romans wrote in them the names of the consuls and prin. magistrates. D.s containing names of the living and dead, especially saints and martyrs, were placed on the altar for a *memento* in the Mass of the early Church.

2. A similar folding tablet made to hold twin portraits or other paintings. Cf. the Wilton D., containing a beautiful portrait of Richard II (National Gallery, London). See TRIPTYCH.

Dipyre (Gk *di*, two, and *pur*, fire), silicate of alumina and lime, which, when subjected to heat, first becomes phosphorescent and then fuses: it occurs as a transparent, tetragonal mineral in the Pyrenees.

Dirac, Paul Adrien Maurice (1892-), Eng. mathematician and physicist: educ. univ. of Bristol and Cambridge; F.R.S., 1930, and Lucasian Prof. of Mathematics, 1932. In recognition of his valuable work in connection with quantum mechanics, he was in 1933 awarded the Nobel Prize (with Edwin Schrödinger). He predicted the existence of the positron which Blackett and Anderson discovered about 2 years later, and he advanced the theory of the spinning electron. His *Principles of Quantum Mechanics* was pub. in 1930.

Dirae, see EUMENIDES.

Dirce, wife of Lycus, King of Thebes. She was dragged to death by a wild bull, to whose horns she had been bound by Amphion and Zethus, sons of Antiope, the divorced wife of Lycus.

Direks, Henry (1806-73), civil engineer and author, inventor of the optical illusion 'Pepper's Ghost.' As an apprentice in a mercantile firm he studied mechanics, chem., and literature, and later became a practical, then a consulting engineer and member of the Brit. Association. He wrote *Popular Education, Inventions and Inventors, Scientific Studies*, etc.

Direct Action. A phrase in popular use in England about the year 1910, chiefly in relation to labour unrest and the Women's Suffrage Movement. Like many slogans invented in times of agitation it has no precise definition, but varies, according to the mood and character of the user, from a small local strike to a violent national uprising. For some years before the First World War an increasing distrust of gaining their ends by constitutional methods was steadily growing among wage-earners at home and abroad; while such bodies as the Independent Workers of the World and the Syndicalists were increasing their activities and urging swifter methods of change. Possibly the most prominent exponent of D. A. in the Brit. Isles to-day is the I.R.A.

Direct and Retrograde, terms used in astronomy to indicate the apparent motions of a planet as seen from the earth. Its motion is said to be D. when it is pro-

gressing from W. to E. towards its E. elongation, and R. when it is travelling towards its W. elongation, apparently in the opposite direction. See PLANETS.

Direct Current, electric current flowing uniformly in one direction in a circuit. Originally used in all supply systems, the application is now mainly restricted to electrochemical plant and traction, and to private generating stations and battery-charging plant. Recently, interest in long-distance D. C. transmission has revived on account of stability problems in alternate current lines. See ELECTRIC MACHINES; TRANSMISSION, ELECTRIC POWER.

Direction-finding, determination of the direction of arrival of radio waves by a

ADCOCK AERIAL

special aerial. Radar (q.v.) is a special version of D. not involving the co-operation of the radio station to be located. D. is used as an aid to navigation, and equipment for this purpose is carried in vessels of any size and all passenger-carrying aircraft. The usual equipment is a rectangular loop aerial with its plane vertical, which can be turned round a vertical axis. The frequencies used by the transmitting stations are of the order of 500-2000 kc/s. When the loop faces the incoming waves, the voltages induced in the vertical sides are equal in phase and amplitude but act in opposite directions round the loop and thus cancel out; the received signal is minimum. When the plane is parallel to the direction of propagation, the voltages differ in phase owing to the difference in distance travelled; the resultant voltage is the vector difference between the two, the signal is a maximum. The minimum signal is always used, being the sharper. At the aerial position of minimum signal, the bearing of the ship is indicated on an

azimuth scale set to true N. Normally the waves are vertically polarised, i.e. the electric vector is vertical. If horizontally polarised waves, reflected from the ionosphere, reach the aerial, voltages induced in the horizontal sides distort the signal. This can be overcome by use of the Adecock aerial, since the voltages induced in the horizontal sides are equal and opposite and so cancel out. See **BLIND LANDING**. See also R. Keen, *Wireless Direction Finding*, 1937.

Director, in law, see **COMPANY; PUBLIC PROSECUTOR**.

Directorium, or *Ordo*, a list printed every year by authority of a Rom. Catholic bishop; it contains directions to ecclesiastics as to the office for each day.

Directory (1795-9), the name given to the gov. of France which followed the Convention and which ruled from 27 Oct. 1795 until its overthrow by Napoleon and Siyès on the 18th Brumaire (i.e. 9 Nov.) 1799. The constituent bodies of the D. were the Council of Five Hundred and the Council of the Ancients, and the D. proper or *directoire exécutif* was elected by the former council from a list presented by the latter council. The members were Barras, Carnot, Lépeaux, Letourneur, and Rewbell. The D. gave its name to the *directoire* style of dress and furniture.

Directory, alphabetical list or index giving various kinds of information. Most useful in Great Britain is the Post Office Directory, compiled for dists.; the largest is the London one, which contains information under the following headings: (1) *Court D.*: names of people occupying private houses, arranged alphabetically, but persons having any rank or title precede others of the same name; (2) *Official D.*: names of persons holding any gov. or law office; (3) *Street D.*: names of the prin. streets of London, with their terminals and intersections with other streets named, and a selection of the in-habs.; (4) *Law D.*: list of judges and official staff of all the courts and of the police force; (5) *Parliament D.*: list of all peers of the U.K., members of the House of Peers, members of the House of Commons and names of places for which they sit; (6) *Postal D.*: all information connected with the transmission of letters, parcels, etc.; (7) *City, Municipal, Parochial, and Clerical D.* gives a large amount of miscellaneous information; (8) *Commercial D.*: list of wharves, booking-offices, railway-carriers, etc.; (9) *Banking D.*: list of bankers, etc.; (10) *Suburban D.*. The Post Office also pub. the *Telephone D.* Other D.s include *Who's Who*; *Who Was Who*; *Burke's Peerage, Baronetage, and Knightage*; *The Catholic Directory*; *Crockford's Clerical Directory*; *The Medical Register*; *The Directory of Directors*; and *Kelly's county, town, trades, and other Directories*. Corresponding D.s are pub. in most countries of the world.

Directory of Public Worship, collection of rules for public worship in England and Scotland drawn up by the Westminster Assembly of Divines (q.v.) in 1644, intended to supersede the Book of Common Prayer.

Dirige (Lat. imperative *dirige*, direct thou), the first word of the opening antiphon used in Rom. Catholic offices for the dead, *Dirige Domine*; thus the term is applied to a piece of music which is suitable for funeral ceremonies.

Dirhem, Arabic silver coin equivalent to about 45 grs. The Fr. gramme is now called D. in Turkey. See **DRACHMA**.

Dirigible, see **AIRSHIP**.

Dirk, proper name for the dagger of the Scottish Highlander. It was worn either within the vest or with the pistol at the belt. The blade was some 5 in. long, and separated by a 'shoulder' from the short, cylinder-shaped handle, which was usually of horn or wood, and was often richly carved with interlacing ornament. It is worn to-day with ceremonial Highland dress.

Dirschau, see **TCZEW**.

Dirt Beds, see **PURBECK BEDS**.

Dirt-track Racing, see **SPEEDWAY RACING**.

Dis, see **HADES**.

Disability, term in law which is applied to a person who is not allowed to do a particular thing. This D. may be due to physical causes, as in the case of those mentally deficient, or to the fact that a person is under age, or to a point of law, as in the case of an alien.

Disabled Persons. After the First World War the resettlement in civil life of men disabled during the war became a national problem. In 1915 an appointments board, under the ministry of labour, was constituted to place disabled officers and men. During the war and for some time after the Armistice disabled officers and men were given a course of training to fit them for civil employment in those cases where they could not follow their previous employment. To encourage employers to absorb the disabled the King's National Roll was inaugurated by Royal Proclamation in Aug. 1919. Those who engaged D. P. in the proportion of 5 per cent of their total staff of employees were given a certificate and were entitled to use a special seal on their business stationery. Such organisations as the Brit. Legion, St Dunstan's Hospital for the Blind, etc. did good work for D. P. War-disabled men, through the operation of the Joint Substitution Board, were given preference over other applicants for work in gov. depts. At the beginning of the Second World War it was anticipated that the largely voluntary organisation which had existed up to that time for the resettlement of D. P. would prove inadequate. In 1941 the ministry of labour and national service set up a number of vocational training and rehabilitation centres, and under an interim scheme officers of the ministry undertook to place D. P. in suitable employment. At the same time an inter-departmental committee was appointed to inquire into the whole question of resettlement and rehabilitation. The committee's report was pub. in Jan. 1943 (White Paper Cmd 6415), and legislation was introduced later the same year. As a result the Disabled Persons (Employment) Act, 1944, became

law on 1 Mar. 1944. For the purposes of this Act a disabled person is defined as one who on account of injury, disease, or congenital deformity is substantially handicapped in obtaining or keeping employment, or in undertaking work on his own account, of a kind which apart from disablement would be suited to his age, experience, and qualifications. The Act applies to Brit. subjects of either sex over the age of 16, and in certain conditions to non-Brit. subjects also. The ministry provides vocational training or industrial rehabilitation courses at centres run as a gov. charge, or arranges for suitable courses to be taken at technical colleges and institutes. In this case the fees are paid by the gov. The ministry may also pay the expenses incurred by those attending such courses, or contribute towards them. The ministry maintains a register of D. P. Registration is voluntary. Employers are obliged under the Act to employ a quota of registered D. P. The quota for any particular employer is determined by the ministry and bears relation to a standard percentage fixed for general application in consultation with employers' and workers' organisations. Special percentages are fixed for particular industries, as necessary. In some types of employment vacancies are exclusively reserved for registered D. P. only. In the administration of the Act the minister of labour is assisted by a national advisory council.

Disarmament. Strenuous but generally fruitless attempts have been made since the First World War to secure some mitigation of the evil of unrestricted competition in armaments, beginning at the peace negotiations at Paris in 1919. International principles were laid down in the covenant of the League of Nations to that end.

During the period 1920-3 the only effective agreements for the limitation of armaments were, however, negotiated outside the League, and of these the most important was the Five Power Pact signed at Washington in 1922, by which the U.S.A., Great Britain, France, Italy, and Japan agreed on certain naval and air limitations. In 1924 an attempt was made to find a solution in the Geneva Protocol. Another solution was provided by the Locarno treaties (q.v.), which conduced to a measure of stability in Europe until Germany denounced them in 1936.

During 1926-7 the League appointed a Preparatory Commission on D. preliminary to a World Conference. As regards land armaments, it made an attempt to limit the effectives of the sev. signatories and to cover arms and ammunition by budgetary limitation, but reached no unanimity. Subsequently there were limited disarmament treaties between individual states (e.g. Three-Power Pact of 1930 between Britain, the U.S.A., and Japan, limiting naval armaments), but the international conference which began at Geneva in 1932 on D., though it passed various general resolutions, achieved nothing concrete. By 1934 D. as a general policy was dead, though efforts

were still being made by some states to secure some limitation of armaments.

Early in 1934 the Brit. Gov. issued a Memorandum stating that it was ready to yield to the Ger. demand for a short-service army of 300,000 men, but held out for the prohibition of 'para-military' forces by constant supervision; and it repeated an earlier proposal for the abolition of military aircraft, subject however to adequate supervision of civil aviation to prevent misuse for military purposes. Not only Germany but Japan, the U.S.A. and Russia were opposed to any system of international supervision or control of their armaments. In May the general commission of the Disarmament Conference met in Geneva; the chief feature of the conference was the Amer. proposal of 'a universal pact of non-aggression' subject to the proviso that the U.S.A. neither took part in European political negotiations or settlements nor used its forces for such settlements—a proposal which was a mere repetition of the Kellogg Pact. The Russian Gov. however, through Litvinov, rejected this proposal and favoured security and a practical system of guarantees—a counter proposal to which Simon returned an emphatic negative; and on 11 June the commission adjourned *sine die*. In 1935 Great Britain concluded an agreement with Germany under which the latter country was permitted to build up a navy to one-third of the strength of the Brit. Navy. In 1936 Great Britain decided on an all-round increase of armaments (see White Paper issued in Mar. 1936), her action being hastened by the uncertain situation which prevailed in Europe, through the militant policy of Italy, the denunciation of the Locarno Treaty by Germany, and the aggressive policy of Japan in the Far E. Furthermore, Japan claimed parity with Great Britain and the U.S.A. for her naval armaments.

No further serious attempts at D. were made, and the international situation steadily deteriorated, culminating in the outbreak of war in 1939. At the conclusion of the Second World War the world was confronted with the weapon of atomic power and the problem of controlling it, and the related question of D. again came to the fore. The subject was actively discussed at the General Assembly of the United Nations which met in New York in the autumn of 1946. The question of a troop census of all nations was debated, but only when this was abandoned was it possible for the political committee of the United Nations to draw up a resolution for presentation to the general assembly. This resolution was adopted by the assembly by acclamation on 14 Dec. 1946. By its terms an early general regulation and reduction of armaments and armed forces was recognised. It also contained a recommendation that the Security Council should expedite practical measures to this end, to be generally and not unilaterally observed, together with provision for an international convention for the control and inspection of armaments and armed

forces. The prohibition of atomic and all other major weapons of destruction, both present and future, was stated as an urgent objective. In fact, however, though innumerable proposals and counter proposals on D. have been raised by the W. powers and the Soviet Union since 1946, both in the United Nations and at various international conferences, the aims of the resolution of Dec. 1946 remain (1957) entirely unrealised. In Nov. 1951, for example, in the United Nations Assembly, Russia rejected the W. powers' proposals for D., which envisaged control of all forms of weapons, and countered with proposals advocating the actual prohibition of atomic weapons. The following month there appeared to be agreement between the 3 W. powers (France, Britain, U.S.A.) and Russia on the generalities of a D. plan, but subsequent debates showed that this was limited and superficial. Then, as in the future, the W. powers were insistent on detailed methods of international inspection of D. being settled before promises were made on the limitation or prohibition of weapons, atomic or otherwise; whereas Soviet resolutions tended to be more sweeping in their advocacy of prohibition, etc., but noticeably vague on the details of inspection and enforcement.

D. was raised at the Four-Power Conference in Berlin in Jan. 1954; and again at Geneva in July and Oct. 1955. But no agreement was reached. In Mar. 1956 Anglo-Fr. proposals for D. in 3 stages were pub. In June of the same year Bulganin, in a personal message to Eisenhower, made new Russian D. proposals on familiar Soviet lines, but subsequent international tension in E. Europe and the Middle E. has tended to push the question of D. into the background.

Discharge, see ABSCESS; BANKRUPTCY; ELECTRIC DISCHARGE.

Discharge (military), the release of a serving soldier from further obligations of military service under the terms of his enlistment. In the Brit. Army a soldier on enlistment undertakes to serve the sovereign so long as his services are required within the period for which he agrees to serve. At the end of the agreed period he may claim his discharge unless a state of war exists or the reserves are called out on permanent service. If he is serving overseas, his period of service may be extended by 12 months. The Crown has the right to discharge a soldier before he has completed his legal period of service, and the grounds for discharge, e.g. medical unfitness, misconduct, inefficiency, services no longer required on reduction of estab., are laid down in Queen's Regulations. A soldier may also purchase his discharge, the minimum amount being £20 with higher rates according to the conditions and length of service. A soldier serving on a regular engagement cannot purchase his discharge until he has completed service equal to his National Service liability. A National Service man cannot purchase his discharge. All men discharged from the

Army are given a certificate of service unless discharged for misconduct.

Disciplina Aroani (Lat. 'discipline of the secret'), a term used in the 17th cent. to describe the system of reserve practised by the Christian Church during the first few centuries, by which the mysteries of the faith were concealed from unbelievers and the unbaptised. No trace of it is found till the end of the 2nd cent., and it began to die rapidly at the end of the 6th cent. Strong traces of it remain in the Gk liturgy. Baptism and the Eucharist were considered the great Christian mysteries, and the latter was divided into a 'Liturgy of the Catechumens' and a 'Liturgy of the Faithful.' The latter included the consecration and communion, and from it the unbaptised were excluded. See P. Battifol, *Etudes d'histoire et de théologie positive*, I, 1906.

Discipline, see MILITARY LAW.

Disco, is. on the W. coast of Greenland. It is 70 m. long and about 50 m. wide. Godhaven is a harbour in the S. of the is.

Discoidea, see ECHINODERMATA.

Discount, amount of money deducted from a sum paid before it is due. Thus if a bill of £110 is due a year hence at 10 per cent, the banker deducts simple interest on £110 at the given rate, i.e. £11. Instead of £10 as in true D. D. is also applied to stock if the price is below the nominal value; thus if £100 stock can be bought for £95 cash, it is at D. of 5 per cent.

Discovery, legal term denoting disclosure by parties to an action of documents in their possession relevant to matters in dispute. The parties are ordered by the court to exchange lists of their documents (usually supported by affidavits to the effect that such lists are exhaustive). The purpose of D. is to ascertain what documentary evidence will be produced at the trial. Those documents which are 'privileged' (i.e. counsel's opinions, witnesses' written statements, and correspondence between the parties and their professional advisers) are excluded from D.

Discovery Committee, Colonial Office committee which was formed in 1923 with the primary object of attempting to place the whaling industry on a scientific basis. Its other objects were to render service to navigation by conducting a hydrographic survey of the whaling areas, to inquire into the resources of whaling regions from the point of view of fisheries, and to add to scientific knowledge of the sea. For this work the royal research ship *Discovery I* made investigations in the vicinity of the Falkland Is. between 1926 and 1927, and the research ship *William Scoresby* and the royal research ship *Discovery II*, a steel-built boat, have made sev. voyages in Antarctic waters since then. The chief investigations were directed to a study of the habits and haunts of whales, their rate and location of breeding, and related topics, with the view to securing data for regulating the industry. This had become an urgent matter owing to the increasing possibility of the extermination of the whale, and is of especial importance to the Falkland Is. dependencies, where

whaling is almost the sole industry, and a lucrative one. The *Discovery I* found that distribution was governed largely by that of the small creatures on which the whale feeds, and that therefore if large tracts are found in which these creatures are scarce, no accumulation of whales can be expected. Direct evidence as to migration of whales is sought by marking whales with numbered darts, which, when the whale is eventually caught, show the course travelled. Whale-marking has been carried out by the *William Scoresby* by means of darts fired into the back of the whale.

At the end of 1930 the D. C. reported that the *Discovery II* had carried out a complete investigation and hydrographical survey of the S. Sandwich Is., this being the first official visit made since the is. were declared Brit. Ter. by Letters Patent of 21 July 1908. Thus the ship had rounded off a chapter of Antarctic hist. associated with the historic names of Cook and Bellinghausen. In 1936 the *Discovery II* deviated from her third voyage of research to the Antarctic in order to rescue the Amer. explorer, Lincoln Ellsworth. In 1949 the D. C. was reorganised as part of the National Institute of Oceanography. See ANTARCTIC AND ANTARCTICA; ANTARCTIC EXPLORATION.

Discus (Gk *diskos*, disk): 1. Circular plate of stone (or metal), in ant. times from 8 to

Games. The D. was held in the athlete's right hand, resting against the forearm, and thrown like a quoit. Sometimes a kind of spherical quoit was similarly used, with a thong passed through a hole in it. A copy of Myron's famous 'Discobolus' is in the Brit. Museum (according to Gardiner the attitude is not strictly correct), and there are also copies in the Vatican and the Palazzo Lancelotti at Rome. The bronze statue in Rome was presented by Mussolini to Hitler in 1939, but in 1948 was reclaimed by the It. commission sent to Germany to find It. masterpieces which fell into the hands of the Germans, and is now restored to Rome. As used in modern times the D. is made of birch wood, with a metal centre piece. It weighs about 4½ lb. and is thrown from a circle of 7 ft. The world record throw, 194 ft 6 in., was made by F. E. Gordien (U.S.A.) in 1953. See ATHLETICS.

2. Name for the paten in the Eucharistic rite of the E.; unlike the W. paten it is supported by a stem and base.

Discussion, term in Rom. law, denoting the exhaustion by the creditor of all legal means of enforcing payment from the prin. debtor before taking proceedings against the person secondarily liable, i.e. the surety. In Scots law the term is also used in 'D. of heirs', the proceedings against the heirs for debts contracted and left unpaid by the deceased.

Disease Carrier, see CARRIER (DISEASE).
Diseases, Notification of, see NOTIFICATION.

Diseases of Animals Act. The prin. function of the Act is to control certain contagious diseases of animals (including certain species of birds—mainly poultry and birds of the parrot family). It also provides for the welfare of animals during transport. The Act gives power to the Minister of Agriculture, Fisheries, and Food to make orders for the purposes of the Act. Some of these orders are of temporary duration—such as those which deal with outbreaks of foot-and-mouth disease and fowl pest. Diseases which are subject to official control measures are: anthrax, cattle plague (rinder pest), foot-and-mouth disease, contagious bovine pleuro-pneumonia, bovine tuberculosis, brucellosis in cattle (Malta fever and contagious bovine abortion), glanders and farcy, epizootic lymphangitis and certain forms of mange in horses, sheep pox, sheep scab (mange), swine fever, atrophic rhinitis of pigs, rabies, fowl pest and allied diseases (including psittacosis).

Although some of the most formidable diseases in the above list have been eradicated from Great Britain for many years past, measures are in force to prevent their reintroduction through importation of animals and products from countries where these diseases still exist. Local authorities and the police are charged with enforcing the provisions of the Act and its orders, but the Ministry maintains a large staff of veterinary surgeons dispersed throughout the country to assist local authorities and to investigate cases of suspected scheduled disease. Veterinary research laboratories are

MYRON'S DISCOBOLUS

A copy in the British Museum

12 in. in diameter, weighing 4-5 lb., used for hurling from a fixed mark over the greatest possible distance as a gymnastic sport and exercise among the Gks and Roms. Disk-throwing was included with jumping, foot-racing, spear-throwing, and wrestling in the *pentathlon* of the Olympic

maintained to undertake research into many diseased conditions in animals and to assist the 'field staff' in diagnostic duties.

Disestablishment, the annulling of the special status and privileges which a particular religious communion has enjoyed by favour of the State. Disendowment, a usual concomitant, is, however, separable in idea from D. The estab. of the Church of England rests not so much on any particular Act or Acts of Parliament as upon the whole interrelated list of Church and State in this country (see ENGLAND, CHURCH OF). The Crown appoints bishops and deans. Certain bishops sit in the House of Lords. The Church of England has certain privileges and duties in relation to national and civic affairs, of which the coronation of the sovereign is the most important. Estab. does not necessarily mean that grants are received from the State. The income of the Church of England is derived from Church endowments and voluntary subscriptions. In France the Rom. Catholic Church was disestablished during the Revolution, reinstated by Napoleon in 1801, and the union was repudiated unilaterally by the State in 1906. In Great Britain the Church of England as estab. in Ireland, where the people were largely Rom. Catholics, was disestablished by a Bill of 1869 which came into force in 1871. The archbishops and bishops ceased to possess the right to seats in the House of Lords, and the rights of patronage were abolished. In the case of private patronage compensation was made, and all offices which carried personal precedence with them were retained for life. Attempts to introduce a Welsh D. Bill began in 1895. The Liberal attempt in that year failed, but in 1903 another Bill was introduced as a result of the findings of the Royal Commission appointed in 1906. The Bill was finally passed by the Commons in the early part of 1913. In the following year it passed into law to come into operation in 1915, but the outbreak of war in 1914 led to the postponement of the measure, and it was not until 1920 that the Welsh Church was disestablished. In Scotland, where the people are mainly Presbyterian, the 2 great divs. of the Scottish Church—Estab. and Free (or United Free)—coalesced in 1929 on a unique basis, viz. complete independence of the State in all spiritual matters and internal gov., along with a definitive transference of the auct. endowments to the United Church. The Eng. Church in India was part of the Estab. Church of England till 1927, when the Indian Church Act disestablished it. The Church of India, Pakistan, Burma, and Ceylon is now self-governing, but it still recognises Canterbury as the mother see. European reps. of recent times, such as Germany, Portugal, Poland, Czechoslovakia, follow the example of the oldest rep., Switzerland, in adhering to Cavour's principle of a 'free Church in a free state.' In the U.S.S.R. the Soviet gov. was at the outset hostile to organised religion, and the Orthodox Church was consequently

disestablished and disendowed. See also CHURCH.

Disfranchisement, see ELECTIONS.

Disinfectants, agents used to kill disease germs with the object of preventing the spread of infectious diseases. There are 3 classes of substances used to counteract bacterial action, whose functions overlap to some extent: they are antiseptics (a.v.), D., and deodorants. Antiseptics act by destroying the germs or neutralising their poisons; deodorants act by disguising the smell or changing the composition of noxious gaseous products without necessarily destroying germs; but D., which are usually applied to clothing, furniture, etc., must, in order to be effective, destroy all germs associated with the disease to be combated. The process of disinfection generally commences with the destruction of organic masses, as excreta and discharges, as soon as possible, and the burning of all inexpensive or much-soiled articles of clothing, and proceeds to subject all articles suspected of contamination to the action of some chemical or physical agent of a germicidal nature. When the articles are placed in a sealed room, an effective disinfecting agent is formalin, which has a particularly penetrative power, but has little action on colouring matter or metals other than iron. Sulphur dioxide was formerly much used, but the penetrative power is less than that of formalin, and there is some doubt as to the dry gas being an effective germicide, though many vermin are readily destroyed by it. The application of considerable heat is the most effectual method of disinfection known. When applied in the form of hot air there is danger of scorching articles of clothing; but steam, at a temp. of about 120° C. and a pressure of 5 lb., has no harmful effects on colours and fabrics. Public disinfecting stations have usually 2 chambers; the clothing, etc., is placed in a cage mounted on wheels so that it can be run from the steam chamber to the drying chamber, where the articles are handled by a different staff and conveyed in different wagons from those connected with the collection of contaminated articles. Liquid D. are used for cleansing articles in constant use in sick-rooms, for treating drains and sinks, etc. The manganeses and permanganates of sodium and potassium, chloride of lime, carbolic acid, corrosive sublimate, etc., are used for this purpose. D. lose their power when much diluted, and the vapour of carbolic acid, though its odour gives a sense of security, has no particular germicidal effects. In recent years the range of disinfectants has been widely extended by chemical research, and some of the new varieties, such as hexahydroresorcinol, are 300-400 times as effective as carbolic acid.

Disinfecting Stations.—By various Acts of Parliament, notably the Public Health Act, 1875, it is incumbent upon sanitary authorities to cleanse and disinfect houses and their contents if they are likely to cause or spread disease. Bedding, clothes, and similar articles which are extremely likely to do this are removed to D. S. and disinfected at the public expense. If

necessary they are totally destroyed, in which case compensation is given. The usual agent in D. S. is steam. Local authorities have power to disinfect persons also who through filth, disease, or vermin are a danger and a nuisance to the public.

Disjunction, in logic, the relation of the sev. terms of a disjunctive proposition, which is the statement of alternative possibilities. It is a matter of dispute among logicians whether the disjunctive form necessitates the mutual exclusiveness of the alternative predicates. A disjunctive judgment is one of the form 'A is either B or C,' when either 'A is B' or 'A is C' must be true. See *Welton's Logic*, II.1.209.

Dislocation, or Luxation (loosening), in surgery, the displacement of one bone from another with which it is articulated (commonly called 'putting out of joint'). Usually the result of an accident, but may be caused by disease or be congenital (occurring before birth). Displacements may be partial or complete. They are classified as 'simple' when the skin is unbroken, 'compound' when the displaced bone pierces the skin. A complicated D. is a displacement of a bone, accompanied by severe local lesion of the soft parts or fracture of the bone. The process of righting a D. is called 'reduction.' Reduction of recent luxations can generally be accomplished by surgical manipulation, but in old and long-neglected cases it involves an operation. The shoulder is the joint most frequently dislocated, or the hip in the lower extremity. There is a congenital form of dislocation of the hip in which the head of the femur (or thigh bone) on one or both sides is not seated in its proper position in relation to the pelvis. This is a condition of faulty growth and not one resulting from injury before or during birth. It occurs more frequently in girls than boys. It may not be noticed until the child starts to walk, when the deformity becomes obvious. Treatment consists in splinting the limb in a position which will correct the deformity.

Dismal Swamp, large marsh about 500 sq. m. in extent in Virginia and N. Carolina, U.S.A. There are many trees growing there, mostly cypress, black gum, pine, and cedar. It is being gradually reclaimed, canals having been cut through it, the longest of which connects Chesapeake Bay and Albemarle Sound.

Disney, Walter Elias (1901-), Amer. artist and film producer, b. Chicago. He worked on a farm and, later, in an ambulance corps in France during the First World War. He studied drawing in Chicago and in 1923 went to California. His first great film success was *Mickey Mouse*, whom he introduced in a number of short film cartoons together with Minnie, Pluto the dog, Donald Duck, and other animal characters. His first full-length cartoon was *Snow White and the Seven Dwarfs*, 1937, based on the well-known fairy tale by the brothers Grimm. His next was Colloidi's *Pinocchio*, an lt. classic; other full-length films followed, notably *Fantasia*, 1940, *Saludos Amigos*, 1941, *Song of the South*, 1947, *Cinderella*,

1950, *Alice in Wonderland*, 1951, *Peter Pan*, 1953, *Lady and the Tramp*, 1955. Recently D. has been concerned with the production of documentaries on natural hist., his 2 outstanding films being *Living Desert*, 1953, and *Vanishing Prairie*, 1954. Later films include *Jawy Crockett*, *The Great Locomotive Chase*, and *Jawy Crockett and the River Pirates*. D. has won sev. Academy Awards for the best cartoons and documentary features.

Dison, small industrial tn in the prov. of Liège, Belgium, N. of Verviers. Pop. 9700.

Disorderly House, see NUISANCE.

Dispart, in gunnery, the difference between the radius of the base ring at the breech of the gun and the ring at the swell of the muzzle. An allowance for D. is necessary in determining the beginning of the graduations on the tangent scale. The line which is drawn from the circumference of the base to that of the muzzle is known as the line of metal; the angle subtended by the D. at the base of the gun is equal to that which, in a vertical plane passing through the axis of the bore, would be contained between the latter and the line of metal. A special D. sight, raised in the centre of the gun between the trunnions, is used when the line of metal gives a large D.

Dispensation, in a wide sense, may be taken to mean the licence of a sovereign power exempting a particular person from any obligation imposed by the law. In Great Britain the Bill of Rights abrogated the assumption of this power by the Crown, and though it survives in the shape of the prerogative of pardon and, more indirectly, in acts of indemnity, it is exercised in a strictly constitutional manner. In a narrower technical sense D. means the granting of a licence or the licence itself to do what is forbidden by a canon of the Church, or conversely, to omit something which is commanded. In the Rom. Catholic Church D.s may be granted by the legislating authority or any superior authority: thus the Pope, his legates, and others deputed by him may dispense from any merely eccles. laws, but not from the divine or natural law, or in such a way as to injure the rights of third persons. A Rom. Catholic bishop may dispense from his own diocesan laws, or, under a faculty from the Pope, from universal laws of the Church. In England the Archbishop of Canterbury formerly had a considerable dispensing power, but it is now exercised chiefly in the shape of special licences for marriages. Bishops can still grant D.s to clergymen from the law against holding pluralities and residence away from their parishes.

Dispenser, person skilled in preparing medicines from prescriptions. To practise as a D. a person must first have passed examinations held under the auspices of the Pharmaceutical Society and he must also be registered under the Pharmacy Acts. The practice of dispensing was not treated as a distinct profession from that of the doctor before the 17th cent. A modern D. must possess wide knowledge and a considerable degree of skill.

Dispersion, in optics, the decomposition of light into rays of different refrangibility. The light we receive from the sun is commonly called white light, but it can be shown that white light consists of various colours. If a pencil of the sun's rays is allowed to pass through an aperture in the shutter of a dark chamber, it will form an image of the sun on a screen placed to receive it. If, however, a prism of flint glass be interposed horizontally, the ray appears to be spread out and is received on the screen as a series of colours at some distance from the position of the previous image. The explanation is that the light is refracted or bent on entering the glass and again on leaving it, and as some of the components of white light are more refrangible than others, they take up different positions on the screen. It is usual to distinguish 7 colours, violet, indigo, blue, green, yellow, orange, and red, of which violet is the most refrangible and red the least. When prisms of different materials are used, spectra are formed of different lengths, i.e. spread out or dispersed in different degrees, but having the same colours and usually in the same order. When artificial light is thus dispersed through a prism, all the colours of the spectrum may not be seen; but the colours are found in the solar spectrum, and in the same order. If the artificial light is yellow, for instance, the dominant colour in the spectrum will be yellow; and such colours as blue, indigo, and violet may be very faint or missing altogether. If the light from the dispersing prism is caught on a concave mirror, so that the rays can be brought to a focus again, the combined rays will produce a light similar to that of the source, thus showing that the colours are simply components of the original light. The composition of white light can also be demonstrated by colouring a disk in sectors with the same colours in the same proportions as they appear in the solar spectrum, and then rotating the disk rapidly so that the retina retains the sensation of all the colours at the same time; the result is something approaching to white light.

Anomalous dispersion.—Some substances produce spectra in which the colours are seen in unusual positions. If a prism be made enclosing one of the aniline dyes it is found that the extent of refraction is greater for some of the colours of longer wave-length than for colours of shorter wave-length, so that the order of the colours is different from that in an ordinary spectrum. This shows that refrangibility can have an anomalous dependence upon wave-length, at any rate for substances with special absorptive properties.

Displaced Persons, people who were uprooted from their homes during the Second World War, either as forced labourers or prisoners of war, by the Nazis, and those who were in exile from Soviet-occupied ter. By the end of 1945 the Allied armies and the U.N. Relief and Rehabilitation Administration (UNRRA) (q.v.) had between them returned over 5,000,000 D. P. to their homes. But there

still remained at that time over a million of these unfortunate persons, chiefly Poles, Ukrainians, Yugoslavs, and refugees from the Baltic States, who were unwilling or afraid to return to their home countries, owing to the Communist control of them. In Dec. 1946 the General Assembly of the U.N. voted by 35 to 5 to establish an International Refugee Organisation (I.R.O.). The I.R.O., created in July 1947, took over the work of relief from UNRRA after the latter had been dissolved. Of the 205,000 D. P. resettled in 73 countries in 1948 the U.K. took more than a third, the rest being taken by Canada, Belgium, and the U.S.A.—in that order. Subsequently the U.S. decided to accept 200,000. The Amer. Bill excluded Jews and others who were not D. P. as at 22 Dec. 1945, or, in other words, D. P. status depended on having been taken into a D. P. camp by that date. The large number of Jewish D. P. was rapidly reduced during 1949 by emigration to Israel. On 1 Jan. 1951 the office of the U.N. High Commissioner for Refugees was estab. under U.N. auspices, and this office took over responsibility for the 'hard core' of approximately 100,000 D. P. who still remained unsettled when the I.R.O. was wound up in Jan. 1952. Over 60,000 were still unsettled in 1956.

Displacement, *see* TONNAGE.

Displacement, Electric, or electric flux density. Consider a disk-shaped cavity in a dielectric (q.v.) in a manner similar to that discussed under INDUCTION, MAGNETIC (q.v.). If an electric field, E , acts perpendicularly to the flat faces of the disk, the $E \cdot D \cdot D$, is defined as the sum $E + 4\pi P$, where P is the polarisation of the dielectric (or dipole moment per unit vol., induced or permanent). Thus D is equal to the force acting on unit charge located in the cavity. In an isotropic medium P is numerically equal to the charge per unit area on the flat face of the cavity. It should be noted that E , P , and D are all vectors.

When a voltage is applied to a condenser, a current flows in the wires while the condenser is charging up. In order to construct a self-consistent formal theory of the associated electric and magnetic phenomena (*see* ELECTROMAGNETIC WAVES) it is necessary to assume that this current is continuous through the dielectric (or even vacuum) between the plates. This 'displacement current' is given by the rate of change of charge on one of the plates of the condenser. It can be shown that this rate of change is proportional to the corresponding rate of change of D in the dielectric.

Disposition, in Scots law, is the name given to any writing by which the proprietor of a feu (fee) or heritable estate (in land), or of a personal right in any property heritable or movable, or of incorporeal heritable property (such as a reversionary right), makes over his property to another. Strictly, the transference of a personal right is specifically known as assignation in contradistinction to D . Many changes have from time to time been made in the essentials of a form

of D. Since the Conveyancing Act, 1874, the customary scheduled form, after the formal parts, conveys the property subject to any burden (q.v.) which may affect it, assigns the rents, and binds the person disposing to relieve the disponee of all feu-duties and public burdens, and to consent to the registration of the D. The creation of a new feu as opposed to transmissibility of a feu is by charter and not by D.

Disputation, exercise of argumentative skill very common in the old univs., a proposition being made which some would attack and others defend. Among famous D.s may be mentioned those between Knox and Kennedy (1562) and Laud and Fisher (1623).

Disraeli, Benjamin, see BEACONSFIELD, EARL OF.

D'Israeli, Isaac (1766-1848), miscellaneous writer, b. Enfield, Middx., of Jewish parentage. He was educ. at Amsterdam and Leyden, and at an early age determined, in spite of parental opposition, to become an author. His first work, a *Defence of Poetry*, in verse, was pub. in 1790, and in the following year he issued the well-known *Curiosities of Literature*. This was so successful that further vols. were issued by him at different periods of his life. *Calamities of Authors* appeared in 1812-13, and *Quarrels of Authors* in 1814. Two years later he wrote an *Inquiry into the Literary and Political Character of James I.*, and between 1828 and 1831 he pub. his *Commentaries on the Life and Reign of Charles I.*, at once his most ambitious and his best work. In 1817, in consequence of a quarrel with the synagogue, d'I. withdrew from the congregation, and in that year he caused his children to be baptised. Many years later, in his *Genius of Judaism*, 1833, he wrote enthusiastically of the Jews in early days, but claimed himself to have outgrown the superstitious practices still adhered to by his contemporaries. See Benjamin Disraeli's preface to *The Works of Isaac d'Israeli*, 1858-9.

Disruptive Voltage, the voltage causing (usually violent) breakdown of insulation between 2 electrodes. The D. V. depends on the insulation material, the distance between the electrodes, their shape, and the way in which the voltage has reached the value at which breakdown occurs. Tests are usually made with impulse voltage, a single steep-fronted wave, the voltage rising to maximum in a few microseconds and falling off more slowly. The value of protective gaps on transmission systems depends on accurate knowledge of their D. V., and on proper co-ordination (q.v.).

Diss, tn of Norfolk, England, situated on the Waveney, 20 m. SW. of Norwich. It was formerly noted for the manuf. of worsted and hemp cloth. There are malting works, also manuf. of brushes, etc., and large weekly livestock, poultry, and corn markets. John Skelton, the author, was a native of the tn. Pop. 3500.

Dissection (cutting apart), term used to represent those processes of separation of the parts of a body which are necessary to

show their formation and their relationship to each other. It is, therefore, a branch of anatomy (q.v.), and so one of the divs. of the science of biology (q.v.). Although of great importance in all its branches, it is in connection with human anatomy that it has its greatest value. Democritus and, later, Hippocrates are supposed to have had some knowledge of D., but Aristotle was the real founder of the art of D., although his work was almost certainly confined to the D. of animals. Erasistratus (250 bc) was probably the first to dissect human bodies, performing his work on the bodies of criminals. The progress, however, was slow, owing to the overwhelming prejudice which existed and still exists against the practice of dissecting human bodies. The consequent difficulty in obtaining subjects caused anatomists to have to rely, in the main, upon D. of lower animals, but in 1832 the Anatomy Act was passed, which provides that the bodies of unclaimed dead shall be handed over to the medical schools. See ANATOMY; VIVISECTION.

Disseisin, see SEISIN.

Dissenters, see NONCONFORMITY.

Dissociation, in chem., is the term applied to the reversible decomposition of a substance by heat. Thus dinitrogen tetroxide has the formula N_2O_4 at ordinary temps. but on heating it splits up into molecules of NO_2 ; these recombine on cooling, forming N_2O_4 again: $N_2O_4 \rightleftharpoons 2NO_2$. To indicate the reversibility of the change the reversed arrows \rightleftharpoons are used instead of the sign of equality =. At high temps. water-vapour dissociates into hydrogen and oxygen: $2H_2O \rightleftharpoons 2H_2 + O_2$. Similarly ammonium chloride vapour is found not to consist of NH_4Cl molecules but of a mixture of ammonia, NH_3 , and hydrogen chloride, HCl , D. having taken place: $NH_4Cl \rightleftharpoons NH_3 + HCl$. If D. results in the formation of an increased number of molecules, increase of pressure hinders D. If, however, there is no increase in the number of molecules, pressure is without effect, as, for example, in the action $2HI \rightleftharpoons H_2 + I_2$, the D. of hydrogen iodide.

Electrolytic D. refers to the separation from one another of the ions of electrolytes when dissolved in water or some other solvent. Thus when solid sodium chloride, consisting of an assemblage of positively charged sodium ions and negatively charged chlorine ions, is dissolved in water, the ions separate from one another and become mobile.

Dissolution (of Parliament), see PARLIAMENT; (of partnership), see PARTNERSHIP.

Dissonance, see MUSIC.

Distaff, stick or staff to which material for spinning, as cotton, flax, etc., was fixed, in the method of spinning by hand. The D. was held under the left arm, and the fibres, as they were drawn from it, were spirally twisted with the right hand. During the process of spinning the thread was wound round a revolving reel.

Distemper: 1. (Fr. *détrempe*, lt. *tempera*). Originally any fluid medium for mixing with pigments, later restricted to glutinous

substances, such as size, white or yolk of egg, gum-water, fig-tree sap, honey, etc. The pigments were ground up with these and water and applied to a smooth surface of dry plaster (not damp as in the case of frescoes) usually spread on wood or canvas. D. painting was known very early in Egypt, Babylon, and Nineveh, and used by the Gks for interior decoration. Until replaced by the oils of the Van Eycks, it was the ordinary method of painting in the highest depths of art. In Italy its use continued till 1500, and early Flem. artists constantly employed it. When treated with oil-varnish such paintings are hard to distinguish from oils. They are precise in form and outline, and the rapid drying of the colours prevents blending of tints. D. is still used for scene-painting and in preparing wallpaper.

2. Disease, especially of animals. *Canine D.* is a virus infection of the dog tribe which is a relatively mild catarrh-like condition, although it is frequently complicated by other organisms which give rise to clinical D. having various manifestations. When the nervous system is affected the dog may exhibit convulsions followed by twitchings of various parts of the body (Chorea) or varying degrees of paralysis. Hard pad disease is now considered to be allied to D. Vaccination of puppies with a vaccine prepared from an egg-adapted virus gives a high degree of immunity. *Feline D.* or feline enteritis is unrelated to canine D.

Distich (lik *dis*, twice, *stichos*, line), a pair of lines of verse, making complete sense. The term is a synonym for 'couplet' (q.v.), but of somewhat wider application, as the lines need not be metrically similar.

Distillation, process which consists of converting a solid or liquid substance into the gaseous form and afterwards condensing the vapours to a liquid form, in order to purify the substance or separate its components. The process was known to the ancients, who devised ingenious forms of apparatus. The essential parts of a distilling apparatus are a retort or still, in which the substance to be distilled is heated to vaporisation, a condenser, in which the vapours are cooled to a liquid form, and a receiver, in which the condensed liquid, or 'distillate,' is collected. The temp. at which a substance boils depends upon the pressure exerted upon it, and therefore it is necessary, in the case of liquids which decompose at a temp. below their boiling-point, to reduce the pressure so that they may boil at a suitable temp. The simplest form of distilling apparatus consists of a glass retort communicating with a receiving flask by a straight tube gently sloping downwards and enclosed by a wider tube through which cold water is run, entering at the lowest point and leaving at the highest. To present a larger surface to the cooling action of the water, the condenser is often flattened or twisted into a spiral form, or 'worm.' A long, wide glass tube or air condenser may be used for liquids with high boiling points.

Another method sometimes employed is that of *Steam D.* Thus aniline, a liquid which boils at 184° C. under atmospheric pressure, if mixed with water and heated, distils off together with water when steam is passed through the mixture, and by condensing the mixed vapours the 2 immiscible constituents aniline and water are obtained. This method is particularly useful for the purification of tarry and dirty preparations in which one of the components happens to be volatile in steam.

Fractional D. is a process which aims at separating components of the original liquid which have different boiling-points. This is achieved by using a dephlegmating

DISTILLATION

From a 16th-cent. book

column (see DEPHLEGMATOR). In the D. of coal tar, the dehydrated material is heated in a wrought-iron cylinder fitted with a thermometer, and the vapours are condensed in cast-iron cooling-pipes laid so as to have a continuous fall to the receivers. As the process continues the temp. rises and the less volatile substances are driven off until only the pitch remains as residue. The distillate is collected in fractions at different stages of the process, and such substances as 'first runnings,' 'light oil,' 'middle oil,' and 'heavy oil' are differentiated. These are afterwards separately fractionated. For the D. of alcohol from roine and from a malt wort, see BRANDY; COFFEY'S STILL; WHISKY. The D. of sea-water to procure water for drinking purposes is of importance in considering the equipment of ships, and all big liners carry apparatus for this purpose.

In large-scale operations 2 types of D. are employed, the continuous and the discontinuous. In the continuous method the liquid to be distilled is fed into the still at a constant rate as D. proceeds, and conditions are so arranged that the cooling of the vapours and the heating of the liquid in the still are carried out at as steady a rate as possible. By the continuous method, large amounts of material

can be dealt with. In the discontinuous method, which is more suitable for small-scale operations, the D. of a quantity of liquid is allowed to proceed until it is at an end. The process may then be repeated with fresh supplies of material. The method has the advantage that plant construction is simple, and costs are low. See J. Reilly, *Distillation*, 1936.

Distinguished Conduct Medal (D.C.M.), awarded to warrant officers, non-commissioned officers, and men of the Brit. Army. First introduced in 1854 as an award for distinguished conduct by other ranks in the Crimean War, it was placed on a permanent basis in 1862. The medal carries with it an annuity.

Distinguished Flying Cross (D.F.C.), instituted in 1918 as a decoration for officers and warrant officers in the R.A.F. for acts of gallantry when flying in active operations against the enemy. The Air Force Cross (A.F.C.), 1918, was instituted for bestowal on airmen as in the case of the D.F.C., for acts of courage or devotion to duty when flying, although not in active operations against the enemy. The **Distinguished Flying Medal (D.F.M.)**, 1918, and the **Air Force Medal (A.F.M.)** were designed for warrant officers and non-commissioned officers for equivalent services to those for the D.F.C. and A.F.C. respectively. The bestowal of the above 4 decorations was extended in 1941 to members of the Fleet Air Arm.

Distinguished Service Cross (D.S.C.) was instituted in 1914 in substitution for the **Conspicuous Service Cross**, 1901, for bestowal on all officers of the Brit. Navy below the rank of lieutenant-commander and on warrant officers.

Distinguished Service Medal (D.S.M.) was instituted in 1914 for the petty officers, men, and boys of all branches of the R.N. and for non-commissioned officers and men of the Royal Marines, and for all other personnel holding corresponding positions in the service afloat. In 1942 its bestowal was extended to men of the Mercantile Marine.

Distinguished Service Order (D.S.O.). This order was instituted by royal warrant on 6 Sept. 1886. It is an order of military merit and was founded in order to recognise special services of officers in the Brit. Navy and Army; it was later extended to officers of the R.A.F. and Mercantile Marine. It has only one class, and holders of this order carry after their names the letters D.S.O. Its numbers are unlimited and the companions of the order rank next in precedence after the companions of the 4th class of the Royal Victorian Order. The decoration itself consists of a white and gold cross with a red enamelled centre which bears the imperial crown surrounded by a laurel wreath. The ribbon is red, with blue edges. See also DECORATIONS.

Distomum, see LIVER-FLUKE.

Distraint, see DISTRESS.

Distress, taking of goods or cattle out of the possession of a wrongdoer into the custody of the party injured, for the purpose of procuring satisfaction for the wrong committed. The most usual injury

for which a D. may be taken is that of non-payment of rent. But the remedy may also be resorted to for the payment of taxes, rates, and duties, as well as to obtain compensation for damage done by cattle wandering over one's grounds. As between landlord and the tenant a D. cannot lawfully be made after the tenant tenders to his landlord the full amount of the arrears. Various statutes and judicial decisions have resulted in the exemption of a large number of things from D. Some of these are *absolutely* privileged, e.g. fixtures; things in actual use; wearing apparel and bedding of the tenant or his family, and tools of his trade if valued at under £5; machines used in cotton, woollen, and silk manufs.; goods delivered to the tenant in the way of his trade; and, in the case of tenants under the Agricultural Holdings Act, hired machinery and breeding stock. Some things, like the tools of a man's trade beyond £5 in value, are privileged only if there be other sufficient distrainable goods on the premises. By an Act passed in 1908 the goods of an under-tenant who pays a rent equal to the full ann. value of the premises or part of the premises occupied by him are exempt from D. for the rent due from his lessor to the superior landlord; and by the same Act the goods of a lodger and those of any other person not being a tenant of the premises, or having any beneficial interest in any tenancy of the premises or any part thereof, are also exempt from D. in respect of the rent due from the tenant to his landlord. Goods comprised in a hire-purchase agreement (except in the case of machinery on an agric. holding) or in a bill of sale, or belonging to the husband or wife of a tenant, are not exempt from D. No D. can be taken until the day following the day on which rent is made payable, and it must be taken between sunrise and sunset. No previous demand for the arrears is necessary in the absence of express agreement to that effect. Under the National Insurance Act, 1936, D. must be postponed in the case of a tenant who is an insured person where a doctor certifies that a D. would endanger his life. D. is usually levied through a certificated bailiff armed with a D. warrant. Goods distrained may be sold at the end of 5 days, and after notice to the tenant. By the Limitation Act, 1939, goods may not be distrained in recovery of rent which is in arrear more than 6 years, unless the liability has been acknowledged during that time by the tenant in writing to the landlord or his agent. See F. A. Enever, *History of the Law of Distress*, 1931; J. P. Eddy, *The Law of Distress*, new ed. 1939.

Distribution, see ECONOMICS.

Distribution, Census of. By the Statistics of Trade Act, 1947, the Board of Trade was authorised to take a C. of D. and other services in any prescribed year. The first of these was taken in 1951 for the year 1950 and covered 684,764 retail and related service trade estabs. and 55,701 wholesale trade estabs. in Great Britain; total persons engaged were 3,136,534 in retail and service trades and 790,266 in

wholesale trades. Pub. of results began in 1952. Policy in regard to future censuses of production and distribution was considered by the Verdon Smith Committee, whose *Report* (Cmd 9276) was pub. in 1954.

Distribution, Electric Power. A well-planned D. network should supply consumers at a voltage not exceeding or

FIG. 1

falling short of the nominal values by more than a small fraction, and a fault or short circuit in any part should not

crossings into a 'mesh network.' If a feeder substation fails, supply is ensured through the mesh. This system is now recommended for dists. with load exceeding 1 MVA per km². The above principles apply to networks in factories, hospitals, and dept stores, as well as to tns, industrial areas, and rural dists.

In d.c. systems, feeders (and some distributors) are of the 3-wire type. Assuming a supply voltage of 230 V, 2 230 V generators, D₁ and D₂, are connected in series at the power station, the voltage between the positive terminal of D₁ and the negative of D₂ being 460 V, and 3 lines, 2 'outers,' M₁ and M₂, and 1 middle, P, are run as shown (Fig. 1). If the load is divided equally between circuits M₁P and P M₂, the return current and outgoing current in P are equal and opposite and cancel out. In case the load on one circuit changes, P will only carry the out-of-balance current. If the full load is 46 kw., a 2-wire, 230-V system will require 2 cables carrying 200 A.

FIG. 2

affect supply elsewhere; reasonable protection against interruption of supply should be afforded. Standard voltage in Great Britain is 230+6 V for lighting and 400 V for power. The rational solution to the problem is to run a number of 'feeders' from the busbars of the control station to conveniently placed substations from which 'distributors' are taken for tapping by 'service lines' to consumers' premises. The feeder system may be a 'ringmain,' practically an extension of the busbars round the dist., tapped at the substations, from which the distributors radiate out. A fault in one section or substation does not interrupt supply elsewhere as each substation is fed from both sides. A modification is the double-loop system, in which 2 cables run in parallel through the circuit; each substation is connected to both cables, but one section of the main cables is left open. If a fault occurs in any section, that section is isolated and the previously open section is closed. In the radial system, separate feeders run radially from the busbars to the substations and the distributors are interconnected at all

The 3-wire system requires 2 'outers' carrying 100 A and a middle of small capacity only. The substations in a d.c. system are mainly D. boxes, the incoming feeder connected through switches to the busbars from which the distributors are taken through fuses.

In a.c. systems, the substations are transformer stations, the feeders being 3-phase lines at 3 kV, 6 kV, or 10 kV. Industrial dists., highly electrified rural areas, and large tns with sev. generating stations are supplied from a high-voltage interconnected transmission network; the D. is in sev. stages, a primary (33-10 kV) feeder system from which a secondary (6-3 kV) system is supplied, this in turn serving the D. networks. The latter are usually 3-phase 4-wire, the 4th wire (neutral) being taken from the neutral point of the star-connected transformer secondary (Fig. 2). In Great Britain phase-to-neutral voltage is 230 V, with 400 V between the phases. On the Continent the 380/220 V is common. As far as possible the load is divided evenly between the phases. The substations are provided with circuit-breakers and fuses

are inserted in the distributor network. In rural areas overhead lines on wooden poles are common, and transformers are often mounted on the poles. See **THREE-PHASE SYSTEM**; **TRANSFORMERS**; **TRANSMISSION**; **GRID SYSTEM**.

Distribution, Statutes of. Acts which settled the distribution of an intestate's real and personal estate. They are now all repealed by the Administration of Estates Act, 1925, which, *inter alia*, changed the rules of intestate succession which had become familiar from their long estab. References to any S. of D. in a deed of gift or will coming into operation after the end of 1925 will be construed as references to Part IV of the new Act, and references in such an instrument or will to statutory next-of-kin will be construed—unless the context otherwise requires—as referring to the persons who would receive benefits under the provisions of the new Act. The old rules of intestate succession are of merely historical interest to-day, though reference to them might well be necessary in tracing title to real property. For present-day rules of intestate succession see **SUCCESSION, INTESTATE**.

Distribution of Animals and Plants, see **GEOGRAPHICAL DISTRIBUTION**.

Distribution of Terms. In formal logic, by 'distribution' of a term is simply meant 'taking it universally,' or referring to all parts of it. In the 'opposition of propositions,' the universal negative *distributes* its predicate, whereas the universal affirmative and particular affirmative do not. These distinctions are important, because the validity of any argument or syllogism will usually depend on the sufficient distribution of the terms occurring in it. In 'conversion of propositions,' i.e. in the transposition of subject and predicate, no term must be distributed in the converse unless it was distributed in the convertend, e.g. the converse of 'all metals are elements' is not 'all elements are metals,' but 'some elements are metals'; but that of 'no metals are compounds' is 'no compounds are metals,' because, in this latter example, all the terms are distributed.

District Heating, see **HEATING**.

Ditchling Beacon, point on the S. Downs, 6 m. N. of Brighton, in Sussex, England. It is 813 ft high and crowned by anet earthworks. It was purchased by the Brighton Bor. Council in 1918. Nearby is Ditchling village.

Dithmarschen, or **Ditmarsh** (anet **Nordalbingia**), dist. of Germany in the *Land* of Schleswig-Holstein (q.v.). It is low-lying, partly marshy, and is situated on the W. coast between the estuary of the Elbe and the Eider. Once an autonomous peasant state, it was annexed by the Duchy of Holstein in 1559, incorporated with the Dan. Crown in 1773, and ceded to Prussia in 1866. It retained its own administrative system until 1867. The largest tn in the D. dist. to-day is Heide (q.v.).

Dithyramb (Gk *dithurambos*, god's three-step measure), a song in honour of Dionysus, having as its subject first the

life and death of that god, but afterwards a variety of topics. The D. seems to have originated in Phrygia, or at least among Thracio-Phrygian peoples, and to have entered Greece with the cult of Dionysus. It is first mentioned, by Archilochus (q.v.), as a riotous revel-song at Paros in the 7th cent. BC, and was originally accompanied by the flute (with or without dancing) to music in the Phrygian mood. As a literary composition, the D. was created by Arion (625–585 BC) at Corinth, and though at first cultivated specially in Dorian ter., it attained its full literary development in connection with the Dionysiac festival at Athens. Here it was danced or sung by a chorus of 50 men or boys grouped in a circle, perhaps about an altar. See A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy*, 1927. See **DIONYSUS**.

Ditmarsh, see **DITHMARSCHEN**.

Dittany, name given to various aromatic plants, after the Cretan mt on which flourishes the D. of Crete, *Origanum dictamnus*; D. of Amoross is *O. tournefortii*. *Cunila mariana* is D. of U.S.A., and *Dictamnus albus* is the bastard common D., also known as Burning Bush or Fraxinella.

Dittersdorf, Carl Ditters von (1739–99), Austrian composer and violinist, b. Vienna, studied under Ziegler and Bonno, and soon became one of the leading violinists of his time. He worked mainly in the employ of private patrons and wrote a score of operettas, mostly humorous, the best known of which are *Doctor und Apotheker*, 1786; *Liebe im Narrenhaus*, 1787; and *Hieronymus Knicker*, 1789; and the oratorios *Isaak*, 1767, and *Esther*, 1773. A number of his instrumental works have been repub. His *Selbstbiographie*, dictated to his son before his death, was pub. in 1801. See C. Krebs, *Dittersdorfiana*, 1900; J. Riedinger, *Karl von Ditter als Opernkomponist*, 1914.

Ditton, Humphrey (1675–1715), mathematician, b. Salisbury, England. He studied theology, and owed his election as mathematical master at Christ's Hospital to the influence of Sir Isaac Newton. Wm Whiston and he invented a method for discovering long., which was approved by Sir Isaac Newton. He wrote *Of the Tangents of Curves*; *A Treatise on Spherical Catoptrics*, which appeared in Phil. Trans.; *An Institution of Fluxions*; *Treatise on Perspective*, etc.

Ditzen, Rudolf, see **FALLADA, HANS**.

Diu, Portuguese is. at Gujerat, India. It is 7 m. long, and resembles part of the coast to which it runs parallel. The Portuguese have been in possession since 1535. Though once of some standing as a port, D. is now of little importance. The Indian Gov. is pressing for its rendition.

Diuretics, medicinal agents which stimulate an increased flow of urine. This is often desirable when from any cause the supply of urine is diminished, or when it is required to promote increased excretion to carry off morbid products circulating in the blood, or, as in dropsy, to aid in the

removal of watery collections. Ordinary water, taken in large quantities, is an effective D. Digitalis and squill act by stimulating the heart's actions and causing an increased blood pressure. Caffeine acts both as a cardiac stimulant and as a renal stimulant, and is a particularly effective diuretic. The mercurial D. (mersalyl, etc.) are the most effective and most commonly used D. in modern practice. Their effectiveness is increased by the oral administration of acid-producing D., such as ammonium chloride, at the same time. In addition to increasing water secretion, mercurial D. also increase secretion of sodium, hence the capacity of the body to retain fluids is reduced. The chief use of mersalyl is in dropsy due to heart failure. It cannot be used in acute nephritis.

Divan (Persian *derin*), word common to many Oriental languages, meaning muster-roll, counting-house, register of payments (cf. Fr. *douane*, custom-house), council, court of justice, sofa. In the sense of a 'collection of poems' Goethe used it in his 'West-östlicher Divan,' and the Persians use it to mean a collection of poems in the alphabetical order of the first letter of the various end rhymes. The Turkish D. was the great council or supreme judicial tribunal of the empire ('*Divani humayun*') at Constantinople. The word dates from the caliphate of Omar (AD 634-44). In the sense of low, cushioned seats or sofas, ranged against the walls as in E. reception-rooms, it became known in Europe in the 18th cent. D.s were especially fashionable about 1820-50. The D., being without side, head, or tail boards, is now widely used as a couch or bed.

Divanieh, see DIVANIYAH.

Diver, see DIVING.

Divergence (mathematical), see SERIES.

Divers, or *Colymbidae*, the name of a family of water-birds which forms the

eggs which hatch into down-covered chicks. The Brit. species are the inconspicuous *C. stellatus*, or red-throated D.; *C. immer*, the great N. D.; *C. adami*, the white-billed N. D.; and *C. arcticus*, the black-throated D. The birds inhabit the temperate regions of both hemispheres.

Dives, Lat. for 'the rich man,' now used as a proper name for the character in Christ's parable of the rich man and Lazarus (Luke xvi).

Dives-sur-Mer, Fr. port in the dept of Calvados, at the mouth of the R. Dives, on the Eng. Channel, 15 m. N.E. of Caen and 8 m. S.W. of Deauville. The Norman fleet assembled off the tn in Aug. 1066, in preparation for the invasion of England. It is a holiday resort, and there are metal industries. Pop. 4900.

Divide (geography), see WATERSHED.

Dividend (Lat. *dividendus*), literally a sum or quantity to be divided, especially applied in commerce to the ann. or half-yearly interest payable on public funds or the National Debt, and on some other loans and debentures. The profits of joint-stock companies, paid periodically to each stockholder or shareholder, are also called 'dividends.' They are usually fixed at a certain rate per cent. A 'cumulative dividend' is one which, if not paid in full, is made up at the following payment. D. is also the term applied to the sum of money apportioned to creditors from the realised assets of a bankrupt's estate. It may mean either the whole sum divided or the proportion or share falling to each creditor. These D.s are commonly reckoned at so much per pound of the claims (as 8s. in the £1).

Dividing Range, see AUSTRALIA.

Divi-divi, or *Caesalpinia coriaria*, species of Leguminosae which occurs in S. America and the W. Indies. The pods are of economic importance, being used in tanning.

Divination (Lat. *divinatio*), the art of obtaining the knowledge of future things by some supernatural means, or by some system outside the ordinary bounds of reason. D. was generally regarded in the classical world as the revelation of the gods. Roughly, methods of D. may be divided into 2 classes, those in which some particular objects are made use of, as in the case of astrology (q.v.), and those in which the divine will is revealed directly to the human spirit, as in the case of dreams. Perhaps astrology should rank first among these methods. It claims to tell, by the relations of the stars, the futures of states and individuals. It reached its highest stage about the 17th cent. The system of D. by dreams (*oneiromancy*) is extremely ancient, and has been practised in all parts of the world. The dreams may be interpreted either literally or by contraries. The casting of lots (*sortilege*) was common in ancient times. A somewhat similar method is that of *bibliomancy*, by which a book is opened at hazard and some 1 or 2 lines selected at random. These lines are supposed capable of interpretation so as to give advice for the future. Of this kind were the *sortes virgilianae*. In the

DIVER

order Colymbiformes. The species are all marine, with short tail-feathers and webbed feet. During the breeding period they live inland and the female lays 2

case of *haruspitation*, or the examination of entrails, the proceedings are far more elaborate, as the institution of the Rom. College of Augurs shows. The time and all the incidental circumstances must be propitious before a good result can be obtained. In the case of D. by *augury* and *omens* this is not so necessary. *Pyromancy* is a method of D. from the behaviour of fire. Somewhat similar is D. by examination of tea leaves. *Crystallomancy* makes use of concentration of the mind induced by crystal gazing. *Cheiro-mancy* or *palmistry* pretends to tell the future of an individual by the lines of his hand. D. in our culture to-day can hardly be considered of great importance, but it is used to a great extent by many primitive peoples. See, e.g., S. F. Nadel, *Nupe Religion*, 1954, for a detailed description of a Nigerian system of D.

Divine Right, the belief that kings are the direct representatives of the Deity, and as such are to receive the obedience due to God's viceroy on earth. They owe obedience to Him alone, and are relieved from all responsibilities towards their subjects. James I of England insisted on D. R. as a principle, which was carried to extremes by the supporters of his son. Charles I's claim to D. R. was the direct cause of the royalist and parl. struggles of the 17th cent. The idea did not lose its hold until after the suppression of the rebellion of 1745 in England, and till the great 1789 Revolution in France. The doctrine was supported by Sir Robert Filmer in England and in a modified degree by Bossuet in France. It was opposed by John Locke in his *Two Treatises of Government*, 1690; and by J. J. Rousseau, *Contrat Social*, 1762.

Diving. In Indian seas the art of D. has been practised from very early times. Before the introduction of mechanical aids, D. was the only means of obtaining the pearls, sponges, and corals in such oceans. When all allowances are made, however, slightly over 3 min. is the limit of time during which a naked diver can remain under water. Persons who habitually engage in D. suffer severely from the constant strain on the lungs. The attention of inventors was very early turned to the discovery of some means by which the diver could remain longer under water. The earliest invention was the D. bell, of which the principle is very simple. If an inverted jar be sunk in a vessel of water, the air contained in the jar excludes the water from the interior. Since air is compressible the water gradually rises in the jar as this is immersed; so that at a depth of 33 ft the air would be compressed into half its original bulk. The D. bells of the first makers were strong, heavy vessels, generally formed of wood girded with iron hoops. The great drawback to these early forms of D. bell was that they had to be raised to the surface at frequent intervals for fresh supplies of air. It was not until 1778 that Smeaton devised a type of bell which contained all the elements of the present appliances. In replacing the shoeing of Hexham Bridge, Smeaton contrived a bell to

which he attached a force-pump. The modern D. bell is usually of a rectangular shape, and weighs about 5 tons. The air-supply pipe, connected with a force-pump, is screwed on to the top, which is supplied with windows of thick glass; the bell is fitted with seats inside, and is worked in water up to a depth of 35 ft. The invention of the D. dress was very gradual, and many persons contributed something to it, but Siebe did more than any other to improve it. In 1829 he invented the 'open' D. dress, which consisted of a helmet and waterproof jacket. The air pumped in at the helmet was allowed to escape below the jacket. The great

A DIVER AT WORK IN A PRACTICE TANK

drawback to this dress was that it obliged the diver to remain in an upright or gently stooping posture. Siebe accordingly invented the close dress in 1857, and this type is now in general use. It consists of a waterproof costume of strong twill and india-rubber, covering the whole body except the head and hands. The helmet is made of tinned copper, and fitted with 3 strong plate-glass windows in front. The middle eyepiece is made so that it can be unscrewed. The air is supplied from a pump by means of a vulcanised india-rubber pipe which is attached to an inlet valve in the back of the helmet; the outlet valve is also fixed to the back. The escape valve is in some patterns regulated by the diver, but more commonly if an adjustable valve is desired a self-righting pattern is used. A life line is attached to the diver's waist for signalling purposes. The boots of a diver are heavily weighted, with leaden soles, and weigh about 20 lb. each; additional weights are attached to the shoulders when required. The First World War gave a strong impetus to D., as many of the ships that were sunk by submarines

contained gold and other valuables estimated in some cases to be worth millions of pounds. Where these vessels lay upon a sea-bed that was not in very deep water and in places easily located the divers were remarkably successful, sometimes recovering practically the whole of the lost treasure. The difficulties of the work were such that dependence on air from above was not desirable, and an apparatus was used that enabled the diver to purify the air by carrying oxygen, stored in bottles, which made him independent of outer supplies. Up to this time the lowest depth at which a diver was able to work was about 200 ft, and even from this

Fox Photos

THE DEEP SEA DIVING OUTFIT

depth it was necessary to ascend by slow and tedious stages if he would avoid ill effects; but recently Neufeldt and Fuhko of Kiel, Germany, invented a diving dress capable of standing the pressure of 25 atmospheres, in which divers have already worked at as great a depth as 515 ft, and for which it is claimed that their tasks can be carried on at as low a depth as 750 ft. This dress consists of an envelope of steel and aluminium.

Diving Bell, see DIVING.

Diving Rod (known also as *Virgula Divina*, *Baculus Divinatorius*, *Caduceus*, or *Mercury's Wand*, *Aaron's Rod*, etc.), a forked branch usually of hazel, willow, or rowan, or sometimes artificially made, or a Y-shaped metallic rod (iron, brass, or copper), by means of which water or minerals may be discovered beneath the earth's surface by certain persons apparently possessed of the requisite powers. The rod is grasped by its 2 prongs and, held thus in front of the holder, twists or quivers suddenly when the exact spot is reached, thrusting down towards the con-

cealed mine or spring. This belief is very old; *Agricola*, *Sperlingius*, and *Kirchmayer* all believed in the occult powers of the magic wand, but the modern use of the diving rod by 'dowsers' should not be confused with the aetad wand. Another use was to discover the authors of a crime, as used by *Jacques Aymer* in the case of murder and robbery at Lyons, 1692. The D. R. of hazel or willow was used by prospectors for metals in the Hartz Mts of Germany in the 15th cent., and the custom was adopted in the next cent. in Cornwall, where it persisted until recent times. Some diviners use a polished stone held at the end of a string like a pendulum instead of a D. R. The stone revolves quickly or slowly, clockwise or anti-clockwise, thus, it is claimed, transmitting its message to the holder. See A. Lang, *Custom and Myth*, 1884; J. Mullins, *The Diving Rod*, 1894; B. Tompkins, *Springs of Water*, 1925; T. Besterman, *Water Diving*, 1938; H. de France, *The Elements of Dowsing*, 1948.

Division, the largest formation in the army which is permanent in composition. It can be either armoured, infantry, or airborne. Commanded by a major-general, it usually consists of 3 brigades (q.v.), each of 3 battalions (q.v.). In war a D. forms part of a corps (see *BRITISH ARMY, Organisation*). An infantry D. has approximately 18,000 all ranks, while the other types are approximately 16,000 strong.

Division of Labour: 1. In economics, a phrase used by Adam Smith, and since become current, to denote the separation of the labour necessary to produce a commodity or service into distinct processes, and the assignment of each of the processes to a different worker or body of workers. D. of L. may be said historically to have begun with the specialisation of industry, or the earliest separation of different trades and employments from one another. The modern application of the term to the specialisation of processes, as distinct from specialisation of industries, is no more than an extension of the same principle. The effect of D. of L. is a more than proportional increase in production, ascribed by Adam Smith to 3 causes: (1) the increase of dexterity in every particular workman; (2) the saving of time lost by passing from one kind of work to another; and (3) the invention of many labour-saving devices or machinery by workmen becoming familiarised with their own operations; to which have been added (4) remuneration of different agents at different rates in lieu of paying for the easy and difficult labour at an equal rate, a result which would follow from all the work being done by one man; (5) the greater scope for innate aptitudes; (6) the use of specialists in work that might not be possible without D. of L.: research, risk-bearing, organisation, etc. But there are many disadvantages: (1) deadening of the faculties from their constant concentration on a single operation, involving as a corollary the inadaptability of the average workman to

any other form of work; (2) the impairment of the physique of workmen, due partly to the monotony of the work, and partly to the herding together of great numbers of operatives in large industrial centres; (3) unemployment. If D. of L. is to increase productivity and maintain high living standards, workers must be willing to exchange their products; D. of L. therefore requires laws and institutions, such as banks and courts of justice to enforce contracts, etc., to facilitate trade and exchange. If the E. countries wish to achieve the high standards of living of the W., they must embark on greater specialisation and D. of L. See also **MASS PRODUCTION**.

2. In biology, the physiological D. of L. in the organs of the same individual body, with an accompanying diversification of structure. In the protozoa, or most primitive animals, there is no D. of L., the individual being composed of one vital unit, which consequently performs all the various functions of motion, nutrition, propagation, etc. In the second cardinal division of the animal kingdom, the metazoa or multicellular animals, the lowest forms contain at least 2 sets of cells, each adapted to the performance of distinct functions, and consequently there is at least a binary D. of L. Higher in the scale the subdivision becomes even greater, until all the essential functions are performed by different organs.

Divona, see **CAHORS**.

Divonne-les-Bains, see **GEX**.

Divorce, dissolution of marriage by legal process. By Eng. law, prior to the Matrimonial Causes Act, 1857, the actual dissolution of the marriage tie, a *D. a vinculo matrimonii*, could only be obtained by Act of Parliament, and the courts could only grant a decree of judicial separation, a *mensa et thoro*, i.e. from board and bed, such as had formerly been granted by the eccles. courts. Decrees of nullity, however, could be granted. The div. of the Supreme Court of Justice known as the Probate, Admiralty, and Divorce Div. has jurisdiction in all matrimonial matters, and can grant decrees in suits for D., judicial separation, nullity, and restitution of conjugal rights.

Grounds of Petition. A petition may be presented either by the husband or the wife for (a) adultery; (b) desertion without cause for at least 3 years; (c) cruelty; (d) incurable unsoundness of mind of respondent—but respondent must have been continuously under treatment and care for at least 5 years immediately preceding the petition. A wife may petition on the ground that her husband has, since marriage, been guilty of rape, sodomy, or bestiality (save for these grounds husband and wife are on equal terms in applying for D.). A petitioner who also has committed adultery must seek the court's discretion, otherwise the petition will fail. In relation to the court's discretion in such cases the decision in *Blunt v. Blunt*, 1943, is important. It was there decided that the chief considerations to be taken into account as warranting the exercise of the

discretion in favour of a petitioner are: (i) the position and interest of any children of the marriage; (ii) the interest of any party with whom the petitioner has been guilty of misconduct, with special regard to the prospect of their future marriage; (iii) the question of reconciliation if the marriage is not dissolved; (iv) the interest of the petitioner, and in particular that the petitioner should be able to re-marry and live respectably; and (v) the interest of the community at large, to be judged by maintaining a true balance between respect for the binding sanctity of marriage and the social considerations which make it contrary to public policy to insist on the maintenance of a union which has utterly broken down. Petitioner may also sue the co-respondent for damages. There is no exact legal definition of 'desertion'; but it implies leaving of the spouse without consent (*Hard v. Ward*, 1858). Refusal to obey an order for restitution of conjugal rights is constructive desertion. 'Cruelty' includes danger to life or limb, or to health, bodily or mental. Prior to the Matrimonial Causes Act, 1937, the court was bound to satisfy itself that the petitioner had not 'connived at or condoned' the adultery, but under the above Act petitioner must satisfy the court that 'there has been no collusion, connivance, or consent'. The Act does not, however, state how the court should exercise its duty of inquiry, though it would seem that if the court is not satisfied it should, before dismissing the petition, either ask for witnesses to be called who might be able to assist, or call on the Queen's Proctor. But even if the respondent were called, he (or she) could not be compelled to answer any question tending to show that he (or she) had committed adultery, though he (or she) might choose to admit it or give evidence in denial. There is no narrow definition of 'collusion', but it exists where the originating of the petition is founded on an agreement between the parties or their agents.

A petition for *judicial separation* may be presented on any grounds on which a petition for D. might have been presented or on the ground of failure to comply with a decree for restitution of conjugal rights or on any ground on which a decree *a mensa et thoro* might have been pronounced. Where the court grants the decree it is not, since the Act of 1937, obligatory for petitioner to cohabit with respondent. The grant of the decree does not bar presentation of a petition for D. upon substantially the same facts.

Nullity. A marriage is void *ab initio* where the parties cannot or have not contracted a valid marriage—e.g. a bigamous marriage, a marriage induced by fraud, or a marriage within the prohibited degrees of affinity. Prior to the Act of 1937, non-consummation for physical or mental defect was the sole ground on which a regular marriage was voidable. New grounds of nullity since the Act of 1937 are: (i) non-consummation owing to wilful refusal of respondent; (ii) that either party, at marriage, was of unsound mind or a mental defective; (iii)

that respondent has suffered venereal disease in a communicable form; (iv) that respondent was at the time of marriage pregnant by some person other than the petitioner. Generally speaking, however, grounds ii, iii, and iv will not nullify the marriage unless the petitioner were ignorant of the facts at the time the marriage took place, and in any case proceedings must be begun within a year; nor will the court grant a decree unless it is satisfied that marital intercourse with the consent of the petitioner has not taken place since the discovery by petitioner of the existence of the grounds for a decree.

Parties may legally marry again after a decree of D. is made absolute; i.e. 3 months

(Licensing Act, 1902) habitual drunkenness. In Scotland, adultery or desertion for 4 years is a ground for divorce for either party, and a party may not marry the person with whom adultery has been committed.

In 1926 an Act was passed to make unlawful the pub. in newspapers of unwholesome details of divorce cases; and under that Act only the following details may be reported: names, addresses, and occupations of parties and witnesses; concise statements of charges; points of law; and the judge's summing up. The effect of the Act has been to stifle reports for the most part, especially as points of law are of no interest to the great majority

*The Ann. Abstract of Statistics gives no figure, since decrees of D. granted by the High Court of Justice before 1 Oct. 1939 (operation of the Matrimonial Causes Act (Northern Ireland) 1939) did not dissolve the marriage.

(formerly 6 weeks) after the decree *nisi* has been pronounced, if the Queen's Proctor has not successfully intervened on the ground of collusion, etc. The reasons why the period of 3 months was selected were twofold: (i) it is sufficiently long for the Queen's Proctor to exercise his function, but not so long as to be an undue burden on the innocent petitioner; (ii) it is the time limited for appeal to the Court of Appeal, so that it can apply in all cases defended or undefended where the time limit for appeal has expired without an appeal having been lodged. The parties may not, however, marry if a decree for judicial separation only is granted. No petition for D. may be presented during the first 3 years after marriage unless the judge allows it on the grounds of 'exceptional hardship' suffered by petitioner or 'exceptional depravity' of respondent. These 2 grounds are entirely within the court's discretion, and, in determining an application, the court must have regard to the interests of the children.

Separation orders may be made (Summary Jurisdiction Act, 1895) by courts of summary jurisdiction after conviction of the husband for aggravated assault, for desertion, persistent cruelty, neglect of maintenance, resulting in living apart, or

of newspapers. The simplification of D. procedure in recent years has in these inflationary times kept down the cost and expedited the hearing of undefended cases. The Legal Aid and Advice Act, 1949, has provided financial assistance for many petitioners who would otherwise have been unable to file petitions. The rules of court have made it possible for defended and undefended cases to be tried in certain prov. ins.

Alimony. While a D. suit is in progress, the husband is liable to provide his wife with alimony or maintenance. The amount is usually one-fifth of his income. After a D. has been pronounced, the court fixes permanent alimony. This is often at such an amount as will make up the wife's income to one-third of the joint incomes, but the court has a wide discretion in this matter. Under section 23 of the Matrimonial Causes Act, 1950, a wife may apply to the D. court for maintenance only, without petitioning for D.

So far as statistics are concerned, it is evident that the rate of D. has increased considerably in recent years. In 1880-2 the number of D.s and annulments of marriages in England, Wales, and Scotland was 366. In 1929 it had risen to

4018, being an increase of 800 on the previous year and the highest figure then on record. In 1937 the total was 5535 and the number has tended to increase steadily since then.

The comparative table gives recent figures. A large number of D.s involve childless unions, and an analysis of the figures suggests the stabilising influence of offspring. Statistics show that many divorced persons soon form other unions and that these re-marriages of the divorced occur largely in the early twenties. Consult *William Lacey, on Divorce*, 1955; and *Rayden, on Divorce*, 1953 (supp. 1955).

Divorce in the U.S.A. In the U.S.A. there is no federal law of D., nor any jurisdiction of the Federal Courts; the different states have their separate laws, and there are 48 different jurisdictions. S. Carolina provides no means of obtaining a legal D.; adultery, cruelty, or desertion are the grounds in practically all states. In 39 states imprisonment is a ground, in 38 drunkenness, in 22 neglect of maintenance. In some of the states other causes for D. are insanity, venereal disease, addiction to drugs, and impotence. Restrictions on D. are greater in the E. states and lesser in the W. states. The rate is lowest in the S. states of Louisiana, New Mexico, and Arizona, where Rom. Catholic influence is strong. Some of the states grant D. for comparatively trifling reasons, e.g. incompatibility. The prevalent opinion in Great Britain on the subject of D. in the U.S.A. is that the rate of D. to marriage is so high that Amer. family life is in serious jeopardy. This opinion, largely based on the wide circulation given by the Press to all cases concerning Amer. film 'stars,' is no doubt exaggerated; but as compared with the rate in Great Britain the Amer. rate is certainly high: assuming approximately 383,700 marriages (1954) in Great Britain (excluding N. Ireland) and 30,227 D.s, the rate per 1000 marriages is about 78; assuming 1,490,000 marriages in the U.S.A. in 1954, and 379,000 D.s, the rate per 1000 marriages is about 254. On the other hand, the rate varies considerably in the different states. In Nevada only 3 months' residence is required, and people of means go there to secure their decrees. Amer. statisticians are at pains to point out that marriages have greatly increased in the U.S.A., and that the D. rate should be based not on the total population but on persons of marriageable age, which, however, varies with individual opinion.

Diwan, see **DIVAN**.

Diwaniyah, prov. and tn of same name in central Iraq (q.v.). Pop. (prov.) 383,000; (tn) 20,000.

Dixie, Lady Florence (1857-1905), author and explorer, the daughter of the Marquis of Queensberry; b. London. In 1878-9 she explored the wastes of Patagonia, and acted as war correspondent of the *Morning Post* in the Boer war of 1880-1. It was mainly through her efforts that Cetewayo was released and sent back to Zululand. She was an

ardent advocate of women's rights. In 1875 she married Sir Beaumont D. Among her writings are: *Across Patagonia*, 1880; *In the Land of Misfortune*, 1882; and *Aniwee: the Warrior Queen*, 1890; and numerous poems.

Dixie, name popularly applied to the S. states of the U.S.A. There are various explanations of the origin of the word. The S. states were those S. of the Mason and Dixon line, and D. is supposed to be a corruption of Dixon. Another story has it that it came from the paper money printed in Louisiana before the Civil war. Owing to the number of people of Fr. extraction living in the state, the paper money had one side inscribed in Fr. 'Tendollar bills therefore had the Fr. word for ten, which is 'dix.' In popular nomenclature the bills became known as 'Dixies.' And Daniel Emmett gave D. immortal currency in his famous song 'Away down South,' which to this day is a favourite tune in the S. states.

Dixie Highway, Amer. road extending from Lakes Michigan and Huron to Florida, with a branch through Nashville, Tennessee. It is 1930 m. long in its W. and 2169 in its E. div. Dixie Overland Highway runs from Savannah, Georgia, to San Diego, California, is 2660 m. in length, and passes through Columbus, Meridian, Vicksburg, Dallas, El Paso, and Phoenix.

Dixmude (Dixmuide), Belgian tn in the prov. of W. Flanders, 15 m. S. of Ostend. Has a trade in linen, chicory, butter, and cattle. Pop. 3700. During the First World War it was in the battle line almost throughout the operations on the W. Front. Situated on the R. Yser, about midway between Ostend on the N. and Ypres on the S., its position exposed it to much bombardment and the tn was almost destroyed. A Franco-Belgian force maintained hold on the tn in 1914, after which the appropriate sluices were opened and a large flooded area kept the opponents apart. The Belgians entered the tn again in Sept. 1918.

Dixon, Henry Hall (1822-70), sporting writer, b. Cumberland. He was educ. at Rugby and Trinity College, Cambridge. Using the pen-name 'The Druid,' he began to write regularly for the *Sporting Magazine*, and pub. 3 novels in it, *The Post and the Paddock*, 1856, *Silk and Scarlet*, 1858, and *Scott and Sebright*, 1862. Other writings were: *Field and Fern*, an account of the herds and flocks of Scotland, 1865; *Saddle and Sirloln*, of those of England, 1870; and *The Law of the Farm*, a legal treatise, 1858. See F. Lawley, *Life and Times of 'The Druid.'* 1895.

Dixon, Richard Watson (1833-1900), clergyman and poet, b. London, son of a Wesleyan minister. He was educ. at King Edward's School, Birmingham, and Oxford, where he associated with members of the Pre-Raphaelite Group. Taking orders, he was vicar successively of Hayton in Cumberland and Warkworth in Northumberland. His vols. of verse include *Christ's Company*, 1861, and *Historical Odes*, 1863, but his greatest work was his *History of the Church of*

England from the Abolition of the Roman Jurisdiction, 1900. See life by his son.

Dixon, William Hepworth (1821-79), writer and traveller, b. Manchester. He began his life as a clerk in his native city. His series of papers in the *Daily News* on 'The Literature of the Lower Orders,' and 'London Prisons,' attracted attention. In 1849 he pub. *John Howard and the Prison-World of Europe*, which attained great popularity. In 1851 appeared *William Penn*, in which he refuted the charges brought by Macaulay against the eminent Quaker. A visit to the U.S.A. in 1866 was followed by *New America*, 1867, and *Spiritual Fires*, 1868.

Dixon Entrance, strait on the W. coast of N. America, situated between Queen Charlotte Is. (Brit. Columbia) and Prince of Wales Is. (Alaska). It is c. 50 m. long, and c. 50 m. wide.

Diyarbakir, cap. of the il D., Asiatic Turkey, on a high mass of basalt rock on the r. b. of the Tigris. Gold and silver filigree is made, and wool, mohair, and copper ore are exported. D. is still surrounded by black basalt walls with 4 gates. It was fortified by Constantine in the 4th cent., fell to Saladin in 1183, was conquered by Timür in 1391, and by Sultan Selim I in 1515. Three other ils were formed out of the il of D. in 1923, **Arghana**, **Mardin**, and **Severek**, leaving that of D. with a pop. of 345,257. The tn has a pop. of 63,180.

Dizful, see **DEZFUL**.

Djezzar, Ahmed (c. 1735-1804), surnamed 'the Butcher' because of his cruelty, b. Bosnia and sold as a slave to Ali Bey in Egypt. He rose to be governor of Beirut, and finally Pasha of Acre and Damascus, in which position, with the help of Sir Sidney Smith, he successfully defended Acre for a month (1799) against Napoleon.

Djibuti, or Jibuti, Fr. tn and port on the Gulf of Aden, S. of Tadjura Bay, in E. Africa, cap. of Fr. Somaliland and terminus of the railway via Diredda to Addis-Ababa in Ethiopia, of which it is the main outlet on the Indian ocean. Following the Fr.-It. armistice in 1940 a Fr.-It. commission came to D. on 2 Sept. 1940, to arrange terms between Italy and Vichy France, by which Italy secured full rights in the port of D. and along the Fr. section of the railway. The Fr. surrender of D. isolated Brit. Somaliland and thereby facilitated its capture by the Italians. Early in 1941, however, Brit. forces advanced on the railway and by summer of that year D. was under close blockade. On 28 Dec. 1942 Fr. Somaliland joined the Allies. The Ethiopian Gov. now has considerable financial interest in the railway. D. may lose much of its influence with the estab. of the port of Asab to the N. in Ethiopia.

Djidjelli, tn of Algeria in the dept of Constantine. Exports cork, wine, and sardines. Pop. 11,400.

Djinn, see **JINN** and **DEMONOLOGY**.

Dmitrieff (Dimitriev), Radko- (1859-1919), Bulgarian gen. who served with the Russian Army during the First World War. He commanded the army which

unsuccessfully besieged Przemysl during Sept.-Oct. 1914; his losses were very severe—70,000 casualties. At the Battle of Cracow (Nov. 1914) he showed great skill as a leader, and succeeded in driving back an Austro-Hungarian army. In the Battle of Dunajewo-San (q.v.) in the spring of 1915 he commanded the Third Army, and suffered another heavy reverse at Gorlice-Tarnow, where an Austro-German force made a very wide break in his line and captured over 50,000 prisoners. He tried to hold up the enemy at the Lupkow Pass, but failed, and as a consequence Brusilov's (q.v.) army was also compelled to withdraw. After the Russian revolution he was murdered by the Communists at Piatigorsk.

Dmitrievsk, or Dmitriyevsk, see **MAKE-YEVKA**.

Dmitriy Donskoy (1350-89), Grand Prince of Moscow from 1363. He is famous for his victory over the Tatars on the Don (hence his nickname) in 1380, the first Russian victory over Tatars since they conquered Russia. D. introduced firearms into the Russian Army.

Dneprodzerzhinsk (Ukrainian **Dniprodzerzhyn's'ke**, until 1936 **Kamenskoye**), tn in the Dnepropetrovsk oblast of the Ukraine, riv. port on the Dnieper W. of Dnepropetrovsk. It is a major industrial centre producing iron and steel (since the 1880's), chemicals, railway cars, and cement. It was founded as a vil. in the 18th cent., and became a tn in 1917. Pop. (1956) 163,000 (1926, 34,000, 1939, 148,000), Ukrainians and Russians.

Dneproges (Russian abbreviation of Dnieper Hydroelectric Station), the first of the big hydroelectric stations built in the U.S.S.R. Situated near Zaporozh'ye, capacity 558,000 kw. Research and design work on this project were started in 1905, the building in 1927. Sev. foreign firms acted as consultants, equipment being largely supplied by the General Electric Co. The completion of the station (1932) was hailed as one of the first successes of Socialist construction.

Dnepropetrovsk (Ukrainian **Dnipropeetrov's'ke**): 1. Oblast in SE. Ukraine, consisting largely of ravined but fertile lowland steppe traversed by the Dnieper. It has rich deposits of high-quality iron ore and of manganese. There are large metallurgical, chemical, engineering, and food industries, wheat and sunflower growing, and milk gardening. The princ. tns are D., Krivoy Rog, Dneprodzerzhinsk, Nikopol'. The first non-nomadic pop. was the Ukrainian Cossacks on the Dnieper from the 16th cent., but mass colonisation took place in the 18th cent. (see **NEW RUSSIA**). Area 12,600 sq. m.; pop. under 2,500,000, mostly Ukrainians and Russians (before the Second World War also Jews, Germans).

2. (until 1926 **Yekaterinoslav**) Cap., an economic and cultural centre of the above, on the Dnieper. It is one of the major industrial cities of the U.S.S.R., with large metallurgical, chemical, and engineering, as well as light and food, industries. It is also an important transportation centre (riv. port, 1 railway

lines, airport). There is a univ. (founded as univ. courses for women in 1916, transformed 1918) and a mining institute (founded 1899). Founded by Potemkin in 1778 sev. m. NE. of its present site, it was transferred in 1783 and made prov. cap.; until the 1870's it developed slowly as a commercial centre of a rich agric. area. After the construction in 1884 of the railway Donets Basin-Krivoy Rog, D. rapidly developed as a centre of the iron and steel industry (first plants built 1885-9); engineering and chemical industries have been developed since the 1930's. The city and its industries suffered greatly during the Second World War and Ger. occupation 1941-3. Pop. (1956) 576,000 (5th in the Ukraine and 15th in the U.S.S.R.; 1897, 113,000; 1917, 217,000; 1923, 129,000; 1926, 224,000; 1939, 501,000).

Dnestr, see DNIESTER.

Dnieper (Ukrainian **Dnipro**, Russian **Dnepr**, anct **Borysthenes**), third largest European riv. (after Volga and Danube), rising in the Valdai upland W. of Moscow and flowing W. to Orsha, S. to Kiev, S.E. to Dnepropetrovsk, S. to Zaporozh'ye, and SW. into the D. liman (estuary) of the Black Sea, E. of Odessa. Length 1430 m., drainage area 200,000 sq. m. The main tribs. are the Berezhina and Pripiet on the right, the Sozh and the Desna on the left. The D. is largely a lowland riv. with a wide valley, quiet flow, and high spring floods. It is ice-bound from Dec. to Mar.-April. The famous rapids between Dnepropetrovsk and Zaporozh'ye have been submerged by the construction of the Dneproges (q.v.). The D. traverses in the N. the forested regions of Smolensk oblast and Belorussia (see POLES'YE), with peat and phosphate deposits, flax and potato cultivation, and dairy farming; in the S. it crosses the Ukrainian wooded steppe and steppe zones with their large iron and manganese ore deposits and diverse agriculture (wheat, sugar beet, cotton). It is navigable for nearly 1300 m. (from Dorogobuzh). The main goods transported are mineral building materials and timber downstream, grain, oil products, and coal upstream. The chief ports are Kiev, Dnepropetrovsk, Zaporozh'ye, Kherson. The large hydro-electric stations of Dneproges and Kakhovka are on the D.; new ones are under construction at Dneprodzerzhinsk and Kremenchug. In the Middle Ages D. formed a part of the famous trade route from Scandinavia to Byzantium and played a great role in the hist. of Kievan Russia (q.v.); in the 16th-18th cents. the banks and is. of the middle and lower D. were colonised by Ukrainian Cossacks (see COSSACKS; SIGM). The intensive development of navigation started in 1823. The Battle for the D. in Aug.-Dec. 1943 was one of the major operations on the E. front during the Second World War. The D. is the celebrated national riv. of the Ukrainians.

Dnepropetrovsk, see DNEPROPETROVSK.
Dniester (Russian **Dnyestr**, anct **Tyras**), navigable riv. in S. Russia, rising in the Carpathians and flowing S.E. into the

Black Sea 30 m. SW. of Odessa. Length 880 m. It separates Bessarabia from Podolia (Ukraine), and in 1918-40 formed the demarcation line between the U.S.S.R. and Rumania.

Dnyestr, see DNIESTER.

Dobb's Ferry, small tn of New York, U.S.A., situated in Westchester co. The reputation of the tn rests chiefly on its historical connection with Washington, Clinton, Rochambeau, and other leaders of the War of Revolution. It is now a residential suburb of New York City, and manufs. chemical and electrical and electronic equipment. Pop. 6268.

Dobell, Sydney Thompson (1824-74), poet and critic, b. Cranbrook, Kent. In 1836 his father, a wine merchant, removed to Cheltenham, with which D. was connected for the rest of his life. The influence of his grandfather, Samuel Thompson, brought him into contact with the 'Free-thinking Christians.' In 1850 under the pseudonym 'Sydney Yendys' he pub. *The Roman*, which met with great success. *Balder* appeared in 1853; *Sonnets on the (Crimean) War*, in which he was assisted by Alexander Smith, in 1855; and *England in Time of War*, which contains his well-known poem 'Keith of Ravelston', in 1856. D. belonged to what has been called 'the spasmodic school' of poets. The undoubted charm of some of his lyrics and the value and originality of some of his thoughts are often marred by excess of metaphor and a general dreariness and nervelessness only relieved by bright 'spasmodic' flashes. See J. Nichol, *Poetical Works of Dobell*, with memoir, 1875, and the collection of his prose works under the title *Thoughts on Art, Philosophy and Religion*, selected from the *Unpublished Papers of Sydney Dobell*, by the same writer, 1876; and Emily Jolly, *Life and Letters of Sydney Dobell*, 1878.

Döbeln, Ger. tn in the dist. of Leipzig, on the Freiburger Mulde, 35 m. ESE. of Leipzig (q.v.). It was sacked by the Russians (q.v.) in 1429. It has iron foundries, and manufs. machinery, machine tools, glass, musical instruments, and leather goods. Pop. 29,000.

Doberan, Ger. tn in the dist. of Rostock, near the Baltic coast, 10 m. W. of Rostock (q.v.). It has a 14th-cent. Gothic church, a former Cistercian abbey with many art treasures, and the tombs of many Mecklenburg princes. The tn is visited as a spa. Pop. 11,000.

Döbereiner, Johann Wolfgang (1780-1849), Ger. chemist, b. Rug, near Hof, Bavaria. In 1810 he was appointed prof. of chem., pharmacy, and technology at Jena, where he made the acquaintance of Goethe. He is chiefly famous for an invention known as 'Döbereiner's Lamp,' in which he demonstrated that spongy platinum in presence of oxygen can ignite hydrogen; a process which has been used in many self-igniting coal-gas burners. He obtained the crystalline compound of alcohol with ammonia, and discovered furfural. His works include treatises on pneumatic chem., 1821-5, and the chem. of fermentation, 1822. He was one of the

first to try to group elements according to their atomic weights, thus helping to prepare the way for Mendeleeff's Periodic System. He also discovered the catalytic effect of manganese dioxide upon the decomposition of potassium chlorate by heat.

Dobree, Peter Paul (1782-1825), classical scholar and critic. At Trinity College, Cambridge, he became an intimate friend of Porson, and in 1823 was appointed regius prof. of Greek. After Porson's death D. was commissioned to edit the pub. of his notes on GK authors, and brought out the *Plutus* of Aristophanes in 1820 and all Porson's *Aristophanica*. In 1822 he pub. the *Lexicon* of Photius, and left an ed. of Demosthenes unfinished at his death.

Dobrich, see **TOLBUKHIN**.

Dobromierz, see **HOTENFUEDEBERG**.

Dobrowsky, Josef (1753-1829), founder of Slavonic philology. b. Dermet, near Raab, in Slavacchia, of Bohemian parents. In 1772 became a Jesuit and in 1786 a secular priest. From 1779 onwards D. ed. magazines on Bohemian literature. Among his works are *Scriptores Rerum Bohemicarum*, 1783-4; *Ausführliches Lehrgebäude der böhmischen Sprache*, 1809; *Entwurf zu einem allgemeinen Etymologicon der slavischen Sprachen*, 1813. With his *Institutiones Linguae Slavicae dialecti veteris*, 1822, and *Cyril und Method der Slaven Apostel*, 1823, he laid the foundations of modern study of Old Church Slavonic.

Dobruja, or **Dobrudja** (Bulgarian **Dobrudzha**, Rumanian **Dobrogea**), dist. of Rumania and Bulgaria. It is a low tract of Quaternary alluvium which stretches for a distance of 140 m. along the Black sea; it is bounded on the N. and W. by the Danube (q.v.). It rises in Sacar Bair to a height of 7765 ft, but the mean elevation of the dist. is only about 500 ft. During the First World War Rumania, after declaring war on Austria-Hungary, 27 Aug. 1916, at once advanced into Transylvania on a front of 350 m. while holding the D. with a comparatively small force. Later the Austrians, who had been taken by surprise, reinforced by Ger. troops, advanced into the D. under the Ger. field-marshal, Mackensen, on 4 Sept., and Turtucaia fell to them on 6 Sept. Ten days later Silistria was also taken and a new Russo-Rumanian defensive line was constructed between Rasova and Tuzia in the D. The Rumanians continued to lose ground in their new sector until the second week in Nov. 1916, when they retook Hirsova. But this success was not consolidated, they were overwhelmed on other fronts, and fighting in the D. generally came to a standstill. It was prematurely agreed among the govts. of the Central Empires and those of their allies that the eventual disposal of the D. should be in the hands of Germany and Bulgaria, the new understanding being that Bulgaria should regain what she asserted had been taken from her by the W. Powers after the last Balkan War; but as the ultimate victory was with the Entente, Rumania retained the ter. In

the Second World War, however, Rumania ceded the S. D. to Bulgaria by the treaty of Craiova, 7 Sept. 1940, Bulgaria gaining thereby an area of about 3000 sq. m., the chief tn. of which is Tolbukhin (q.v.). The D. was overrun by Ger. troops in Mar. 1940 and was occupied, with all Bulgaria, until 1944. The N. part of the D. fell to the Russian armies with the capture of Galati on 27 Aug. 1944. Constanta fell to them on 29 Aug. These captures, however, were from Ger. troops, for Rumania had accepted armistice terms on 23 Aug., and had joined the Allies. The peace treaty of 1947 confirmed the retention of S. D. by Bulgaria. See R. Vulpe, *La Dobroudja à travers les siècles*, 1939; B. Newman, *Balkan Background*, 1944.

Dobson, Frank (1889-), sculptor, b. London, son of Frank D. artist. He studied art from boyhood in a London sculptor's studio and later at Arbroath and the City and Guild School, Kennington. He exhibited at Venice, Dresden, Stockholm, Wembley, Paris, and New York. His best sculptures include many studies of form in single figures, nude or draped, including 'Truth' (Tate Gallery), which have placed him among the leading living sculptors, and a number of portrait busts, e.g. a bronze bust of the Earl of Oxford and Asquith, a brass head of Sir Osbert Sitwell, and his bust of Sir Thomas Lipton. Works by him are in the National Gallery of Brit. Art, Tate Gallery, and Manchester City, Glasgow, and Leeds art galleries. He was elected R.A., 1952, and was prof. at the Royal College of Art from 1946 to 1953. He has also made many pencil and water-colour drawings.

Dobson, Henry Austin (1840-1921), Eng. poet, critic, and biographer, b. Plymouth. Educ. at Beumais Grammar School and the gymnase at Strasbourg, he entered the Board of Trade in 1856, became a first grade clerk in 1874, and prin. clerk in 1884, which last position he retained until his retirement from the service 7 years later. It was, however, as a man of letters rather than as a gov. official that Austin D., as he usually subscribed himself, achieved fame. At an early age he came before the world as a poet; and he issued sev. books of verse: *Vignettes in Rhyme*, 1873; *Proverbs in Porcelain*, 1877; *Old World Idylls*, 1883; and *At the Sign of the Lyre*, 1885. His collected poems were pub. in 1897. One of the greatest authorities on the Georgian period, D. wrote mainly on that era, his prin. works being monographs on Fielding, 1883, Steel, 1886, Goldsmith, 1888, Horace Walpole, 1890, Hogarth, 1891, Richardson, 1902, Fanny Burney, 1903; *Eighteenth Century Vignettes* (3 series, 1892, 1894, 1896); and *At Prior Park and Other Papers*, 1912. His complete poetical works were ed. by A. T. A. Dobson, 1923, and a collected ed. of his essays was issued 1923-6. See life by A. T. A. Dobson, 1928.

Dobson, William (1610-46), portrait and historical painter, b. Oxford. He was apprenticed as a boy to Peake, a picture-dealer. Van Dyck befriended him, and

he became his pupil though not his imitator, succeeding him as court painter to Charles I, but developing a masculine style of his own. D. painted portraits of Charles I, the prince of Wales, Prince Rupert, and sev. courtiers. Examples of D. in the National Portrait Gallery, London, are: 'Francis Quarles,' 'Endymion Porter,' and others. There are also 3 at Hampton Court. 'The Decollation of St John' is one of his best historical works.

Dobson, William Charles Thomas (1817-1898), Eng. artist, b. Hamburg. His paintings were mainly on historical and scriptural subjects, including 'Tobias and the Angel,' 1853; 'The Charity of Dorcas,' 1854; 'The Holy Innocents,' 1858; 'The Good Shepherd'; and 'St Paul at Philippi,' 1873, in the Diploma Gallery.

Dobu, is. of Melanesia, SE. of New Guinea. The islanders are yam growers and fishermen. Residence at marriage is 1 year at the wife's home and 1 at the husband's, and so on alternately; marriage is unstable and divorce is frequent. The islanders have elaborate belief in witchcraft and sorcery. See R. F. Fortune, *The Sorcerers of Dobu*, 1932.

Docetae, or **Docetism** (Gk *doktein*, to appear), name given in the early Church to a group of heretics who believed that during His life on earth Christ had no real but only an 'apparent' or phantom body. The doctrine originated in the Gk, Oriental, and Alexandrine theory that since 'matter' is essentially impure and imperfect, the union of the divine spirit with matter was impossible. It appears in its most developed form among the Gnostics and Manichaeans, and its believers were divided into 3 groups: those who held that the body of Christ was a real, earthly body, but had no essential connection with His divine nature; those who declared that His human body was a mere phantom, a delusion (Marcion, the Ophites, and Manichaeans); and those who declared that it was an ethereal body, descended with Him from heaven (Valentinus, Basilides). The theory precludes the idea of the virgin birth and the crucifixion, or holds them to be only 'phantoms.' The docetic doctrine appears among the Priscillianists and the Bogomils, and also among a small faction of the Anabaptists. See GNOSTICISM; also Dorner's *System of Christian Doctrine*, 1880; and Harnack's *History of Dogma*, 1894-9.

Dochart, riv. and loch of Perthshire, Scotland. The riv. carries off the surplus waters of the loch, and flows in a NE. direction for 13 m., finally entering Loch Tay at Killin. The Falls of D. near Killin are famous. Salmon, pike, and trout are plentiful in the stream.

Dock, common name of many perennial tap-rooted species of *Rumex*, a genus of Polygonaceae. *R. crispus*, the curled D., *R. obtusifolius*, the broad-leaved D., *R. pulcher*, fiddle D., and *R. hydrolapathum*, the greater water-D., are all species found in Britain as weeds, and the leaves are used by children as a cure for nettle stings.

Dock, in marine and riv. engineering, a

space or structure in or upon which ships may be placed to discharge or load cargo, or to undergo repairs. There are 2 main classes of D.: the wet D., with which the tidal D. may be classed, and the dry D., with which the floating D. may be considered.

A *wet dock* is a basin in a sheltered position, where vessels may lie alongside quays, which are fitted with proper appliances for taking on or discharging cargo. It adjoins the sea coast or a tidal riv., and is closed with gates so that the water in it may be retained at a uniform level independent of the tide. Quays usually surround the D. as much as possible, as it is of importance to secure as large a quay area as possible. The disadvantage of the wet D. is that vessels are able to enter or leave it only at high tide when the water outside and inside is at the same level. This disadvantage is minimised by locks which receive the outgoing vessel at the D. level, and then, by letting water out, drop it to the outside level. The depth given to a D. depends upon the depth of the channel by which it is approached. The depth of channel available for vessels is reckoned from the high-water of the lowest neap tides. The period of time over which vessels can daily enter the D. depends upon the range of the tide. The approach channels to some of the S. Wales ports are inaccessible at low tide, for they are then nearly dry. It is in places where the range of tide is very great that the wet D. is used in preference to the tidal D. At Liverpool, England, which possesses one of the finest D. systems in the world, the difference in level is over 30 ft., while in the Thames it is some 20 ft. Where the difference is more than 12 ft. wet D.s are a necessity. The Liverpool D. system was developed greatly at the end of the 19th cent., and the D. area is now some 1100 ac. The largest D.s are the Canada (18 ac.), the Langton (18½ ac.), and the Alexandra (17½ ac.), with its branch D.s, area 44½ ac. The W. Float D., with a water area of 52 ac., is the largest on the Birkenhead side of the riv. The Port of London D.s cover an area of 4247 ac. with a water area of 722 ac., and provide 48 m. of quays. The King George V D. is connected with the Royal Albert D. and the Royal Victoria D., together forming the largest sheet of enclosed dock water in the world. The system is known as the 'Royal Docks' and affords 11 m. of berthing accommodation for shipping. The total area of these 3 D.s (including land for extension) is 1102½ ac., water area 247 ac., length of prin. entrance 800 ft., width of prin. entrance 100 ft., depth of prin. entrance 45 ft. and quaysage 12½ m. These great Thames D.s are 40 m. from the sea and only 5 m. by road from the heart of London. Other important London D.s are the London, St Katharine's, Surrey Commercial, E. India, W. India, and Millwall. The E. India D.s have a total area of 67½ ac., water area 31½ ac., length, width, and depth of prin. entrance 300 ft., 80 ft., and 31 ft. respectively, and quaysage 1½ m. The Tilbury D.s, the

first D.s in the Port of London on approaching from the sea, are 24 m. from the Thames Estuary. They consist of a main D. and 3 branch D.s. Their total area is 725 ac., water area 104½ ac., length, width, and depth of prin. entrance lock 1000 ft., 110 ft., and 45½ ft respectively, and quayage 4 m.

A *tidal dock* is a basin similar to that described above, but open to the harbour waters, so that the level of the water in the D. rises and falls with the tide. D.s of this kind are suitable where the difference between levels at high and low tide is small. This state of things prevails on the shores of the Mediterranean and the

from which the water can be pumped so as to leave the vessel's hull dry for repairs, repainting, cleaning, etc. The dry D. has access to the sea from one end only, and this end is furnished with gates, or caissons, fitted with sluices, so that the water may be drained away; but when it has access to a wet D. the water must of course be pumped out. The other end is generally shaped round in the form of a ship's bows. On the face the walls are stepped, the steps being known as 'altars.' The bottom is heavily paved, and slopes downwards from the centre so as to allow any water left in the D. to drain out. These D.s were formerly constructed of

Bristol Development Corporation

AVONMOUTH DOCKS

Atlantic coast of N. America, and as examples of such D.s we may cite those at Marseilles, Genoa, and Naples in the Mediterranean and the Atlantic D.s, Brooklyn, in the U.S.A. Wet and tidal D.s are usually constructed on low-lying land near the estuary of a riv. The D. is here somewhat sheltered, and the excavation of the basin is facilitated by the lowness of the land. The riv. acts as an approach channel, and if, as in the case of the Albert and Victoria D.s, and Chatham dockyard on the Medway, a sharp bend in the riv. is utilised, upper and lower entrances are easily provided. Other notable examples of D.s formed on low-lying land adjoining a tidal riv. are those at Liverpool, Hull, Southampton, Belfast, Antwerp, Rotterdam, Hamburg, and St Nazaire. In the Mediterranean ports, where the basins are actually in the sea, breakwaters, as at Marseilles, are built to act as shelters. Examples of sheltered D.s, constructed on low-lying land bordering the shore and with direct access to the sea, are Swansea, Hartlepool, Barrow, and Bombay.

Dry, or graving, docks are basins of particular shape, which can be closed, and

timber in America, but they are now universally constructed, as formerly in Europe, of masonry, brickwork, or concrete. The 'altars' are lined with granite blue-bricks, or specially strong concrete, and additional steps and means of access are provided for the men to ascend and descend. Along the centre line of the D. bottom are keel-blocks, upon which the ship settles as the water is pumped out. When brought into the D., which is of a length and depth sufficient to receive the largest vessels frequenting the port, it is placed carefully in position over the keel-blocks, and shored up with timber shores resting on the steps, which retain it in an upright position as it settles down. The King George V Graving D., Southampton, opened by King George V in 1935, is the largest dry D. in the world. It is 1200 ft by 135 ft. The largest London dry D., out of 33, is the Tilbury, which is 846 ft long, 70 ft wide at the entrance, and 35 ft deep. The size of the Canada D., Liverpool, is 925 ft long, 94 ft wide at entrance, and 31 ft deep at high water.

Flotting docks serve the same purpose as graving D.s. The advantages plainly are: (1) that the D. can be built in the

cheapest and best place, and then towed to its destination; (2) it can be moved from one port to another; (3) it usually costs less to work than a dry D., where the cost of pumping out the water is apt to be very great. The disadvantages are: (1) that the durability is so much less: a floating D. cannot be expected to last for more than 50 years; (2) the cost of maintenance is generally much higher; (3) it cannot be used for such large vessels as can the regular graving D. A sheltered site, with a considerable depth of water, is necessary for a floating D., which consists of a number of pontoons or watertight boxes, of which some form the bottom of the D. and others the 2 sides. The pontoons are divided into watertight compartments, and for filling or emptying these compartments there is machinery in the side boxes, usually steam-pumps. The lower boxes are at first filled with water so as to be well below sea-level. The vessel is then floated in, and carefully adjusted in position over the keel-blocks. The water is then pumped out from the watertight compartments, and the bottom of the D. rises, lifting the vessel with it. Shores are at the same time placed between the hull and the side walls to retain the vessel in position. This continues until the hull of the vessel is well out of the water. The repairs are made, the D. is sunk, and the vessel floated out. Stability is ensured by making the displacement of that part of the D. below the bridge greater than that of the upper part of the D. plus the greatest vessel it could take. Floating D.s are constructed of iron and steel, and are carefully overhauled at regular intervals. The difficulty of doing this has led to a notable improvement in form. Under the old system, the floating D. had itself to be brought into dry D. at regular intervals. Now, however, the floating D.s are made self-docking: they are constructed in 3 parts, so that if one of these requires cleaning it can be detached and dry docked on the other 2 parts as though it were itself a vessel.

Dock entrances and locks. Access to a D. may be either by entrance or by a lock. The former is used when possible. Entrances consist of 1 or more pairs of gates at the opening of the D. These are fitted with sluices, closed by vertical sluice-gates, which are worked by hydraulic pressure. In the case of a dry D. opening on to the sea, these enable the water to be drained entirely away, and in this case they are supplemented by culverts in the side walls. In the case of a wet D. they serve to bring the water in the D. down to the level of that outside. These entrances are economical, not only in money but also in space, and it is much more easy for a vessel to pass through them. The disadvantage is that they are available for a comparatively short period of time daily, unless the difference between high- and low-water levels be very small. Locks, on the other hand, form a watertight compartment *outside* the D. itself. At each end they are fitted with sluice-gates, as are the entrances. They are

constructed on the same plan as the locks on canals (q.v.) and rivers, but the scale is much greater and more elaborate. When it is required to pass a vessel out from the D. into the open channel, water is first passed through the sluices from the D. to the lock-chamber, so as to bring both to the same level. The gates between them are then opened, and the vessel passes into the lock-chamber. This pair of gates is then closed, and the other sluices are employed to bring the water in the lock-chamber down to the level of that outside. The outer gates are then opened and the vessel leaves by that entrance. The lock-chamber must be long enough to receive the largest vessels likely to need docking. The gates which close the entrances and locks are constructed either of wood or of iron, braced carefully so as to resist the pressure of the water. The leaves are constructed to meet absolutely truly in the centre, and the greatest care is also exercised to make the union of the heel-posts and side walls thoroughly watertight. Of woods, greenheart is the most suitable in salt water, best resisting the action of the teredo. D. gates are sometimes made straight and sometimes segmental. Rollers are often placed along the floor to support the outer ends of the gates in very wide locks. Sliding or floating caissons sometimes take the place of gates.

Recent Developments. The construction since 1945 of very large aircraft carriers and of large numbers of tankers more than 700 ft in length has focussed attention on the strategic and commercial importance of a sufficiency of dry D.s of commensurate size. There are 33 dry D.s in the world 1000 ft in length or more, of which 10 are in the Brit. Commonwealth (distributed to cover most of the world's main sea routes), 10 about the seaboard of the U.S.A., and 8 in Europe. The construction of such a D. is a cap. project of deterring magnitude. Only 2 in that category have been completed since the war, the Sturrock D. at Cape Town (1181 ft) and the Capt. Cook D. at Sydney (1133 ft). The Sturrock D. cost £3½ million, but a 1145-ft D. under construction at Naples is to cost £8½ million, and naval dry D.s planned for Boston, Bremerton (Washington), and Mare Is. (San Francisco) will cost £9 million each. A dry D. on the Clyde capable of accommodating the largest merchant and naval vessels has for long been projected, but the financial obstacles have hitherto been insuperable. The N.E. coast has been the scene of the most extensive developments in this country since the war, where 3 new D.s, between 675 and 710 ft in length, have been completed, and a fourth is planned. See F. N. Du Plat-Taylor, *Docks, Wharves, and Piers*, 1928, 1934, and 1949.

Dock Dues, see TONNAGE DUES.

Dock Warrants. In England, are certificates given to the owners of goods warehoused in the docks. When goods are transferred the certificates are endorsed in favour of the purchaser, and thus become a warrant for the removal of goods. Under the Factor's Act of 1889 they are a

'document of title,' and any person lawfully in possession of one, although not the owner of the goods, by endorsement and delivery of it has the absolute right to all goods described in it. Warrants may be obtained for the whole or a part of the goods consigned. All D. W. require a 3d. stamp.

Docking, operation for removal of part of the tail of an animal. The Docking and Nicking of Horses Act, 1947, makes it illegal—except on veterinary advice—to remove any part of the tail of a horse in Great Britain or to import a docked horse, save under special licence from the Ministry of Agriculture, Fisheries, and Food. Formerly it was the fashion to dock practically all horses. Hackneys were commonly nicked by cutting tendons or muscles in the tail in order to make the tail permanently erect, with a view to improving the appearance of the trotting horse. D. is still a common practice amongst certain breeds of dogs, but it is illegal to dock the tail of a puppy after its eyes are opened (i.e. a few days old), unless the animal is under the influence of an anaesthetic. Lambs on lowland grazings are regularly docked to prevent attacks of the maggot fly (q.v.).

Dockyards, **Government** (in America called **Navy Yards**), in the fullest meaning of the term are the establs. where warships are built and repaired, supplied with stores, ammunition, and men, and put in a state of complete efficiency. As a fact very few yards are so complete. In many of them there is no ship-building at all, while in many more, although the frame of the ship is built in the gov. yard, the machinery and fittings are supplied from the workshops of some engineering firm. All Brit. D. are under the Admiralty, and governed by officers under an admiral-superintendent at the larger yards, and a captain-superintendent at the smaller. All Admiralty instructions with regard to the building or commissioning of ships are directly conveyed to the superintendent, as well as to the officers more nearly concerned with the carrying out of the instructions. The chief Admiralty official is the Controller of the Navy (Third Sea Lord of the Board of Admiralty), and below him are the Directors of D.s, the Director of Stores, and the Director of Naval Construction. The chief artisans of a D. comprise the engineers, shipwrights, platers, caulkers, joiners, smiths, sail-makers, rope-makers, and a large body of labourers. The scale of pay is determined bi-annually by a special board. The great D.s of the U.K. are Portsmouth, Devonport, Chatham, and Rosyth, with smaller ones at Sheerness and Portland; of the Commonwealth, Malta, Gibraltar, Singapore, Hong Kong, Simonstown (transferred to S. Africa in 1957), Sydney (New S. Wales), Halifax (Nova Scotia), and Esquimalt (Brit. Columbia). During war the R.N. has to use many commercial ports as additional temporary bases, and Scapa Flow, owing to its suitable geographical position, was used as a base for the Home Fleet during the 2 World Wars. *See also* SINGAPORE

BASE. The prin. D. of France are at Cherbourg, Brest, Lorient, and Toulon; of U.S.A., Norfolk, San Diego, Charles-town, and Brooklyn; of Italy, Spezia, Naples, and Taranto; of Russia, Leningrad, Kronstadt, Sevastopol, Vladivostok, and Nikolaiev.

Doctor (Lat. 'teacher'), one who is skilled or learned in any branch of knowledge, or whose attainments entitle him to express an authoritative opinion. As a title or degree it is granted by univs. to those who have attained the highest qualification, and ranks above master; but the ranks vary: thus in divinity, law, music, etc. there are no masters, and the lower degree is bachelor; in other faculties such as arts there are no D.s. In the 14th cent. the degree of D. was conferred in medicine, and in common parlance a 'D.' means a physician, or, quite generally, a qualified medical practitioner, whether he has taken the degree of D. of Medicine, M.D., or not. The first univ. degree of D. was granted at Bologna in the faculty of law, in the 12th cent. The faculties in which the degree is granted are too numerous to specify, and new faculties tend to spring up with the growth of specialisation. The D. of Philosophy (D.Phil. or Ph.D.) degree is acquired by many post-graduate students in all faculties. The univs. are accustomed to grant honorary doctorates to members of other univs., and to those who have distinguished themselves in a particular branch of knowledge, or who are prominent generally, such as distinguished statesmen, military and naval officers, scientists, artists, writers, etc. Of these honorary degrees those of D.C.L., D. of Civil Law, at Oxford, and LL.D., D. of Laws, at Cambridge, are perhaps of the highest distinction.

Doctors' Commons, the name formerly given to a society of eccles. lawyers in London, forming a distinct profession for the practice of civil and canon laws, and also to the buildings erected by them, 1567, on St Bennet's Hill, St Paul's Churchyard, under Harvey, Dean of the Arches. The houses (so called from the 'community of board' of members of the college) were destroyed by the Great Fire, 1666, but restored in 1672. Advocates and 34 proctors (corresponding to attorneys and solicitors), all Oxford or Cambridge graduates duly admitted by the Archbishop of Canterbury, lived there, headed by a president (Dean of Arches for the time being). Incorporated by Royal Charter, 1768, but on estab. of the Divorce Court and Probate Court the college was dissolved and the property sold, 1857, the various courts (Courts of Arches, of Admiralty, of Delegates, Prerogative, Faculty, and Archdeacon's Court) being now open to the whole Bar. The buildings were demolished in 1867, but the old name still survives. In 1874 the D. C. Will Office was removed to Somerset House.

Doctrinaire, theorist who pays no regard to practical considerations, generally a political ideologist. The term is of Fr. origin, and was bestowed upon a group of politicians at the time of the Restoration

(1815-30), who desired a constitution in France modelled according to historical principles and the monarchical system in England, and were opposed to absolutism as much as to revolutionary principles. The leaders were Royer-Collard, Guizot, and the Duc de Broglie.

Dodd, Francis (1874-1949), artist, b. Holyhead. Received his artistic training at the Glasgow School of Art and in Paris and Italy. A.R.A., 1927; R.A., 1935. A trustee of the National Gallery of Brit. Art (1928-35). As an official war artist he painted a series of portraits, 'Generals of the British Army,' during the First World War. His 'Interrogation of a German Prisoner' is in the Imperial War Museum. He is represented in the Tate Gallery by 'A Smiling Woman,' bought by the Chantry Bequest in 1924, and other works. He also executed a number of water-colours portraying some of the older London suburbs—Blackheath, Brixton, and Dulwich.

Dodd, William (1729-77), Eng. forger and man of letters, educ. at Clare College, Cambridge. He took holy orders in 1751. He soon became a popular preacher, and attracted large congregations to the Magdalen House, of which he was chaplain from its inauguration in 1758. In 1763 he was appointed chaplain to the king, and soon after became tutor to Philip Stanhope, godson and heir to Lord Chesterfield. He became a noted person in society, but, living beyond his means, got into such straits that in 1777 he forged a bond for £1200 in the name of Lord Chesterfield. The forgery was discovered, and D. was sent for trial, condemned to death, and subsequently hanged, in spite of the efforts of Samuel Johnson and others on his behalf. Of D.'s many books, the best known is the vol. of selections entitled *The Beauties of Shakespeare*, 1752, reprinted many times. Besides some contemporary anonymous memoirs, there is a biography by P. Fitzgerald, *A Famous Forgery, being the story of the Unfortunate Dr. Dodd*, 1865.

Dodd Mead, Amer. firm of book publishers, founded in 1839 in New York City, its earliest pubs. being of a religious nature. Over the last century the company has expanded rapidly, acquiring many pub. rights, including those of the original John Lane Company, acquired in 1922. The direction of the firm is still largely in the hands of the D. family.

Dodder, name applied to sev. Brit. species of *Cuscuta*, a parasitic genus of Convolvulaceae. The plants twine round the branches of woody or other plants, strike minute suckers in their bark and thus obtain their necessary sustenance. *C. europaea*, the greater D., attacks heath, furze, nettles, hops, and other plants. *C. epitimum* is the flax D., *C. trifolii* attacks clover, and *C. epithymum*, the common D., takes as host sev. low-growing plants.

Doddridge, Philip (1702-51), Eng. dissenting minister and writer. In 1729 D. opened at Northampton an academy for educating Nonconformist ministers. He formed a society for distributing Bibles

to the poor, and paved the way for foreign missions among Nonconformists. His chief works are: *The Family Expositor*, 1739-56; *Of the Evidences of Christianity*, 1743; *Rise and Progress of Religion in the Soul*, 1745; *Course of Lectures* (pub. by Clarke), 1763; and hymns. See J. D. Humphreys (ed.), *Correspondence and Diary of P. Doddridge*, 1829-31.

Dodds, Sir Edward Charles (1899-), physician and biochemist, b. Darlington. He received his medical education at the Middlesex Hospital, London, and graduated M.D. in 1926. He is a fellow of the Royal Society (1942) and of the Royal College of Physicians (1933), of which latter he has also been Harveian Librarian since 1949. Since 1925 he has been Courtauld prof. of Biochemistry and director of the Courtauld Institute at Middlesex Hospital. He is the recipient of many high awards in the medical field, and a distinguished lecturer. With his colleagues he synthesised stilboestrol (1938) and other sex hormones, of great value in treatment of endocrine disorders and in cancer of the prostate. He was knighted in 1954.

Dodecahedron, see POLYHEDRON.

Dodecanese Islands, the name, which means '12 islands,' now given to those is. of the S.E. Aegean which were seized by Italy from the Turks in 1912 and were ceded to Greece after the Second World War. They are also known as the S. Sporades. In the Middle Ages the term D. was applied to a group in the Cyclades Is. (q.v.). After the Turkish conquest of the archipelago it was used for certain is., of which Cos was the chief, which had special privileges. The Italians extended it to include all the Aegean Is. under their rule. The chief is. of the D. are Rhodes, Cos, Astypalaea, Calymnos, Carpathos, Casos, Castellorizo, Leros, Nisyros, Patmos, Symi, and Telos. Except for small communities of Turks and Sp.-speaking Jews in Rhodes and Cos the inhab. are Greeks. There are few minerals. The chief occupations are agriculture and fishing; sponge fishing is important. The chief crops are cereals, olives, vines, oranges, figs, potatoes, tomatoes, and tobacco. The chief animals are sheep and goats. There is much small coastal shipping. Roads are few and land transport is mostly by pack animals. There is an airport on Rhodes. The D. were colonised from the Gk mainland in the 11th cent. BC. Rhodes became the dominant is. and in Hellenistic times was a prosperous state and naval power. In 1310 the Knights of St John occupied Rhodes and they held most of the D. till the Turks took Rhodes in 1522. Under the Turks the D. had considerable freedom. They were seized by Italy in 1912 and ceded by Turkey at the Treaty of Lausanne (1923). Italy spent much money in the D.; Rhodes was developed as a tourist resort. Leros as a naval base, and antiquities were carefully preserved, but the people had no political rights and efforts were made to impose It. culture. It. bases were bombarded by the Brit. in 1939. In 1943, after Italy's surrender,

the Brit. landed on Cos and Leros but were expelled by the Germans. The D. were formally incorporated in Greece in Mar. 1948, and now constitute an administrative dept. Area 1022 sq. m.; pop. 121,500. *See also* ARGÆAN SEA AND ISLANDS and ITALIAN FRONT in SECOND WORLD WAR.

Dodecatheon, genus of plants of the Primulaceae. They are hardy perennials, and easily cultivated in gardens with well-drained soil. The flowers, which somewhat resemble cyclamen, are variously coloured. *D. integrifolium* has clusters of handsome, rosy-crimson flowers. *D. jeffreyi* is reddish purple. *D. meadia* is pale lilac. Various hybrids derived from crossing *D. meadia* with other species are popularly grown; of these *D. m. lanceifolium* has large leaves and red flowers with yellow markings. Amer. cowslip is the popular name for the genus.

Dodge, Mary Elizabeth Mapes (1838-1905), Amer. authoress, b. New York. For some years she assisted Harriet Beecher Stowe and Donald G. Mitchell in editing *Heath and Home*. In 1873 she was appointed editress of *St Nicholas*. Besides numerous contributions to periodicals she wrote *Irrington Stories*, 1864; *Hans Brinker, or the Silver Skates*, 1865; *Rhymes and Jingles*, 1874; *Theophilus and Others*, 1876; *When Life was Young*, 1894; and the vols. of poems *Along the Way*, 1879, and *Poems and Verses*, 1904.

Dodgson, Charles Lutwidge, *see* CARROLL, LEWIS.

Doddington, George Bubb, 1st Baron Melcombe (1691-1762), son of Jeremiah Bubb, an Irish apothecary. In 1720 he took the name of D. on inheriting an estate from his uncle. In 1715 he was elected to Parliament, and was member for Bridgwater (1722-54). He was constantly changing sides, serving in succession Walpole, the prince of Wales, the duke of Argyll, and the prince again. He was a patron of Young and Thomson, and wrote some poems himself, but he is only remembered for his posthumous *Diary* (ed. by H. P. Wyndham, 1784), which reveals the intrigues of his time and his own egotism. He was created Baron Melcombe in 1761.

Dodman, The, lofty headland of S. Cornwall, England, 8 m. S. of St Austell. It is now the property of the National Trust.

Dodo, a large extinct flightless bird, belonging to the order Columbiformes in the family Raphidae, which formerly inhabited Mauritius. It was exterminated by early settlers around 1681, and its remains occur in peat-bogs on the is. The bird was as large as a turkey, of unwieldy build, with short curly tail-feathers and rudimentary wings; the bill was blackish in colour, forming at the end a horny hook, and the abortive keel also indicated its flightless condition. *Raphus cucullatus* was the species in Mauritius; *Raphus solitarius* in Réunion.

Dodona, ancient in Epirus; seat of the earliest Gk oracle, which was dedicated to Zeus and administered by priestesses known as *peleiai* (doves). The god was

believed to speak generally through the sound of wind in an old oak tree, but sometimes through the cooing of doves in its branches, or through the clanging of bronze vessels hung round the tree or temple. This temple of Zeus Naios was destroyed by the Aetolians in 220 BC, but the oracle lasted into Rom. imperial times. Extensive excavations have been made at D., which was also, in the 5th and 6th cents. AD, the seat of a Christian bishopric.

DODO

Dods, Marcus (1834-1909), theological scholar. In 1889 he was appointed prof. of N.T. Exegesis in New College, Edinburgh, of which he became principal in 1907. Among his most important writings are: *Israel's Iron Age*, 1874; *Mohammed, Buddha, and Christ*, 1877; *On Genesis*, 1882; *The Gospel according to St John*, in the Expositors' Gk Testament, 1897; *The Bible, its Origin and Nature*, 1904.

Dodsley, Robert (1703-64), author and bookseller, was in early life in domestic service as a footman. While so engaged, he wrote occasional verses and received encouragement from his employer, the Hon. Mrs Lowther, and later the active patronage of Defoe. He pub. *Scrittude*, 1729, later reissued as *The Footman's Friendly Advice to his Brethren of the Livery*, 1731; *A Muse in Livery*, 1732; and other vols.; and in 1735 his dramatic satire, *The Toy-Shop*, was staged by Rich at Covent Garden Theatre. In the same year D., with capital supplied by Pope and others interested in him, set up as a bookseller at the sign of Talby's Head in Pall Mall. He continued throughout his life to write books and plays, but it is as a bookseller he is now best remembered. His first important venture as a publisher was in 1737 when he issued Pope's *First Epistle of the Second Book of Horace imitated*. In the following year he brought out Dr Johnson's *London*. In 1759, joined by his younger brother James in the business, he pub. Goldsmith's *Polite Learning*, and in the same year he retired into private life, with an ample competence and a host of friends. It was

James D. who, after having refused a first version of *Tristram Shandy*, brought out Sterne's masterpiece, purchasing the copyright of the first 2 vols. for £250, and of the 3rd and 4th vols. for £380. D.'s chief claim to fame now rests on his *Select Collection of Old Plays*, 12 vols., 1744. He was also co-founder of the *Annual Register*, 1758. See R. Straus, *Robert Doddsley, Poet, Publisher and Playwright*, 1910.

Dodsworth, Roger (1585-1654), antiquary. He collected materials for a hist. of Yorks and an Eng. baronage and pub. in collaboration with Sir Wm Dugdale a *Monasticon Anglicanum*, 1655.

Dodwell, Henry (1642-1711), theologian and chronologist. In 1688 he was elected Camden prof. of hist. at Oxford, but was deprived of his post on refusing to take the oath of allegiance to William and Mary in 1691. His theological works are of far less value than those on classical chronology.

Doe, John, and Roe, Richard, see FICTION, LEGAL.

Doenyo Egere, see KENYA, MOUNT.

Dog, term designating a quadruped of the domesticated variety, *Canis*, which may be extended to include wild D.s, jackals, foxes, wolves, etc.

Origin. Darwin believed the D. to be descended from 2 species of wolves, *Canis lupus* and *Canis latrans*, as well as from certain European, Indian, and African canine species, and from the jackal. The arguments in favour of the wolf origin are that the D. and wolf will interbreed with each other, and that the progeny thus obtained will again breed with either the D. or the wolf, whereas most hybrids are not fertile. On the other hand the domesticated D. is in one feature very different from the wild Canidae. The pupil of its eye is round, whereas in the wolf the pupil is placed obliquely, and in the fox and jackal perpendicularly.

Chief Characteristics. The dog is digitigrade, assisped, with slender legs, the fore feet having 5 toes, the hind feet 4, with non-retractile claws. The head is small, the muzzle pointed, but the shape of the head differs greatly in various species. The neck is short and thick-set. The teeth usually consist of 6 incisors, 2 canines, and 8 premolars in all, but the numbers vary. The upper jaw has 4 molars and the lower has 6. The vertebrae of the tail vary in number, and some species have no tails. The tongue is smooth. The mammae are sometimes 4, sometimes 5, on each side. The period of gestation is 63 days. There are 4 to 8, occasionally as many as 20, pups in a litter. The young are born blind and remain so for about 10 days. The average life of a D. is from 10 to 14 years, though some live to be 20. The D. has a very acute sense of smell, and can readily be trained, for it has a good intelligence. By nature it is carnivorous, and in a wild state D.s will combine to hunt out prey. A D. will feed on birds or fresh meat; in cold countries it eats fish, and some kinds of D. will also eat crabs, reptiles,

and insects. The Pariah D. of India feeds on carrion and offal, whereas the Chowchow of China is a strict vegetarian. See V. W. F. Collier, *Dogs of China and Japan*, 1921.

History. The D. was, apparently, the companion of man from the very earliest time. Canine remains have been found in the Dan. kitchen-middens of the Neolithic period side by side with human remains. The Egyptians held D.s in the greatest affection, almost veneration. The friezes of their temples were carved with figures of D.s, and many very early Egyptian monuments (dating from about 3000 BC) are decorated in like manner. The Jews, as we can see from the O.T. and N.T., regarded D.s with the utmost contempt, as unclean beasts. This feeling was perhaps the natural outcome of seeing the worship bestowed upon them by the neighbouring tribes of Egyptians and Syrians. Assyrian sculptures represent 2 forms, a greyhound and a mastiff, whereas the Egyptian represent a wolf-dog, greyhound, turnspit, and a kind of terrier. The Egyptians worshipped Sirius, a star, which they called 'Dog Star,' because of its faithfulness in appearing at a certain season to warn them of the approaching overflow of the Nile. The Ethiopians went still further, and elected a D. to be their king, whose growlings or fawnings they received as directions of govt. The Greeks used D.s in battle as well as in the chase. 'D.s of war' had spiked collars, and proved very valiant and dangerous fighters. Oppian, in his *Cynegética*, is the earliest authority who mentions the use of D.s for hunting. The Greeks had formerly used nets to ensnare animals, but later pursued their prey with D.s. The Romans divided D.s into 3 classifications: (1) *Canes venatici*, or hunting-D.s; (2) *Canes pastores*, or sheep-D.s; (3) *Canes villatici*, or watch-D.s. The hunting-D.s were further divided into *pugnaces*, who attacked the quarry, *nare sagaces*, who tracked it out, and *pedibus celeres*, who overtook it. Early Britain was renowned for its bloodhounds, which, according to Strabo, played an important part in the Gallic wars. During the Middle Ages D.s were used in England chiefly in sport. King John had a pack of other hounds. Bull-D.s, then called Butchers' Hounds, were used for catching cattle, and in the popular sport of bull-baiting. Juliana Berners (15th cent.) made out the following list of domestic D.s: 'A Grehoun, a Bastard, a Menkrol, a Mastif, a Lemor, a Spanyel, Raches, Kenettys, Teroures, Butchers' Hounds, Dunghyll Dogges, Tryndelatydes, Pryckeryd Currys, and small Ladyes' Poppes.' D.s have played a useful part in exploration, from the time of Columbus's discovery of America (1492) down to the Arctic expeditions of recent years. Among the most famous D.s in hist. are the bloodhounds who attacked Wm Wallace of Scotland when fleeing from the Eng.; the mastiffs of the Knights of Rhodes, who could smell out a heathen Turk in whatever disguise; and the D. who woke up William the Silent on the eve

of the attack at Mons to warn him of approaching danger.

Dogs in Literature. D.s are present in the mythology and folklore of the earliest peoples. In this connection should be mentioned Fingal's favoured companions, Bran and Luath; Cavall, 'King Arthur's hound of deepest mouth,' and Hodain, of the Tristram and Iseult story. In Gk mythology we have Argus in the *Odyssey*, Ulysses' faithful D., who recognised his master after an absence of 20 years. Such another D. was Maera, who, by his prolonged howling, directed Erigone to the spot where her father, Icarus, had been murdered. Maera was placed among the stars by Zeus, where he was known as Procyon ('little dog') or *Icarus Canis*. Another faithful D. in story is the Dog of the Seven Sleepers, who accompanied his masters to the cave in which they were confined, and stood on guard by their side for 300 years, without moving, eating, drinking, or sleeping. Mohammed admitted him into paradise under the name of Katmir. In folklore D.s have often been credited with mysterious knowledge of spiritual things, and have sometimes been uncanny friends of such magicians as Cornelius Agrippa. It was a rabbinical superstition that D.s howl at death. They were, too, depicted as terrible monsters, such as the snarling, many-headed Cerberus, who guarded the entrance to Hades on the farther side of the Styx. Among the D.s noted in Eng. literature are Pope's Bounce, Byron's Boatswain, Scott's Maida, Dandie Dinmont in *Guy Mannering*, Mrs Browning's Flush, John Brown's *Rob and his Friends*, and Gelert, the dog of Llewellyn. See *The Dog in History and Folklore*, in J. J. King's *Sketches and Studies, Descriptive and Historical*, 1874.

Uses of Dogs. The earliest races made a friend and companion of the D. No other animal shows such affection and gives such faithful service. D.s have been and are used in the hunt, for coursing and retrieving game. They are also valuable for collecting sheep and keeping the flock together, and are useful guards and watchers to keep off thieves. In the Arctic regions D.s drag sleighs and other vehicles across the snow. They have frequently saved people from drowning, and from suffocation in snowdrifts. Barry, the famous St Bernard, saved 40 lives. D.s are also employed as messengers, and for tracking criminals, for scouting, for ambulance work, and leading blind persons.

Classification. The various breeds of D. have increased greatly since the early part of the 19th cent., owing to careful breeding—by crossing, selecting, and interbreeding new varieties can be 'manufactured.' Many classifications have been made of D.s, though there is no generally accepted one. Cuvier recognised 3 main divs.—Mâtins, Spaniels, and Housedogs. Youatt enlarged this arrangement as follows: (1) those with more or less elongated heads, with parietal bones widest at the base of the skull, gradually approaching each other

as they ascend, and with the condyles of the lower jaw on a line with the upper molar teeth, e.g. the Irish Wolfhound, Greyhound, etc.; (2) those with heads moderately elongated, and with the parietals diverging as they ascend, thus enlarging the cerebral cavity, e.g. the St Bernard, Newfoundland, Sheep-D., Spaniel, Setter, etc.; (3) those with more or less shortened muzzles, large frontal sinuses, and elevated and diminished cranium, e.g. the Terrier, Bull-D., and many toy D.s. Fitzinger divided D.s into 180 different classes. A very practical classification is that of Rawdon B. Lee (in *Modern Dogs*, 1897), into sporting and non-sporting D.s. These 2 great divs. have been defined by F. C. S. Pearce in the *Kennel Club Stud Book*, 1874, and were defined in further detail by that club in 1900, so that there might be no misunderstanding on the part of intending exhibitors. Gun-D.s and terriers are included in the classification of sporting breeds, and toys under non-sporting.

Breeds of Dog. The Kennel Club has registered 92 different varieties of D. But, with the free interbreeding of various types, many intermediate species occur, which account for the 185 types differentiated by naturalists. Numerous foreign D.s have been imported into the U.K.: the Dachshund, the Schweisshund, and a breed of Mastiff from Germany; the Chesapeake Bay D. and the Boston Terrier from America; the Chow from China; the Japanese Spaniel from Japan; the Poodle from France; and many others. These and Brit. D.s are dealt with in separate articles.

Wild Dogs. Among the wild D.s may be included the Wolf (*Canis lupus*), the Fox (genus *Vulpes*), and the Jackal (*Canis anthus*, *Canis aureus*, etc.), which are considered in special articles. Other wild D.s may be divided into 4 groups, African, Amer., Asiatic, and Australian.

1. *African wild dogs.* Two types of wild D. occur in S. Africa. The Hyæna D. (*Canis* or *Lycan pictus*), or Cape Hunting-D., is about the size of a wolf, and varies in colour, generally having large, irregular patches of black, yellow, and white. It is found in the region of the Cape and through the E. belt of Africa as far as Kordofan. It runs in packs, and is semi-nocturnal, semi-diurnal. It is very swift-footed, and has 3 different and most curious cries. The Long-eared Cape D. or Fox (*Otocyon* or *Megalogotis lalandii*) stands about as high as a fox, and has a bushy tail about 2 ft long. Its ears are very large and quite out of proportion to its head; they are held very erect. It has 6 more teeth than the average D.

2. *American wild dogs* include the Canisiss, or Crab-eating D. (*Cerdocyon thous*), found in a region of S. America extending from Orinoco to La Plata; the Bush D. (*Speothos venaticus*), found in Brazil and Brit. Guiana: it is short-limbed, and varies in colour from red round the head and shoulders to black in its hind-quarters; *Pseudalopex gymnocercus* is found in the region of the Andes: it is a solitary animal, which comes out at night

to seek its prey; in colour yellowish, or reddish-brown verging to black.

3. *Asiatic wild dogs*. The Pariah D. is very common in the E. where it moves about in bands, acting as scavenger and feeding on offal. The Dhole, also called Kolsun, and Bhuasuh (*Cuon javanicus*), is found in various parts of India. It is rather larger than the Jackal, and has a full, rather long tail. It hunts in packs of about 50, and is absolutely fearless in attack. Its habits are nocturnal, and it has a very keen scent. In general the Dhole is untamable, though it has sometimes been employed for coursing and pig-sticking. The Raccoon D. (*Canis procyonoides*) occurs in N. China and Japan. It is so called (first by St G. Mivart) because of its resemblance to the raccoon. It has a pointed muzzle, a short and bushy tail, and short, round ears. Its body is arched and its legs stumpy. Its coat becomes thicker and longer in winter, and in colour is yellowish and brown.

4. *Australian wild dog*, or *Dingo* (q.v.). *Canis dingo*, is the only higher mammal (excluding man), native to that country.

Wild D.s can be and often have been tamed. In their natural state they hold ears and tail erect and do not bark. When tamed they will fawn, crouch, wag their tails, and lavish affection upon the master in the manner of an ordinary domesticated D.

Diseases of Dogs. *Distemper* is an infectious catarth of the mucous membranes of the eyes and nose. It generally occurs in D.s between the ages of 1 and 2 years, but may attack a D. at any age. The first signs are feverishness, loss of appetite, and depression. Complications may ensue and the skin is sometimes attacked. Nourishing food, such as gruel, milk, beef-tea, eggs, minced meat, etc., and careful nursing in a warm room are essential. The eyes should be frequently bathed in a solution of boracic acid, creolin, and water. *Rabies* (hydrophobia) is contagious and may be transmitted by means of a bite. The disease has often been prevented from spreading by muzzling every D. within a certain area, and is fortunately unknown in the U.K. The symptoms, however, are set forth on the reverse of every licence form issued. *Mange* may be common (or sarcoptic) or follicular. The former, which is parasitic in origin, is very contagious and spreads rapidly, the affected areas giving off an offensive odour. It is treated by the application of sulphur ointment to the bare patches, the remainder of the coat being dusted with flowers of sulphur. Follicular mange does not spread so rapidly, the parasite burrowing under the skin. The D. is irritable and restless but does not scratch. It is treated by washing with sulphur soap, but in severe cases it may be necessary to shave the animal to expedite the cure. *Scema*, also known as surfelt, or blotch, is a non-contagious skin eruption usually caused by irregular feeding and unwise over-feeding, unclean conditions, or lack of exercise. The best treatment is a change to a rational diet, scrupulous

cleanliness, and plenty of fresh air and exercise. Medicine must frequently be given internally, and the affected parts should be dressed. In all cases of serious canine illnesses a veterinary surgeon should be consulted.

Law as to Dogs. In the U.K. no person may keep a D. over 6 months old without a licence. The licence is obtainable at any post office, costing 7s. 6d., and must be renewed annually. D.s used solely for tending sheep and cattle, and for leading the blind, may be kept without a licence, certificates of exemption being obtainable from the commissioners of Inland Revenue. Anyone found keeping a dog not under these heads of exemption without a licence is liable to a penalty of £5. If a D. bites or attacks a person, on its second offence the owner is liable to an action for damages. The court may decide that such a D. should be destroyed. Dog-stealing, setting traps for D.s, injuring or killing D.s, etc., are offences punishable under criminal law statutes. Stray D.s, if not taken into homes for the purpose, may be adopted or sold, or destroyed by members of the police force. Accidental killing of a D. on the roads must be reported to the police. See F. Lupton, *The Law Relating to Dogs*, 1888.

Glossary of Technical Terms. *Apple head*, a head rounded on top; *blaze*, a white mark or streak on the head; *blue*, applied to shades of grey; *brisket*, the front of the chest; *brush*, the tail—usually applied to collies or sheep-D.s; *butterfly nose*, a spotted nose; *button ear*, where the tips of the ears fall over, covering the orifice; *cat foot*, a rounded, high-knuckled foot; *chops*, the pendulous underlip of a bull-D.; *cloddy*, stoutly built; *cobby*, compactly built; *couplings*, the part of the body between the shoulder blades and the hip joints; *cow hocks*, hocks that turn in; *dew claw*, extra claw; *develap*, loose hanging skin under the throat; *dish-faced*, when the nose is turned up and higher than the muzzle at the stop; *dudley nose*, a yellowish nose; *feather*, the hair on the legs and tail; *flag*, the tail, usually of a setter; *flews*, the hanging lips of a bloodhound and of some other breeds; *forearm*, the part of the foreleg that extends from elbow to pastern; *frill*, long hair on the chest; *hare foot*, a long narrow foot, carried forward; *haw*, the red inside eyelid, showing in St Bernards and bloodhounds; *hucklebone*, the tops of the hip joints; *leather*, the skin of the ear; *occiput*, the bony lump at the back of the head; *overshot*, the upper teeth projecting beyond the lower; *pastern*, the part of the leg below the knee; *pig eye*, small, sunken eye; *pig jaw*, an exaggeration of overshot; *pity*, applied to a soft, woolly coat; *rouch back*, an arched back; *rose ear*, where the tips turn back, showing the interior of the ear; *septum*, the div. between the nostrils; *snipy*, with a too pointed muzzle; *stifes*, the top joints of the hind legs; *stop*, the indentation below the eyes; *tulip ear*, an erect ear; *undershot*, the lower teeth projecting beyond the upper.

Dog Shows and Clubs. The first club in England was formed by Lord Orford in 1776, at Marham Smeeth, near Swaffham. Though coursing meetings have been held since the time of Charles I, the first actual show took place in 1859 at Newcastle-on-Tyne, under the patronage of Mr Pape and Mr Shorthose. Sixty D.s were exhibited, and the show was so popular that others were held in the same year at Birmingham and Edinburgh. Now that D.-breeding has become a lucrative business as many as 500 shows have been held in the U.K. in one year. The Kennel Club was founded in 1873 by S. E. Shirley, who held the position of president till his death in 1904. This club has had an enormous influence in improving the condition of various breeds, and in promoting the welfare of D.s in general. It has been instrumental in putting a stop to cropping of ears (1889), to mutilating the membrane of the mouth, and in some cases to docking the tail. It controls the different shows, and practically rules the canine world. It defines the recognised breeds, and maintains a breed register. Its own show was held in Oct. at the Crystal Palace until that place was burned down in 1936, while another famous D. show—Cruft's—is held annually at the Agricultural Hall, London. Other well-known clubs are the Ladies' Kennel Association and the Westminster Kennel Club. Most breeds of D. have their own particular club, such as the London Bulldog Society, the Dandie Dinmont Terrier Club, the Gamekeepers' Association of the United Kingdom, the Pomeranian Club, etc. The chief foreign and colonial clubs are La Société Centrale (Paris), the Italian Kennel Club, the American Kennel Club, and the South African Kennel Club. A D. is valued by its points, so many marks being assigned to each. For example, a bloodhound is valued thus: head, 20; ears and eyes, 15; legs and feet, 15; back and ribs, 10; chest and shoulders, 10; colour and coat, 7½; symmetry, 7½; flews, 5; neck, 5; stern, 5; total, 100. D.s vary considerably in price, as much as £1500 having been paid for a collie, and 1000 guineas for a bulldog. A fox terrier has more than once fetched 500 guineas, and a pointer 200. Ladies' toy D.s may be of great value, and have been sold for their weight in gold.

Books on Dogs. GENERAL AND HISTORICAL: J. J. King, *Sketches and Studies, Descriptive and Historical*, 1874; R. B. Lee, *Modern Dogs*, 1897; H. Compton, *The Twentieth Century Dog*, 1904; A. J. Dawson, *Everybody's Dog Book*, 1922; W. H. Miller, *The American Hunting Dog*, 1926; E. F. English, *The Dog Owner's Guide*, 1933, 1938; C. G. Trew, *The Story of the Dog and his Uses to Mankind*, 1940; C. L. B. Hubbard, *The Observer's Book of Dogs*, 1945, and *Working Dogs of the World*, 1947; B. Vesey Fitzgerald (ed.), *The Book of the Dog*, 1948. BREEDING: E. Mayhew, A. J. Sewell, and F. W. Cousins, *Dogs and their Management*, 1910, 1934; R. Leighton, *The Complete Book of the Dog*, 1922, 1927; O. E. M. Hollyer, *Dog-Keeping and Breeding*, 1926.

H. Clark, *First Aid to Dogs and Cats*, 1941. **Journals.** Weekly, *The Field*, 1853; *Our Dogs*, 1895; and *The Dog World*, 1919. Monthly, *The Kennel Gazette*, 1880, and *Dogs*, 1946.

Dog-days (*Dies Caniculares*), the hottest period of the year in the N. hemisphere, generally reckoned now from 3 July to 11 Aug. Various dates, from 3 July to 15 Aug., were assigned for the first of the D. by the Greeks and Romans, and various periods of duration from 20 to 54 days. They were generally associated with the influence of Sirius, the 'dog-star,' and according to Pliny began with its heliacal rising on 19 July (New Style). They were regarded by the ancients as the most unhealthy period of the year, and as being the direct cause of madness among dogs.

Dog-fish, name given to any member of the Scyliorhinidae, a family of elasmobranch fishes. The species are marine, living all over the world in warm seas, and many fossil forms are found in the Jurassic and Cretaceous. There are 2 small spineless dorsal fins, a distinct spiracle, no nictitating membrane; the mouth is inferior and the teeth are small. The females are oviparous and the egg cases are 4-sided and large; in habit the fishes are predaceous. *Scyliorhinus caniculus* and *Sc. maculatus*, the small-spotted and large-spotted D., are Brit. species of small size.

Dog Licence, see Dog, *Law as to Dogs*.

Dog-watch, nautical term. The first D. is from 4 p.m. to 6 p.m., and the second from 6 p.m. to 8 p.m. See WATCH.

Dog-whelk, popular name of *Nassa reticulata*, a Brit. gastropod mollusc; it is also applied to the near species of *Purpura lapillus*, the dog-periwinkle.

Dogbane, or *Apocynum*, a genus of Apocynaceae, of which *A. cannabinum*, the Canadian hemp, and *A. androsaemifolium*, or fly-trap, both grow in N. America, and are used in medicine. *A. venetum*, D., is native to S. Europe.

Doge (Lat. *dux*, leader), former title of the chief magistrate of Venice, Genoa, and Amalfi. The 1st Venetian D., Paolo Lucio Anafesto, was elected c. 697 to replace the former 7 tribunes. At first their powers were largely undefined; their attempts to make the office hereditary were checked (1032) by a declaration that the election of a D. Consort (son with father) was illegal. The privy councillors (*consiglieri ducali*) were appointed instead. In 1172 the Great Council of 480 members was formed as a check on the D.s. Sebastian Ziani, the 1st D. chosen from the candidates of this council, introduced the custom of wedding the Adriatic by throwing a ring from the ship *Bucentaur*. Later a more elaborate method of selection was devised, and increasing restrictions were placed on the actual power of the D., who became more and more of a figure-head. The office disappeared on the fall

of the Venetian rep. (1797). The D.s of Genoa dated only from 1339. In 1528 restrictions were made on their power; in 1797, on Fr. occupation of Genoa, the office disappeared, and after a short restoration vanished for good in 1804. In Amalfi D.s existed from 897 to 1350. The D.s palace (Palazzo Ducale) at Venice is a Gothic building of the 14th and 15th cents., and was a residence of the councillors and D.s.

Dogger (Dutch *dogger*, codfish boat), vessel something like a ketch, with 2 masts, and of about 80 tons' burden, used in the cod and herring fisheries in the N. Sea.

Dogger Bank, extensive sandbank in the N. Sea, 50 m. from the nearest point on the Eng. coast. The average depth of

naval authorities. See also **HELIGOLAND BIGHT**.

Doggett, Thomas (d. 1721), actor, b. Dublin, who made his first appearance in D'Urfe's *Love for Money* in London, 1691. He was highly thought of, both for his acting and his personal character, and was associated with Cibber and others in the management of Drury Lane and the Haymarket. He is chiefly remembered, however, as the founder of the prize of 'D.'s Coat and Badge' in 1715, in honour of King George I's accession. The prize consisted of a red coat with a large silver badge on the arm, and was competed for by Thames watermen who had completed their apprenticeship within the 12 months prior to the race. The race took place on 1 Aug., and the course was from London

Canadian Pacific

THE DOGE'S PALACE, VENICE

the water above it is from 10 to 20 fathoms, but in some places there is a depth of only 6 fathoms. It is about 170 m. long by 65 m. broad, and is a famous fishing ground, probably obtaining its name from the Dutch *dogger*, a codfish boat. In 1781 the S. end of the bank was the scene of an indecisive battle between the Eng. and Dutch fleets under Adms. Hyde Parker and Zoutman. In 1904, during the Russo-Japanese war, a Russian fleet fired on the trawlers on the D. B. The excuse given was that there were Jap. torpedo boats among the trawlers. After a protest had been lodged a commission was appointed, which ordered Russia to pay compensation to the families of the victims. In the First World War the Battle of D. B. was fought on 24 Jan. 1915, between the Brit. and Ger. fleets, the former under the command of Adm. Sir David (later Earl) Beatty and the latter under Adm. Hipper. As soon as Hipper saw Beatty's fleet he made for Heligoland and the battle developed into a chase. The Ger. warship *Blücher* was hit very early in the action and sank. The *Seydlitz* and *Derfflinger* were also badly hit. The result of the fight was to impose the greatest caution on the Ger.

Bridge to Chelsea. Money was left to continue the prize, and the race is still held annually under modified conditions. A list of the winners has been kept since 1791.

Dogma (from Gk *dokein*, to seem good or true), a term now chiefly used in theology. The D. of a Gk assembly was merely its decree, or that which seemed right and proper. Originally an opinion stated as a positive assertion, it came to mean a belief derived from authority, and especially doctrines of the Church. From meaning the essential doctrines of Christianity as contained in the Scriptures or writings of the fathers, it developed the popular sense in English of 'assertion without proof.' On the Continent (Ger. *Dogmen*) it means 'doctrine,' with no censure implied, the science of D. having a separate professorship in the Protestant univs. of Germany. See C. G. A. Har-nack, *History of Dogma* (trans.), 1895-6; R. Seeberg, *Lehrbuch der Dogmengeschichte*, 1895-1920; J. Tixeront, *Histoire des dogmes*, 1912-14.

Dogmatic Theology, the systematic statement of religious (and generally Christian) doctrine, considering each article of faith in connection with others

with which it is in apparent relation. It deals, that is to say, with the actual deposit of faith, and not with its relation to, and effect on, the life of the believer. Neither does it deal with doctrine from the point of view of hist. and development. The term did not come into general use until the 17th cent. Protestant divines used to call D. T. *Theistic Theology* and *Positive Theology*. The earliest period of Christian doctrinal statement, almost entirely apologetic, may be said to end with Origen, who sketched out the main plan of the science. In the 7th cent. D. T. was brought to the highest level it has attained among the Greeks by John Damascene, but in the Middle Ages it developed greatly in the W. Important W. names are those of Augustine, Anselm, Duns Scotus, and Thomas Aquinas. The Reformation produced many vols. of Protestant D. T., notably the work of Calvin, but thereafter Protestants showed themselves averse from D. T. until it was revived by the writings of Schweitzer and Karl Barth (q.v.). In the Anglican Church, with its deliberate comprehensiveness and tolerance of divergent opinions, the study of theology has tended to be historical rather than dogmatic, but the Oxford Movement produced some dogmatic works, notably F. J. Hall's *Dogmatic Theology* in 10 vols., 1907-22, and C. Gore's *Reconstruction of Belief*, 1926. D. T. is most highly developed in the Rom. Catholic Church, notable exponents of it in recent times being the Jesuits Tanqueray, 1920, and Lenners, 1947, Pohle (trans. Preuss), Pesch, 1920, and G. van Noort, 1918-26. D. T. is usually divided into the following 7 Treatises or Tractates, following the Apostles' Creed: (1) Concerning Faith (*de Fide*); (2) Concerning the Unity of God (*de Deo Uno*); (3) Concerning the Trinity (*de Deo Trino*); (4) Concerning Creation (*de Deo Creatore*); (5) Concerning the Incarnation and Redemption (*de Verbo Incarnato et Redemptore et de Maria*); (6) Concerning Grace and the Sacraments (*de Deo Sanctificante*); (7) Concerning the Resurrection, Judgment, Heaven and Hell (*de Deo Remuneratore*). Cardinal Newman has proved to be one of the most formative influences in Rom. Catholic theology in recent years, with his defence of the Development of Doctrine. Prefixed to works of D. T. are usually the treatises of Fundamental Theology, concerning Revelation, the Founts of Revelation (Scripture and tradition), and its recipient (the Church). Judaism has never developed a systematic theology. 'It has always lacked the essential element for a Creedal religion, authoritative direction and definition by a supreme ecclesiastical Body. Formulations of the cardinal tenets of Judaism have carried no greater weight than that imparted by the forms and scholarship of their authors.' The 'doctrinal element never crystallised into fixed phraseology or rigid dogma' (E. G. Hirsch, 'Articles of Faith,' *Jewish Encyclopedia*). See J. H. Newman, *An Essay on the Development of Christian Doctrine*, 1845; W. G. T. Shedd.

History of Christian Doctrine, 1881; A. Lecerc (trans. by Leigh Hunt). *An Introduction to Reformed Dogmatic Theology* (1870), 1948.

Dogs, Isle of, Poplar Marshes, or Millwall, riverside dist. in the bor. of Poplar, E. London. It contains the W. India Docks. The 2 main settlements are Millwall (q.v.) on the W. side and Cubitt Tn in the SE. It is actually a peninsula; the origin of the name is not known.

Dog's Mercury (*Mercurialis perennis*), weed of the Spurge family (Euphorbiaceae), with creeping root-stock and erect unbranched stem bearing male and

DOG'S MERCURY

female flowers on separate plants. Although poisonous it was formerly used in medicine.

Dog's-tail Grass, see *CYNOSURUS CRISTATUS*.

Dog's-tooth Violet, or *Erythronium dens canis*, a species of Liliaceae which grows in a mild climate, and in Britain is often used for borders. The bulb has a toothed appearance, and the flowers are violet-coloured; hence the name of the plant.

Dogstar, see *SIRIUS*.

Dogtooth Ornament, in architecture, an ornamental moulding much used in medieval building from Late Norman to Early Decorated, and cut in projecting teeth. In later architecture the 'dog-tooth' frequently becomes a 4-leaved flower with the centre projecting, e.g. in Elgin Cathedral.

Dogwood, name given to *Cornus sanguinea*, deciduous shrub, native to Britain and Europe. Black D. is *Frangula alnus*. See *CORNUS*.

Dohnányi, Ernő (1887-), Hungarian pianist and composer, b. Pozsony, first studied in his home tn and from 1893 at the Royal Hungarian Academy of Music in Budapest. He produced a symphony in 1897 and appeared as pianist in Berlin and Vienna, visited England in 1898, and the U.S.A. in 1899. He was piano prof.

in Berlin in 1908-15, but returned to Budapest, where he became director of the Conservatory in 1919, of the Hungarian Radio in 1931, and of the High School of Music in 1934. He left Hungary for political reasons in 1948 and settled first in Argentina and then in Florida. His works include 3 operas, a ballet, choral music, 3 symphonies, and a suite in F sharp minor for orchestra, a piano and a violin concerto, *Variations on a Nursery Song* for piano and orchestra (his most popular work), chamber and piano music, and some songs.

Dohrn, Felix Anton (1840-1908), Ger. zoologist, b. Stettin. In 1870 he founded the great zoological station at Naples, which within 10 years became one of the most noted schools and laboratories of natural science in the world, and was the model for many later ones. D.'s early studies were almost entirely concerned with insects, and his later with marine invertebrates. He produced many valuable natural science works, including *Ursprung der Wirbeltiere*, 1875; *Studien zur Urgeschichte des Wirbeltierkörpers*, 1882; and *Die Pantopoden des Golfs von Neapel*, 1881.

Doiran, Battle of. One of the surprises of the First World War was the Allied offensive on the Macedonian front in Sept. 1918. The new Allied Commander-in-Chief, the Fr. Gen. d'Espèrey (q.v.), planned this attack immediately he assumed command. The Bulgarian Army occupied strong positions on the heights to the W. of Lake Doiran, from which they dominated their opponents. After a preparatory bombardment the Brit. forces attacked the 'P' Ridge on 18 Sept., whilst Gk troops attacked Doiran Hill. After severe fighting Gen. Sir George Milne, commanding the Brit. and Gk forces, gained Petite Couronne, Doiran tn, and the lower slopes of Grande Couronne. On 21 Sept., on the Vardar front, the Franco-Serbian offensive had reached the line Gradista-Boshava-Dragejil and the heights of Porta dominating the Varda, thus turning the flank of the enemy on the Brit. front and cutting his communications. This forced the Bulgarians to retreat on the Doiran front. By 22 Sept. the Bulgarians were in full retreat in great disorder on a front of 100 m. This collapse of Bulgaria exposed Turkey to attack on its W. flank and compelled it to cease offensive operations. The remaining forces of the Central Powers were now exposed to attack from the E., a factor which contributed to their decision to conclude an armistice.

Dola Sequanorum, see **DOLE**.

Dolabella, Publius Cornelius, Rom. gen. and husband of Cicero's daughter, Tullia; b. c. 70 bc, and one of the most notorious profligates of his age. Soon after the outbreak of civil war he transferred his allegiance from Pompey to Caesar, with whom he fought at Pharsalus (48), and later in Africa and Spain. On Caesar's death D. seized the consulship and sided with Brutus and his fellow conspirators. Bribed by Antony, he once again changed sides and accepted the

prov. of Syria. Having plundered the cities of Greece and Asia on his way there, he murdered Trebonius, proconsul of Asia, who had denied him admission to Smyrna. Cassius was sent to take his place, and besieged him in Laodicea. To avoid capture D. ordered one of his soldiers to kill him (43 bc).

Dolce, Lodovico (1508-68), It. author, b. Venice, where he worked for the publisher Giolito. Besides translating or paraphrasing the classics, he produced (among other original pieces) *L'Aretino*, a dialogue on painting, 1557, which has been ed. by D. Ciampoli, 1912.

Dolci (Dolce), Carlo, or Carlino (1616-1686), Florentine painter chiefly of religious subjects, pupil of Jacopo Vignali. He also painted portraits of the Imperial family at the Emperor's court. Among his best works are: 'St. Andrew praying before his Crucifixion' (Pitti Gallery), 1646; the 'St. Cecilia' (Dresden) and 'St. Veronica' (Dulwich); but a pathos near to sentimentality mars his work.

Dol-de-Bretagne, Fr. tn in dept of Ille-et-Vilaine, 14 m. from St Malo. The level, fertile dist., Marais de Dol, is protected from the sea's inundations by a dyke, 22 m. long, built in the 12th cent. D. has a fine 13th-cent. cathedral of granito, with good glass, sculptures, and 2 fine porches. In 1793 the Vendéens defeated the republicans here. Pop. 4800.

Doldrums, regions of calms or light winds, heavy rains and thunderstorms, situated in equatorial seas. They follow the sun's ann. changes of declination but to a smaller degree, being never more than 5° N. or S. of their mean positions. See **WIND**.

Dole (anc. **Dola Sequanorum**), Fr. tn. cap. of an arron., in the dept of Jura, on the Doubs and the Rhine and Rhône canal. It was known to the Romans, and was the cap. of Franche-Comté (q.v.) before being displaced by Besançon. It faces the heights of the forest of Chaux, on a vine-clad slope. There are many fine public buildings, and some old houses in the style of the Sp. Renaissance. Pasteur (q.v.) was b. here. There are iron and copper foundries, and machines and chemicals are manuf. Pop. 18,250.

Dole: 1. A colloquial rather than official term which came into general use in Great Britain during the years that followed the end of the First World War. It denoted the out-of-work donation paid to ex-service workers from 1919. This allowance varied from 20s. to 29s. for men and from 15s. to 25s. for women. In 1920 the difficulty and cost of having 2 separate systems of allowances for unemployment in operation side by side led to a new Act, which repealed all previous legislation and placed all unemployed persons on the same level. See also **NATIONAL INSURANCE**.

2. In Scots Criminal Law, means a corrupt and evil intention proved or assumed to exist. It is assumed in 'such circumstances as indicate a corrupt and malignant disposition, a heart contemptuous of order and regardless of social duty.'

Dolerite, coarse-grained basaltic rock used for road mending and kerbstones. It consists of augite and plagioclase feldspar with the addition of olivine in some varieties, and of quartz in others. Variable quantities of hornblende, apatite, and biotite are often present.

Dolet, Etienne (1509-46), Fr. Renaissance scholar, b. Orleans; set up a printing press in 1542, and was sev. times arrested for publishing heretical works. In 1544 he was imprisoned for heresy; burned in the Place Maubert, 1546. *See* life by Chassaingne, 1931.

Dolgelley, urb. dist. and co. tn of Merioneth, N. Wales. It is situated at the base of Cader Idris, on the Afon Wnion, 230 m. from London. In the neighbourhood is the Parliament House, in which it is said Owen Glendower held a parliament in 1404. *Dolgelley beds* are a series of rocks of the Upper Cambrian system wall exposed near D. and Blaenau Ffestiniog and consisting of slates and shales containing characteristic trilobites. Pop. 2508.

Doll, figure in the shape of a human being, used as a child's toy. Various derivations have been suggested of which 'idol' is the most probable. Others are Norse *dauð*, woman, and the name 'Dorothy.' D.s date from very ancient times, and were common in Egypt, Greece, and Rome. Early primitive people delighted in rude images carved out of wood or bone. To the Negro a D. has a magical significance, and may be regarded variously as a mascot, a votive offering, or an idol. Wooden D.s were introduced into England from the Netherlands, and were called Flanders babies, or simply 'children's babies.' Since then the manuf. of D.s has greatly advanced, and the stiff wooden D. has been superseded by the stuffed sawdust D., with composition or wax head. Its features became more and more realistic. Hair was substituted for painted ringlets, joints were made, and wire mechanism introduced so that the D. could be made to close its eyes and utter sounds. *See* Lesley Gordon, *A Pageant of Dolls*, 1948.

Dollar, burgh in Clackmannanshire, Scotland, 6 m. N.E. of Alloa. It has an academy, founded in 1818, and endowed by Capt. John McNab (1732-1802). An object of interest is the ruin of Castle Campbell. Pop. 1500.

Dollar (derived from the Ger. *thaler*), applied especially to the unit of the monetary system of the U.S.A. and Canada. It was brought into common use in the U.S.A. about 1794. The Act of 1837 estab. the silver coin containing 371.25 grains of silver, 41.25 of alloy, total weight being 412.5 grains. Before that time the weight was 416 grains. Under the Act of 1873 trade D.s of 420 grains (378 grains silver, 42 alloy) were coined for the purpose of export to China and other Asiatic regions, not legal tender at home. There are paper as well as silver D.s. The D. mark \$ is written before the number, a sign whose derivation is much disputed. A D. (approximately 7s.) contains 100 cents. Silver

half and quarter D.s, and dimes (10 cents), are issued; also 'nickel' 5-cent pieces and bronze cents. A gold coin of similar value (25.8 grains in weight—23.22 grains of gold, 2.58 of alloy) was used from 1849 to 1889. Though declared the standard of value in U.S.A. in 1900, gold coinage has been prohibited by the Gold Reserve Act of 30 Jan. 1934, and silver D.s have been minted only irregularly. The Brit. double florin (first struck 1887, now obsolete) about equalled a D. By 1600 the word was common in England for the Ger. thaler, a silver coin of varying value current from the 16th cent., and was especially used later for that worth 3 marks (2s. 11d.). It is sometimes used roughly as a slang term for crown (5s.). The par values of the currencies of member nations of the International Monetary Fund have been announced, since 1946, in terms of gold as a common denominator or in terms of the U.S. D. of the weight and fineness in effect on 1 July 1944. *See also* METROLOGY.

Dollar Diplomacy, in Amer. politics, a term specially associated with the Taft administration, 1908-13. It means a systematic effort by the State Dept to help Amer. cap. to flow into areas abroad which it would not otherwise enter. Taft and his secretary of state, Philander C. Knox, pursued the D. D. most actively in the Far E., their chief motive being to promote trade and safe cap. investment, and a minor motive being to strengthen Chinese political integrity. In Theodore Roosevelt's administration the Amer. consul-general at Mukden, apprehensive of Jap. penetration, came to the conclusion that if America put more money into the Far E. she could more easily maintain the policy of the Open Door. The economic motive was also dominant in the application of D. D. to Central America, though a political purpose, the safeguarding of the Panama canal route, was also served. Knox thought that if Amer. cap. flowed into Nicaragua and Honduras through Amer. bankers, traders, and railroad builders that would offset any possibility of European interference on the plea of economic depression and financial instability. When Woodrow Wilson became president (1913) he explicitly repudiated D. D. He himself, however, maintained it both in China and Nicaragua, co-operating with the bankers; but it has been generally condemned from his time, and since the First World War is no more than a memory. *Consult* A. Nevins, *America in World Affairs*, 1942.

Dollfuss, Engelbert (1892-1934), Austrian statesman, b. Teting. He studied law at Vienna Univ., served with distinction in the First World War, and, entering politics, soon became leader of the Christian Socialists. In 1932 he became chancellor, and set himself to restore Austrian economic stability. Though opposed to the Nazis, D. used methods not dissimilar from theirs in his campaign against the social democrats, accepting help from Starheimberg's *Heimwehr*. There was an unsuccessful Socialist

attempt on his life in 1833, and an unsuccessful Socialist revolution early in 1834, after which representative gov. in Austria was abolished by D. and a type of 'corporate state' estab. In July 1834, however, D. was assassinated by the Nazis in the chancellery in Vienna.

Döllinger, Johann Joseph Ignaz von (1799-1890), Ger. Catholic theologian, b. Bamberg, Bavaria. He was educ. at the gymnasium and univ. at Würzburg, and in 1822 was ordained priest. After lecturing for 3 years in the Lyceum at Aschaffenburg (1823-6), D. was appointed to the chair of eccl. hist. and law at Munich. It has generally been assumed that during the early part of his career he was an ardent champion of Ultramontanism in Germany, though even as a young man his views were by no means narrow. He was a friend of the leaders of the Oxford Tractarian movement—Pusey, Hope Scott, Manning, and others—and wrote vehemently against Protestantism in *Die Reformation*, 1846, and *Luther*, 1851. His visit to Rome, 1857, worked a great alteration in his opinions. In 1861 he delivered certain lectures at Munich in which he declared his belief that the progress of the Rom. Catholic Church did not depend on the temporal sovereignty of the Pope. He answered his assailants in *Kirche und Kirchen*, 1861, and *Die Papsttätigkeit des Mittelalters*, 1863. In 1864 Pius IX issued his *Syllabus* condemning certain current philosophic systems, which was replied to anonymously by the pub. of *Janus*, written by D. in collaboration with Huber and Friedrich. When in 1870 the Vatican Council defined the doctrine of papal infallibility, D. headed a protest, and in 1871 addressed his famous letter to the Archbishop of Munich, in which he refused to accept the doctrine. He was excommunicated, but sev. of the leading univs. of Europe expressed themselves in his favour by conferring on him honorary degrees. During the latter years of his life he endeavoured to bring about a union of the Christian Churches which do not belong to the Rom. Communion. He was elected a president of the Munich Academy in 1873. His later pub. include *Quellenwerk zur Geschichte des Konzils von Trient*, 1876; and *Studies in European History* (Eng. trans.), 1890. See Lord Acton, 'Döllinger's Historical Work' (in *Eng. Historical Review*, vol. v), 1890; and life by J. Friedrich, 1899-1901.

Dollman, John Charles (1851-1934), painter. His most famous pictures are 'The Hunter,' 1911, and a much earlier one, 'Les Misérables,' 1886, which is now in the London Museum. His 'A Very Gallant Gentleman,' 1914, a memorial to Capt. Oates who perished with Scott in the Antarctic, is in the Cavalry Club. D. had pictures in the Royal Academy almost without a break for 60 years.

Dollond, John (1706-61), London optician, b. Spitalfields, by trade a silk weaver. He studied mathematics, astronomy, and optics, and was also a good linguist. In 1752 he became a practical optician in partnership with his son,

Peter, founding the well-known firm of Dollond & Co., Ltd in St Paul's Churchyard. In 1758 his treatise on the dispersion of light, pub. in *Philosophical Transactions*, won him the Copley medal from the Royal Society. Its result was his invention of the achromatic telescope. He also invented the heliometer (q.v.), and in 1761 was elected F.R.S.

Dolman (Turkish *dolman*), originally a long, loose garment with narrow sleeves. It was worn usually by the Turks, and was the name of the uniform jacket worn by hussars. In the second half of the 19th cent. a close-fitting jacket called a D., which had sleeves cut in one piece with the back, came into fashion for ladies' wear.

Dolmen, a word of uncertain though perhaps Cornish derivation, which was at

W. F. Mansell

DOLMEN DE MANÉ KERIONEK, BRITTANY

one time more widely used than at present in antiquarian circles to denote a megalithic structure consisting of 3 or more large uprights capped by a horizontal stone. The term is still commonly used in Ireland, where there are very many examples. Many occur also in Wales and Cornwall and in France; current archaeological opinion regards them as the burial chambers of chambered-tombs and passage-graves of the Neolithic period, revealed by the denudation of the covering grave-mound.

Dolmetsch, Arnold (1858-1940), Fr. expert on old musical instruments and their music; b. Le Mans. Studied violin under Vieuxtemps in Brussels and at the Royal College of Music, London. Collected and repaired old instruments and learned to play them. He was at Chickering factory, Boston, U.S.A., 1902-9, and later had a dept in Gaveau factory, Paris, 1911-1914, where he made clavichords and harpsichords; returned to England, 1914, and equipped a workshop at Haslemere, Surrey, where he arranged periodical festivals of old music. He made, and revived the playing of, most instruments of the 15th to the 18th cents. Supporting these activities was a 'Dolmetsch Foundation.' Pub.: *Select English Songs and*

Dialogues of Sixteenth and Seventeenth Centuries, 1912; *The Interpretation of the Music of the Seventeenth and Eighteenth Centuries*, 1915, new ed. 1944. His third wife, Mabel D. (b. 1874), and all his children, including the sons Rudolph (1906-42) and Carl (b. 1911), followed him in his enterprise.

Dolo, It. tn in Veneto (q.v.), on the Brenta (q.v.), 13 m. W. of Venice. Pop. 8000.

Dolomieu, **Déodat Guy Sylvain-Tancredé Gratet de** (1750-1801), a famous geologist and mineralogist of Dolomieu, Isère, France. Early a member of the Order of Malta, he killed a knight of his gallej in a duel (1768), but the death-sentence was revoked by the grand master, and 9 months' imprisonment substituted. D. soon left the army to study science. In 1783 he pub. *Voyage aux îles de Lipari*; in 1784 studies on earthquakes; and in 1785 appeared memoirs on basalt and the mineral 'dolomite' (named after him, 1791). He became prof. of geology at the School of Mines, 1796, and Daubenton's successor at the Natural Hist. Museum, 1800. In 1798 D. was on the scientific staff which accompanied Bonaparte's expedition to Egypt. Returning for health reasons, 1799, he was imprisoned at Taranto, and only released after the battle of Marengo, 1801. Other works are *Mémoires sur les îles Ponces*, 1788; *Dernier voyage dans les Alpes*, 1802; *Philosophie minéralogique*, 1802 (partly written in prison).

Dolomite, common mineral crystallising in rhombohedra and consisting of carbonates of calcium and magnesium. It has a hardness of $3\frac{1}{2}$ to 4, and a sp. gr. of 2.8, and is therefore harder and heavier than calcite. The crystals are usually white in colour, and have curved faces, some varieties being almost spherical. The term D. is also applied to rocks containing that mineral. Such rocks are common to every geological formation both in the Old World and in the New. They seldom contain fossils and are often found in the neighbourhood of rock salt and gypsum. Many of the D. rocks of Britain are esteemed as building stone. The Houses of Parliament were built with D. from Bolsover, in Derbyshire; other localities are Notts (Mansfield stone) and Durham. D.s are common in the Alps, and a dist. in the S. Tyrolean Alps, much favoured by tourists, is known by that name.

Dolomites, **The**, mountainous dist. in the S. Tyrolean Alps, N. Italy. It is chiefly composed of magnesian limestone, where the peaks rise in most fantastic forms and shapes, and are streaked by veins of wonderful vivid colourings. The highest peak is the Marmolata, 10,972 ft., but other much more typical peaks are the Sorapiss, the Cimón della Pala, the Langkogel, the Pelmo, Drei Zinnen, and Rosengarten.

Dolon-Nor, or **Lama-Miao**, tn of Inner Mongolia. It is situated 165 m. N. of Peking, and is noted for the manuf. of brass and iron idols, vases, bells, etc. It is a centre of trade for E. Mongolia.

There are numerous ruins and Buddhist temples in the neighbourhood. Pop. 30,000.

Dolores: 1. City, cap. of D. dist., Buenos Aires prov., Argentina. 127 m. from Buenos Aires city. D. is an agric. centre, with dairying and other industries. Pop. 14,400.

2. City of Seriano dept, Uruguay, a riv. port on San Salvador R., shipping grain. Pop. 11,500.

3. Or **D. Hidalgo**, city of Guanajuato state, Mexico, on the central Mexican plateau at an altitude of 6230 ft. chiefly occupied in agriculture and pottery-making. It is famous for the call to arms (*Frito de Dolores*) by which M. Hidalgo started the liberation of Mexico on 16 Sept. 1810, the day still celebrated as independence day. Pop. 6000.

Dolphin, popular name of various species of toothed cetaceans of the Delphinidae, which family also includes the porpoises. D.s are distinguished from the latter in that the snout is beaked. In fact D.s comprise all members of the Delphinidae except the porpoises and the larger species, such as the killer and the beluga. Among the numerous species of D.s there are: the common D., *Delphinus delphis*, found in schools over much of the temperate and tropical ocean; Risso's D., *Grampus griscus*; riv. D.s such as the Irrawadi D., *Orcella brevirostris*, and the Amazonian D., *Inia geoffrensis*; and the bottle-nosed D., *Tursiops truncatus*. D.s feed mainly on squid and fishes and most are active creatures capable of good turns of speed. Recent studies have shown that certain D.s emit a wide range of sounds, some in the supersonic register. There are also fishes known as D.s, these being of the species *Coryphaena hippurus*, a beautiful oceanic fish which preys on flying-fishes.

Dolphin, **The**, see DELPHINUS.

Dom, 14,942 ft., the highest mt entirely in Swiss ter. It rises between the valleys of Saas and Zermatt, in the canton of Valais. First ascent by the Rev. J. L. Davies in 1858.

Domagk, **Gerhard**, (1895-) Ger. chemist, b. Lagow, Brandenburg, attached to the Bayer Company at Elberfeld. He introduced into medicine Prontosil (1935), the first drug containing sulphanilamide, Thiosenicarbazone (for treatment of tuberculosis) and other drugs. His results are due to an extension of the method developed by Ehrlich (q.v.), but he tried the effects of a series of dyes on bacteria in the body, irrespective of their effects on bacteria outside the body. Awarded Nobel prize for medicine in 1939.

Domat, or **Daumat**, **Jean** (1625-96), Fr. jurist, was the author of *Lois civiles dans leur ordre naturel*, 1689, and *Le droit public*, 1697. This work, which earned for D. a pension of £2000 from Louis XIV, is still regarded as a valuable and authoritative treatise on the science of law, all law being considered a development from principles of ethics. When Pascal died D. took care of his private manuscripts.

Domažlice (Ger. **Taus**), Czechoslovak tn in the region of Plzeň (q.v.). It has an

engineering industry. In this dist. in medieval times lived the Dogs' Heads, whose task it was to guard the passes through the W. Forest of Bohemia (q.v.). Pop. 7300.

Dombasle, Fr. tn in the dept of Meurthe-et-Moselle. It is important for the production of soda and its derivatives. Pop. 8300.

Dombes, dist. in France, formerly part of Burgundy, now in the dept of Ain. It was very swampy, but has been extensively drained. The cap. was Trévoux.

Dombrowski, Jan Henryk (1755-1818), Polish patriot and general, b. Pierszowice, Cracow. From 1792 to 1794 he took part in the Polish campaigns against Russia and Prussia, gaining distinction during the siege of Warsaw under Kosciuszko. In the 1st campaign he was conspicuous for his bravery at the Trebbia (1799). With the div. of Poles he had organised for Napoleon in 1806 he commanded in the Polish campaign of 1809, and during the fatal march on Moscow in 1812 was wounded whilst crossing the Beresina. For his reorganisation of the Polish forces he was appointed cavalry-general in the new kingdom of Poland (1815).

Dome, a convex roof, of approximately hemispherical form, over a square, octagonal, or circular space in a building. D.s may be constructed of stone, brick, concrete, reinforced concrete, hollow tiles, timber, steel, or aluminium framing; and may be covered externally with lead, copper, etc. For ideal visual effect, a hemispherical D. is satisfactory internally, but needs to be steeper than a hemisphere externally, or it appears insignificant. Hence, certain D.s are of double (e.g. St Peter's, Rome (fig., C, p. 450)) or even of triple construction (e.g. St Paul's, London (fig., D)), where the heavy stone lantern is carried by a brick cone, entirely concealed between the outer and inner D.s, the former being of timber framing covered with lead, and the latter of brickwork 18 in. thick). D.s were used by the Assyrians many centuries BC, but the first important historical example is the Pantheon at Rome, c. AD 112, of brick and concrete, 142 ft 6 in. in diameter (fig., A). The famous Byzantine D. of St Sophia at Istanbul, AD 537-552, is of brick, 107 ft in diameter (fig., B).

In Islamic architecture (q.v.), and in India both before and after the Muslim conquest, D.s were largely used for mosques and tombs. Though seldom found in Romanesque or Gothic architecture, the use of the D. was reintroduced after the Renaissance. Famous examples are Brunelleschi's steep D. (1420-34) at Florence Cathedral; Bramante's beautiful little *tempietto* (1502-10) adjoining St Pietro in Montorio at Rome; and 4 buildings at Paris—the Sorbonne (1635-1649), 40 ft diameter; the Val-de-Grâce (1645-50), 56 ft diameter; the Invalides (1706), 91 ft diameter; and the Pantheon (1757-90), 69 ft diameter. Among more modern examples are the D. over the Brit. Museum Reading Room, London (1857), 140 ft diameter; the extraordinary stone D. over the church at Musta in

Malta (1864), 118 ft diameter; and the aluminium 'Dome of Discovery' at the 1951 Exhibition in London, 365 ft diameter, demolished in 1953.

Dome of the Rock, see OMAR, MOSQUE.

Domenichino, Domenico Zampieri (1581-1641). It. painter of the Bolognese school, pupil of Calvaert and the Carracci. A friend of Albani, he visited with him Parma, Modena, and Reggio to study Correggio and Parmigiano, later joining him at Rome. Cardinal Agucchi was his first patron, and employed him in his palace. D. helped Annibale Carracci at the Farnese, and painted 'The Death of Adonis' from his own designs. He painted frescoes for Cardinals Borghese, Farnese, and Aldobrandini. He should be judged chiefly by his frescoes, and undoubtedly stands high among It. painters. Some of the best are the series at the Basilian Abbey of Grottaferrata. His famous oil painting, 'The Last Communion of St Jerome,' was judged by Poussin next best in Rome to Raphael's 'The Transfiguration.' In 1617 he returned to Bologna disgusted by the jealousy of rivals, but was in Rome again in 1621. In 1630 he went to Naples to decorate the Capella del Tesoro. His fame roused much envy among the estab. painters there, and it was suspected that he was poisoned. Among his works are: 'The Flagellation of St Andrew,' 1608; frescoes of the lives of St Nilus and St Bartholomew, 1609-10; frescoes of St Cecilia (St Luigi de' Francesi, Rome); 'The Four Evangelists' (St Andrea della Valle); 'Diana and her Nymphs'; 'The Sybil of Cumae' (Borghese Palace); 'The Repose of Venus'; 'Diana and Actaeon' (Pitti, Florence); 'The Angel and Tobias,' 'St George and the Dragon' (landscapes, National Gallery, London); 'Moses and the Burning Bush,' 'Combat of Hercules and Achelous,' 'The Triumph of Love' (Louvre); 'St John in a Vision'; 'Time Trampling on Youth.' His portrait of Cardinal Colonna was highly praised. See C. P. Landon, *Works of Domenichino, with a memoir*, 1823; and life by L. Serra, 1921.

Domenico, Veneziano (d. 1461). It. painter, b. in the early part of the 15th cent. His works have scarcely anything in common with the Venetian school, though he signs himself a Venetian. He worked on the decorations of the Portinari Chapel in Santa Maria Novella, Florence, 1439-44, and is said to have used linseed oil as his medium. His paintings include an enthroned Virgin and Child with St John the Baptist, St Francis, and other saints. He d. at Florence sev. years after the death of Andrea del Castagno, whom Vasari erroneously accuses of having been his murderer. But few of his paintings are in existence, one of the most important being the enthroned Madonna in the National Gallery. His prin. surviving work is an altar-piece in the Uffizi.

Domesday, or Doomsday, Book, survey of England made by William the Conqueror (q.v.) in 1085-6. The returns which came in from all over the country were probably compiled in the existing MS. of

A

B

C

D

COMPARATIVE SECTIONS OF FOUR FAMOUS DOMES

A The Pantheon Rome; B, St Sophia, Istanbul; C, St Peter's, Rome;
D, St Paul's, London.

2 vols. (now in the Public Record Office) between 1088 and 1100. D. B. gives details of land-ownership, of the type of cultivation, of the number of inhab. on the various estates and of their respective classes, etc., both at the actual date of the survey and with references to the conditions prevailing in 1066. The material is arranged so as to present clearly the way in which the land was divided amongst the various barons. It is an amazing compilation, both in the wide scope and in the intimate detail of its information. The method of obtaining the information was notable in that it made great use of the jury. The prin. object of the survey was

home nursing, the management of household expenditure and income, and sometimes also of child care and gardening. Degree courses are taken at London (Queen Elizabeth College, q.v.) and Bristol. Training colleges which specialise in D. E. are as follows: the 3 London colleges, at Battersea, Berridge House, and Buckingham Palace Road; and the colleges at Bangor, Bath, Cardiff, Clacton-on-Sea, Eastbourne, Gloucester, Ilkley, Leeds, Leicester, Liverpool, Manchester, Newcastle-upon-Tyne, Shrewsbury, Stafford, Totley, and Worcester. There are colleges in Scotland at Aberdeen, Edinburgh, and Glasgow, and in N. Ireland at

AN EXCERPT FROM THE DOMESDAY BOOK

at one time thought to be fiscal; to make possible a sounder system of taxation. It was also clearly of value in settling outstanding pleas, for the commissioners had the authority of royal justices. But probably William was most interested in finding out as much as possible about his kingdom, and it is for the picture which it gives of conditions in England in 1066 and 1088 that D. B. is so highly valued by the historian. It is a unique medieval document. See J. H. Round, *Feudal England*, 1895; F. W. Maitland, *Domesday Book and Beyond*, 1897; A. Ballard, *The Domesday Inquest*, 1906; F. M. Stenton, *English Feudalism 1066-1166*, 1932, and *Anglo-Saxon England*, 1943.

Domestic Economy (from Gk *oikos*, house, and *nomos*, to manage) is the only expression in which 'economy' bears its original meaning of house management. To-day it is used both of the thrifty control of the home from a financial point of view and more generally of the science which teaches household duties and control. This science has, in recent years, assumed a prominent place in the education schemes of girls' schools, training colleges, and in some univs. for women students. D. E. treats of the study of food values and preparation, nutrition and physiology, personal hygiene, ventilation, sanitation, house cleaning, laundering, needlework,

Belfast. Among schools providing specialised training are Winkfield Place, Windsor, and the Cordon Bleu Cookery School, London. See **COOKERY**; **HOMEMAKING**; and subsidiary articles.

Domestic Science, see **DOMESTIC ECONOMY**.

Domestic Servants are those employed to perform the work of a household. The majority of them are women, though page boys, footmen, and butlers, etc. are indispensable in all large estates. D. S. are included in the Employers' Liability Act, and under the National Insurance (Industrial Injuries) Act, 1946 (replacing the Workmen's Compensation Act, 1925) (see **WORKMEN'S COMPENSATION**), can claim compensation for injuries arising during their employment, provided that gross negligence or other wilful misconduct on their part has not caused the injury. All D. S. must insure against sickness under the National Insurance Acts, the conditions being the same for them as for other workers. Statistics show a decrease in the number of D. S. proportionate to the population. The census returns of 1921 showed that 371,682 men-servants were employed throughout Great Britain in that year, and 1,844,574 women, giving a total of 2,216,256. In the financial year 1936-7 the number of licences taken out for male servants was only 173,822. There

are no up-to-date statistics of female D. S., but the total to-day is far below the total for 1931. A gov. scheme (the National Institute of Houseworkers), introduced by the Labour Gov. in 1947, had for its primary object the raising of the prestige of domestic work by giving it the status of a skilled craft, and consequently attracting more workers. It estab. a diploma for skilled domestic workers who qualify at the end of a 6 months' training course, and for other domestic workers able to satisfy an examining board. The Institute cannot enforce standards of conditions and wages, but prescribes rates of wages and conditions to which employers of holders of diplomas are expected to conform. 'Resident workers' of the Institute have a working week of 48 hours and 'non-resident workers' one of 44 hours, spread over a 7-day week. Employees are entitled to one full day and one half day off each week, but there may be mutual agreement for 3 half days instead. Workers have a fortnight's holiday with pay each year for the first 5 years after obtaining the diploma, and 3 weeks a year afterwards.

The Local Health Authority is empowered to arrange for domestic help (under the National Health Service Act, 1946, section 29) in households where such help is necessary owing to illness, and for this some payment may be asked.

Domestication of Animals, process by which man has changed certain species of animals to suit his own needs. This change can only be rendered effective if carried on for successive generations, as the term domestication implies permanent changes in certain characteristics, and also in many cases in the structure, these changes being brought about by alteration of the animals' environment and the introduction of a system of breeding. D. of A. includes also the protection and provision of food for some animals and the special control exercised over them which prevents their leading an absolutely wild life. It is necessary in the case of the animals that they should be able and willing to adapt themselves to this control, and that they should be fertile, though under control or living under different conditions. The process by which domestication is produced consists principally in selecting certain species which possess the most desirable qualities and in causing them to breed only with other desirable species, at the same time, in all probability, altering their food and surroundings. This leads to changes in outward form, in some cases not very noticeable, in others very marked, as the difference in feathers, hair, colouring, and, deeper-seated still, changes in structure. Among domestic animals there may be mentioned a number of birds, as fowls, ducks, geese, and many others. Dogs, cats, and sev. other mammals are also domesticated. Certain kinds of insects and fishes, too, have certainly been altered by man, if they cannot lay claim to the title of domesticated animals. See C. Darwin, *The Variation of Animals and Plants under Domestication*, 1868; and

N. S. Sclater, *Domesticated Animals, their Relation to Man and his Advancement in Civilisation*, 1896.

Domett, Sir William (1754-1828), adm., b. Devonshire. He was present in the fight off Ushant (1778), in the *Chesapeake* under Arbuthnot (1781), and in the battle of the Saints (1782). On the glorious first of June (1794) he commanded the flagship *Queen Charlotte*, and in 1795 he was present in the action off L'Orient. Four years later he fought in Basque road, and at Copenhagen he served as flag-capt. under Sir Hyde Parker (1801).

Domfront, Fr. tn in the dept of Orne. It owes its origin to a 6th-cent. hermit, St Front. It has a 11th-cent. church, and the remains of an ancient castle and the tn ramparts. The tn is built on a rocky crest and is dominated by the fine modern church of St Julien. Pop. 2600.

Domicile, in Eng. law, is the country in which a person is deemed to have his permanent home. It is possible for a person to be domiciled in England but to be resident in Nigeria (e.g. a member of the colonial service). D.s may be of sev. types: D. of origin; D. of dependence; D. of choice. The D. of the father is the D. of the child and the latter changes with the D. of the father during minority. An illegitimate child takes the D. of the mother. Should the father die during the minority of a child, the child's D. is the last D. of the father. A woman when she marries takes the D. of her husband (D. of dependence). A male or an unmarried female over 21 may acquire a new D. by manifesting an intention of adopting the country of that D. as his or her permanent home (D. of choice) and of abandoning the D. of origin. If a person dies after abandoning his D. of choice but before acquiring a fresh D., his D. of origin revives.

D. is of practical importance in disposition of property by will and in the administration of intestacies. The administration of personal estate is governed by the law of the country in which the intestate died domiciled. The devolution of real property on the other hand is governed by the law of the place where the land is situate (*lex situs*). In matters affecting status (e.g. divorce) the Eng. courts will only recognise decrees which are valid according to the law of D.

Dominance, in biology, connotes the fact that when an offspring receives the genes of 2 contrasting characters from its parents, in many cases one of those characters, the dominant, will develop to the exclusion of the other, instead of combining with it. The repressed character—the recessive—may, however, reappear in the next generation; thus, a hybrid between pure-bred horned and hornless (dominant) cattle produces offspring which are all hornless; but if these were mated some horned animals might be found among their descendants. See HEREDITY.

Dominic, St (Dominic de Guzman) (1170-1221), b. Caleruega, a small tn in the diocese of Osma in Old Castile, Spain. As a young priest he resigned a canonry to

take up missionary work among the Albigenses in the S. of France. In 1215 he founded his order of mendicant friars, adding to the Rule of St Augustine his own constitutions. Pope Honorius III recognised and sanctioned the order in 1216. The régime of the order was most severe, enjoining silence, poverty, and fasting. The friars were called Dominicans from their founder; Preaching Friars from their zeal in persuasion; Black Friars from the colour of their dress; and in France Jacobins, from their original H.Q. in the Rue St Jacques at Paris. For women desirous of following the same Rule the 'Second Order' was formed; and a confraternity of men and women in the world but governing their lives by the same principles was called the 'Third Order.' The order numbered some famous theologians, including Thomas Aquinas. The Dominican Order have always upheld Aquinas's theological system (Thomism), and on some matters have taken part in acrimonious disputes with theologians of other schools, notably the Jesuits. The Order furnished examining judges and often the presidents of the Sp., Rom., and Portuguese Inquisitions. St Dominic was canonised by Pope Gregory IX in 1235; his feast day is 4 Aug. See A. Jessopp, *The Coming of the Friars*, 1889; J. Herkless, *Francis and Dominic*, 1901; and B. Jarrett, *Life of St Dominic*, 1934.

Dominica, largest of the Windward Is., Brit. W. Indies, is 29 m. long and 15 m. broad; area 305 sq. m., of volcanic formation and very mountainous, with a healthy climate and a rainfall of 80 in. in parts and over 250 in. in others. Sugar has ceased to be an article of export, and the main exports are now of bananas and of lime juice and lime oil. Copra, cacao, vanilla, and grapefruit are also exported. There are about 100 pure Caribs still living on the is. D. owes its name to the fact that it was discovered by Columbus on a Sunday (Sp. *Domingo*), 3 Nov. 1493. The is. was included in a grant by Charles I to the earl of Carlisle, but as all attempts to subdue the aboriginal Caribs failed, it was agreed in 1748 by the treaty of Aix-la-Chapelle that D. and other W. Indian is. should be neutral and the Caribs left in possession. But the Fr. ignored this arrangement and estab. plantations in the is., after which England captured it in 1759; and by the peace of Paris, 1763, it was assigned to England. In 1778 the Fr. under the Marquis de Bouillé invaded it and marched into Roseau; but though many Brit. W. Indian is. fell into Fr. hands at this time Rodney, at the Battle of Saints, saved the situation, and D., with various other is., was restored to England by the Treaty of Versailles, 1783. The Fr. republican, Victor Hugues, however, invaded D. with a force from Guadeloupe in 1795, but was repelled. Then later, in 1805, Gen. La Grange captured Roseau once more but was unable to reduce the colony, and, after extorting a payment of £12,000 from the people and vainly calling on the Eng. governor to surrender, sailed to Guadeloupe. The Eng. gover-

nor, Gen. Prevost, was duly rewarded by the Dominican House of Assembly for his gallantry and on his return to England was created a baronet. Until 1940 D. was a part of the Leeward Is. group but in that year became a separate colony under the governor of the Windward Is. A legislative council was created in 1893 when the assembly was abrogated and Crown Colony gov. estab., but in 1925 the elective principle was reintroduced. Since 1956 there have been 3 ministers in the executive council. Pop. 59,000. Roseau (12,000) is the cap.

Dominical Letter, the letter used to denote the Sundays throughout 1 year. The 7 letters, A B C D E F G, are used in succession to denote the 1st 7 days of the year, from 1 to 7 Jan., and then in rotation the next 7 days, and so on. Thus, if 3 Jan. be a Sunday, which occurred in 1954, it is evident that the D. L. for the year is C, as the number of letters and of the days of the week is the same. (The *Nautical Almanac* gives the D. L. each year on p. 1, and shows that C was the D. L. for that year.) Leap year has 2 D. L.s. 1 for the days preceding 29 Feb. and the other for the rest of the year. The intercalary day is marked by the same letter as the day preceding it, thus effecting the change on the following Sunday. D. L.s displaced the nundinal letters in the Rom. calendar; rules and tables for finding them are given in prayer books.

Dominican Order, see DOMINIC, ST.

Dominican Republic, also known as **Santo Domingo**, W. Indian rep., formerly the Sp. portion of the is. of Santo Domingo (q.v.) or Hispaniola. It occupies the E. or larger part of the is., of which Haiti is the W. part. Its area is 18,700 sq. m., with 1000 m. of coast-line; the pop. was estimated at 2,400,000 in 1955. There are 18 provs., and the chief tns are Ciudad Trujillo (formerly Santo Domingo), Santiago de los Caballeros, San Pedro de Macoris, San Francisco de Macoris, and Puerto Plata. The chief crops are sugar and cocoa; coffee and tobacco are also grown in quantities; and among other products are mahogany and other furniture hardwoods, cotton, lignum vitae, honey, logwood, turtleshell, etc. In 1946 imports were valued at 27,880,000 gold pesos and exports at 64,792,000. The gold peso equals the U.S. dollar. In 1954 the figures had risen to 82,800,000 and 119,700,000 gold pesos respectively. There are 260 m. of publicly owned railways. There is cable communication with N. and S. America, New York, Puerto Rico, and Cuba. The rep. is governed under a constitution proclaimed on 10 Jan. 1947. Congress is composed of a senate of 19 members (1 from each prov. and the dist. of Santo Domingo) chosen by direct popular vote, and a chamber of 45 deputies, both houses being chosen for 5 years, as is the president. Héctor B. Trujillo Molina was elected in 1952. The judicial power is vested in the supreme court, courts of appeal, courts of first instance, communal courts, and other tribunals set up by

special laws such as the land courts. The state religion is Rom. Catholicism with an archbishop at Ciudad Trujillo, but other forms of religion are tolerated. The D. army consists of 12,000 officers and men; there is an air corps and a small navy, each of about 2000. The D. R. is the oldest settlement of European origin in the New World, having been founded by Bartolomé Colón (brother of Columbus) in 1496, when it was named Hispaniola, or La Española. After its discovery it was occupied by numbers of Spaniards with imported African slaves, and the local tribes were quickly exterminated. An independent rep. was proclaimed in 1821, when the Spaniards evacuated the is. The present rep. seceded from Haiti (q.v.) in 1841, and became the independent D. R. in that year. The first foreign state to recognise her independence was Great Britain (in 1850). In 1916 Amer. military forces landed in the D. R. and a military gov. was proclaimed. Between 1922 and 1924 a provisional D. gov. was in office, but a duly elected constitutional gov. replaced it in July 1924, with authority in all matters except customs and foreign debt redemption, which latter were administered by an Amer. official. In 1941 a law was passed for the creation of the reserve bank, which, starting with branches purchased from the National City Bank of New York, opened for business on 27 Oct. 1947. In 1947 a new central bank was inaugurated, with total assets (31 Dec. 1947) of 13,625,000 pesos. See O. Schönrich, *Santo Domingo: The Country with a Future*, New York, 1919; S. Welles, *Naboth's Vineyard* (2 vols.), 1928.

Dominion, The, New Zealand national daily newspaper, estab. 1907, pub. in Wellington, with wide rural and metropolitan circulation and influence. Independent in outlook, its plain-spoken editorials, particularly on domestic politics, are widely respected.

Dominion Status, the political S. of any co-equal member of the Brit. Commonwealth of Nations. The self-governing D.s are Canada, Australia, New Zealand, S. Africa, India, Pakistan, Ceylon, and Ghana. Newfoundland (q.v.) was formerly a D., but after having had its D. S. suspended for some years for economic reasons, it finally elected to become a prov. of Canada, and so became in 1949. S. Rhodesia enjoys a large measure of autonomy but should be classified as a self-governing colony. All the 8 great D.s enjoy complete autonomy and appoint their own diplomatic representatives in foreign caps. or in each other's caps. They are bound together with the 'mother country' by their common allegiance to the Crown. Their gradual approach towards independence was recognised in the Balfourian formula adopted in the Inter-Imperial Relations Report of the Imperial Conference of 1926, which Report stated that equality of status is the principle governing inter-imperial relations or affairs as between the U.K. Gov. and the gov.s. of the Dominions, which are there described as

'autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegiance to the Crown and freely associated as members of the Brit. Commonwealth of Nations.' This loosely worded formula found its sequel in the Statute of Westminster of 1931, which gave extra-territorial operation to the legislation of the various D. parliaments and removed the last vestiges of the governor's veto. The governor—or governor-general in the case of a D.—has become the King's representative and is not the agent of the U.K. Gov. The common allegiance to the Crown is exemplified in the appointment of the governor-general chosen by the premier of the D. concerned, the right of appeal to the Judicial Committee of the privy council, and the status of all subjects of the D.s as Brit. subjects. The Rep. of Ireland has by Act of the Dail abolished the right of appeal to the Judicial Committee in the case of its own citizens and has eliminated the Crown from the internal part of its constitution. See BRITISH COMMONWEALTH OF NATIONS OF BRITISH EMPIRE; GOVERNOR-GENERAL.

Dominions Art Museums and Galleries.

The National Gallery of Canada in Ottawa, founded by the marquess of Lorne in 1880, is governed by a board of trustees estab. under the terms of the National Gallery of Canada Act, 1913. It consists of a sculpture court and nearly a score of picture and print g.s. The collection includes the work of 11 schools—from 14th-cent. Sienese to Botticelli, Veronese, Titian, Tintoretto, Canaletto; painters of the Dutch, Flem., and Sp. schools—Ruisdael, Jan Lievens, Rubens, Van Dyck, Goya, Murillo; and Hoppner, Gainsborough, and many others of the Eng. school. Veronese's 'The Rest on the Flight to Egypt,' El Greco's 'St Francis in Meditation,' Constable's 'Hampstead Heath,' and John Crome's 'Ruined Buildings' are recent accessions. There is also a section devoted to contemporary Brit. painting, and the most complete collection of Canadian art in existence. The Art Gallery of Toronto (instituted in 1912) has a permanent collection containing works by Bordonie, Boudin, Canaletto, Constable, Corot, Courbet, Delacroix, Gainsborough, Augustus John, Monet, Orpen, Pissarro, Sargent, Sisley, Hogarth, Rowlandson, Renoir, and Fantin-Latour. Canadian artists are also well represented.

The National Art Gallery of New S. Wales, in Sydney, was opened in a temporary structure in 1885, but a new building in freestone has taken its place. The present collection is valued at £157,000 and includes examples of Brit. and foreign modern artists—among them Poynter, Millais, Leighton, Peter Graham, A. de Neuville, Fildes, Shannon, Lavery, Clausen, and A. East. Recent additions include works by Corot, Boudin, Munnings, Orpen, and others. Two special courts are set apart for the works of

Australian artists, which form the most representative collection in any Australian G.—works by John Longstaff, George W. Lambert, Sir A. Streeton, W. Withers, Bernard Hall, Will Ashton, J. J. Hilder, and many others. The National Gallery of Victoria was incorporated in 1869 as the result of the appointment of a commission by the gov. to submit a scheme for the formation of a public M., G., and school of art. The first permanent picture G., now known as the McArthur Gallery, was opened to the public in 1875. G. costing over £175,000 were subsequently added, including 3 in 1932 in a building erected mainly through the bequest of James McAllan of Richmond. In 1904 £189,000 was bequeathed for the acquisition of works of art or antiquities. Works by Turner, Watteau, Reynolds, Corot, Millet, de Wint, Orpen, Ruissdnel, Lavery, Jan van Eyck, Burne-Jones, Bastien-Lepage, Puvis de Chavannes, Hoppner, Gainsborough, Allan Ramsay, Dupré, Courbet, Tintoretto, Titian, and numerous others have been purchased since 1905. Tipolo's 'Banquet of Cleopatra' (purchased 1933, much admired, 1954-5, at the European Masters of the 18th cent. exhibition in London) may be specially mentioned. Two courts of the National Art Gallery of S. Australia, in Adelaide, are devoted to Australian painters, and a fine collection has been built up.

New Zealand's National Art Gallery, in Auckland, opened in 1888, contains 2 collections, one of which belongs to the city corporation, while the other is administered by a trust. The former consists mainly of pictures by both Brit. and foreign artists, with a section devoted to the work of New Zealanders. The latter, known as the Mackelvie collection from the name of its donor who bequeathed it in 1885, contains paintings representative of the modern school of Brit. and continental artists.

The S. African National Gallery, founded in 1872, was taken over by the Cape Gov. in 1875, and the present G. was built in 1928 and opened in 1930. It has paintings by Wilson Steer, Augustus John, Sir W. Rothenstein, and a number of paintings by modern European artists.

Dominions Office, Brit. Gov. dept. dealing with the U.K. Gov. relations with the self-governing D. including S. Rhodesia. Up to 1925 its work had been done by the colonial O., but in that year a separate secretary of state was appointed with a separate (but more or less interchangeable) staff. The D. O. dealt also with the high commissioner. ters. of the Bechuanaland Protectorate, Basutoland, and Swaziland. In July 1947 the title of the D. O. was changed to Commonwealth Relations Office.

Dominis, Marc Antonio de (1566-1624), It. theologian and natural philosopher, b. Arba, Dalmatia. During his novitiate in the Jesuit order he taught rhetoric, mathematics, and physics. It was during this period that he wrote his *De Radiis Visus et Lucis in Vitris Perspectivis et Iride*. He became bishop of Segni and

afterwards of Spalatro, but being implicated in the disputes between Rome and Venice, having quarrelled with the pope and exhibited, moreover, certain Protestant leanings, he was obliged to resign his see. He was subsequently received in 1616 by James I of England. As dean of Windsor he wrote *De Republica Ecclesiastica*. He afterwards expressed a desire to return to the Catholic Church, but some letters he possessed belied his conversion, and he was imprisoned under the inquisition at St Angelo, where he d. in a few months.

Dominium, term in Rom. law which has been adopted into most European codes. It signifies complete and lawful right to and in an object, being distinct from the usufruct which is merely the right arising from actual possession.

Domino (etymology dubious), originally the hood or cape which priests wore out of doors in cold weather. In Venice and other parts of Italy the D. was worn at masquerades and fancy-dress balls by people not otherwise dressed in character. It was a wide-sleeved enveloping cloak with a half-mask. The word D. is popularly used as synonym for mask.

Dominoes (probably so called from the resemblance of the black backs of the pieces to the mask known as the domino), a game, partly of chance, partly of skill, played by any number of players, from 2 upwards. Twenty-eight oblong pieces of ivory, bone, or wood, white on the face, are required. The white face is divided into 2 parts by a line, and, except in the case of the double-blank, there are dots on one side or both sides of this line from the number of which the piece takes its name. Thus there is the double-six, with 6 dots on either side, the six-five, the six-four, etc.; the double-five, five-four, etc., ending with six-blank, five-blank, etc. Sometimes sets are also used ranging up to double-nine and double-twelve. The *block* and *draw games* are played as follows: The pieces, called also cards, are shuffled on the table face downwards, and each player draws the number of cards required, usually 7. The remainder of the pieces form the *stock*. The leader then plays, or, technically speaking, *poses* a D., generally the highest he has: the 2nd player must then pose one from his own set so that one of its numbers shall be the same as one of those on the D. first posed. Thus, if double-six were first posed, he can follow with any D. which has 6 on one side. By some rules, however, if a player pose a double he may play a 2nd card if possible. If a player cannot match he 'passes', and the 1st player (supposing the number be 2) plays again. If the 'draw' game is being played, however, a player who cannot match may draw on the stock until he gets a card that does match, provided always that 2 cards be left in the stock. If a player play out all his pieces he cries 'Domino' and wins the hand, scoring a number of points equivalent to the number of *pips* on his opponent's remaining cards. If neither can play any further, each counts the number of pips on his

remaining D., and each then scores the number of his opponent's pips. Fresh hands are then dealt until one player reaches 100. Double cards are laid cross-wise (*à cheval*). This is the commonest system of playing D. in England, but the *matador* is the commoner form on the Continent and is perhaps the more scientific. The object here is not to match the end number, but to make that number up to 7. There are a large number of other well-known D. games, among them Bergen (each player taking 6 pieces, the object being to play so that the same number appears at each end of the row, so scoring 2 points) and Bingo (played on the principle of Bézique, q.v.). The game probably came from the E.

Domitian (Domitianus), Titus Flavius (AD 51-96), Rom. emperor, younger son of Vespasian (q.v.); succeeded his brother Titus as emperor in AD 81. Though Tacitus (*Hist.* iv. 61, 68) alludes to the immoral practices of his youth, he commenced his reign with an earnest attempt to stem the tide of immorality at Rome. He reorganised the gov. of the provs. and erected some fine buildings in the city. During his reign the conquest of Britain was effected by Agricola, but his arms were humiliated elsewhere. The vices that disgraced his youth, however, grew malignant towards the end of his reign. In constant fear of assassination, he put to death members of his own family and many of his most illustrious subjects. He also exiled Epictetus and other philosophers from Rome. In AD 93 a persecution of the Christians and Jews took place. A conspiracy was formed against the emperor in AD 96, and he was put to death by a freedman in his own chamber, with the connivance of his wife, Domitia.

Domitius Ulpianus, see ULPIAN.

Domodossola, lt. tn. in Piedmont (q.v.), on the Toce, 48 m. NW. of Novara (q.v.). It is 25 m. SE of the head of the Simplon Pass (q.v.), is an international frontier station, and is the chief tn. of the Ossola valleys. Pop. (tn) 10,100; (com.) 12,100.

Domrémy-la-Pucelle, Fr. vil. in the dept of Vosges, on the l. b. of the Meuse, c. 30 m. SW. of Nancy. It is famous as the bp. of Joan of Arc (q.v.). The house where she was b. is preserved as a national memorial, and a basilica (1881) stands on the spot where *la Pucelle d'Orléans* first heard the voices. Pop. 280.

Don: 1. (anc. **Tanais**) Navigable riv. in European Russia, rising in the Central Russian upland and flowing SE. towards the Volga near Stalingrad, then turning SW. to empty into the Sea of Azov. Length 1236 m.; basin 162,000 sq. m. The chief tribs. are the Voronezh, Khoper, Medveditsa, and Severeskiy Donets. The chief port is Rostov-on-D. The Volga-D. Canal (q.v.) connects the D. with the Volga. From the 16th cent. the banks of the D. and its tribs. were colonised by Cossacks (q.v.), and until the Russian Civil war the D. area was the main centre of the Cossacks.

2. Riv. of NE. Scotland, rising in the Loder Hills and flowing E. to the N. Sea near Aberdeen. Length 83 m.

3. Riv. of NE. England, rising in the Pennines and flowing through Sheffield to join the R. Ouse at Goole; 70 m. long.

Don Benito, Sp. tn in the prov. of Badajoz. It manufs. hats and oil, and has a trade in agric. produce and wine. Pop. 20,700.

Don Carlos, see CARLOS, DON.

Don Cossacks, see COSSACKS.

Don Giovanni, see DON JUAN.

Don Juan (lt. **Don Giovanni**), famous figure in legend, whose prototype is found in the Sp. play (pub. in 1630) entitled *El Burlador de Sevilla y convidado*, and attributed to Tirso de Molina. The story runs that D. J., of the noble family Tenorio, is an abandoned profligate living in the days of Pedro the Cruel at Seville. When Ulloa thwarts D. J. in his machinations to seduce his daughter, he is promptly stabbed by the dissolute lover. An ardent disbeliever, D. J. mockingly challenges a stone image of his victim to a banquet in his tomb. The outraged Ulloa accepts and thereupon carries his murderer off to the very hell at which he has so exultingly scoffed. This story has been immortalised by Mozart's magnificent music to Da Ponte's libretto. Hence came the inspiration for Mérimée's novel *Les Ames du purgatoire*, Dumas's *Don Juan de Marana*, and Bulzac's *Elizir d'une longue vie*. Henry Purcell, who used Shadwell's play, *The Libertine*, 1676, was the first to write a musical setting, whilst Gluck's ballet music is still played. Goldoni, Molière, Espronceda, Flaubert, Landau, and Heyse have all coloured the legend according to their own fancy, but of all later writers Zorrilla, whose *Don Juan Tenorio* has come to be regarded as a national work, may justly claim the distinction of having cast the story into its most popular form. D. J. is introduced into Bernard Shaw's play *Man and Superman*. See O. Rank, *Don Juan*, 1924; L. di Bradi, *Don Juan, la légende et l'histoire*, 1930.

Don Quixote, see CERVANTES.

Dona Francisca, see JOINVILLE.

Donaghadee, tn of N. Ireland, in co. Down, situated on the Irish Channel, near Belfast Lough. It is the nearest port to Britain. The harbour is small, and accommodation scanty, but a shipping trade in dairy produce and cattle is carried on. Pop. 3400; summer 6000.

Donat, Robert (1905-), actor, b. Withington, Manchester, educ. Central School, Manchester. Married (1) Ella Annesley Vorse (marriage dissolved), (2) Renée Asherson. D. studied for the stage with James Bernard in Manchester and first appeared at the Prince of Wales's, Birmingham, 1921, as Lucius in *Julius Caesar*. He was a member of the famous Benson company from 1923 until 1928. His first London appearance was at the Wimbledon Theatre, 1928, in *The Merry Wives of Windsor*. He joined the Liverpool Repertory company at the Playhouse in 1928, and from 1930 to 1940 scored many West End successes. He went into management, also with success, in 1943. After being absent from the stage for nearly 6 years, he played Becket

in *Murder in the Cathedral* at the Old Vic, 1953. R. D. has had a particularly brilliant film career. He entered films in 1932 and has had outstanding successes, such as *The Private Life of Henry VIII*, *The Count of Monte Cristo*, *The Thirty-Nine Steps*, *The Ghost Goes West*, *The Winslow Boy*, and *Goodbye, Mr Chips*. He is one of the finest actors the Brit. stage has had for many years, with wonderful sensitivity and charm.

Donatello, or **Donato di Betto Bardi** (c. 1386-1466), It. sculptor, b.

Alinari

DONATELLO'S 'JUDITH' IN FLORENCE

Florence. His father was a wool merchant. D. came to Rome at the age of 17 with his friend Brunelleschi, where the 2 youths, besides carrying on the trade of goldsmith, devoted themselves to the study of architecture. After some years both men returned to Florence rich in ideas and inspiration. D. is celebrated for his marble and bronze statues, which are beautifully executed, and which reveal the nobility and force of those works of antiquity which formed his constant study and delight. He combines the good

points of the Renaissance with his own original way of treating his subject. The Renaissance betokened the revival of the Classic as opposed to the Gothic in the hist. of architecture, and Brunelleschi (q.v.), D.'s life-long friend, was the inaugurator of this new movement. D.'s patron was Cosimo de' Medici, who well rewarded him for his industry. The sculptor was correspondingly generous towards his friends. His prin. works are the marble statues of St Peter and St Mark in the church of San Michele at Florence; a bronze statue of David at Florence; another bronze figure of the equestrian Gattamelata in a public place at Padua. Other sculptural works are the statues on Giotto's belfry, decorative work on the pulpit of San Lorenzo, and figures in the baptistery at Florence. See Lord Crawford and Balcarres, *Donatello*, 1903; M. Crutwell, *Donatello*, 1911.

Donati, Giovanni Battista (1826-73), It. astronomer, b. Pisa. From 1854-64 he discovered 6 comets, the finest, which appeared in 1858, bearing his name. By subjecting the light of a comet to the spectrum analysis, he was able to describe its gaseous composition, and he is noted for his researches on stellar spectra. His work was carried out at the Observatory of Florence of which he became a director in 1864.

Donatio Mortis Causa, gift made in prospect of death. This practice is derived from Rom. law, and is thus defined in the *Institutes* (ii. tit. 7): "A gift made under an apprehension of death, as when a thing is given on condition that, if the donor die, the donee shall have it, but that it shall be returned if the donor shall survive the danger he apprehends or repents of his donation or if the donee die before the donor." Actual transfer is necessary, but where the nature of the goods makes this impossible the transfer of a symbol of ownership (e.g. a key) is permitted.

Donation: 1. **D. of Constantine**, a forged document, probably produced by a cleric at Rome about AD 750 to assist the Popes in extending their temporal dominions. It purported to be a deed of the Emperor Constantine whereby he bequeathed to Pope Sylvester the W. ters. of the empire. It was thought to be genuine until the 15th cent., when it was questioned by many eminent churchmen and finally proved a forgery by Lorenzo Valla. See H. Bettenson, *Documents of the Christian Church*, 1943; also ISIDORIAN DECRETALS.

2. **D. of Pepin**, 756. Pepin le Bref, after his victorious campaigns against the Lombards in 754 and 756, bestowed the conquered ters. on St Peter, i.e. the Pope. This was the true foundation of the temporal power of the Holy See and of the Papal states.

Donatists, powerful sect which arose in the Christian Church in N. Africa at the beginning of the 4th cent. There had long been 2 parties in Carthage: the moderates, headed, until his death in 311, by the bishop Mensurius; and a strong fanatical group, headed by Lucilla, a

wealthy widow. This latter party carried on in a more developed form the African tradition of severity towards *traditores*. On the death of Mensurius, in order to forestall the rigorists the moderate party hastily elected Caecilian as bishop, without awaiting the arrival of the Numidian bishops, and secured his consecration by Felix, bishop of Aptunga. Secundus, bishop of Tigris, treated this act as illegal, and convened a synod of 70 bishops at Carthage, which excommunicated Caecilian. The lector Marjorinus was elected in his stead, and on the death of Marjorinus in 315 Donatus, from whom the sect is named, took his place. Both parties had, before this time, appealed to the emperor Constantine, and his decisions had been in favour of orthodoxy. General synods at Arles (314) and Milan (316) also pronounced against the D., but the schism spread, and there were soon rival bishops throughout N. Africa. The D. excommunicated the rest of the Church, baptising again all Catholics who seceded to them. The orthodox reaction against the practice gave rise to the theory of a sacramental character imparted in baptism, confirmation, and holy orders. Finding them proof against persuasion, Constantine ignored them, but they were subjected to severe persecution under Constantine. In 411 a great disputation, attended by 286 Catholic and 279 Donatist bishops, was held at Carthage, and decision again given for the orthodox. St Augustine (q.v.) was among their strongest opponents. The members of the sect were subject to cruel persecutions in which they gloried; and in the 7th cent. they were annihilated by the Saracens. See D. Voelter, *Ursprung des Donatismus*, 1883; P. Monceaux, *Histoire littéraire de l'Afrique chrétienne* (vols. iv, vi), 1913, 1923.

Donatus, Aelius (4th cent. AD), Lat. grammarian and commentator, under whom St Jerome studied. The preface, life, and introduction to the *Eclogues* are the only portions of his commentary on Virgil that can be definitely said to have survived. We likewise possess his commentary on Terence, though probably not in its original form.

Donau, see DANUBE.

Donaueschingen, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Danube (q.v.), 64 m. SSW. of Stuttgart. It was largely rebuilt in 1908 after a serious fire. There are brewing and textile industries. Pop. 7000.

Donauwörth, Ger. tn in the *Land* of Bavaria (q.v.), at the confluence of the Danube (q.v.) and the Wörnitz, 54 m. NW. of Munich. It was once a free city of the Empire. The offer of the tn, then Protestant, to Bavaria by the emperor Rudolf II (q.v.) was one of the contributory causes of the Thirty Years' War (q.v.). Marlborough (q.v.) defeated the Fr. and Bavarians nearby in 1704; and here, in 1805, the Fr. under Soult (q.v.) defeated the Austrians. There is a ruined fortress, parts of the ancient walls remain, and there is a notable Gothic church.

There is also a splendid baroque (former Benedictine) abbey. Ironware is manufactured. Pop. 10,000.

Donawitz, Austrian tn in the prov. of Styria, 2 m. W. of Leoben. It has lignite mines and steel works. Pop. 18,000.

Doncaster, co. bor. of Yorks, England, on the r. b. of the Don, 35 m. SW. of York and 156 m. from London, on the Great N. Road. Apart from its importance as a centre for the richest coal-fields in the co. and its manuf. of locomotives and rolling stock for Brit. Railways, D. has varied industries, including confectionery, men's clothing, agric. machinery, wall-paper, electrical equipment, and brass, fencing, and wire rope works. The Mansion House near Priory Place, the first stone of which was laid in 1744, contains one of the finest banqueting halls in the country and D.'s municipal treasures include a mace dating from 1683. Other noteworthy buildings are the guildhall, now used solely for police H.Q. and courts; the central library in St George's Gate; the museum and art gallery overlooking the Beechfield Gardens; the technical college, for which a new college is now projected; and the corn exchange opened in 1873, adjoining which is the mkt hall and covered mkt.—among the best of their kind in the co. The corporation owns all these buildings, as well as the public utilities, the airport, and the racecourse. (The famous St Leger race has been run on this course since 1776. In addition to 5 'flat' meetings, there are 3 National Hunt meetings held each year.) It also owns 7 public parks and pleasure grounds: these include the Hexthorpe Flatts (28 ac.) containing the well-known beauty spot 'the Dell'; Elmfield Park opened in 1923; and Sandall Park, a new park in rural surroundings. To the N. of French Gate is the par. church of St George. The old building was destroyed in 1853, and the present medieval-looking building, with elaborately pinnacled and battlemented tower, was designed by Sir Gilbert Scott. The Romans had a military station here named *Danum* and in Domesday Book the place name occurs many times as 'Donecastre.' In 1194 Richard I gave the tn its first known charter, and it was a charter of Edward IV, dated 30 Oct. 1467, which authorised the election of a mayor. From such street nomenclature as French Gate, Baxter Gate, St Sepulchre Gate, etc., it might be inferred that in feudal times D. was fortified; but according to Leland it was never a walled tn, the word 'gate' in this context meaning simply 'street.' Such names as Priory Place and Greyfriars Road indicate the former presence of religious orders. In the mid-17th cent. John Evelyn described D. as 'a large, fair town, famous for great wax lights and good stockings.' For its loyalty in the Civil War Charles II granted the tn the privilege of being a free bor. of itself. The traditions of the tn when it was chiefly interested in agric. are kept alive in Robert Southey's memoirs of Dr Daniel Dove. For generations D.

retained the character given it by Southey, but with the advent of the railway the character of the tn was completely changed and works for the manuf. of brass, wire, wagons, and woollens opened in due course, while the development of the S. Yorks coalfield soon led to further great changes. In 1926 D. was constituted a co. bor. and granted arms which incorporate a Saxon crown indicative of the fact that D. (part of which pertained to the seke of Hexthorpe) belonged to Earl Tostig. Pop. 82,500.

Donegal: 1. Co. of Ireland in the prov. of Ulster, but belonging to the Rep. of Ireland, bounded by the Atlantic Ocean and the cos. of Londonderry, Tyrone, Fermanagh, and Leitrim. The coast-line is very irregular, being broken by Lough Swilly, Sheep Haven, Boyleagh Bay, Gweebarra Bay, and Donegal Bay. The coast is fringed by many is., of which the chief are Inishtrahul, Tory Is., and Aran Is. The surface of the country is mountainous. These mts include 8 summits of which Mt Errigal (2466 ft) is the highest. Adjoining Malin Beg Head in the W. of Donegal Bay there is a sea cliff 1964 ft in height. The chief rvs. are the Foyle, the Finn, the Swilly, the Erne, the Gweebarra, the Gweedore and the Owenena. The co. also possesses many lakes, of which the prin. are Loughs Berg, Deele, Gartan, Kesh, and Glen. The climate of D. is inclement. Rude winds prevail, rendering great tracts of the co. barren. The mould in some regions consists of light clay, suitable for crops of potatoes, oats, and barley. Agric. implements are for the most part primitive. The breeding of cattle and sheep is the most profitable occupation but the fisheries of the coast support most of the inhab. The country women occupy their time with the embroidery of linen, lace, and muslin. Linen and tweed (Donegal tweed) are also manuf. in the co. Of the historical remains the most interesting is the Grianan of Aileach, the palace of the kings of N. Ireland from most anct. times. There are also interesting relics of St Columba and the famous Purgatory of St Patrick situated on an is. in Lough Berg. The co. tn is Lifford. Area 1,193.581 ac.; pop. 136,317.

2. Mkt tn at the head of D. Bay. D. Abbey is the remains of a Franciscan friary (15th cent.), and D. Castle, now a ruin, was restored by Red Hugh in 1505. Pop. 1100.

Donelson Fort, camp at Dover, Tennessee. It was built in the time of the Civil war by the Confederates for the purpose of guarding the Lower Cumberland R., and it consisted of 2 lines of entrenchments on the land side, and water batteries. It was taken by the Federals in 1862, the prisoners numbering nearly 15,000, which was considerably over two-thirds of the original army.

Doneraile, small tn in co. Cork, Rep. of Ireland, situated on the R. Awbeg, about 6 m. N.E. by N. of Mallow. Pop. 800.

Donets Basin (abbreviation **Donbas**), the most important coal-mining basin of the U.S.S.R., the core of the S. Industrial

Region (q.v.). It is situated in the SE. Ukraine (Stalino and Voroshilovgrad oblasts) and the Kamonsk oblast of the Russian Federal Rep., on the slightly inundated plain of the Donets Plateau, with steppe landscape: E.-W. 240 m., width N.-S. 90 m., total area 9000 sq. m. There are rich deposits (70 milliard tons) of excellent anthracite and steam coal in comparatively thin seams, usually under 3 ft, also deposits of mercury, salt, and mineral building materials. Recent prospecting has shown that coal deposits extend far beyond the old boundaries of the D. B. to the E., N., and W. There are large coal-mining (since 1722), iron and steel (since 1795), chemical (since 1889), and heavy engineering (since 1895) industries. Powerful thermo-electric stations have existed since 1910. The area has diverse agriculture. There is a dense railway network. The chief industrial centres are the Stalino-Makeyevka and Kadiyevak-Voroshilovsk conurbations, Voroshilovgrad, Gorlovka, Shakhty, and Kramatorsk. Coal was discovered in the D. B. in 1721 and mining began immediately, but rapid industrial development started in the 1870's, and soon the D. B. became the most important centre of heavy industry in Russia. Twice the industries were ruined, during the Civil War (1918-20) and the Second World War (1941-3), and on both occasions followed periods of restoration (1920-7, 1943-8) and further expansion. Both before 1917 and during the period of the Dictatorship of the Proletariat (q.v.) the D. B. was a stronghold of the Bolshevik party. The Shockworkers' and the Stakhanov movements (q.v.) originated here. On the other hand, the anti-Communist Industrial party (q.v.) allegedly had many adherents among the technical intelligentsia of the D. B.

Dong-nai, riv. of Cochinchina (q.v.), rising at an altitude of 5000 ft. It receives the Saigon R. and others. After a course of 250 m. it enters the China Sea to the NE. of the Mekong delta.

Dong-Trieu, coal-mining tn of Quang-yen (q.v.), Tonking (q.v.), and scene of heavy fighting in 1945-54 war in Viet Nam (q.v.). Produced 500,000 tons of high-grade anthracite annually before the Second World War; no later figures are available.

Dongola, Sudan, consists of a long, narrow plain, situated in the valley of the Nile, and includes both banks of that riv., while to the E. lies the Nubian desert, and to the W. is the Libyan desert. From 1820 to the Mahdi insurrection of 1885 it was Egyptian. Gen. Kitchener took it in 1896. Merowé (q.v.), the cap. of the prov. (pop. 15,000), is situated on the l. b. of the Nile. New Dongola (pop. 16,000) is the chief centre of trade. Old D., a decayed tn, is 75 m. SSE. of New D. The Nubian race are the prin. inhab. of the prov.

Doni, Antonio Francesco (1513-74), It. priest and writer, b. Florence. He settled down in Venice as a printer, publishing many original but eccentric books. His 2 main works, both pub. in

1552, are *I Marmi*, imaginary conversations on the 'marble steps' of the cathedral of Florence, and *I Mondi*, a picture of a social utopia, which reflects the influence of Sir Thomas More.

Dönitz, Karl (1892-), Ger. adm., b. Mecklenburg of a family of shipowners. At first he served in the cruiser *Breslau*, but transferred to the submarine branch of the service and served for the greater part of the First World War in U-boats. Took part in many attacks on Allied convoys in the Mediterranean until he was captured in 1918 and interned in England. After the outbreak of war in 1939 Hitler chose him to be head of the U-boat service. He had a fanatical faith in the power of the U-boat to gain victory for Germany by destroying the sea-power of the Allies, and his successes in the early months seemed to confirm his optimism. He developed the 'pack' system of attack. But in 1943 the tables were turned and the Allies got the upper hand. D. attained the rank of adm. in 1942 and that of grand adm. in 1943, in which year he succeeded Raeder as commander-in-chief of the Ger. Navy. On the Ger. surrender he put himself forward as the successor to Hitler, with the style of Führer. But he was arrested and held for ultimato trial as a war criminal, and subsequently imprisoned, being released in 1956.

Donizetti, Gaetano (1797-1848), It. composer, studied music in his native place, Bergamo, and later at Bologna. There is no truth in the story that he was of Scottish descent. The opera which made his name widely known was *Anna Bolena*, produced in 1830 at Milan, although he had already produced over 30 before. His *Elixir of Love*, 1832, abounds in clear pure sentiment and radiant joy. Altogether he composed more than 70 operas. His *Lucia di Lammermoor*, produced at Naples in 1835, was his greatest success and gained him a professorship of counterpoint in that city. His closing years were saddened by signs of lunacy. Considering that his rivals were Rossini and Bellini, D.'s contemporary popularity is a remarkable tribute to his talents. *La Fille du Régiment*, 1840, was his most popular work in Fr., but the finest of all is *La Favorite*, produced in the same year, and the most enduring is the delightful *Don Pasquale* of 1843. In the 'marriage contract' and 'tomb' scenes of *Lucia* and in *Favorita* and *Linda*, 1842, he proves himself as gifted a master of melody as Bellini, and a more dramatic master of the concerted number. His melodies demanded capable singers in a period when opera was essentially an exhibition of vocal tone and technique. D. combined the gift of writing pleasant melodies and composition peculiarly suited to the voice with extreme facility, vigour, and humour. He became paralysed in 1845. See G. Gavazzeni, *Gaetano Donizetti*, 1935; and A. Fraccaroli, *Donizetti*, 1944.

Donjon, see DUNGEON.

Donkey, see ASS.

Donnay, Maurice Charles (1859-1945),

Fr. playwright and author, b. Paris. His plays, characterised by keen observation, gained great popularity, and D. was elected to the Academy in 1907. Among his plays are: *Amants*, 1895; *Douloureuse*, 1897; *L'Affranchie*, 1898; *La Patronne*, 1908; *Les Éclaircissements*, 1913; *La Chasse à l'Homme*, 1920; *Un Homme léger*, 1925; *La Reprise*, 1925; *L'Ascension de Virginie*, 1929. Of his non-dramatic works *Alfred de Musset* appeared in 1914. See H. Duvrernois, *M. Donnay*, 1928.

Donne, John (1572-1631), clergyman and poet, b. London, son of Rom. Catholic parents, connected through his mother's family with Sir Thomas More and with John Heywood, the dramatist. He is quaintly enough the hero of a truly romantic love-story. This is strange because the very glow of his spiritual life, combined with his melancholy and fantastic humours, would seem to leave small room for romance. Both at Oxford and Cambridge he proved an excellent scholar, but his religion, Rom. Catholicism, forbade his taking the oath necessary for a degree. His lifelong intimacy with Sir Henry Wotton dates from his Oxford days. At 17 he began to study law at Lincoln's Inn, and it was at this time that he became a Protestant, finding himself after careful scrutiny more in sympathy with the Anglican than the Rom. standpoint. After a year spent in Italy and Spain he became Lord Ellesmere's secretary, fell in love with his patron's niece, whom he secretly married, and thus lost his position. D. was imprisoned by his father-in-law, but finally won back his freedom and his wife after a protracted lawsuit which ran away with nearly the whole of his property. With the accession of King James his fortune changed. In 1610, desirous of a place at Court, he made a bid for royal patronage with *Pseudo-Martyr* (a contribution to the disputes about the Oath of Supremacy and Allegiance), and in 1611-13 with *Ignatius his Conclave* (an attack on the Jesuits), an *Elegy on Prince Henry*, and an *Epithalamium* for the marriage of the princess Elizabeth. So delighted was the king with *Pseudo-Martyr* that he insisted on the author's taking holy orders and appointed him his chaplain-in-ordinary. Other honours followed, and at his death, which was hastened by consumption, D. was vicar of St Dunstan's and dean of St Paul's Cathedral, London.

Isaac Walton has left a delightful biography of D. In the pulpit he was, according to his biographer, 'always preaching to himself like an angel from a cloud, but in none.' Writing of D.'s poetry, Saintsbury justly praises 'the magical illumination of obscure and shadowy thoughts with the lightning of fancy,' whilst Dryden's verdict is that he was 'the greatest wit though not the best poet of our nation.' But it would be difficult to find a better appreciation than Ben Jonson's observation that he was 'the first poet in the world in some things,' but that he would perish 'for not being understood.' Although there has been a decided revival of interest in D.'s poetry

in recent years, the richness of his fancy and wealth of erotic fervour are obscured from the ordinary gaze by a host of fantastical conceits, of 'quips and cranks' expressive of far-fetched, if ingenious, imaginings, and of wanton deformities, both of wit and metre. Like other poets of the 'metaphysical' school, he strives to ennoble poetry by applying it to the phenomena of science and making his muse the handmaid of natural philosophy. D. is the lover and sensualist, but he reviews his love in philosophical terms, or explores it with the images conceived in his scientific and theological reading. 'He can perceive beauty, but at the very moment of that perception, he sees the corpse, the ceremonial cloths, the skeleton. He knows passion, but he can mock at the physical body through which passion is transmitted . . . This frankness, in passion, this despair of making a unity out of the broken images of life, have brought him close to some contemporary poets' (B. Ifor Evans), and partly explain the revival of interest in his works. The standard ed. of Donne's poems is that of H. J. C. Grierson, 1912, 1929; and some of his prose works appear in *The Complete Poetry and Selected Prose*, ed. by J. Hayward, 1930. Bibliography by G. Keynes, 1914, 1932. See lives by Izaak Walton, 1658; H. F. A. Fausset, 1924; J. Bennett, 1934; also Sir E. Gosse, *Life and Letters of John Donne*, 1899; Mary P. Ramsay, *Les Doctrines multivales chez Donne*, 1917, 1924; Evelyn M. Simpson, *A Study of the Prose Works of John Donne*, 1924; G. Williamson, *The Donne Tradition*, 1930; C. M. Coffin, *John Donne and the New Philosophy*, 1937; J. B. Leishman, *The Monarch of Wit*, 1951.

Donnybrook, suburb of Dublin (q.v.). Rep. of Ireland.

Donoghue, Stephen (1885-1945), jockey, b. Warrington, Lancs. Rode Derby winner in 1915, 1917, 1921, 1922, 1923, and 1925. He retired from racing in 1937 and took up training. Wrote a novel: *The Luck of the Gentle Gaffer*, 1926; and an autobiography, *Just my Story*, 1923.

Donzy, Fr. tn in the dept of Nièvre. It has Rom. remains. Cardinal Mazarin (q.v.) founded factories here in 1659. Pop. 2000.

Doolittle, Hilda (1886-), Amer. poetess, b. Bethlehem, Pennsylvania. Educ. at Bryn Mawr College, she came to Europe in 1911 and remained to become one of the Imagist group of poets and marry Richard Aldington, one of their leaders; after their divorce in 1937 she settled in Switzerland. Her books of verse include: *Sca Garden*, 1916; *Hymen*, 1921; *Heliodora*, 1924; and the religious trilogy *The Walls Do Not Fall*, 1944, *Tribute to the Angels*, 1945, and *Flowering of the Road*, 1946. Of all the Imagist poets she remained most faithful to their principles, her lyrics displaying an objective approach and a chiselled beauty reminiscent of ancient Greek art.

Doom, or **Doom**, popular name of *Hyphocne thebaica*, a palm-tree of Upper Egypt, clumps of which occur near Thebes. The fruit is about the size of an orange, reddish in colour, and has a spongy, tasteless, but nutritious rind.

Doomsday Book, see DOMESDAY BOOK.

Doon, loch and riv. of Ayrshire, Scotland. The loch is 3 m. S. of Dismellington, some 6 m. long and 1 m. wide, nearly 700 ft above sea-level. There are sev. small is., and it is enclosed by mts. The R. D. flows through the loch, emptying itself into the firth of Clyde 1 m. from Ayr. There are trout and salmon in both loch and riv., and the stream has been immortalised by Burns.

Door, a movable barrier closing the 'doorway' to a building or room. It may be hung on hinges, or pivoted at top and bottom, or made to slide; and may be secured by locks, latches, and bolts.

DOORWAY AT MAGDALEN COLLEGE, OXFORD (15th cent.)

The doors are of late-Gothic type, midway between the ledged type and the panelled type

D.s are normally made of wood; but ancient tombs were occasionally closed by stone D.s; and a pair of magnificent bronze D.s, each measuring c. 24 ft high by 7 ft wide, still exist in the Pantheon at Rome, AD 112. In the Brit. Museum is a wooden D. from Egypt which has survived in perfect preservation for over 3000 years. It measures c. 8 ft by 4 ft, and consists of 5 vertical boards 24 in. thick, held together by 3 horizontal battens. This simple type, still used for sheds, etc., in modern practice everywhere, is a 'ledged door.' The addition of diagonal braces, to prevent the D. sagging from its hinges, produces the familiar 'ledged and braced door.' During the Middle Ages framed D.s, in which the horizontal 'rails' are tenoned into the vertical 'stiles,' were introduced; and, in Tudor times, panelled D.s followed. These consist of a framed structure filled with thin panels, the latter becoming progressively larger through the 17th-18th cents. A modern innovation is the factory-made flush-panel D., which has a rough frame entirely

concealed by a thin veneer of polished wood. *See* JOINERY.

Doorn, small tn in the prov. of Utrecht, Netherlands, 11 m. SE. of the city of Utrecht. At D. the ex-emperor of Germany, William II, resided from 1920 to 1941.

Doornik, *see* JOURNAL.

Dopes, for fuels, *see* MOTOR CARS and MOTOR CYCLES.

Doppler, Christian Johann (1803-53), celebrated Austrian scientist, b. Salzburg, chiefly remembered for 'Doppler's principle,' 1842. This states (a) that the pitch of a sound is changed if the object emitting it is moving relative to the observer, and (b) that the light emitted by a moving source is changed in colour as perceived by a relatively stationary observer. In each case the frequency derived is greater or less than the actual frequency according to the body's approach or recession. D.'s principle has proved of great value in physics and astronomy.

Dorado, 'the sword-fish,' a S. constellation, discovered by Bayer in 1603, situated in the S. hemisphere between Pictor and Hydrus. Alpha Doradus is a white star of 3.5 magnitude, with a peculiar spectrum. The Great Looped Nebula surrounding 30 Doradus is a bright nebula, visible to the naked eye, and is situated in the larger Magellanic Cloud.

Doran, John (1807-78), miscellaneous writer, b. London, of Irish parentage. He obtained a doctorate of the univ. of Marburg, in Prussia, devoted himself to literature, and in 1869 was editor of the *Athenaeum*, and, later, of *Notes and Queries*. He pub. a number of works dealing with the lighter phases of manners, antiquities, and social hist., often bearing punning titles, e.g. *Table Traits with Something on Them*, 1854, and *Knights and their Days*, 1856. He also wrote *Lives of the Queens of England of the House of Hanover*, 1855, and *The History of Court Fools*, 1858, and ed. Horace Walpole's *Journal of the Reign of King George the Third*, 1859. *Their Majesties' Servants*, 1864, is a hist. of the stage.

Dorat, Claude Joseph (1734-80), Fr. author and poet. He left the career of advocate to devote himself to literature, and contributed largely to *L'Amanach des muses*. He wrote comedies, fables, madrigals, romances, and dramas, but had no very real talent, being merely a 'bouffon poet' of considerable popularity in his own time. Among his plays are: *Zulica*, 1760, and *Adelaide de Hongrie*. His *Réponse d'Abdard à Heloïse* gained immediate popularity. Among his poems may be mentioned: *Sélim et Sélima*, *Le Mois de mai*, *Les Tourterelles*.

Dorat, Jean, *see* DAURAT, JEAN.

Dor-beetle, or *Geotrupes stercorarius*, species of Scarabaeidae frequently found in England, where it is sometimes called the buzzard clock. It is a dung-B., not quite an inch in length, and in colour it is a metallic black. In summer evenings it flies about at dusk with a curious droning sound.

Dorcas Society, name given to working parties of ladies, where they make garments for charity. The name is derived from Dorcas (mentioned in Acts ix. 36), who made coats for the widows.

Dorchester: 1. Municipal bor., co. tn of Dorset, 120 m. SW. of London, and very picturesquely situated. It is Roman in origin, and was called Durnovaria. A fragment of its walls remains; their line is now marked by pleasant avenues which surround about three-fourths of the tn. The foundations of a Rom. house, discovered in 1937 in the grounds of the new co. hall, are preserved as an ancient monument. Maumbury Rings was used as the amphitheatre of the Rom. tn, although its origin goes back to late Neolithic times, about 2000 BC. Particularly interesting buildings in the tn are St Peter's Church, Judge Jeffrey's Lodgings, and Napper's Mite (16th cent.), formerly an almshouse. The museum has remarkably fine collections exhibiting the archaeology, natural hist., and geology of the whole co. The tn has literary associations with Wm Barnes, the poet, and Thomas Hardy, the latter being b. 3 m. from D. at Higher Bockhampton, and living for the last 50 years of his life at Max Gate, which he built on the outskirts of the tn. Maiden Castle, the pre-Rom. tribal cap., is a magnificent earthwork 2 m. SW. of the tn. Pop. 12,000.

2. Dist. of Boston, U.S.A., containing 2 of the oldest houses in New England and a burying ground dated 1634. It was founded by 110 colonists from Dorsetshire, England, encouraged thereto by Rev. John White, of Trinity par., D. *See* W. D. Orcutt, *Good Old Dorchester*.

Dorchester-on-Thames, par. and vil. of Oxon., England, 9 m. SE. of Oxford. In AD 634 Cynegils, king of the W. Saxons, was baptised here by St Birinus, the apostle of Wessex, King Oswald of Northumbria standing sponsor. The bishopric founded here in the time of Birinus lasted until removed to Lincoln by Remigius (1067-92). There is an Augustinian abbey church dating from Norman times; D. is also the site of a Rom. station (Dorocina), and of a Brit. earthwork. Pop. 1503 (1954).

Dordogne: 1. Dept of SW. France, formed from Périgord, and parts of the ancient provs. of Limousin and Angoumois. The surface is in general hilly and well wooded, with beautiful and fertile valleys in the centre of the dept, and marshes in the E. There are numerous vineyards on the hill-slopes, chestnuts are produced in great quantities, and wheat, maize, tobacco, and potatoes are grown. The truffles of Périgord are famous. Some iron, coal, and manganese are found. There are leather, textile, and distilling industries. The prin. tns are Périgueux (the cap.), Bergerac, Nontron, and Sarlat (qq.v.). Area 3550 sq. m.; pop. 377,900.

2. Riv. of France, which rises in the Puy de Sancy, Puy de Dôme, and flows through Souillac, Bergerac, Castillon, Libourne, and Cubzac to join the Garonne at Ambès, a distance of 306 m. *See*

A. H. Brodrick. *The Caves of Lascaux*, 1948.

Dordrecht (popularly called **Dort**), seaport on the R. Merwede, 12 m. SE. of Rotterdam, in the prov. of S. Holland. Intersected by a number of canals which greatly facilitate communications, it is engaged in many industries, such as ship-building and engineering, and has manufs. But Rotterdam has diverted a great part of the traffic which made D. the richest and most important trading tn of Holland and a member of the Hanseatic League. It still retains many quaint thoroughfares

H. Kumpke

THE VOORSTRAATSHAVEN, DORDRECHT,
SOUTH HOLLAND

and gabled houses. The original residence of the counts of Holland, it witnessed in 1572 the declaration of independence of the United Provs., and in 1618-19 the famous synod of Protestant theologians which anathematised Arminius' (q.v.) heresies. Pop. 75,590.

Doré, Louis Auguste Gustave (1832-83), Fr. painter and illustrator, b. Strasburg, drew first for the *Journal Pour Rire*, 1848, and later for the *Journal Pour Tous*. His drawings show genius for grotesque and humorous illustration as also fertility of invention and preference for the fantastic. He illustrated an ed. of the Bible; among other works illustrated by him were Balzac's *Les Cent Contes Drôlatiques*, 1837, trans. into Eng. as *Droll Stories collected from the Abbeys of Touraine* (with 425 engravings by D.), 1874; Dante's *Divina Commedia*, 1863-6; Milton's *Paradise Lost*, 1866; Tennyson's *Idylls*, 1867-8; La Fontaine's *Fables*, 1867; and Rabelais' *Gargantua and Pantagruel*. His *London*

contains some of his best work. As a sculptor he is remembered for his statue of Dumas, in Paris, whilst he was ambitious for fame as an historical and religious painter. The Doré Gallery in London was long decorated with his huge canvases depicting 'Christ leaving the Praetorium,' 1867-72, etc. See B. Roosevelt, *Life and Reminiscences of Gustave Doré*, 1885; and life by M. Rose (ed. J. Laver), 1945.

Dore, Monts, volcanic mt group in the dept of Puy-de-Dôme, France, part of the Auvergne system. The highest point is the Puy-de-Sancy (6000 ft).

Dorema, genus of Umbelliferae. *D. ammoniacum*, a perennial herb, is found in dry plains in Persia and Baluchistan; it yields the gum ammoniacum used in medicine.

Doria, Andrea (1466-1560), Genoese soldier, b. Oniglia. He served under various It. princes on different expeditions; he then entered the service of the Fr. king Francis I, and eventually became high adm. of the Levant. Later on he resigned his command of the fleet, as he feared for the safety of Genoa, which was threatened by the Fr., and transferred his services to the emperor Charles V, who made him prince of Meli. In 1528 D. expelled the Fr. from the garrison of Genoa, and ruled the city himself on republican lines. He was very active in his attacks against the Turkish pirates in the Mediterranean, and was styled 'father and liberator of his country.'

Dorians, one of the 3 main branches of the Hellenic race. They probably came simultaneously from the N. and from Crete, occupying the Peloponnesus, the Sporades, SW. Asia Minor, and the S. coast of Sicily. The Dorian invasion is commonly supposed to have taken place about 1100 BC; it is associated in legend with the return of the Heraclidae. Compared with other Greeks, the D. were more conservative and aristocratic in outlook, and in the Peloponnesus at any rate they seem never to have forgotten that they were a conquering race. Hence the austerity of Spartan customs and the permanent subjection of the helots.

Doric Dialect, one of the 4 main dialects of the anct Gk language. It was spoken in every region where Dorians (q.v.) settled. The broad features which distinguish it from Ionic are *mes* for *men* in 1st person plural; *-ae* and *-æ* for *ē*; *ka* for *an*; and *-sēo*, *-siō*, and *-sō* as endings for the 1st person of the future. The Dorians invariably claimed a greater antiquity for their dialect than Ionic, a fact which probably accounts for the archaic D. which appears as an anachronism in Attic drama. Pindar wrote in D.

Doric Order, earliest and most characteristic type of Gk architecture, of which the Parthenon at Athens is a fine example. The D. column is a massive fluted pillar imposing in its severity and absence of adornment. There is also a *kom.* D. O. See ORDERS OF ARCHITECTURE.

Dorigny, Sir Nicholas (1657-1746), Fr. engraver, b. Paris. He studied at Rome,

and from 1711 to 1719 worked for Queen Anne at Hampton Court, engraving the cartoons of Raphael. He was knighted by George I in 1720, and in his later years worked in Paris, where he d.

Dorion, Sir Antoine Aimé (1816-91), Canadian statesman. He became leader of the Liberal party, and was the first to enunciate clearly the principle of federation as applicable to his country. As minister of justice in the Mackenzie gov. he passed the Electoral Law, 1874, and the Controverted Elections Act. In 1874 he was appointed justice of the prov. of Ontario.

Doris, small mountainous dist. of anct Greece. It was surrounded by Phocis, Locris, Aetolia, and Malis, and contained the sources of the Cephissus. The Dorians claimed this ter. as their home. It is now included in the gov. of Phocis.

Doris, or **Archidoris**, important genus of nudibranchiate molluscs, typical of the family Dorididae. The species are usually a white, brown, or yellow colour, whence they are called sea-lemons, but they often take the colour of their surroundings. *D. pilosa* and *D. tuberculata* are well-known members of the genus.

Dorking, urban dist. and mkt tn of Surrey, England, 6 m. W. of Reigate and 24 m. S. of London. It enjoys a lovely setting, ringed by wooded hills and with some of Surrey's finest scenery in the vicinity. To the N.E. of the tn the landscape is dominated by Box Hill (q.v.); also in the vicinity are Leith Hill, Rammer Common, The Nower, Mickleham Downs, and Glory Wood. Meredith d. (1909) at Flint Cottage, Box Hill, where he had lived since his second marriage, and is buried at D. D. fowls are noted for their 5 claws. Pop. 20,050.

Dormer, or **Dormer Window**, originally a window in a dormitory (q.v.) or attic-bedroom; hence any window, whether with a flat or sloping top, rising from a sloping roof. D.s have always formed a prominent feature in Fr., Flem., and Ger. architecture.

Dormitory (Lat. *dormitorium*, a sleeping place), originally the sleeping quarters of monks. In some monasteries the D.s were on the ground floor, giving easy communications with the church, though generally they formed the upper storey of the cloisters. Sometimes they were long halls, but more often a series of cells or cubicles. To-day the name is applied to communal bedrooms in schools, etc.

Dormont, residential bor. of Pittsburgh, Pennsylvania, U.S.A. Pop. 13,405.

Dormouse, name given to members of the rodent family Muscardinidae, consisting of small, arboreal animals living in the Old World. The eyes and ears are large, the tail is long and hairy, and the intestine has no caecum. The animals are squirrel-like in habit and diet, but they are nocturnal. *Muscardinus vellianarius*, the common D., is found all over Europe, and is remarkable for its winter sleep, the period of time during which it hibernates being about 6 months. *Elis glis*, the fat or squirrel D., is an allied European species.

Dornbirn, Austrian tn in the prov. of Vorarlberg, on the Dornbirner Ache, near the Lake of Constance. It has iron, chemical, and textile industries. Pop. 22,550.

Dornburg, Ger. tn in the dist. of Gera, on the Thuringian Saale, 22 m. WNW of Gera (q.v.). It has 3 castles: the Altes Schloss was frequently used as a residence by the emperors Otho II and III; the Neues Schloss, built in the 18. style in 1748, has associations with Goethe; and the 3rd castle is a modern structure. Pop. 1300.

Dornoch, par., royal and police burgh, and cap. of the co. of Sutherland, Scotland. The tn is situated on the N. of Dornoch Firth, 14 m. E. of Bonar Bridge, and 8 m. SE. by S. of Mound Station. In pre-Reformation times it was the see of a bishop, and Gilbert de Moravia, who d. in 1245, and was the last on the calendar of Scottish saints, built a cathedral, which was restored in 1837 by the 2nd duke of Sutherland. The last execution for witchcraft in N. Britain took place here in 1722. Skibo Castle, about 4 m. from D., belongs now to a daughter of the late Andrew Carnegie. The golf links in the vicinity of D. are very fine and are the earliest recorded (1616). Pop. of par. 2500; tn 720.

Dorohoiu, or **Dorogoi**, tn of Rumania, 75 m. NW. of Jassy in prov. of Suceava. There is considerable trade in dairy and farm produce, also timber. A noted ann. fair is held in June. Pop. (1930) 16,000.

Doronicum, or **Leopard's Bane**, genus of bright orange composite plants found in Europe. *D. plantaginifolium*, L. f., and *D. pardalianches*, Great L. B., grown in gardens, have become naturalised in Britain.

Dorp, Afrikaans (q.v.) word for a vill., in common use throughout S. Africa.

Dorpat, see TARTU.

D'Orsay, Alfred Guillaume Gabriel, Count (1801-52), Fr. dandy, b. Paris, the 2nd son of Gen. Count d'O., served in the Fr. Army until 1822, when, after a tour of the Continent with the earl and countess of Blessington, he came to England. Though married to a daughter of Lord Blessington by his first wife, d'O. was on very intimate terms with Lady Blessington. During his 20 years' residence in England he executed a series of admirable drawings of his most noted contemporaries, and was noted as a brilliant conversationalist. He became bankrupt in 1849 and returned to Paris, where he d. He was appointed Director of Fine Arts in Paris by Louis Napoleon after the *coup d'état*, but he did not live to fill the position.

Dorset, maritime co. in the SW. of England, the co. tn being Dorchester. Chalk downlands provide the central feature of its topography and separate the heathlands of the E. from the clay pastures of the N. and W. To the E. the beautiful coastline is broken by Poole Harbour, 10,000 ac. in extent, to the S. of which lies the peninsula known as the Is. of Purbeck. Chesil Bank is a remarkable stretch of shingle connecting the Is. of

Portland with the mainland and continuing unbroken along the coast to Bridport. At Portland Roads the protection afforded by the Chesil Bank has been augmented by breakwaters to provide an important harbour for the R.N. The prin. streams are the Stour, flowing S.E. into Hants, and the Frome and Piddle, which enter Poole Harbour. Agriculture is the chief industry, the co. being noted for its excellent dairy produce. Second in importance is the holiday industry. Poole, Swanage, Weymouth, Bridport, and Lyme Regis being coastal resorts. Quarrying is another important industry. The white freestones of Portland have been used in buildings all over the world, particularly in London, and the white pipe-clay of E. Dorset is in great demand by the pottery industry. Purbeck is famed for its marble. Bridport is noted for the manuf. of rope, twine, and net. Gillingham and Sherborne stand on the former S. main railway line connecting London and Exeter; Poole, Warcham, and Dorchester stand on the former S. main line running from London through Southampton and Bournemouth to Weymouth. Dorchester is also on the former Great W. main line from London to Weymouth through Reading and Yeovil. Wimborne Minster, Blandford Forum, Swanage, Portland, Bridport, and Lyme Regis are served by branch lines. Poole, Weymouth, and Bridport are the chief seaports. Wimborne Minster, the abbey church of Sherborne, the fine ruins of Corfe Castle, and the prehistoric earthwork Maiden Castle all possess considerable antiquarian interest. The co. is also interesting geologically, and remains of immense reptiles have been unearthed at Lyme Regis. The total acreage of the co. is 622,813; pop. 299,360. See A. de Selincourt, *Dorset*, 1947.

Dorset, Charles Sackville, Earl of Middlesex, 6th Earl of Dorset (1638-1706), courtier, son of the 5th earl, whom he succeeded in 1677. The early part of his career was spent in pleasure and dissipation at Charles II's court. He had no prominent place at court during the reign of James II, but was reinstated on the accession of William III. He was a patron of poets and dramatists, and wrote verse himself; but the only lyric by which he is remembered is 'To All You Ladies now on Land,' said to have been written before the battle of Marston, 1665.

Dorset, Thomas Sackville, 1st Earl of (1536-1608), poet and statesman, b. Buckhurst, Sussex, son of Sir Richard Sackville, chancellor of the exchequer. Educ. at Oxford and Cambridge, he studied law at the Inner Temple, and while there wrote, in conjunction with Thomas Norton (q.v.), *Ferrex and Porrex*, afterwards called *Gorboduc*, 1561-2, the first regular Eng. tragedy. A little later he planned *The Mirror for Magistrates*, which was to have been a series of narratives of distinguished Englishmen, somewhat on the model of Boccaccio's *Falls of Princes*. Finding the plan too large, he handed it over to others—7 poets

in all being engaged upon it—and himself contributed only 2 poems, one on Buckingham, the confederate and afterwards the victim of Richard III, and the other an 'Induction' or introduction, which has been described as the best poem between Chaucer and Spenser. These 2 pieces are distinguished by strong inventive and imaginative power and a stately and sombre grandeur of style. D. played a prominent part in the hist. of his time and held many high offices, including those of lord steward and lord treasurer. He was created earl in 1604. See J. Swart, *Thomas Sackville*, 1948.

Dorsetshire Regiment, The, formerly the 39th and 54th Foot. The 39th was raised in 1702, and after service in Europe went to India in 1754, being the first royal regiment to serve in that country, a fact which is commemorated in its motto 'Primus in India.' The 54th was raised in 1755. Towards the end of the 18th cent. Wm Cobbett was a sergeant-major in the 54th. The D. R. has a long roll of battle honours, and its battalions served on many fronts during the First World War. The 2nd Battalion was with Gen. Townshend at Kut-el-Amara, and was taken prisoner at its fall; another 2nd Battalion was raised to take its place. In the Second World War the D. R. fought in NW. Europe, taking part in the Battle of Normandy and the advance to the Rhine. Other units were part of the Brit. forces in Burma. The D. R. will be amalgamated with the Devon Regiment by 1959.

Dorsten, Ger. tn in the *Land* of N. Rhine-Westphalia (q.v.), on the Lippe, 32 m. N. by E. of Düsseldorf (q.v.). Pop. 9000.

Dorstfeld, Ger. tn in the *Land* of N. Rhine-Westphalia (q.v.), a NW. suburb of Dortmund (q.v.).

Dort, see DORTRECHT.

Dortmund (anc. Throtmanni, Trotmunde), Ger. industrial city in the *Land* of N. Rhine-Westphalia (q.v.), on the Emscher, 37 m. NE. by N. of Düsseldorf (q.v.). It is first mentioned in the 9th cent., and it became a free city of the empire and an important member of the Hanseatic League (q.v.). Its fortunes declined with those of the League and at the beginning of the 13th cent. it was only a small prov. tn. It rose to importance again with the development of the coal and iron industries of the Ruhr (q.v.) basin in the middle of the 19th cent. and the construction of the D.-Ems canal (q.v.). During the Second World War the city was badly damaged by bombing: in Mar. 1945 more than 5000 tons of bombs were dropped on D. in one of the biggest daylight air attacks of the war—an attack in which 1000 aircraft of the R.A.F. took part; other attacks were those of 23 May 1943, 29 Nov. 1944 (by day), 20 Feb. 1945 (at night). Since the end of the war there has been much reconstruction, and whole dists. have been rebuilt. The city has 3 notable churches—the *Marienkirche* (c. 1175), the *Reinoldikirche* (1250), and the *Propsteikirche* (1354)—all of which suffered

damage in the war. There are sev. technical institutes, including the Social Research Institute of the univ. of Münster, and there are important museums. The Westphalia Hall is the largest hall in Europe, and there is a vast stadium. The canal port has 10 harbour basins. The prin. industries are coal, steel, engineering, and brewing. Pop. 609,500.

Dortmund-Ems Canal, canal in Germany, which, beginning at Dortmund (q.v.), connects the Ruhr region, via Münster, with the N. Sea port of Emden (q.v.). Between 1892 and 1899 the R. Ems was canalised for 43 m., and this was the nucleus of the present canal (169 m. long, 108 m. of which were excavated). The canal has a width of 98½ ft at the surface, 59 ft at the bottom, and a depth of 8 ft 2 in. The cost was about 3½ million pounds. The R.A.F. frequently damaged the canal in the Second World War.

Dory, or **John Dory**, the *Zeus faber*, a species of *Zeidae* allied to the boar fish

JOHN DORY

(*Capros*) (q.v.). It is a marine fish found in temperate seas of the Atlantic, and is valued highly as a food. The body is laterally compressed and about 1½ ft in length, and the general appearance is very unprepossessing. During the breeding season it utters curious sonorous noises. J. D. is probably from the Fr. *jaune dorée* (yellow gilded), a reference to the metallic lustre of the fish.

Dos Passos, **John Roderigo** (1896-), Amer. novelist and playwright, b. Chicago. Educ. at Harvard, he served with the Medical Corps in the First World War, and wrote 2 'debunking' novels, *One Man's Initiation*—1917, 1920, and *Three Soldiers*, 1922. Others of his novels are *Streets of Night*, 1923, and *Manhattan Transfer*, 1925; the trilogy *U.S.A.*, made up of *The 42nd Parallel*, 1930, 1919, 1932, and *The Big Money*, 1936; and the trilogy *District of Columbia*, comprising *Adventures of a Young Man*, 1939, *Number One*, 1943, and *The Grand Design*, 1949. His plays include *The*

Garbage Man, 1926; *Airways Inc.*, 1929; and *Fortune Heights*, 1933. *State of the Nation*, 1944, and *Tour of Duty*, 1946, are collections of essays; and he also wrote sev. unconventional travel books, as well as *The Head and Heart of Thomas Jefferson*, 1954.

Dōsah (Arabic, 'treading'), a religious ceremony performed by the dervishes of the Sa'di order in Cairo. The chief, or sheikh, of the order rode on horseback, allowing his horse to tread upon the bodies of the dervishes who were lying down, and who were said to be unharmed by the hoofs of the animal. The ceremony was abolished in 1881.

Dospad Dagh, see RHODOPE MOUNTAINS.

Dossaret, in Byzantine architecture, a stone block (often carved) resting on the top of a capital in an arcade; and helping to distribute the superincumbent weight of an arch or a pair of arches.

Dossi, **Dosso** and **Battista**, brothers, and painters of the 15. school. Battista, D. (d. c. 1548), who worked with his brother, was the landscape painter, while Giovanni di Nicolo di Lutero (c. 1479-1542) (real name of D. D.) painted the figures. Both these brothers seem to have been pupils of Lorenzo Costa, and they also spent some time in Venice together and probably also in Rome. These painters, whose work is notable for its beautiful colouring and originality, are mentioned by Ariosto in his *Orlando Furioso*. Many of their paintings are in the gallery at Ferrara and in the palace there, as they were employed by the duke. 'Muse inspiring a Court Poet' (National Gallery) is one of D. D.'s notable works.

Dost, **Mohammed** (c. 1798-1863), supreme ruler of Afghanistan from 1818 to 1839 and again from 1843 to 1863. See AFGHANISTAN.

Dostoyevskiy, **Fëdor Mikhaylovich** (1822-81), great Russian author and thinker, one of the greatest novelists in world literature, b. Moscow, son of a doctor. He suffered all his life from epilepsy, which he described in *The Idiot*. His other handicap was his passion for gambling, which he also pictured brilliantly in *The Gambler*, 1864. He went to the St Petersburg engineering school, but his love for writing was greater than his desire to be an army officer. His first pub. work, a long story *Poor Folk*, 1846, was applauded by the Radical critics. In 1849 he was arrested for alleged association with a secret revolutionary socialist society; he was sentenced to death, and endured a horrible moment expecting to be shot (described in *The Idiot*), but was reprieved and sent to a penal colony in Siberia. Four years spent among criminals and political prisoners furnished material for his *Notes from the Dead House*, 1861-2. The first truly 'Dostoyevskian' work was the *Letters from the Underground*, 1864. During the later 1860's and the 70's, when he wrote his great novels *Crime and Punishment*, 1866, *The Idiot*, 1868, *The Possessed*, 1871-2, and *The Brothers Karamazov*, 1880, D. was struggling almost constantly with poverty. Like Balzac he

sat at his writing-table penning immortal novels in the endeavour to keep the wolf from the door. As a publicist (in his own magazines *Time* and *Epoch*, 1861-5, in the Conservative weekly *The Citizen*, 1873-4, and in *The Diary of a Writer* pub. as separate vols., 1876-81) D. represented an original 'soil-bound' trend—national, democratic, and Christian. He spent sev. years in W. Europe, and his observations pub. in 1863 in *The Diary of a Writer* present a combination of Russian nationalism and messianism with a sincere love for the treasury of European civilisation. A few months before his death, in 1880, D. delivered a famous speech at the opening of Pushkin's monument in Moscow on the destiny of Russia and of the Russian intelligentsia. D.'s works have considerably influenced the further development of literature both in Russia and abroad, and have an enormous influence on modern thought. As an artist he was one of the creators of the 'psychological novel.' As a psychologist he was mostly interested in extreme conditions and situations and in the Russian national character. Nietzsche, not given to praise, said he was the only man who had taught him something of psychology. But his most profound contribution is in the field of religious and social thought. Here, apart from the special subject of the working of the Russian popular mind, he concentrated on the central problems of freedom and of the destiny of man. He was the greatest antagonist of atheistic humanism and is the inspirer on one hand of existentialism, and on the other of Christian personalism and solidarism. See his novels, trans. by C. Garnett (12 vols.), 1912-20. The literature about D. is vast. See studies by D. S. Merezhkovski, 1902; J. Lavin, 1920; J. Middleton Murray, 2nd ed., 1923, A. Gide, Eng. trans. 1925. See also H. de Lubac, *The Drama of Atheist Humanism*, 1949.

Dot, in music, is a mark which is placed after a note and increases its duration by one half. When the D. is placed over the note it indicates a short staccato tone.

Dothan, city of Henry co., Alabama, U.S.A., about 120 m. S.E. of Montgomery. It has iron-works and cotton mills and many diverse manufactures. Pop. 21,600.

Dotterel, or *Eudromias morinellus*, a limicoline bird of the plover family, or Charadriidae. Its home is N. Europe and Asia, but in Britain, e.g. in the Lake District and the Scottish mts, it is approaching extinction owing to the custom of shooting the birds during the breeding season to ensure the delicacy of their flesh. The general colour is ashy-brown, with white and black markings, and the 3 eggs, which are laid in hollows of the ground, are pale green with brown marks.

Dou, Dow, or Douw, Gerrit or Gerard (1613-75), Dutch genre painter, b. Leyden. At an early age he became a pupil of Rembrandt, from whom he acquired the art of beautiful colouring. His pictures reveal his close study of nature and are remarkable for their delicacy and finish. They number in all about 200, 'The Woman

with the Dropsy,' in the Louvre, being his masterpiece. Other well-known works are 'The Poulterer's Shop,' and 'Self-Portrait,' in the National Gallery.

Douai, Fr. tn, cap. of an arron., in the dept of Nord, on the Scarpe and the Sensée canal. Its site has been occupied since Rom. times. In 1529 it came into the hands of Spain. It was taken by Louis XIV in 1667, by Marlborough in 1710, and was returned to France in 1713. Its univ. (1562) was removed to Lille in 1887. The great college for Eng. Rom. Catholics, founded at D. by Wm Allen (q.v.) in 1568 (removed to Rheims 1578-1593), came to an end at the Fr. Revolution, and was refounded in England at Ushaw and Ware; it was in this college that the Rheims-D. Bible (see BIBLE) was prepared. D. had also Eng. Franciscan and

DOTTEREL

Benedictine foundations, and Irish and Scots colleges (see also DOUAI SCHOOL; DOWNSIDE SCHOOL). The tn suffered greatly in both world wars. There is a 15th-cent. to hall, and there is a splendid 14th-15th-cent. belfry (210 ft). D. is the seat of a court of appeal, and has a mining school and art institutions. There are iron, steel, coal, chemical, and engineering industries. Pop. 37,500.

Douai School, public school for boys attached to the Eng. Benedictine Abbey of St Edmund, K.M., which was founded in 1615 in Paris, transferred to D., France, in 1818, and to Woolhampton, Berkshire, in 1903. The Junior School is, since 1948, at Ditcham Park, Petersfield.

Douala, tn and harbour in Fr. Cameroons, W. Africa, on the Vouri R. There is a railway from D. to the new cap. Yaounde. It has many modern buildings and institutions, and is the most important port of the Cameroons for palm oil products. In the First World War it was captured by the Brit. forces on 26 Sept. 1914. Pop. (1955) 110,000.

Douarnenez, fishing tn of W. France, in the dept of Finistère, and the arron. of Quimper. The sardine and mackerel fisheries are important. Other industries are boat-building and net- and rope-making. Pop. 20,600.

Douaumont, Fr. vil. in the dept of Meuse, 5 m. N.E. of, and containing the

first of the outlying permanent forts of Verdun. In the First World War the fighting here in 1916 was a vital part of the epic defence of Verdun (see VERDUN, BATTLE OF, 1916).

Double-Bass (music), see VIOLIN.

Double Bassoon, see BASSOON.

Double Entry, see BOOK-KEEPING.

Double-flower may consist of (a) a flower in which the petals are increased in number; and (b) flower-head in which disk-florets are replaced by ray-florets or themselves greatly enlarged. Doubling is common in cultivated flowers, but less frequent in nature. The constitutional cause is unknown, but doubling may result from transformation of stamens and carpels into petals, or development of sepals and petals instead of stamens and carpels, in which cases the flowers are sterile; or from multiplication or branching of petals, with stamens or carpels unaltered.

Double Refraction, name applied to the splitting up of a ray of light incident on a crystal of calcite into 2 refracted rays. The phenomenon was first described by Erasmus Bartholinus in 1669, who was led to its discovery by observing that when objects were viewed in certain directions through transparent crystals of Iceland spar 2 images of each object were seen. If a pencil mark is made on a sheet of white paper and a crystal of calcite is placed upon it, 2 images of the pencil mark are seen. On rotating the crystal, one image remains stationary while the other revolves in a circle about it. The stationary image is called the ordinary image, while the moving image, which is always displaced in the direction of the shorter axis of the rhombic face of the crystal, is called the extraordinary image. When a beam of light falls obliquely on a crystal of calcite the 2 rays into which it divides are called the ordinary ray and the extraordinary ray. The ordinary ray obeys the laws of refraction in the usual way, but the extraordinary ray departs from the plane of incidence, and the ratio of the angles of incidence and refraction which it makes with the face of the crystal is not constant. The 2 refracted rays are found to be polarised in perpendicular planes. See POLARISATION.

Double Vision, see EYE.

Doubleday and Company, Inc., Amer. publishing firm, largest book publishing organisation in the world, founded in 1897 by F. N. Doubleday and publishing in New York City, with offices in New York, Garden City (Long Is.), San Francisco, Toronto, London, and Paris, and its own manufacturing plants in Hanover, Pennsylvania, and Berryville, Virginia. The company publishes, manufs., and distributes books to retail stores throughout the U.S.A., distributes books by mail order to sev. million book-club members, and operates its own nation-wide chain of over 30 book stores (which also sell books of other publishers). The company publishes original non-fiction and fiction for both adults and children by many distinguished world-famous writers. *Anchor Books*, a series of inexpensive

paper-bound books for the educ. reader, and *Image Books*, paper-bound books specially designed for inspirational reading, are among the pubs. of this company. D. has its own serialisation dept and a Catholic text div.

Doubling the Cube, problem which originated in early Gk times, and was one of the 3 great problems studied by the early mathematicians. Hippocrates, Archytas, and others solved the problem, though its solution could not be obtained by simple geometry, but necessitated a more advanced knowledge. There are various traditions as to how the question arose, one concerning an attempt of the Delians to double a cubical altar, so that it is sometimes known as the Delian problem.

Doublings, heraldic term applied to the linings of state robes, mantles, or mantlings.

Doubloon (Sp. *doblon*, double), gold piece, once coined in Spain and Sp. America, worth 2 pistoles. Up to 1848 its value was £3 4s. 8d., but the 'Doblon de Isabel,' which entered the currency in that year, was worth only 100 reals.

Doubs, dept on the E. frontier of France, formed of part of the anc. prov. of Franche-Comté. It falls naturally into 3 regions. The plains between the Ognon and the D. are very fertile, and produce wheat, oats, and other cereals, as well as vegetables, hemp, fruits, and vines. The central plateau is mostly given to pasturage, and the mountainous dists., crossed by 4 parallel chains of the Jura, are thickly wooded. There is considerable industry, the prin. manufs. being machinery, artificial silk and other textiles, clocks and watches, hardware, foodstuffs, and wine. There are rock-salt deposits, and building-stone. The prin. tns are Besançon (the cap.), Montbéliard, and Pontarlier (qq.v.). Area 2052 sq. m.; pop. 327,200.

Douce, Francis (1757-1834), antiquary, pub. his curious *Illustrations of Shakespeare* in 1807, and his *Dance of Death* in 1833. A contributor to *Archæologia* and the *Gentlemen's Magazine*, he bequeathed at his death a valuable collection of books, illuminated manuscripts, coins, etc., to the Bodleian Library.

Doughty, Charles Montagu (1843-1926), traveller and author, son of a clergyman, b. Therberton Hall, Suffolk. Educ. for the navy, and, later, at King's College, London, and at Cambridge Univ. He travelled widely in 3 continents, Europe, Africa, and Asia. His most memorable journey, begun in 1876, was through parts of Arabia unexplored by Europeans up to that time. Author of *Travels in Arabia Deserta*, 1888, and much poetry of an austere vein, his best-known work being *The Dawn in Britain*, 1906. Other vols. of poetry were *The Cliffs* (a play in verse), 1909; and *The Clouds* (a poetic drama), 1912. See D. G. Hogarth, *The Life of Charles M. Doughty*, 1928; B. Fairley, *Charles M. Doughty: A Critical Study*, 1927.

Douglas (Gaelic *dubh glas*, black water), name of a famous Scottish family. *William of Douglas* is the first one of this

family of whom anything definite is known, and of him there are records between the years 1175 and 1213. He was succeeded by his son, *Sir Archibald*, who *d.* about the middle of the 13th cent. *Sir William of Douglas* (*d.* 1298) ('le Hardi') was the grandson of the former. He rose against Edward I in 1297, for which he was imprisoned and *d.* in the Tower the following year. *Sir James of Douglas* (1286-1330), known as the 'Good' Sir James, was his son, and bore the title Lord of Douglas. During the life of Robert Bruce D. was his firm supporter, sharing the command at Bannockburn, and being successful in many border raids, till his name of 'Black D.' roused terror among the people. *William D.*, his son, *d.* at the battle of Halidon Hill, and *William D.*, 1st earl (1327-84), became owner of the estates through his uncle Hugh, was made earl of D. about 1358, and became earl of Mar by his marriage. His son, *James, Earl of D. and Mar* (*d.* 1388), succeeded him and fell at the battle of Otterburn. As there was no direct heir to the estates, *Archibald D.* (*c.* 1328-*c.* 1400), a natural son of Good Sir James, became the 3rd earl. He in his turn was succeeded by his son *Archibald* (*c.* 1369-1424), who was made a prisoner at the battle of Homildon Hill and at Shrewsbury. He afterwards became duke of Touraine, and was killed at the battle of Verneuil. His successor was his son *Archibald*, 5th earl (*c.* 1391-1439). *William*, his son and heir, was murdered with his brother in Edinburgh Castle, 1440, by order of Sir Wm Crichton. The estates then passed to *James D.*, their great-uncle, known as the 'Gross.' His son *William*, 8th earl (*c.* 1425-52), was murdered by James II in Stirling Castle, and *James* (1426-88), his brother, became the 9th earl. He at once went to war with James on account of the murder of his brother, but had to surrender. His brothers identified themselves with his cause, but were defeated by the earl of Angus, another branch of the D. family who were coming into prominence. The lands of the D. branch were given over to the 4th earl of Angus, known as the 'Red D.' *Archibald*, 5th earl of Angus (*c.* 1449-1514), called 'Bell-the-Cat,' was succeeded by *Archibald* (*c.* 1489-1557), his grandson, who married Margaret, sister of Henry VIII, king of England, and their daughter Margaret was the mother of Lord Darnley, father of James VI. His successors were *David*, 7th earl, and *Archibald*, 8th earl, the estates then passing to another branch, *William D. of Glenberrie*, 9th earl. In 1633 his grandson *William* (1589-1660), the 11th earl, was made marquis of D., and his son became the 3rd duke of Hamilton by his marriage. *James D.*, 2nd marquis (*c.* 1646-1700), and grandson of the 1st marquis, was succeeded by his son *Archibald* (1694-1761), 1st duke of D., but as he had no heirs the title *d.* with him. About the year 1760 one of the twin sons of Lady Jane D., sister of the duke, became the heir to the estates in spite of his right having formerly been disputed, and

in 1790 became baron D. of Douglas, being raised to the peerage. He was succeeded in turn by his 3 sons, and when the 4th baron D. *d.*, the earls of Home became the next heirs. The dukes of Hamilton, Buccleuch, and Queensbury, as well as the earls of Morton, Home, and Wemyss, are members of this family. See D. Hume of Godscroft, *The History of the House of Douglas and Angus*, 1644; and H. Maxwell, *History of the House of Douglas*, 1902.

Douglas, Lord Alfred Bruce (1870-1945), poet, *b.* Worcester, 3rd son of the 8th marquess of Queensbury. He was educ. at Winchester and Magdalen College, Oxford. In London he became known as the close friend of Oscar Wilde and a member of his circle. In his *Without Apology*, 1938, and his *Oscar Wilde: a Summing Up*, 1940, he returned, with candour and generosity, to the subject of his former friend as if unable to rid himself of the obsession of the past. But when that is forgotten, it is probable that some of his literary work will be remembered with the best that has been written by his contemporaries. His serious verse is seen at its best in his sonnets, and he also wrote some of the best nonsense verse in the Eng. language—*Tales with a Twist* and *The Placid Pug* are typical of this verse. His first book of poetry was *The City of the Soul*, pub. in 1899. Twenty-five years later came his *In Exercisio*, 1924, written in prison as was its counterpart Oscar Wilde's *De Profundis*. This work seems to show that great poetry was within his powers but that he did not use them. See W. Freeman, *Lord Alfred Douglas*, 1948.

Douglas, Sir Andrew Snape (1761-97), naval officer. In 1781 he commanded the *Chatham* and captured over 50 Fr. vessels. He was appointed flag-capt. of Lord Howe's flag-ship the *Queen Charlotte*, and was dangerously wounded on the 'glorious first of June,' 1794. He recovered sufficiently to take part in the victory off L'Orient in the following year, but *d.* 2 years later.

Douglas, Sir Charles (*d.* 1789), rear-adm. Made commander in 1759, he was sent out to defend Quebec in 1776, and was present at the battle of Ushant in 1778.

Douglas, David (1798-1834), traveller and botanist, *b.* Scoon, Perthshire. He was originally a gardener, but in 1825 went to the U.S.A. on a commission for the Royal Horticultural Society, and on his second journey to America about 2 years later he made sev. discoveries of plants, among them the tree named after him as D. Fir (*q.v.*), and *Douglasia*.

Douglas, Gavin, or Gavin (*c.* 1474-1522), prelate and poet, *b.* Tantallon Castle, N. Berwick, son of the 5th earl of Angus, nicknamed Archibald 'Bell-the-Cat.' He was educ. at St Andrews for the Church. Promotion came early; in 1501 he was made provost of St Giles, Edinburgh, and in 1514 abbot of Aberbrothock and archbishop of St Andrews. But the times were troublous, and he had hardly received these latter preferments when he was deprived of them. He was, however, named bishop of Dunkeld, and after some

difficulty and undergoing imprisonment was confirmed in the see. In 1520 he was again driven forth, and 2 years later *d.* of the plague in London. His prin. poems are *The Palace of Honour* and *King Hart*, both allegorical; but his great achievement was his trans. of Virgil's *Aeneid* in 10-syllabled metre, the first trans. into Eng. of a classical work. D.'s language is more archaic than that of some of his predecessors, his rhythm is rough and unequal, but he had fire and a power of vivid description, and his allegories are ingenious and felicitous. His poetical works were ed., with a life, by J. Small, 1874. See also L. M. Watt, *Douglas's Aeneid*, 1920.

Douglas, George (Scottish writer), see BROWN, GEORGE DOUGLAS.

Douglas, George Norman (1868-1952), author, *b.* Tilquhillie, of Scottish and Ger. ancestry. Educ. at Uppingham and Karlsruhe, he spoke and wrote Eng. and German with equal fluency. After 2 years in the diplomatic service he went to Italy and finally settled at Capri. *Siren Land*, 1911, *Fountains in the Sand*, 1912, and *Old Calabria*, 1915, are travel books, but it was his novel *South Wind*, 1917, which made him famous; other novels are: *They Went*, 1920; *Alone*, 1921; and *Together*, 1923. *Looking Back*, 1933, and *Late Harvest*, 1946, are autobiographical.

Douglas, John Sholto, see QUEENSBERRY, MARQUESS OF.

Douglas, Lloyd Cassel (1877-1951), Amer. novelist, *b.* Columbia City, Indiana. Till middle life he was a Lutheran minister, but then retired to devote himself to writing. *Magnificent Obsession*, 1929, his first book, and *Foraie Us Our Trespasses*, 1932, both great successes, were followed by *Precious Jeopardy*, 1933; *Green Light*, 1935; *White Banners*, 1936; *Disputed Passage*, 1939; *Invitation to Live*, 1940; *The Robe*, 1942; *Home for Christmas*, 1949; and *A Time to Remember*, 1951.

Douglas, O., pseudonym of Anna Buchan (1-1948), novelist, *b.* Kirkealdy. The daughter of a Free Church minister, and sister of John Buchan (q.v.), she was educ. at Hutcheson's Grammar School, Glasgow, and Glasgow Univ. From 1906 onwards she was mistress of the family home in Peebles, the Priorsford of her books. Her first novel, *Olivia in India*, 1913, written after a visit to her brother Wm, who was in the Indian civil service, was followed by *The Scots*, 1917, a delightful picture of Glasgow suburban life. Others of her novels are: *Penny Plain*, 1920; *Ann and her Mother*, 1922; *Pink Sugar*, 1924; *Eliza for Common*, 1928; *The Day of Small Things*, 1930; *Priorsford*, 1932; and *The House that is Our Own*, 1940. *Unforgettable*, *Unforgotten*, 1945, is an autobiography.

Douglas, Stephen Arnold (1813-61), one of the greatest Amer. statesmen and orators of his time, *b.* Brandon, Vermont, 23 April. Son of a doctor, he studied law and settled in the state of Illinois, and soon became a leader in the Democratic party. In 1836 he entered the state legislature, in 1840 became the state's secretary, and in

1843 was elected congressman. Four years later he was elected to the U.S. Senate, and remained there until his death. He was the hero of the slave-holding states in the political struggles prior to the Amer. Civil war. Stood for the presidency when Lincoln was elected. Was a leader in the W. states. In the Senate, however, D. superbly defended Lincoln's inaugural address and went to the White House and pledged Lincoln his support. In the last great speech of his life, which he made at Columbus, Ohio, on his way to Washington, he declared that the union must be preserved at all costs. *D.* *d.* in Chicago. See life by Allen Johnson, 1908.

Douglas, Sir William Fettes (1822-91), painter, *b.* Edinburgh. From 1877-82 he was curator of the National Gallery of Scotland, and in 1882 he became president of the Royal Scottish Academy. He was knighted in 1882. Among his best works are: 'The Alchemist,' 'The Rosierucians,' and 'A Fishing Village.'

Douglas: 1. Cap. of the Isle of Man, and a popular seaside resort, situated 80 m. NW. of Liverpool and 62 m. WNW. of Fleetwood, with both of which it is in regular steamer communication. D. has grown up round a splendid bay in the E. of the is., at the confluence of the Avin-Dhoy and Avin-Glass. A fine esplanade circles the bay from Derby Castle on the N. to Douglas Head on the S., N. of which lies the harbour, the first in the world to be equipped with radar to aid navigation. D. is served by steamers crossing in the season to Heysham, Dublin, Belfast, and Glasgow; by trams, and by the Isle of Man railway, connecting it with Ramsey, Peel, Castletown, and Port Erin. It has public buildings (including the House of Keys), a free library, a Manx folklore museum, and a great number of attractions for its visitors, who exceed half a million from Easter to Oct. Pop. 22,000.

2. Vil. of Lanarkshire, Scotland, and, formerly, a place of some importance. It has a ruined castle (Scott's *Castle Dangerous*). The main occupation is mining; D. is also the depot of the Cameronians. Pop. 2,400.

Douglas Fir (*Pseudotsuga taxifolia*), a tall, evergreen tree native to W. N. America. It attains a height of 250 ft or more. The timber is one of the world's most important structural woods and it is exported in large quantities as lumber and as plywood. Once known as Oregon or Brit. Columbian Pine. See FORESTRY; TIMBER.

Douglass, Frederick (1817-95), Amer. journalist and orator. *B.* Tuckahoe, Maryland, he was at first brought up as a slave, his father being a white man and his mother a Negro slave, Harriet Bailey. In 1838 he managed to free himself by escaping from a shipyard in Baltimore, and he then assumed the name of D. After living at New York and then New Bedford, he was appointed a lecturer by the Anti-Slavery Society on account of his eloquence. He pub. the *North Star* on the abolition of slavery, and in addition

he filled some important offices, among them marshal for the dist. of Columbia and minister to Haiti. See autobiography, *The Life and Times of Frederick Douglass*, rev. ed. 1947.

Douglass, Sir James Nicholas (1826-98), engineer, b. London. After being apprenticed and holding one or two posts as an engineer, he became in 1862 chief engineer to Trinity House, his chief work being the designing of the new Eddystone Lighthouse of 1878.

Doukhobors, see DUKHOBORS.

Doullens, Fr. tn in the dept of Somme. It stands on the Authie to the N. of Amiens, and has a fine 16th-cent. church, and a citadel founded to Vauban. The tn was damaged in the Second World War. It has jute manufs. and mechanical engineering works. Pop. 5400.

Doulton, Sir Henry (1820-97). Eng. manufacturer of pottery and chinaware (q.v.). He founded his own factory at Lambeth, which continued to operate there until 1956, when it was transferred to the D. company's Teignmouth factory (though Lambeth continues to be the home of the company's head office). The wares bear the name 'Royal Doulton.'

Doom, see DOOM.

Doumer, Paul (1857-1932), Fr. statesman and colonial governor-general, b. Aurillac. He was a prof. of mathematics, and later a journalist, and became a deputy in 1888. Unsuccessful at the presidential elections of 1906, he was elected president in 1931. He was one of the makers of the Fr. colonial empire. Arriving in Indo-China in 1897 as governor-general, it was he who finally gave the colony a definite administrative structure, and his period of office there was outstandingly successful. He was president of France for only a few months, being assassinated by a Russian fanatic named Gorgoullov.

Doumer Bridge, steel road and rail bridge, 1837 yds in length, crossing the Red R. (q.v.) at Hanoi (q.v.). Originally constructed only as a railway bridge and opened in 1902, it was later enlarged to carry a road as well. Neglected during the 1945-54 war, the bridge is now in poor condition.

Doumergue, Emile (1844-1937), Fr. theologian, b. Nîmes; studied theology in Geneva, Montauban, and Germany. Then made a special study of Calvinism and pub. vols. on Calvin, among which are: *L'Art et le sentiment dans l'oeuvre de Calvin*; *La Piété réformée d'après Calvin*; *Calvin le fondateur des libertés modernes*.

Doumergue, Gaston (1863-1937), Fr. statesman, and president of the Fr. Rep. 1924 to 1931; b. at Aigues-Vives, the son of a farmer. He was educ. at the lycée, Nîmes; practised as barrister and became a magistrate first in Cochín China, and then in Algiers. D. was elected deputy for Gard, 1893; became secretary of the chamber of deputies, 1895-6; colonial minister, 1902, 1905; vice-president of the chamber, 1905-6; minister of commerce, industry, and labour, 1906-8; of education, 1908-10; and premier in 1913. On the outbreak of war he was colonial

minister in Viviani's cabinet. He had the distinction of being the first Protestant president of the Fr. Rep., and he became premier again in 1934, after the Stavisky riots, but resigned after his suggestions for parl. reform had met with hostile criticism.

Doune, burgh of Perthshire, Scotland, on the R. Teith. It lies to the NW. of Stirling and contains the well-preserved ruins of its castle, built in medieval times. The old bridge was erected by the tailor of Princess Margaret of England, afterwards queen of James IV. Pop. 820.

Dour, tn in the prov. of Hainaut, Belgium, 10 m. SW. of Mons. There are coal-mines in the vicinity. Pop. 11,600.

Topical Press

GASTON DOUMERGUE

Doura, ruined tn on the banks of the Euphrates, founded 300 BC, but abandoned after the destruction of Palmyra in AD 273. Brit. troops discovered here in 1920 paintings of the 2nd and 3rd cents., and excavations were made by the Fr. Académie des Inscriptions, which revealed the plan of the fortress, the streets, the temple of the Palmyrian gods, frescoes, sculptures, and inscriptions.

Doura, see DURRA.

Douro (Spanish Duero; anct Durius), riv. of Spain and Portugal, the 3rd largest in the peninsula. It rises in Spain, on the S. side of the Peña de Urlión in the prov. of Soria, and, after flowing E. and S. through the tn of Soria (q.v.), turns and flows W. across the Castilian plateau. For some 65 m. it forms the Sp.-Portuguese frontier, and it reaches the Atlantic at São João da Foz, 3 m. below Oporto (q.v.). Rapids, and a sand-bar at the mouth, make it generally unsuitable for navigation, but it is used by some small craft. It is now being utilised for hydro-electric power. Part of its valley is

famous for the vineyards from which port wine (q.v.) is produced. Length 480 m.

Douro Litoral, prov. of NW. Portugal, with a coastline on the Atlantic. It is crossed E.-W. by the broad valley of the Douro (q.v.), and is mountainous in the S. and NE. Its chief product is wine, especially port. The prin. tn is Oporto (q.v.). Area 1268 sq. m.; pop. 1,237,200.

Douroucouli, popular name for *S. Amer.* monkeys of the genus *Nyctipithecus* in the family Cebidae. The incisors in the lower jaw project forwards, and the eyes of the monkeys are large, both of which features give them a lemurine appearance. They are unlike many of their allies in having the long tail non-prehensile.

Douw, Gerard, see *Dotu*.

Dove, riv. of England, rising in Axe Edge, Derbyshire, 4 m. from Buxton, and flowing S. for 40 m. to join the Trent near Burton. It forms the SW. border of Derbyshire, separating the co. from Staffordshire. Trout abound in its waters, and it was well-known to Isaac Walton and to the Lake poets. The valley of Dovedale, below Hartington, where the riv. runs through a narrow rocky gorge some 2 m. long, thickly wooded and with an abundance of wild flowers, is particularly beautiful.

Dove, see *PIGEON*.

Dove, Ring, see *WOON-PIGEON*.

Dover, Thomas (1664-1742), physician and buccancer, b. Warwickshire. He qualified in medicine at Cambridge, 1687, settled in Bristol, and after some years in practice sailed in a privateer for the S. Seas (1708). At the is. of Juan Fernandez he found and rescued Alexander Selkirk, the original of Robinson Crusoe, who had been alone there for 4 years and 4 months. On his return in 1711 D. practised first in Bristol and later in London, where he d. He is remembered for his famous *Dover's powder* (opium and ipecacuanha). He wrote *The Ancient Physician's Legacy to his Country*, 1732.

Dover: 1. One of the 5 Cinque ports, bor., mkt tn, and holiday resort in the co. of Kent, England. It is situated in a breach between high chalk cliffs on the NW. side of D. Straits. It is 21 m. distant from Cap Gris Nez on the opposite side of the Eng. Channel, and lies 72 m. to the ESE. of London. The dominant feature of the tn is its castle, with an altitude of 375 ft above sea-level, which includes in its grounds a Rom. lighthouse, the ancient cruciform church of St Mary-in-Castro, a massive Norman keep now used as a bomb magazine, and barracks for 200 men. The prospect from the keep includes, on a clear day, the Fr. coast from Boulogne to Gravelines, and the cliffs from Folkestone to Ramsgate, together with the many elaborate fortifications which honeycomb the D. cliffs on either side. D. College has been built round the fine remains of the 12th-cent. St Martin's priory. The harbour is divided into 3 main areas of a total of 610 ac., incorporating the Outer Harbour, the seaward boundary of which is the S. Breakwater 400 ft in length, the W. Docks, and the E. Docks. The W. Docks include the Admiralty Pier from

which the cross-channel services principally operate, the Prince of Wales Pier, the Brit. Railways train ferry dock, and the tidal basin with the Granville and Wellington Docks. The E. Docks comprise the camber and berths at the E. Arun as well as the industrial land area. A modern reception hall with filling stations and a ramp for facilitating the embarkation and disembarkation of continental motor car traffic has recently been constructed at the E. Docks. The D. routes to the Continent *via* Calais, Dunkirk, Boulogne, and Ostend are popular. The steamer crossing to Calais takes little over 1 hr. There is a pilot station (75 pilots) and a lifeboat station. The bor. boundaries were last extended in 1950. During the Second World War D. was one of Great Britain's 'front-line' tns, being repeatedly shelled from the coast of France by the Germans in addition to considerable aerial bombardment. The bor. council, having been granted authority to acquire 26 ac. of 'blitzed' sea-front by compulsory purchase, propose to build blocks of 8-storied flats and hotels to replace the derelict boarding-houses. D. has ship-repairing, rope- and sail-making industries, besides her fisheries and traffic in dairy produce and general cargoes with France. Pop. 35,217.

2. Cap. of Delaware, U.S.A., and co. tn of Kent co., on Jones's Creek and the Philadelphia, Baltimore, and Washington railway, 40 m. S. of Wilmington. Besides being the centre of a fruit dist., D. has factories for canning fruit; its manufs. include hosiery, paint, and rubber products. Pop. 6223.

3. The oldest (1623) city in the Stafford co. of New Hampshire, U.S.A., on the Cocheco R., 68 m. N. by E. of Boston. It has textile mills and manufs. wood and leather products, machinery and monuments. It has a 17th-cent. garrison house. The univ. of New Hampshire is at Durham 5 m. SW. Pop. 15,870.

4. Tn of Morris co., New Jersey, U.S.A. It manufs. metal products, machinery, rock wool, clothing, and truck and dairy products. Picaatinny Arsenal and the U.S. Navy rocket experimental station are near by. Pop. 11,170.

Dover, Strait of (anc. *Frctum Gallicum*; Fr. *Pas de Calais*), narrow channel separating France and England, and joining the Eng. Channel to the N. Sea (q.v.). It is about 22 m. long, and at its narrowest points, from D. pier or from S. Foreland to Cap Gris-Nez, its breadth does not exceed 21 m. The S. of D. extends from Dungeness and Cap Gris-Nez in a NE. direction to S. Foreland and Calais; its greatest depth is not quite 180 ft. The geological formation of the channel bed points to the fact that at one time England was joined to the continent of Europe. The tides of the N. Sea and the Eng. Channel meet in the S. of D.; the prin. ports are D. and Folkestone (q.v.) on the Eng. shore, and Calais and Boulogne (q.v.) on the Fr.

Dover Patrol. On the outbreak of the First World War the D. P. formed part of

the E. Coast Naval Command, under the command of Adm. Ballard. Its duties were to prevent Ger. ships forcing their way into the Eng. Channel, and to inspect neutrals for contraband (q.v.). Soon after the war commenced it was made a separate command. Later on 'drifters,' i.e. vessels equipped with drift nets in order to catch submarines, and trawlers to sweep for mines were added to the patrol. Adm. Bacon was in command from 1915 to 1917, being succeeded by Vice-Adm. Keyes (later Adm. Lord Keyes). The work of the D. P. was very varied. Besides safeguarding the transport of troops to France, the patrol was engaged offensively against the Germans on the Belgian coast, and against their bases at Zeebrugge and Ostend; and in all 28 bombardments were carried out. Mines and mine net barrages were laid along the Belgian coast, a procedure which stopped enemy mine-laying in the Channel. Over 5 million troops were transported to France without a single casualty. From 1915 Commander Lambe (later Air Vice-Marshal Sir Charles Lambe) commanded the units of the Royal Naval Air Service of the D. P., and aeroplanes played an increasing part, as the war progressed, in the D. P.'s operations.

Dovercourt, holiday resort of Essex, England, situated at the mouth of the Stour estuary, S. of Harwich. There are 2 lighthouses guarding the entrance into Harwich Harbour and also marking the position of a sandbank. Good bathing is to be obtained at D. Pop. 10,000.

Dovey (or Dyfi), riv. of N. Wales, rising in Merionethshire and emptying into Cardigan Bay at Aberdovey. Length, 30 m.

Dovrejsfjell forms part of the mountainous tableland of Norway, being marked off by the valleys of the Sundul, Laagen, and Rauma, and by the fjords of Nordmøre. Precipitous, irregular spurs, attaining an elevation of 6000 ft, shut in the Rauma valley (well known to tourists as the Romsdal), but Snøhetta, a magnificent snow field, is the highest peak (7615 ft).

Dow, Lorenzo (1777-1834), Amer. Methodist preacher, b. Coventry, Connecticut. He went as a missionary to the Catholics in Ireland, and both in England and America attracted great audiences; he helped to found the Primitive Methodist society in England. D. was a strenuous opponent of the Rom. Catholics.

Dowager (O.F. *douage*, dower) meant originally a widow with a dower. First used in England of Catherine of Aragon, widow of Prince Arthur, it is now applied to all widows of high rank to distinguish them from their sons' wives.

Dowden, Edward (1843-1913), scholar and critic, b. Cork. He was educ. at Queen's College there, and at Trinity College, Dublin, where he had a brilliant record and in 1867, 4 years after he had graduated, was appointed prof. of Eng., a post which he held till the end of his life. He is chiefly remembered as a great Shakespearean scholar. *Shakespeare: his Mind and Art* appeared in 1875, and the *Shakespeare Primer* in 1877, and he also ed.

many of the plays. Others of his books are: *Studies in Literature*, 1878; *Transcripts and Studies*, 1888; and biographies of Southey, 1880, Shelley, 1886, Browning, 1904, and Montaigne, 1905. He was a close friend of Walt Whitman, and pub. some vols. of verse. See L. E. Marshall, *The Letters and Poems of Edward Dowden*, 1914.

Dowie, John Alexander (1847-1907), religious fanatic, b. Edinburgh, went at 13 to S. Australia. For a time a student at Edinburgh Univ., he returned to S. Australia and became minister of a Congregational church. Later on he claimed the power of being able to heal people by means of prayer, and went to the U.S.A. in 1888. At Chicago in 1896 he organised the 'Christian Catholic Church in Zion,' he himself being general overseer; and in 1901 he estab. Zion City on the shore of Lake Michigan. In 1903 and 1904 he visited England, where he did not meet with much encouragement, and in 1906 his prestige with his followers was lost after the revolt of Zion City. D. was popularly known by the title of 'Doctor,' and he himself claimed to be Elijah.

Dowlais, industrial community of Glamorgan, Wales, adjoining Merthyr Tydfil, of which it is a suburb. The site of the former famous D. Iron and Steel Works is now occupied by factories.

Dowland, John (1563-1626), lutenist and composer, b. (probably) London. According to Fuller's *Worthies* he was a native of Westminster. The greatest lutenist of his age, he held the position of court lutenist to Christian IV of Denmark at a salary of 500 dalers per annum, a sum equalling the salaries of the high officers of state. According to Henry Peacham (*Minerva Britannia*, 1612) D. was neglected in England, Peacham comparing him to a 'nightingale sitting on a briar in the depth of winter.' D. was recognised in his own country only in his old age when he was appointed one of the King's (Charles I) Musicians for the Lutes. His songs with lute accompaniment are the most accomplished of their kind and were pub. in many European centres. His *First Booke of Songes or Ayres of Fourc Partes with Tableture for the Lute* was pub. in 1597. Its success was immediate and 3 more vols. were called for between 1600 and 1613. All 4 books with 3 songs in 'The Musical Banquet' have been pub. in *The English School of Lutenist Song-writers* (ed. E. H. Fellowes). As a performer on the lute D. had no rival in Europe and his skill is celebrated in a sonnet by Richard Barnfield. His son Robert (1586-1641) succeeded him in his Eng. royal office.

Dowlas, coarse kind of unbleached linen. Exceedingly strong, it was used by workmen for their aprons and sometimes for their shirts. It is not used so much, however, in the present day, and is now generally applied to coarse cotton woven cloth with a 'linen finish' glaze.

Down, maritime co. with a coastline of 67 m., in N. Ireland, having an area of 609,439 ac. Belfast Lough, Dundrum and Carlingford Bays are spacious inlets

along the indented shores, but the largest is Strangford Lough, whose waters are studded with 260 islets. Slieve Donard reaches the highest altitude (2796 ft) in the Mourne Mts to the S. The Bann, the Lagan, the Quoile, and the Newry are the chief rivs., whilst the Newry Canal along the W. gives increased facilities for communication. Oats, potatoes, wheat, turnips, and flax are widely cultivated, whilst pigs, sheep, and cattle are reared. Linen, hosiery, woollens, leather, cattle, butter, eggs, corn, and granite are the prin. exports. The co. tn is Downpatrick (q.v.). Round towers, stone cairns, raths, and abbeys are among the antiquities of interest. Two members represent D. in the Imperial House of Commons and 8 in the N. Ireland Parliament. Pop. 241,151.

Downham Market, mrkt tn and urb. dist. of England, in the co. of Norfolk. It is situated on the Ouse, 11 m. SW. of King's Lynn, and has a large flour mill and malt houses. Pop. 2759.

Downing, Sir George (c. 1623-84), soldier and politician, educ. partly in England and partly at Harvard College. He returned to England about 1645, and became a scout-master-gen. in Cromwell's Scottish army, and a teller of the exchequer. D. was one of Cromwell's prin. advisers on foreign policy during the Protectorate, his mission being to try to bring about a union of all the European Protestant powers. After the Restoration he worked for Charles II, successfully bringing about the arrest of various regicides on the Continent, and was rewarded with a baronetcy, 1663. His greed and treachery led to his unpopularity even with those he served, though his abilities were undoubted. Downing St perpetuates his name.

Downing College, Cambridge, founded under the will (1717) of Sir George D. (1684-1749), had the grant of its charter delayed, owing to litigation, to 1800, when it became a constituent college of the univ. of Cambridge. The college maintains its traditional devotion to the encouragement of law and medicine.

Downing Street, off the W. side of Whitehall, London, deriving its name from Sir George D. (q.v.), the 17th-cent. politician who built the street. It is famous because it has been the official residence of the Prime Minister (at No. 10) since the time of Sir Robert Walpole. The chancellor of the exchequer resides at No. 11, and the Foreign Office is also in this street. See E. Jameson, *Ten Downing Street: the Romance of a House*, 1945.

Downpatrick, cap. of co. Down, N. Ireland, 28 m. SSE. of Belfast, is a tn of extreme antiquity, situated close to the SW. fringe of Strangford Lough. Though St Patrick founded the see in 440, the present cathedral (Protestant) is not older than 1790. Ships of 100 tons come up as far as Quoile quay, about a m. from the tn. The dun or rath of Keltar, extending over an area of 10 ac., is one of the best preserved in Ireland. D.'s race meetings attract visitors. The making of braces,

belts, and shirts forms the chief industries; cattle, pigs, corn, and potatoes the chief exports. Pop. 3800.

Downs, North and South, 2 ranges of rounded chalk hills (average height c. 500 ft above sea-level) situated in the S. and SE. of England, enclosing the valley of the Weald (q.v.). At their most W. point both N. and S. D. lie in Hants; the N. D. run through Surrey and Kent, ending in the S. Foreland; the S. D. cross Sussex and terminate in Beachy Head. The celebrated Southdown sheep are pastured on the D.

Downs, The, safe anchorage for ships, in the Eng. Channel (q.v.), 8 m. long by some 6 m. broad, between the N. and the S. Foreland, protected by the Goodwin sands, and scene of sea-battles between the Spanish and Dutch (1639) and the Brit. and Dutch (1666).

Downside School, Rom. Catholic public school for boys, founded at Douai about 1603 and attached to the Eng. Benedictine community of St Gregory. It moved to Acton Burnell, near Shrewsbury, at the Fr. Revolution, and settled finally at Downside, near Bath, in 1814. The preparatory school is at Worth Priory, Crawley.

Downnton, par., formerly a mrkt tn, in the co. of Wilts., England, situated on the Avon, 6 m. SE. of Salisbury. D. is of anc. origin, having been important in A.-S. times. The 'Moot' and earthworks of that period still remain. Cerdic, the Saxon, gained a victory here in 519. It sent 2 members to Parliament until 1832. Pop. 2000.

Downs, see DIVINING ROD.

Dowson, Ernest Christopher (1867-1900), poet, b. Kent. Educ. at Oxford, he spent much of his life in France, where his irregular habits undermined a constitution weakened by consumption and poverty. As a poet he ranks with the Fr. 'decadents.' His books of verse include: *Dilemmas*, 1893; *Verses*, 1896; and *Poems*, 1905. *The Pierrot of the Minute*, 1897, is a poetic drama.

Doxology, ascription of praise to God. D.s occur at the end of some of the N.T. epistles, and sometimes in the middle of an argument (e.g. the ends of Rom. and 2 Pet. and in Rom. ii. 36). The title is most frequently given to (1) the ascription 'Glory be to the Father and to the Son,' etc., repeated principally at the end of psalms and canticles. This is known as the Lesser D.; (2) the Trisagion or Tetractis taken from Isaiah vi. 3; (3) St Matthew's conclusion to the Lord's prayer, 'For Thine is the Kingdom,' etc.; (4) the Greater D., the *Gloria in Excelsis*, which occurs at the beginning of the Rom. Mass and the end of the Anglican Communion rite.

Doyle, Sir Arthur Conan (1859-1930), novelist, b. Edinburgh of an Irish Rom. Catholic family; his uncle and grandfather were both well-known artists. Educ. at Stonyhurst and Edinburgh Univ., he qualified as a doctor, and from 1882 to 1890 practised at Southsea. In 1882 he pub. *A Study in Scarlet*, an adventure story which introduced the

famous character Sherlock Holmes. A later Holmes novel was *The Sign of Four*, 1890, but he first became really famous with the pub. in the *Strand Magazine* of the *Adventures of Sherlock Holmes*, a series of short stories. Holmes and his friend and chronicler Dr Watson set the fashion for the detective story, the former being modelled on Dr Joseph Bell, under whom D. had worked as a surgeon. Later vols. of short stories on the same theme were *The Memoirs of Sherlock Holmes*, 1894, *The Return of Sherlock Holmes*, 1905, *His Last Bow*, 1917, and *The Case-Book of Sherlock Holmes*, 1927. Of full-length Holmes novels the most famous was *The Hound of the Baskervilles*, 1902. Among novels that D. wrote on other themes the best are *Micah Clarke*, 1889, and *Rodney Stone*, 1896, a boxing story. *The White Company*, 1890, and *Sir Nigel*, 1906, are historical romances with a strong appeal to the young, while *The Exploits of Brigadier Gerard*, 1895, recounts with humorous irony the adventures of a young Napoleonic officer. D. served as a doctor in the S. African war, and wrote a hist. of the conflict, *The Great Boer War*, 1900. In 1902 he was knighted. Later he created an amusing new character in the belligerent Prof. Challenger, who is the hero of the scientific romances *The Lost World*, 1912, and *The Poison Belt*, 1913. *Songs of Action* is a book of poems, and *Memoirs and Adventures*, 1924, contains his reminiscences. In his later years D. was deeply interested in psychic phenomena, and wrote a *History of Spiritualism*, 1926. See lives by J. Lamond, 1931; H. Pearson, 1943; and J. D. Carr, 1949. There is also an extensive literature dealing with Sherlock Holmes, who is treated as a real person. See also DETECTIVE STORY.

Doyle, Richard (1824-83), caricaturist, b. London, was the 2nd son of John D., also famous as a caricaturist. At 15 he pub. *The Fingington Tournament*, or, *The Days of Chivalry Revived*. In 1843, when *Punch* was 2 years old, he became a regular contributor, and much of his best work appeared in it, notably 'Manners and Customs of ye English', until in 1850 he retired, owing to the paper's attacks on Rom. Catholicism. He illustrated many books, among others Thackeray's *Rebecca* and *Kensha* and *The Newcomes*, Locker's *London Lyrics* and the *Bon Gaultier Ballads*. As an artist he was at his best in fantastic designs, for his fancy was unbounded, and in dainty elf-like designs such as those, by him, which formerly decorated the cover of *Punch*.

D'Oyly Carte, Richard (1844-1901), theatre manager. Beginning his career as a concert and lecture agent, at the age of 31 he became a theatrical manager, and it was in that capacity he became known to the world. In Mar. 1875 he produced at the Royalty Theatre, London, *Trial by Jury*, the first of the series of comic operas written by Sir W. S. Gilbert (q.v.) and composed by Sir Arthur Sullivan (q.v.). At the Opera

Comique he brought out *The Sorcerer* and *H.M.S. Pinafore*, and followed these with *The Pirates of Penzance* and *Patience*. All these were successful, and with the aid of Amer. tours the 3 men made, it is said, £60,000 a year. D. invested his share of the profits in the erection of the Savoy Theatre, where he put on the other Gilbert and Sullivan plays, nearly all of which had a long run. In 1891 D. opened the Eng. Opera House (now the Palace Theatre), London, but here he met with his first and only check. The venture was a failure, and the building was disposed of to a syndicate for music-hall purposes.

Dracaena, genus of Liliaceae, comprehends 40 species found in warm parts of the Old World. It was estab. by Linnaeus and named from one of the species yielding the resinous exudation known as dragon's blood. Often confused with *Cordylus*; *D. fragrans*, *D. godaefiana*, and *D. sanderiana* are grown under stove conditions. *D. draco*, the dragon-tree, which yields the red gum-resin, had a celebrated representative in Tenerife. This tree, which was blown down in 1868, was 15 ft in diameter, 70 ft in height, and was supposed to be about 6000 years old.

Drachenfels, peak (1055 ft) in the Siebengebirge (q.v.), Germany, on the Rhine, 8 m. SE. of Bonn. It is the steepest, though not the highest, mt. of the group. It is named 'the Dragon's Rock' from the legend that here Siegfried vanquished the dragon (see NIBELUNGENLIED). A castle, ruined since the Thirty Years' War (q.v.), stands on the summit.

Drachm, or **Dram**, see METROLOGY.

Drachma, in anc. Greece, a silver coin, equal in value to one-hundredth part of a mina and a six-thousandth part of a talent. Until Solon's day a D. was worth a little over a shilling, but the Attic D. was equivalent to about 9½d. in Eng. currency. The obol was equal to one-sixth of a D. In Athens the prin. coin in use was the tetradrachmon, worth 4 drachmae, having the head of Pallas engraved on one side, and the owl on the other. As a weight measure, 100 drachmae were again equal to 1 mina (almost a lb.). The Gk D. in modern currency is worth about 8½d. It is divided into 100 lepta. See also METROLOGY.

Drachmann, Holger (1846-1908), Dan. poet and novelist, b. Copenhagen. At first a painter of the sea, he constantly returned to this subject in his writings. He pub. his first poetry, *Digte*, in 1872, and his later verse includes *Daempede Melodier*, 1875; *Sangesnes Bog*, 1889; and *Broget nær*, 1901. D. has won a high place among the lyric poets of Denmark. He also wrote innumerable novels and stories of his travels and of the sea, as well as sev. melodramas. See P. V. Rubow, *Drachmanns Ungdom*, 1940, H. Drachmann 1878-97, 1945, and H. Drachmann *Sidste Aar*, 1950.

Dracina, Draconin, see DRAGON'S BLOOD. **Drackenstein Mountains**, chain of mts in the SW. of Cape Province, S. Africa. They extend N. and S. to a distance of 25 m. eastward of Cape Town.

Draco (7th cent. BC), Athenian statesman and lawgiver. He was the first codifier of the laws of Athens. Before his time the laws were unwritten and were administered by the Eupatridae. Tradition has always connected his name with a severity which has become proverbial in the word 'draconian.' Demades, the orator, declared that D.'s laws were 'written in blood,' for nearly every law-breaker suffered the penalty of death. It is now generally agreed by scholars that the constitution assigned to D. by Aristotle (*Athen. Polit.*) is not authentic. See also ATHENS; GREECE—History.

Draco (lizard), see FLYING DRAGON.

Draco ('the dragon'), constellation in the N. hemisphere. The star γ Draconis was used by Bradley in his discovery of the aberration (q.v.) of light from 1725 to 1728.

Dracontium, or **Dragon**, family Araceae, genus of tuberous Andean herbs, with huge, solitary leaves and hooded gaping spathe, reddish-purple within. *D. asperum*, *D. gigas*, and *D. carderi* are sometimes grown in warm greenhouses.

Draconculus, or **Dragon Plant**, family Araceae, genus of 2 rhizomatous herbs, *D. canariensis*, Canary Is., and *D. vulgaris*, Mediterranean, akin to Arum, and grown in water gardens.

Dra-el-Mizan, tn of Algeria in the arron. of Tizi-Ouzon, with marble quarries and cork manufs. Pop. 6740.

Draft, order written by the drawer to authorise the payment of a sum of money by some other person acting as an agent. These D.s are used in commerce between firms and in municipal affairs by corporations.

Drag, see CASTING.

Dragoman (Arabic *targuman*, interpreter), a man who acts as guide and interpreter where Arabic, Turkish, or Persian is spoken; more generally, one who acts as intermediary between Europeans and Orientals. The term was first used of diplomatic officials of the Turkish court, who were appointed owing to the Turkish Gov.'s dislike of using the language of any non-Moslem nation; these D.s had considerable importance. But the term is now applied very widely to interpreters attached to banks or business concerns, or even hotel touts.

Dragon (Gk *drakon*, the seeing one; Lat. *draco*; Fr. *dragon*), in almost all mythologies typical of the power of evil, hence the great work of the heroes was to kill the D. To the Chinese, however, the D. is a benevolent monster. The conception of its shape varied, but generally was a winged serpent or crocodile, able to breathe fire. In Gk mythology the hydra, or monster with 9 heads, was slain by Heracles, while other heroes also slew D.s. So too with the heroes of N. mythology, among them the god Thor, Siegfried in the *Nibelungenlied*, and Beowulf. D.-slaying is also found in later Gk romances and in the medieval stories of King Arthur and Tristram. In Gk mythology the D. is represented with eyes ever on the watch, e.g. guarding the 'Apples of the Hesperides' and the

'Golden Fleece.' The D. passed into Christian tradition as the symbol of evil or the devil. D.s were met in the legends of St George and of St Margaret of Scotland. They feature also in Celtic mythology, the Red D. still being an emblem of Wales.

Dragon, popular name of sev. species of lizard, and particularly applied to members of the Amer. genus *Dracaena* and the Malayan *Draco* (see FLYING DRAGON). The Komodo D. (see MONITOR) is the largest of the monitors.

Dragon, in botany, name applied to plants in the genus *Dracontium* (q.v.). Green D. is a N. Amer. herb, *Arisaema dracontium*. D. plants are species of *Dracontium* (q.v.). The name of D.-wort is given to *Artemisia dracunculoides*, a species of Compositae, and *Polygonum bistorta*, a species of Polygonaceae. The D.-tree is *Dracaena draco*, a liliaceous tree from which exudes the resin known as D.'s blood. D. root occurs in hot countries and is believed to be fertilised by snails; the tuber is used in medicine. D.'s head, or *Dracoccephalum*, a genus of the Labiatae, receives its name from the appearance of the corolla.

Dragon-fly, name of a number of insects (about 2500 species) now considered to belong to the order Odonata. They are

DRAGON-FLY

sometimes called 'devil's darning needles' and 'horse-stingers,' but are at the same time harmless except to the insects which form their food; horses and ponies, however, view them with some misgiving and will move out of their path of flight. They are characterised by a very freely moving head; large compound eyes, made up of thousands of facets; an overhanging upper lip enabling them to catch their prey; small antennae; 2 pairs of wings equal in size, the main nervures having a longitudinal direction crossed by a number of nervules; an elongated abdomen and slender legs. The flight is very fast and

powerful, and on migration the D. can fly hundreds of m. In the early stages of their life they live close to the water, the eggs being deposited in or near the water, and there is no pupal stage of quiescence. During the nymph phases the mask, a modification of the lip, enables them to obtain their prey. The species are distributed over the globe, but principally in tropical regions; some, however, are natives of Britain. It is a curious fact that none of the varieties has been given a popular name, as is the case with butterflies and moths. They are exceedingly voracious and very active, some species having a brilliant and beautiful colouring. Included in the number of 43 species in Britain are 16 damselflies, differing little in appearance from D.s. Their nymphs, however, breathe through the back while those of D.s breathe through their tails. The damselfly, too, is not so strong as the D. and is content to fly around the home water. See W. F. Kirby, *A Synonymic Catalogue of Neuroptera Odonata*, 1890; W. J. Lucas, *British Dragon-flies, Odonata*, 1900; C. Longfield, *Dragon-flies of the British Isles*, 2nd ed. 1949.

Dragon Mountains, see DRAKENSBERG.

Dragonet, *Callionymus*, a genus of small, spiny-rayed fishes living in temperate and tropical seas; the males have the fin-rays produced into filaments.

Dragonnades, see CAMISAIRDS.

Dragon's Blood, a name applied in ancient pharmacology to the resin derived from a number of plants, chief of which are the *Caesalus draco*, an E. Indian palm, *Dracaena draco* of the Canary Is., and the *Croton draco* of Mexico.

Dragon's Mouth and Snappedragon, popular names for flowers of the genus *Antirrhinum*, family Scrophulariaceae. The corolla is personate, and when pinched between the fingers the mouth opens and then closes with a snap.

Dragoon (Fr. *dragon*), originally applied to a cavalry soldier, trained to fight on foot. He received his name from his weapon, a 'dragon' or short musket, so called from the dragon's head worked on the muzzle, which was first carried by the horsemen of Marshal Brissac in 1600. Accustomed to fighting with the infantry, they were organised into companies, their officers bearing infantry titles. D.s were naturally at a disadvantage, as regards armament and horsemanship, compared with the *bona fide* cavalry regiments. Since the campaigns of Frederick the Great the term D. has been used of medium cavalry. In police actions and all kinds of guerilla warfare D.s have been employed, for they combine efficiency with economy. When Louis XIV proceeded against the Protestants, he was said to 'dragoon' or 'dragoonade' them. The Scots Greys (estab. in 1683) is the oldest D. regiment in the Brit. Army. See also DRAGOON GUARDS; ROYAL DRAGOONS; SCOTS GREYS.

Dragoon Guards. Prior to the First World War there were 7 regiments of D. G.: the 1st (King's), 2nd (Queen's Bays), 3rd (Prince of Wales's), 4th (Royal

Irish), 5th (Princess Charlotte of Wales's), 6th (Carabiniers), and 7th (Princess Royal's). The progress made in mechanisation (q.v.), combined with the need for economy, resulted in the amalgamation of many of the old cavalry regiments and eventually in their conversion into armoured car or tank units. The regiments in 1957 were the 1st (King's), 2nd (Queen's Bays), 3rd Carabiniers (Prince of Wales's, an amalgamation of the 3rd and 6th), 4th/7th (Royal), and the 5th Royal Inniskilling (an amalgamation of the 5th D. G. and the 6th Inniskilling Dragoons). The 1st and the 2nd D. G. are to be amalgamated by 1959.

All the old regiments of D. G., except the 7th, were raised at the time of the Monmouth rebellion of 1685. The 1st regiment acquired their title 'King's' in 1746. They fought, as did most of the other regiments of D. G., in Marlborough's campaigns, also in the S. African War, and at Ypres and Loos in the First World War. The Queen's Bays fought at the battle of the Boyne as the 3rd Regiment of Horse, and their present name came into use in the mid 18th cent. In the First World War they fought at Mons, Le Cateau, Néry, Gheluvelt, and at various points in the Ypres salient. The 3rd D. G., the old-time 4th Regiment of Horse, fought under Marlborough as 'Wood's Horse' and received their title, 'Prince of Wales's,' in 1768. Besides taking part in Marlborough's campaigns they fought in the Peninsular battles; and, in the First World War, at Holbeke, Klein Zillebeke, and Gheluvelt in the 1st battle of Ypres; and in 1915 took part in combined cavalry operations in the 2nd battle of Ypres. The Royal Irish D. G., raised in 1697 as 'Arran's Cuirassiers,' received their eventual name in 1788, and fought with distinction at Balaklava and other Crimean battles, and at Tel-el-Kebir. In the First World War they are credited officially with being the first Brit. troops to come into contact with the Germans, charging and routing a column of Uhlans at Jemappes on 20 Aug. 1914. They also fought at Mons and in the Ypres sector. The 5th D. G. were the former 2nd Green Irish Horse of 1717; they also fought in Marlborough's battles, and in those of Wellington. In the First World War they were at Le Cateau, Néry, and Ypres. The Carabiniers, formerly the 8th Regiment of Horse, became the 3rd Irish Horse in 1745 and the Carabiniers in 1788. Besides taking part in Marlborough's campaigns, they fought in the Afghan War of 1879 and at Paardeberg in the S. African War. Like other regiments of cavalry, their fighting in the First World War was mainly in the capacity of infantry in 1914, notably at Gheluvelt. The 7th D. G. were raised in 1689 by the 1st duke of Devonshire to support the Protestant cause during the revolution. At the battle of the Boyne they fought as Schomberg's Horse. After Marlborough's battles their commanding officer was the famous Jean Louis Lord Ligonier (q.v.). Their other battles prior to the First World War included Dettingen and

Tel-el-Kebir. In the First World War they were at the battle of the Somme, 1916, being especially prominent in the stiff fighting around Bazentin and Longueval.

Mechanised, and fighting as units of the Royal Armoured Corps, all the D. G. regiments won new honours in the Second World War. The 1st King's D. G., in action in the first Libyan campaign, served in the W. Desert and Tunisia until the destruction of the Axis armies in N. Africa. In Italy they led the fighting advance of the Fifth Anglo-Amer. Army into Naples. They also fought as infantry. In Dec. 1944 they went to Greece to restore public order in Athens and Attica. The 2nd D. G. (the Queen's Bays) served in the W. Desert and in Tunisia with the Eighth and First Armies. They fought in the Knightsbridge battles, the withdrawal into Egypt, and at El Alamein. In the pursuit to Tunis they were part of the armoured desert wing whose surprise turning movement drove the enemy from his Mareth defences. They were continuously in action in the It. campaign between the spring of 1944 and the early summer of 1945. The 3rd D. G. (the Carabiniers) were the only tank unit in the garrison of Imphal (Burma), besieged by the Japanese in the summer of 1944. Some of their tanks climbed slopes of over 35 degrees, and, after the Jap. failure, mounted the Chocolate Staircase to Tiddim and fought their way up Kennedy Peak, 8500 ft high. Crossing the Chindwin and the Irrawaddy they helped to capture Mandalay, Prome, and Rangoon. The 4th/7th D. G. were among the first armoured troops to land in Normandy in June 1944. They were engaged in the heaviest fighting of the Caen-Palaisse battles until mid Aug. The first armour across the Seine, they fought at Arnhem, and, in the following Feb., were the first Brit. troops to link up with the Americans against the Ger. counter-offensive in the Ardennes. They crossed the Rhine with the 51st Highland Div. and supported the 3rd Brit. Infantry Div. in the capture of Bremen. From 'D' Day until the end of the war they destroyed 100 Ger. tanks and many self-propelled guns and machine-gun posts. The 5th Royal Inniskilling D. G. also landed in Normandy among the first armoured troops. They were in action continually during the Caen battles from mid June until late Aug. In the sweep from the Seine to the Scheldt they drove from the neighbourhood of Amiens to the region of Ghent in 3 days. After crossing the Rhine they led the way into Hamburg.

Draguignan, Fr. tn, cap. of the dept of Var, on the Nartuby, 528 m. SE. of Paris. It has leather and textile industries, and a large Amer. military cemetery. Pop. 12,000.

Drain, see PUBLIC HEALTH; SEWAGE; and SANITATION OF BUILDINGS.

Draining, Drainage, removal of water or other fluid by gravitational flow. Drainage is often associated with the carrying away of sewage matter in artificial channels (see SEWAGE), and with re-

claiming land by enclosing it with dykes and carrying off the water by special channels. In the practice of agriculture, however, the term is most often used to designate the removal of excess of water, which would otherwise become stagnant, from a clayey soil. Such D. was practised by the Romans, who kept their lands dry by open trenches or drains in which a porous channel was maintained by a layer of stones or twigs. The use of covered drains was revived in England by Joseph Elkington about 1763, who showed that land could be freed from stagnant water by tapping the obstructing clay by deep drains in suitable directions. In 1823 James Smith of Deanston introduced the parallel system which is the basis of all methods now in use. When the slope of the field, or of any section of it, is determined, and a suitable outlet for the water obtained, a main receiving drain is constructed along the lowest part of the ground, and a series of parallel drains made so as to fall towards the main drain. Smith suggested that each trench should be 30 in. deep; at the present day they are usually cut to a depth of 3 to 4 ft, the width at the bottom being just sufficient to receive the line of porous cylinders which carry off the water. Formerly these were connected by collars, but if well laid there is no necessity for that method of joining. The distances between the parallel drains may be from 10 to 40 ft, according to the extent to which water is imprisoned.

The effect of D. land is greatly to increase its agric. value. In a marshy soil, aquatic plants and mosses thrive and prevent the proper development of grass or corn. The temp. tends to be low from the constant evaporation, and crops are, therefore, liable to fail in bad seasons. Tillage is difficult on account of the toughness of the soil. The excess of moisture prevents the passage of air through the soil, thus starving the roots. Sheep and cattle are much more liable to disease. When the land is drained these disadvantages disappear. By this means many dists. in the low-lying parts of the E. of England have been converted into good arable and pasture land. The Land Drainage Act, 1930, was passed to promote schemes of land drainage, through the formation of catchment authorities under the Act. See R. W. Walker, *Principles of Underdrainage*, 1929; B. W. Adkin, *Land Drainage in Britain*, 1933; H. H. Nicholson, *The Principles of Field Drainage*, 1942.

Drake, Sir Francis (c. 1545-96), sailor and circumnavigator. Local tradition has it that he was born at Crowndale, near Tavistock, his parentage, and the exact year of his birth, being doubtful. But there is no reason to doubt Camden's statement that in his youth D. was apprenticed to the sea. In 1565 he sailed with Capt. John Lovell to the Sp. Main, and his capacity for handling a vessel became so well known that 2 years later he was selected to command the *Judith* in that ill-fated expedition of Sir John Hawkins (his cousin), which was defeated

with great loss off San Juan de Lua. Between 1570 and 1573 he made 3 voyages to the W. Indies, during which he sacked Portobello and Vera Cruz, and accumulated a considerable fortune. It was in 1577 that he set out for the R. Plate on a buccaneering expedition, and he made his way through the straits of Magellan, sailed through the Indian Archipelago, rounded the Cape of Good Hope, and returned to England, having thus completed the circumnavigation of the globe, the first Englishman to have done so. To his vessel, the *Golden Hind*, came Queen Elizabeth I on 4 April 1581, and there knighted the intrepid sailor. Four years later he was given the unofficial command of a fleet, and committed many savage assaults on the Sp. fleet and the Sp. coast

SIR FRANCIS DRAKE

tus. In 1588, when the Sp. Armada (q.v.) sailed for England, D. played a leading part in its defeat off Gravelines, pursuing it and destroying sev. vessels, as the fleet sailed northwards up the coast to Scotland. The following year D. was associated with Norreys in the disastrous Lisbon expedition, and its failure was used by his enemies to discredit him and his aggressive policy. In 1595 he was sent with a fleet to the W. Indies, and it was whilst on this expedition that he d. of dysentery near Nombre de Dios and was buried at sea. D. has been called by some critics a common pirate, and alternatively hailed by others as a Protestant hero. In fact he played a considerable part in founding the Eng. naval supremacy which was to endure for cents. after his death; and his character and career, with the strange mixture of idealism, extreme brutality, and brilliant individualism and courage, epitomised the Elizabethan age. See life by J. S. Corbett, 1890; see also J. S. Corbett, *Drake and the Tudor Navy*, 1898; and A. L. Rowse, *The Expansion of Elizabethan England*, 1955.

Drake, Nathan (1766-1836), essayist and doctor, b. York. His best-known books were *Shakespeare and his Times*, 1817, and *Memorials of Shakespeare*, 1828.

Drake, see DUCK.

Drakensberg Mountains, or Dragon

Mountains, chain of mts. situated in SE. Africa and lying parallel to the coast, between Cape Province and the Vaal R. The seaward slopes are steep and precipitous, while landwards the slopes are more gradual and form part of the tableland. That portion of the chain between Natal and Basutoland contains the highest points, Champagne Castle, Mont-aux-Sources, and Giant's Castle, each being considerably over 10,000 ft in altitude, and all within 60 m. of each other. The prin. heights along the Transvaal, Natal, and Orange Free State frontiers are Malani, Inkwele, Tintwa Majuba, and Drakensberg. The S. part of the chain forms the watershed between the rvs. flowing W. to the Atlantic and those flowing E. and S. to the Indian Ocean. The Orange R. and the Tugela rise in Mont-aux-Sources. Van Reinen's Pass and Laing's Neck are the chief passes crossing the range.

Dram, see METROLOGY.

Drama, in of E. Macedonia, Greece, celebrated for its tobacco. It has an active trade and fertile surroundings. The pop. includes many refugees from Asia Minor who settled in D. after 1922, thereby providing labour for a large increase in tobacco culture. Pop. 29,500.

Drama (from the Gk *drân*, to do), a form of literary art for the direct representation of human actions and characters through individual impersonation, before an audience. This article does not attempt to give more than a general historical sketch of world D. Greater detail will be found in articles on the literatures of each country and on the individual writers mentioned. There are also separate articles on the main London theatres and on a number of actors and actresses. For other subjects related to D., see CENSORSHIP OF THE DRAMA; CINEMATOGRAPH; COMÉDIE FRANÇAISE; COMMEDIA DELL' ARTE; COSTUME DESIGN. THEATRICAL; MELODRAMA; MUSIC HALLS; MUSICAL COMEDY; NATIONAL THEATRE (BRITISH); NON-PLAY; PANTOMIME; RADIO DRAMA; REPERTORY THEATRE; THEATRE; UNITED STATES OF AMERICA (FILM).

In literary hist. the D. is usually classified as a branch of poetry, though many plays have been written in prose. Both the epic, or narrative, and the lyric, expressing individual emotion, are applied in D., where the facts of a story are developed in interchange of speech and action. This latter distinguishes the D. from simple dialogue; the illusion of reality is rendered plausible by the scene-painter and the stage-manager; altogether they express objectively every emotion by word, gesture, or play of feature. The div. of a play in acts and scenes originates in the subject-matter of the D. itself; the invention of the drop-curtain and scene-shifting has created mechanical accessories. All these divs. mark the different stages of the development of the plot, show the complications leading to the climax, and finally solve the problem by the 'catastrophe.' The famous doctrine of the 'unities' is hardly more than a

formulation of the inevitable stage-restrictions. Their origin may be traced to Aristotle's remarks on tragedy, but as conventions of the theatre they were definitely accepted by the classical Fr. dramatists, foremost among them being Racine and Corneille. The 'dramatic unities' are three: of place, of time, and of action. Place precludes any extensive change of scene; time is limited to the space of one day for the development of events; action requires that all the events shall converge on a simple plot. Shakespeare, Lessing, and the Fr. romanticists recognise as fundamental only the last of the three. Upon the Gk stage, the model for the classicists, there was no curtain and very little possibility for change of scene; consequently, unity of place was practically inevitable. Unity of time was necessary from the habitual presence of the chorus on the stage. Unity of action is simply an application of the principle on which is based every work of art. Sometimes a secondary plot is created by the author for the display of subsidiary characters of the play, mostly for the purpose of enhancing, by contrast, the effectiveness of the main action.

The classic departments of the D. are tragedy and comedy; tragedy has a sad ending, comedy ends happily. But there are other differences. Tragedy deals seriously with serious themes, with the sufferings of humanity, and with fatality. Comedy exploits the follies and absurdities of the ridiculous and the base. Tragedy entertains through the excitement to pity and sympathy, comedy through the excitement to mirth. Satirical purposes may dictate the choice of the object of ridicule. Under-plots in tragedy introduce a comic element as a counterpoise to tragic emotions and heighten the impressiveness of the latter (see the grave-digging scene in *Hamlet*). Modern plays, however, contain much more diversity of plot than the ancient, and many of them are neither tragedy nor comedy, neither fish nor flesh. Of the different kinds of D., the so-called historical or romantic are sufficiently defined by their names. *Melodrama*, of lt. origin, is a broadly treated mixture of tragedy and comedy, appealing to the lesser critical emotions. This term was first applied to romantic D. to which music had been added, and was used in this sense in England to describe those plays which could not be performed as written owing to the veto exercised by the charter rights of Drury Lane and Covent Garden Theatres. Music was introduced into them and they thus circumvented the ban and were known as melodramas. The Fr. *drame*, described variously as *tragédie bourgeoise*, or *comédie larmoyante*, represents life with little imitation as to form. Comedy has developed in not a few varieties, from the 'comedy of manners' of the 18th cent. to farce, burlesque, and vaudeville. Pantomime and ballet are ancient offshoots of the regular D., perhaps parts of its origin. Mimicry is fundamental to the acted D., an inevitable part of human nature, and doubtless common to all people. The

dramatic dialogue of the Book of Job and the dramatic lyrics in the Canticles may be the primitive form of dramatic tendency, but the regular dramatic history begins in Greece.

Greek drama, both tragedy and comedy, was the consequence of the worship of Dionysus or Bacchus. At the Dionysian festivals in Attica, the followers of the wine-god were impersonated by choruses of men half-clad in goat-skins, whence probably derives the word tragedy (*tragōidia* = lit. goat-song), singing dithyrambic songs in honour of the god as they danced about the altar; thus, about 600 BC the Corinthian poet, Arion, led a cyclic chorus of 50. Half a century later appeared Thespis of Attica, whose innovation was the introduction of an actor to fill the intervals of singing with stories, mimicry, and short dialogues with the leader of the chorus. Soon after the more serious performances were limited to the sadder parts of Dionysus' story and of other mythological tales, 'Isistratus estab. at Athens the *Lenaea* festival, in which, as somewhat later, at the *Great Dionysia*, prize dramatic contests were included, and the development of tragedy was continued by Choerilus, Phrynichus, and other playwrights. The 5th cent. BC produced the greatest tragic writers of the Athenian stage: Aeschylus, who enlarged the dramatic possibilities by making the number of actors 2; Sophocles, who added a 3rd; and Euripides. The original chorus of 50 was divided into 4 or 12 each (increased to 15 by Sophocles), and plays were presented in groups of 4 called tetralogies, in one of which in each tetralogy the original satyric form was maintained. The other 3, called a trilogy, formed a consecutive series upon a single legend. A tragedy generally was made up of a series of episodes, separated by lyrics sung by the chorus, introduced by the prologue and terminated by the exode. The actors were trained by the author, and to 'teach' a D. was equivalent to producing it. The expenses of the production were borne by a chosen citizen, called the *choregus*, who thus participated in the contest. The Athenian tragedy was a sort of serious religious function. Aristotle in his *Poetics* defines its motive as 'to purify the passions of fear and pity through the exalted exercise of them.' Characterisations of the 'great tragic trio' of Athens have been innumerable from the time of Aristophanes. With Aeschylus, the idea of *Nemesis* (divine vengeance) is an overwhelming mystery; with Sophocles it is a part of the moral law of life; with Euripides it becomes a source of human sadness. Under this trinity, tragedy in Attica became the means of expressing the deepest religious thoughts; their successors, Ion, Achaëus, Agathon, and others, are insignificant, as none of their works has come down to us. Later, most of the lyrical element was lost through the dropping of the chorus: from being an Athenian institution, tragedy spread to other Gk lns, and its special relation to the worship of

Dionysus disappeared. However, the earlier works were continually reproduced; we find them performed under the Ptolemies at Alexandria. Gk comedy developed parallel with tragedy; it originated with the crude songs of the more rustic Dionysian festivals, which led naturally to a dramatic composition of a gay character. It is said to have been introduced into Attica early in the 6th cent. BC by Susarion, the Megarian, but before it was encouraged at Athens it developed elsewhere, particularly among the Dorians in Sicily, where flourished Epicharmus of Cos (b. c. 540 BC) and Sophron, the inventor of mimes, who wrote in Doric prose, dispensing with both chorus and plot. Athenian comedy is commonly divided into 3 periods of old, middle, and new comedy. Aristophanes was the great master of the first; Cratinus, Crates, and Eupolis were his contemporaries. It was constructed on similar lines to tragedy, but with a chorus of 24 and an additional element, the *parabasis*, in which the audience was directly addressed; it dealt frankly in personalities, was largely political, and did not hesitate to caricature the leading men of the day. At the period of middle comedy the freedom of speech was somewhat limited, and the butt of the comedian's ridicule was the follies and foibles of whole classes rather than those of individuals. The chorus was dropped. The new comedy, at the beginning of the 3rd cent. BC, brought the aforementioned tendency to a full development. Political questions were neglected, and writers like Menander and Philemon devoted themselves to the exhibition of ridiculous complications of the social life of a decadent society. Some of the types then created, the gullible old man, the dissipated son, the impudent servant, serve still in our days. This latest Gk comedy is chiefly known to us through the adaptations of the Rom. comedians Plautus and Terence.

Roman drama. The Romans, who had but few dramatic gifts, naturally preferred comedy to tragedy. Comic elements are to be found in the *saturae* of the early Lat. ins. It is generally assumed that the Romans borrowed their first idea of a play during a period of national despondency (364 BC, Livy vii. 2) from the Etruscans, from whom came their word *histrion*, an actor. The rude farces known as *fabulae Atellanae* were effusions of sportive humour, and came from the Oscans. Mimes they took from Magna Graecia; and their literary D. was practically an imitation of the Greek. The D. was one of the earliest branches of literature cultivated by the Romans. Both comedies and tragedies were written by Livius Andronicus, Naevius, and Ennius; tragedies by Pacuvius and Attius, none of which has come down to us. Naevius is celebrated for having got into trouble by ridiculing prominent people in imitation of the old comedy of Athens. What is left to us of Rom. comedy belongs to the works of Plautus and Terence, of the class called *palliatae*; closely adhering to the Gk models, as distinct from the so-called

togatae, which had Rom. subjects. Plautus, once a poor labourer, has a degree of rough vigour and broad jocularity, while Terence, a Carthaginian slave, is more refined and delicate in his wit and characterisation. The works of both are based on Menander and Philemon, but one change of form is to be particularly noted: the prologue ceased to be the first act of the play, and became what it has since remained, a detached explanation. Tragedy, more as literature than for stage production, was cultivated by writers of the Augustan age and later. Of all these attempts nothing remains except the rhetorical D.s attributed to Seneca the Younger. One of them, *Octavia*, is of the class called *praetextae*, treating historical Rom. subjects; the remainder are all from Gk mythology. With the decadence of the Rom. empire, all 'legitimate' D. declined, and the stage was held by dancers and pantomimes, some of whom became great popular favourites. Cicero testifies to the excellence of Roscius, the most celebrated of Rom. actors.

Indian drama was long said to have been derived from the Greeks, but is now generally thought to be of independent origin. Like the Greek, it arose from religious ceremonies, along with the dances and songs of popular festivals. However, the Hindu D. is not tragic, and makes far more of romantic love than does that of the Greeks. Kālidāsa, the greatest literary genius of India, commonly assigned to the 1st cent. BC, is by recent criticism placed several cents. later. The best period of Sanskrit D. was from about the 4th to the 9th cents. AD. A peculiar feature of Indian plays is the use of different dialects for different characters. Gods, heroes, and men of high standing speak Sanskrit; women and men of low position speak Prakrit in various forms. The best known Sanskrit play is Kālidāsa's *Sakuntala*, a heroic love D. of poetical beauty. Another 5-act play of Kālidāsa's is *Micramorvasi* (The Hero and the Nymph). Among other Hindu dramatists deserve to be mentioned Bhavabhūti, a Brahman of S. India in the 8th cent.; 2 of his 3 plays concern the adventures of Rama, the hero of the epic of *Rāmāyana*, on which sev. of the later Indian D.s are founded. Other noted plays are: *Mricchakatika* (The Toy Cart), a D. of social life, in 10 acts, credited to King Sudraka of the 6th cent.; and *Ratnavali* (The Pearl Necklace), a romantic play, supposed to have been written by King Sriharsha, of the 7th cent. The Muslim invasion killed the D. in India, and, though Sanskrit plays have been written in modern times, they are rarely acted.

Chinese drama. The rudiments of Chinese D. had their origins in dance and impersonated acting as early as the 7th cent. BC when the court clown Yu Meng acted the part of a late minister to admonish King Chuang of Ch'u; since then the word 'yu-meng' has become synonymous with that for 'actor.' In the Han Dynasty (206 BC-AD 219) acrobatics performed on top of tall poles carried in teams of running chariots, and the performance of

miracle-plays based on popular legends, were the vogue at court. In the 6th cent. theatrical performance was known as 'broadway acting.' The actors and actresses trained by the T'ang Emperor in the 'Pear Garden,' however, were mostly dancers and singers, though to this day 'pear garden' is still occasionally used to mean the theatre. Extant Chinese dramatic literature dates from the Sung and Chin (10-12th cents.) when plays based on stories from Chinese history, popular romance, and Buddhist legends were written in lyrical verse of 'Irregular Metres' to be sung on the stage, while most of the dialogues were left to the actors and actresses to improvise. Play writing was the chief subject in public examinations in the Yüan (Mongolian) Dynasty, the Golden Age of Chinese D. The plays required in the examination papers were divided into 12 subject-matters, including legends of saints and immortals, lives of past celebrities, paragons of loyal ministers, filial sons, virtuous women, and faithful friends, stories of military achievements, comedies or tragedies of love, etc. The Yüan plays are usually divided into 4 or 6 acts, complete with classical verse, vernacular dialogue, and stage directions. In the following Ming and early Ch'ing times (15-18th cents.) Chinese D.s became enormously lengthy, each play often consisting of 40 or more acts (or scenes). As such a long play would last 2 or 3 days on the stage, the fashion has grown of extracting 1 or 2 acts from each of sev. plays for one performance by the repertory company. From Sung times Chinese D. has developed into 2 separate schools: the orchestra of the S. School, now known as the K'unshan Opera, mainly uses pipes and flutes to accompany the singing; that of the N. School, now known as the Peking Opera, uses string instruments, while percussion instruments are used in both Schools to punctuate the acting, which is often symbolised by highly stylised gestures, dance, or acrobatics if it is a 'military play.' Since the founding of the rep. in 1912, the modern W.-style play of dialogue and realistic acting has been introduced, and works of Shakespeare, Dumas, Ibsen, Gorky, Galsworthy, Shaw, and others have been trans. and put on the stage. (For further details about Yüan, Ming, and Ch'ing playwrights and their works, see CHINESE LITERATURE.)

Japanese drama. The origins of Jap. D. were both social and religious. First written references to Jap. D. occur in the *Ko-ji-ki*, a Record of Ancient Matters. Ad 712, where an account of *Kagura*, God-Music, is given. *Kagura* may have been originally music and dance either between, or in the presence of, gods. It is still played before *Shinto* shrines, and chants, rhythmic accompaniments to the movements of labour, such as the song for driving in stones, seem to have been incorporated into the *Kagura*. Field dances, *Tanar*, and field music, *Dengaku*, are of anet origin; while other dramatic forms of social origin are *Saibara*, songs probably sung when the people were about to carry

tribute to their rulers, and *Azuma mae*, songs of the K. provs. The *Malenri* (processions of cars) are still popular in Japan. *Dengaku* included 6 forms of D.—*Shiba* (lawn), *Dai* (great), *Sho* (small), *Maiko* (dancing girls), *Maru* (village) and *Kachi* (walking, probably on horseback)—and, with other dance D., such as *Ennen*, became formalised with the growth of Buddhism and developed into the *Noh* plays ('noh' meaning accomplishment), which are extremely conventionalised. *Noh* of *Sarugaku* (monkey-music) was originally comic, but lost its comic nature under the influence of the priests. In *Noh* there are 2 or more actors, the play is in verse and is chanted, the players are often masked, and all movement is formalised. By the end of the 15th cent. 4 types of *Noh* plays were in existence—*Shinto noh*, which deals with mythological subjects; *Shugen noh*, commemorating customs; *Yurri* and *Serei noh*, in which ghosts and spirits occur; and *Genzai mono noh* dealing with things of life to illustrate a moral truth. As the literary preservation of *Noh* plays was under the care of Buddhist priests, all comic element in them disappeared. The comic plays were extempore, and became incorporated in *Kyogen*. *Kyogen* means easy speech, and is realistic, non-literary social comedy. It is in prose, and is performed as interludes in the long programmes of *Noh* plays (see NOH-PLAY).

Medieval drama. During the Middle Ages the Church, practical as ever, undertook to replace the pagan shows by a Christianised equivalent, which seems to have arisen naturally out of the responsive chants and narrations of biblical events with which the congregations were both instructed and entertained. Later these entertainments took the form of regular liturgical D., which developed into the *miracle-plays*, *mysteries*, and *passion-plays*, cycles of which were performed at Chester, York, Coventry, etc. in the 15th cent., and which have survived in modern times at Oberammergau and elsewhere. With a similar purpose arose also the *moralities*, which mostly were performed by wandering churchmen. Lately there has been great interest in the mysteries and miracle and morality plays and many have been revived, often in eccl. surroundings. The most famous, *Everyman*, has been played in theatres with success, notably at the Court, 1903; Shaftesbury, 1905; and Garrick, 1907. One reason for their original production was the dissemination of religious instruction amongst the illiterate masses. The earliest recorded performance of a play in enclosed premises was at Dunstable in 1136.

Italian drama. The revival of the classical D. was earliest in Italy. Of the It. religious D., the *Rappresentazione Sacra*, mostly in connection with the festivities in honour of Saint John the Baptist, were responsible for 2 works of great merit, *Abramo e Isacco*, 1449, by Feo Belcari, and *San Giovanni e San Paolo* by Lorenzo de' Medici. At the beginning of the 16th cent. Plautan

comedy was revived in the writings of Cardinal Bibbiena, Ariosto, and Machiavelli, and some erratic attempts like that of Poliziano; but the modern It. D. was born when Aristino produced a rather dull and conventional tragedy in blank verse. *Sofonisba*. Torquato Tasso's *Aminia*, 1573, set the fashion of pastoral plays. At the end of the same cent. Giambattista della Porta wrote his familiar and sometimes farcical comedies of a pleasant originality. The romantic D., originated in Spain, found favour in Italy, and the reaction against the domination of the classic school became effective. Borghini, Michelangelo Buonarroti (a nephew of the great artist), with his comedies *Fancia*, 1612, and *Fiera*, 1618, and others supported the movement. At the same period Rinuccini and his followers, by uniting music to the romantic D., created what was called the *melodrama*. Consequently tragedy and comedy were rapidly superseded by the *musical opera*, which, a cent. later, was brought to a literary level by Zeno, and perfected to the utmost by Metastasio, who with his *Didone Abbandonata* (first produced in Rome 1723) completely fascinated the It. public. His long series of works culminated in the triumph of his *Attilio Regolo*, 1750. Maffei produced his *Meropé*, 1713, with the definite purpose of restoring classic tragedy. But Fr. dramatic art soon began to influence the It. stage, especially through the efforts of the actor-playwright Riccoboni. The 18th cent. produced Italy's 3 greatest dramatists: Carlo Goldoni, Carlo Gozzi, and Vittorio Alfieri. Goldoni (1707-93) left his native Venice in 1761 for Paris; he is called the 'Italian Molière,' and may be called the master of It. regular literary comedy. Gozzi (1720-1806), his rival, wrote dramas based on fairy tales; both transformed the popular *Commedia dell'arte* (Comedy of Masks) into a literary shape which for some time enjoyed immense success. Alfieri (1749-1803) was of quite another metal. He was bold and passionate, a follower of the classic school and observer of the unities, and helped to revive the national spirit by such tragedies as *Filippo II*, *Saul*, and *La Congiura de' Fazzi*. His successors, Monti, Nicolini, Manzoni, Silvio Pellico, and Cossa, relaxed their adherence to classic forms. In the 19th cent. Italy was influenced by Shakespearean methods, in consequence of which her dramatists affected to give prominence to the historical D. Some exceptionally good works were successfully performed by the great It. actors, Modena, Salvini, Rossi, and Madame Ristori. In recent years the poet Gabriele d'Annunzio gained some reputation as a playwright, principally by such of his works as he wrote specially for the great actress Eleonora Duse. Luigi Pirandello (1867-1936) is one of the greatest 20th cent. dramatists. His drama is metaphysical, and is influenced by the theory of relativity. There is nothing absolute about his plays and the characters in them are always concerned with their real, though hidden, personalities. Although the problems of his

plays may be considered as abstractions, the characters are so possessed with these abstractions that the problems become human, and the characters lose nothing of their reality. The language of the plays is exact and unembellished, and his whole dramatic treatment is objective, but his D.s hold the spectator throughout, and possess something of the quality of poetry. *Six Characters in Search of an Author*, 1921, and *Henry IV*, 1922, are 2 of his best plays, most of which have been translated into Eng. and many other languages. See also COMMEDIA DELL'ARTE. Giuseppe Giacosa (1847-1906) and Roberto Bracco (1862-1943) showed in their work much of the influence of Ibsen.

Spanish drama. Spain may well be considered as the bp. of the romantic D. Santillana, Lope de Rueda, called the patriarch of the Sp. stage, and Naharro were the beginners; Cervantes (1547-1616), Lope de Vega (1562-1635), and Calderon de la Barca (1600-81) became the perfectioners, the masters of Sp. dramatic literature. It is not generally known that Cervantes, of Don Quixote fame, is also the author of *La Numancia*, a serious tragedy of literary worth and dignity. Of his lesser contemporaries Cueva, Virues, and Argensula may be mentioned. Lope de Vega, the most prolific of dramatists of all times and nations, set all literary laws at defiance. He wrote with the most prodigious facility and with dramatic vigour. The number of his plays is said to exceed 1800, and they won great popularity, to which he often sacrificed some of his better qualities. Contemporaries of his were Juan Ruiz de Alarcón (c. 1580-1639) and Tirso de Molina (1571-1648) (Fray Gabriel Téllez), in whose *Burlador de Sevilla, ó el convidado di pietra* was first introduced the figure of Don Juan. Calderon was greater than Lope de Vega. He was the greatest of Sp. dramatists and one of the great dramatists of the world. He is lyrical and animated by the highest sentiments. His ideals were devotion to the king, to the church, and to personal 'honour.' Some of his best works are the religious plays called *autos sacramentales*, in which the mystery of the Eucharist is dramatically set forth. With his death in 1681 the brilliant period of the Sp. theatre was practically closed. His contemporary, Moreto, wrote numerous fine comedies, mostly of the 'cloak and sword' sort, for which the Sp. stage is renowned. José Echegaray y Eizaguirre (1832-1916) wrote more than 60 plays, many of which have as their theme a conflict between 2 forces. His best play is *El Gran Quilezo*, 1881. He attempted to deviate in his plays from the so-called 'punto de honor,' on which Sp. D. had centred hitherto. In 1904 Echegaray shared the Nobel Prize for literature with Frédéric Mistral, but the younger Sp. dramatists, the 'generation of '98,' revolted against the past theatre of Spain and expressed their grievances in a manifesto against Echegaray. Benito Pérez-Galdós (1843-1920) was exempt from the criticism of the 'generation of '98.' His plays usually express some

attitude of revolt, and are written regardless of stage technique, but the characterisation is good. One of the most famous of the 'generation of '98' is Jacinto Benavente (b. 1866), whose work is prolific and varied. His plays form the link between the old and new D. of Spain and contain the varied thought of all the most important European dramatists of the 19th cent. Among 20th-cent. dramatists Gregorio Martínez Sierra (b. 1881) and the brothers Serafin (1871-1938) and Joaquín Álvarez Quintero (1873-1944) are outstanding.

French drama. France, accepting the 'unities' as the first essentials in the D., revived the classical D., which appeals to the logical temper of the national genius. In the *mystères*, *moralités*, *satires*, *farces*, romantic or anti-classic tendencies were manifest, but no great advance in proper dramatic achievement was made. The first regular 5-act tragedy was written by Jodelle for the court of Henri II. He wrote some more plays, not without merit, but nothing remarkable was done till Pierre Corneille appeared in the reign of Louis XIII. He had to humour the Court by humouring the Academy, and to please the Academy he had to observe the so-called rules of Aristotle. He had already produced sev. plays of classical elegance and dignity, when, attracted by its romantic tendencies, he wrote his masterpiece, *Le Cid*. All Paris rang with the praises of this work, but the Academy held aloof. Corneille had to return to the classical limitations, and was rewarded with a seat in the Academy. It was more than came to his contemporary, the great Molière, who insisted on remaining an actor, a resolve which the dignified academicians could by no means tolerate. Molière's name is doubtless in all the essentials of pure comedy the foremost name in the hist. of the stage. Like Shakespeare, he borrowed much from both the Italians and the Spaniards, but he made his theatre truly Fr. in wit, expression, and characterisation. By the union of Molière's company with that of the actors of the Hôtel de Bourgogne, Louis XIV estab. in 1680 the Comédie Française (q.v.), an institution which is at the heart of the Fr. theatre, and is the most famous national theatre in the world. Racine was the great tragedian of the times of Louis XIV. He was not tempted, like Corneille, to overstep the academic proprieties. He was perhaps the most tender and the most elegant of Fr. writers, and it may truly be said that *Athalie*, his masterpiece, has never been surpassed in noble elegance and severe grandeur. The brilliant and erratic Voltaire astonished Europe with the audacity and power of his romantic tragedies. Could he have been able to temper the intolerant leonoclasm of his fight against superstition he would have ranked as a dramatist with Corneille and Racine. In the 19th cent., the D. of France was much more prolific than that of any other nation. Alfred de Vigny, Scribe, and Legouvé, Alexandre Dumas père, and Victor Hugo, the leaders of the 'romantic movement,' Alfred de Musset,

Emile Augier, Dumas fils, Octave Feuillet, Victorien Sardou, Edmond Rostand (the reviver of poetical plays), Jean Richepin, François Coppée, all produced meritorious dramatic works. Writers who composed their plays on the 'marital triangle,' giving great attention to construction, are P. Hervieu (1857-1915), praised for his literary style, Maurice Donnay (1860-1945), and Henri Bataille (1872-1922). Other 20th-cent. dramatists who specialise in sex drama, often with applied psychology, are Henri Lavedan (1859-1940), Jules Lemaitre (1853-1914), and Georges de Porto-Riche (1849-1930), while the plays of Alfred Capus (1858-1922) are sceptical in the extreme. Henry Bernstein (b. 1876) is a popular dramatist whose plays are almost melodramatic. Eugène Brieux (1858-1932), with other of his contemporaries, François de Curel (1854-1928) and Henri Bocque (1857-99), had his plays first produced at the Théâtre Libre, which was founded by Antoine in 1890. Brieux is known in Europe for the controversial subjects of his plays, but his dramatic ability is great and his language is incisive. Sacha Guitry (1885-1957) is another dramatist, but his fame is more in connection with his acting and elocution. Since the First World War, and more notably since the Second World War, Fr. D. has developed European importance in the works of H. K. Lenormand, Jean-Jacques Bernard, Jean Sarmant, Jules Romains, Paul Géraudy, Paul Claudel, Jean Giraudoux, Jean Cocteau, Jean-Paul Sartre, and Jean Anouilh, and experiment has taken the place of tradition.

German, Austrian, and Czechoslovak drama. Ger. D. dates practically from Lessing, Goethe, and Schiller. Its origin is similar to that of all cultured nations, and up to the middle of the 18th cent. the Ger. stage was little more than a feeble reflex of Fr. influence. Lessing, both by his works and critiques, was the reformer, not to say the inaugurator, of Ger. dramatic art. His tragic plays, *Miss Sarah Sampson*, 1755, and *Emilia Galotti*, 1772, and his comedy *Minna von Barnhelm*, 1763, opened a new era for the Ger. D., while in his *Hamburgische Dramaturgie*, 1767-9, he attacked Fr. classicism and praised Shakespeare. Goethe, one of the world's greatest geniuses, does not rank high as a dramatist. His *Faust*, 1759, is doubtless one of the greatest modern compositions; but his chief purpose is self-cultivation, and in the prologue, his last and most famous production, he explains why, although writing in dramatic form, he cannot accommodate himself to the exigencies of a popular theatre. Schiller is the dramatic poet proper of Germany. Goethe's genius was fuller and more complete, but Schiller compensated by the intensity of his powers. Of his contemporaries there deserve to be remembered Heinrich von Kleist, Körner, Effland (actor, manager, and author); of his successors Grillparzer, Grabbe, Otto Ludwig, Hebbel, Hahn, Mosenthal, Gottschall, Auzengruber, Gerhart Hauptmann (1862-1913) is an important dramatist of the late

19th cent. His plays are naturalistic and poetic and, with those of Sudermann, were performed by the Free Stage Society, founded in Berlin in 1889. Sudermann's greatest play is *Mayday*. A contemporary of his, Frank Wedekind (1864-1918), wrote plays which refuse to be classified. *The Awakening of Spring* is one of his best known plays: his dialogue is brilliant and his influence on post-war dramatists great. If Wedekind may be called a writer of expressionistic drama, 4 important 20th-cent. dramatists may be classed with him, Georg Kaiser (1878-1945), Ernst Toller (1893-1939), Fritz von Unruh (b. 1885), and Bertolt Brecht (1898-1956). Carl Zuckmayer (b. 1896) deals with topical problems. Max Reinhardt (1873-1943) is also important, his designs for productions being world famous. Arthur Schnitzler (1872-1931) is an important Austrian dramatist, his best play being *The Green Cockatoo*; Hugo von Hofmannsthal (1874-1929) is a tragic poet of profound influence; and Max Mell (b. 1882) deals in drama of the homeland. Czechoslovakia has 2 expressionistic dramatists, Karel Capek (1890-1939) and his brother Josef, whose best-known play is *R.U.R.*

Dutch and Scandinavian drama. The Dutch D. is hardly more than an imitation of Fr. romantic plays. Nothing remarkable has been produced in Holland save for the work of Hermann Heijermans (1864-1924) and Jan Fabritius (b. 1871); or in Flem. Belgium, Fr. Belgium is the motherland of the poet Maurice Maeterlinck (1862-1949), whose plays display somewhat extreme features of the symbolist movement. Maeterlinck's play *The Blue Bird* was very successful when produced at the Haymarket Theatre in 1909. The Scandinavian countries have in recent times developed a D. of importance. The Norwegians, Bjørnsterne Bjørnson (1832-1910) and, first and foremost, Henrik Ibsen (1828-1906), have become very distinctive figures in the D. of psychological and social problems. Ibsen's influence on European D. is immeasurable. *Peer Gynt*, 1868, *The Pillars of Society*, 1877, *A Doll's House*, 1879, *The Wild Duck*, 1884, and *Hedda Gabler*, 1890, are some of his best-known plays. Contemporaries and followers of his are Gunnar Heiberg, Vette Visle, Gabriel Finne, Anders Stilloff, and Knut Hamsun. Johan August Strindberg, the Swede (1849-1912), a powerful but somewhat discursive dramatist, is an antidote to Ibsen's feminism. In Denmark, Adam Gottlob Oehlenschläger (1779-1850) is known for his dramas of the national tradition of the Nordic hero-world. A wide influence in D. and literature also belonged to Georg Brandes (1842-1927), both dramatist and critic, and Kaj Munk (1898-1944), a writer of religious and idealistic plays. Notable early 20th-cent. Dan. dramatists are Johannes Anker-Larsen, Valdemar Rørdam, Otto Benson, Fru Emma Død, Gustav Esmann, Sven Lange, Gustav Wied, Hans Wiers-Jønsen, and Hjalmar Bergström.

Russian drama is of very recent development. It is said that in earlier

days Russian religious plays were performed. The first Russian theatre was estab. in 1756 in St Petersburg, and its manager, Sumarokoff, and Kizaznin, and other forgotten authors, wrote plays for it in the Fr. style. Catharine II herself elaborated satirical comedies, and in her time Ozlerov (1769-1816) was a writer of tragedies of repute. In the 19th cent. we have Griboedov (1795-1829), the author of *Gore of ума* (The Misfortune of Being too Clever); Nicolai Gogol (1809-52), whose comedy *Revizor* (The Inspector) has become known all over the world; Alexander Pushkin (1799-1837), whose *Boris Godunov* shows Shakespearean influence; Alexander Ostrovsky (1824-86), whose plays are realistic and deal with the emotions of the people; Alexis Tolstoy (1817-75), whose D.s are founded on stories of the Russian kings; and Count Leo Tolstoy, whose plays follow no traditions, but contain great character studies. Early 20th-cent. dramatists are Maxim Gorky, whose greatest play is *The Lowest Depths*, and Leonid Andreyev, whose plays are written in excellent prose. Both these authors belong to the period of the first revolution. Anton Chekhov, one of the greatest 20th-cent. dramatists, wrote plays for the Moscow Art Theatre, which theatre did not produce a specifically Soviet play until 1926. These plays are naturalistic artistically, needing simple yet sensitive acting. A later 20th-cent. writer is Evreinov, much of whose work is based on his own theory of 'monodrama.' Since the revolution, 1917, a new theatre has been built up in Russia. The theatre in Moscow to-day falls broadly in 2 parts: there is the section represented by the Moscow Art Theatre, the Maly Theatre, and the Kamerny Theatre, which has successfully merged the old traditions with the new. The other section is led by men like Meierhold, the firebrand of the Soviet theatre, and Nikolai Okhlopkov, of the Realistic theatre. Meierhold works on an elaborate theory of bio-mechanics; his actors, in fact, use stylised movements and steps and ladders; Okhlopkov has abolished the div. between the auditorium and the stage, becoming more Elizabethan than the Elizabethans.

English drama, as in other countries, had its origin in the religious plays, written and performed by churchmen, who understood how to spice their miracle plays and mysteries with grotesque amusement, and it was not until the middle of the 16th cent., as elsewhere, under the influence of the Renaissance, that the Eng. D. freed itself from these ant fetters. The earliest known Eng. comedy is (c. 1531) *Ralph Roister Doister*, by Nicholas Udall, a learned master of Eton. A few years later Sackville and Norton produced their dull tragedy in blank verse, *Gorboduc*, or *Ferrex and Porrex*. Thereafter dramatic production was rapid, but mostly worthless; authors were Bishop Still, Kyd, Lodge, Lyly, Peele, Green, and Nash. The first dramatist of real merit was Christopher Marlowe, the great predecessor of Shakespeare, whose best tragedies

are *Doctor Faustus*, 1604, and *Edward II*, 1594. But the great luminary of Eng. D.—it may well be said of all the world's D.—is Shakespeare. Among dramatists, the worthiest of his contemporaries are Ben Jonson and Beaumont and Fletcher. Jonson wrote comedies and tragedies, stood more under the influence of the classics, but also became famous with his light and graceful masques, which were the court's favourite entertainment. Beaumont and Fletcher worked in collaboration, and stand next to Shakespeare in romantic D. Dekker, Massinger, Ford, Webster, Chapman, and Shirley were authors of older Eng. D.s, when this kind of literature was abruptly and sharply terminated by the Puritan revolution. With the Restoration Fr. influence became apparent. Display mastered the play, and lavish staging assumed undue importance. Lee and the unfortunate Otway wrote tragedies; Shadwell and the licentious Wycherley produced comedies; Vanbrugh, Congreve, and Farquhar brilliantly depicted society under a veil of immorality and indecency even more marked than that of the licentious writers of Elizabethan times. Then came Gay, Mrs Centlivre, and the actor-playwright Colley Cibber, who was not lacking in dramatic spirit and invention. Famous, in another way, became Addison's tragedy *Cato*, 1713, a solemn literary work, written in blank verse. Lillo, Moore, Garrick the actor, Goldsmith, the Colmans, and Cumberland nearly all wrote in prose. They produced agreeable comedies; but, except Goldsmith's *She Stoops to Conquer*, 1773, hardly any of their works had a lasting success. Sheridan, who gave the impulse to what the Fr. call 'Comédie de Salon,' and whose *School for Scandal*, 1777, is perhaps among its best Eng. examples, has long acquired a lasting place in the hist. of the Eng. D. Sheridan's immediate successors, Holcroft, 'Monk' Lewis, Maturin, Mrs Inchbald, and others, are insignificant. Later Joanna Baillie, Coleridge, Byron, Shelley, and Henry Taylor wrote fine book-D.s little suited for theatrical production. Then came in more recent times the dramatic poetry of Tennyson, Browning, and Swinburne. Plays of scenic power were written by Sheridan Knowles and Bulwer-Lytton, and during the Victorian era many mediocrities flooded the Eng. stage with their wares. A sort of speciality was created by W. S. Gilbert in the 'libretti' he wrote for Arthur Sullivan's operas. Late 19th-cent. dramatists were H. A. Jones (1851-1929), Sir Arthur Wing Pinero (1855-1934), and Oscar Wilde (1854-1900), who wrote comedies of wit. Bernard Shaw (1856-1950), with the plays that followed his dramatic criticism, brought new life to the Eng. theatre. His plays are controversial and witty, and have received world-wide recognition. *Arms and the Man*, one of his earliest plays, was produced by the Independent Theatre that was founded by Grein in 1891. Others among his most famous are *Man and Superman*, *Pygmalion*, and *St Joan*. Other 20th-cent. dramatists are

John Galsworthy (1867-1933), whose plays were statements of social problems; Sir James Barrie (1860-1937), who introduced an element of fantasy; John Drinkwater (1882-1937), who specialised in chronicle plays; John Massfield (b. 1875), the Poet Laureate; Winifred Ashton, who writes under the name Clemence Dane; Rudolf Besier (1878-1942); Harley Granville-Barker (1877-1946), whose most important work was in stage production; O. H. Mavor (1888-1951), who used the pseudonym James Bridie; and the novelists Somerset Maugham (b. 1874) and J. B. Priestley (b. 1894). Repertory theatres have produced such dramatists as Stanley Houghton (1881-1913) and Allan Monkhouse (1858-1936). Verse drama was written by Stephen Phillips (1867-1915), Robert Bridges (1844-1930), Laurence Binyon (1869-1943), Laurence Housman (b. 1865), and Gordon Bottomley (1874-1948), and obtained a new lease of life with the plays of T. S. Eliot (b. 1888) and Christopher Fry (b. 1907). Leading modern dramatists were Ivor Novello (1893-1951) and Noel Coward (b. 1899), both of whom were actor-managers as well as playwrights. Other actor-dramatists are Robert Morley (b. 1908) and Emlyn Williams (b. 1905). Peter Tstinov (b. 1921), John Osborne (b. 1929), and Terence Rattigan (b. 1912) are among the best-known of the younger school.

In 1890 the Irish Literary Theatre was estab. by Edward Martyn, George Moore, and W. B. Yeats, later to be joined by Lady Gregory and 'Æ' (George Wm. Russell, 1867-1935). In 1904 this theatre became the Irish National Theatre, when it was financed by Miss Horniman as the Abbey Theatre. W. C. Fay (1872-1947), an actor who was also a founder of the modern Irish dramatic movement, was one of the creators of the style of acting which made that theatre famous. Two types of plays have been produced—literary plays and folk plays. Irish dramatists who have written for this theatre are W. B. Yeats (1865-1939), J. M. Synge (1871-1909), Lady Gregory (1859-1932), Sean O'Casey (b. 1884), and Lennox Robinson (b. 1886). Other Irish dramatists are Lord Dunsany (b. 1878), St John Ervine (b. 1883), and Samuel Beckett (b. c. 1906).

American drama is of comparatively recent growth. Royal Tyler's *The Contrast*, 1787, is cited as the first native comedy, but throughout the 19th cent. the inspiration of Amer. playwrights was mainly derivative, and they imitated Eng. or Fr. models. With the advent of such popular melodrama as *The Old Homestead* of Denham Thompson (1833-1911) and such essentially indigenous farces of low life as the semi-improvised works of Edward Harrigan (1845-1911), native originality first began to reveal itself. Probably James A. Herne (1839-1901), actor and stage manager, gave the greatest impetus to Amer. D. with his realistic play of New England life, *Shore Acres*, 1892, and his later pieces *Griffith Drennon*, 1898, and *Sag Harbor*, 1900. In their directness, sincere representation of human

nature, and absence of all psychological finesse lay their popularity. One of the most successful of modern Amer. dramatists was Clyde Fitch (1865-1909), whose social D.s put him in the front rank. Other notable successes were *The Easiest Way*, 1909, by Eugene Walter; *The Great Divide*, 1907, by William Vaughn Moody; *Jeanne d'Arc*, 1906, a poetical play by Percy MacKaye; and *Salvation Nell*, 1908, a striking slum theme by Edward Sheldon. The plays of these authors and also of Augustus Thomas (1857-1934) and Charles Rann Kennedy (b. 1871) are serious in intent and are written on European models. It was not until the rise of Eugene O'Neill (1888-1953), unquestionably the greatest playwright America has yet produced, that the period of tutelage definitely ended and Amer. drama came of age. A great experimenter, O'Neill was mainly a realist, but also used expressionist technique, as in *The Emperor Jones*, 1920; *Desire under the Elms*, 1924, and *Mourning Becomes Electra*, 1931, show the depth of his tragic power. Next to him comes Maxwell Anderson (b. 1888), who has won a high reputation with his historical tragedies in verse such as *Elizabeth the Queen*, 1930. Elmer Rice (b. 1892) became famous by his *Adding Machine*, 1923, an expressionist experiment, while his *Street Scene*, 1929, was intensely realist. Other dramatists of note are Lynn Riggs (b. 1899), whose *Green Grow the Lilacs* formed the basis of the highly popular musical comedy *Oklahoma*, in 1943; Clifford Odets (b. 1906), whose *Waiting for Lefty*, 1935, is a kind of proletarian morality play; Tennessee Williams (b. 1914) with *A Streetcar Named Desire*, 1947; and Arthur Miller (b. 1915), with *Death of a Salesman*, 1949, etc. In richness and variety the modern Amer. theatre rivals that of most other nations.

Dramatic Unities, 3 rules of D. construction derived from Aristotle's *Poetics*, observed by the Fr. dramatists, but ignored by Shakespeare, that (1) a play should represent what takes place 'within the limits of a single revolution of the sun, or nearly so,' (2) there must be no change of locality, and (3) there must be no minor plot. They were frequently adapted and modified by later critics, especially during the 17th cent.

Dramburg, see DRAWSKO.

Drammen, seaport of Norway, in Buskerud county, 33 m. SW. of Oslo by rail, at the head of Drammen R., through which the broad D. Fiord empties its waters into Oslo Fiord. Timber, floated down from the upland forests, and wood pulp are the staple exports, saw-milling, the manuf. of paper, and ship building being the other active industries. Pop. 30,000.

Drane, Augusta Theodosia (1823-94), historian and poetess, b. Bromley St. Leonards, Middx. Having been influenced by Tractarian teaching, she became a Rom. Catholic in 1850, entered a Dominican convent, and in 1872 became prioress of Stone, Staffordshire. Her works include *Catholic Legends and Stories*, 1855, *The Life of St Dominic*, 1857, *The Knights of St John*, 1858, *The Three Chancellors*, 1859, *Historical Tales*, 1862, and *Tales and Traditions*, 1862; also sev. lives of the saints and a vol. of verse, *Songs in the Night*, 1876. See B. Wilberforce, *Memoir of Mother Francis Raphael*, 1895.

Drang Nach Osten, expressive phrase given to the Ger. policy of forcing a way to a foothold in the E. through the Balkans. In the First World War they had by 1916 so far trans. the dream into a reality as to secure uninterrupted and unthreatened communication and commerce with Constantinople, over the 2 main arteries of Asiatic Turkey, and also with the cities of Damascus, Mecca, Jerusalem, and Bagdad. In the Second World War Ger. armies reached the Balkans and held them for sev. years, and also threatened Egypt and Persia. See also BAGDAD; BAGDAD RAILWAY.

Drant, Thomas (d. c. 1578), Eng. divine, first Eng. metrical translator of Horace. He won fame by his sermons attacking vanity and sensuality before the court at Windsor in 1569, and to the congregation

at St Mary Spital, London, in 1570, both pub. in that year. He wrote verses in Eng., Lat., and Greek (1564), his works including: *A Medicinable Morall*, 1566, *Sylva*, 1576; and a trans., *Horace, his Art of Poetrie, Pistles, and Satyrs, Englished*, 1567.

Draper, Elizabeth, née Solater (1744–78), b. India. She is remembered for her friendship with Sterne. The daughter of an Anglo-Indian official, she married at the age of 14 Daniel D. of the E. India Company's service, a man much older than herself. Coming to England in 1766 for her health she met Sterne and was flattered by the attention of the great man. When she returned to India he wrote regularly to her, and began the *Journal to Eliza*, which, owing to Sterne's death early in 1768, never reached her. In 1772 she left her husband, returned to England, and settled at Bristol. She was buried in Bristol Cathedral. The full story of her life is told, and her letters are printed, in the *Life of Sterne*, by 'Lewis Melville' (L. S. Benjamin) (1911).

Drapers' Company, one of the 12 great livery companies of the city of London, in existence in the 12th cent.; Henry Fitz-Alwyn (d. 1212), first mayor of London, is believed to have been a Draper. Chartered in 1364, the company enjoyed monopolistic control over the woollen cloth trade until the 17th cent. The first hall was in St Swithin's Lane, but in 1541 the estate of property of Thomas Cromwell was purchased from Henry VIII for use by the company. Twice, in 1666 and 1772, the hall was destroyed by fire, and it was largely rebuilt in the last century. The company is trustee of a great number of charities and a large proportion of its own income is devoted to charitable purposes.

Drau, see **DRAVA**.

Draught, current of air, in particular one which is induced or artificially forced to support combustion. *Natural D.* is produced by a chimney, through which the heated gases rise by reason of their lesser density, thus inducing a current of cool air through the fire. *Forced D.* may be produced by driving air at more than atmospheric pressure through the fire by means of fans. In locomotive boilers the D. is increased by turning the exhaust steam into the chimney, thus increasing the velocity of the current of air.

Draughts, generally thought to be one of the oldest of table games. A game of this kind was known to the Greeks and Romans and various monuments represent the anc. Egyptians as engaged in a similar amusement. It became common in Europe during the 16th cent. The game is played by 2 persons on a board similar to that used for chess, i.e. square board containing 64 squares, checkered in black and white alternately. Each player has 12 'men' in the form of circular discs, one set being black and the other white. These men are arranged on the 3 rows directly before each player. They may be placed either on the black or the white squares, but the extreme left hand square in front of each player must always be occupied. Lots are cast to decide which colour

each player shall have, and black plays first. The players then change colours after each game. The men move diagonally, one square at a time, so that play continues entirely on squares of one colour. If a man comes next to a man of the opposite side he is unable to move past unless there be a vacant square on the other side of his adversary's man, in which case he must jump over his man and occupy the vacant square, removing his enemy's man from the board. If, after taking a man in this way, it is possible for him to jump another man, taking this one also, he must do so in the same move. In the rare event of a player neglecting to take when the opportunity is given him, his adversary may either take the piece with which the capture would have been made (a proceeding known as 'huffing'), or compel him to revoke his last move and perform the capture. He may also, if he wish, allow the move to stand. If a player gets one of his men into his adversary's back line, this man becomes a 'king,' and is 'crowned' by having another man of the same colour put on top of him. The king may move either backwards or forwards, whereas the ordinary men can move only forwards, but this is the only privilege he has. He captures in the same way as ordinary men, except for this one difference. If a player touches a piece, he must move it if possible. 'The game is won by a player removing all his adversary's men from the board or by his placing them in such a position that they cannot move. See J. Sturges, *Guide to the Game of Draughts*, 1800; A. Anderson, *Game of Draughts* (revised by R. McCulloch), 1888; F. Tescheleit, *Master Play of the Draught Board*, 1926; Lees' *Guide to the Game of Draughts* (revised by J. W. Dawson), 1930.

Drava, see **SLAVENIA**.

Drava, or **Drave** (Ger. **Drau**), riv. of central Europe, the 2nd largest trib. on the r.b. of the Danube (q.v.). It rises in the Tirol and flows generally ESE, through Austria and Yugoslavia to join the Danube 13 m. E. of Osijek (q.v.). For part of its course it forms the boundary between Yugoslavia and Hungary. It is navigable for light boats for some 380 m., as far as Villach (q.v.). It was by way of the valley of the D. that the Huns and Slavs (qq.v.) reached the Alps. Length 450 m.

Dravidians (Sanskrit *Drāvida*, or *Drāmida*), name of a large group of Indian peoples (non-Aryans) and their family of languages. They are found chiefly in S. India, extending upwards from the peninsula N. to the Arabian Sea, about 100 m. below Goa, thence along the W. Ghat to Kolhapur, NE. through Hyderabad, and E. to the Bay of Bengal. They also appear in N. Ceylon (see *Cust and Constable's Linguistic and racial maps*). The more important languages in the D. group are Telugu, Tamil, Kanarese, Malayalam, and those of more backward tribes, such as Gōndi, Kōṭa, Kurux, Kul, and Rajmahal. The Brāhmins of Baluchistan also speak a D. dialect. The D. languages seem to have formed a quite distinct group, independent of the Aryan

or Indo-Germanic. There are about a dozen different tongues comprised in the group, differing from each other radically and not merely in dialect forms, and yet derived from a common D. source. But all the chief literary languages, that is Tamil, Malayalam, Kanarese, and Telugu, now contain a large proportion of Sanskrit words. Inflections are expressed by 'agglutination,' or affixing particles to primary roots or bases, but these additions do not blend with the roots as in the case of inflectional languages. Nouns are of 2 classes, high-caste and casteless (for rational and irrational beings respectively), gender being distinguished only in the former. A peculiarity is the double

hinged at one end and free at the other, so that it could be drawn up or let down as required. The original form was the lifting D., used to span the moat of a castle; this form is used now to provide a passage over canals, etc. The swing-bridge is a D. which revolves in a horizontal direction.

Drawing, the art of representing in line forms seen or imagined. D. can be done in many mediums on a suitable surface. The medium can be pencil, pen, brush, graver, or burin (tool used for engraving on copper). The surface can be paper, wood, linoleum, copper, stone, etc. D. can be placed under 2 broad headings: (1) free drawing and (2) mathematical drawing.

DRavidIAN TYPES OF INDIA

Left to right: Scytho-Dravidian (Tamil), Aryo-Dravidian (Hindu), and Mongol-Dravidian (Bengali)

form for the first person plural of the personal pronoun, for including or excluding the person addressed. There are no relative pronouns, relative participles being used instead. A separate negative conjugation, usually with only one tense, exists for verbs. D. tongues were spoken by some 57,497,000 people according to the census of 1901. The D. were probably the aborigines of the Deccan. They are mostly very dark-skinned, with wavy, black hair (not woolly), and are possibly descendants of the Negritos of Malaysia. See E. Hultzsch, *S. Indian Inscriptions, Tamil and Sanscrit*, 1809-95; R. Caldwell, *A Comparative Grammar of the Dravidian Languages*, 1856, 1875; G. A. Grierson, in *Linguistic Survey of India*, iv. 1904; A. H. Keane, 'Race and Speech' in *East and West*, 1905; W. R. R. Rivers, *The Todas*, 1906; E. Thurston and K. Rangachari, *Castes and Tribes of Southern India*, Gov. Press, Madras, 1909; G. Slater, *The Dravidian Element in Indian Culture*, 1924; L. K. Ananta Krishnayyar, *The Mysore Tribes and Castes*, 1928-31; W. Koppers, *Ethnologische Probleme Vorderindiens*, 1916.

Drawback, see CUSTOMS DUTIES.

Drawbridge, in ancient times an invariable adjunct of a castle. It was a bridge

1. This involves the use of *free expression* and, in its finest examples, a high degree of skill and aesthetic taste. In advanced D. the representation of a 3rd dimension needs an understanding of light and shade and reflected light, also a knowledge and appreciation of lineal and aerial perspective. Lineal perspective is the diminution in size of objects as their distance increases. Aerial perspective is the change of colour (and/or lack of distinctness) of objects caused by atmospheric conditions, as their distance increases. The application of D. to surfaces such as wood, linoleum, copper, stone, etc., needs further technical skill and is dealt with under the headings of wood-cut, lino-cut, engraving, etching, lithography, etc. A thorough knowledge of D. is the only true basis for the painting of pictorial subjects. 'Drawing,' said Ingres, 'is the probity of art.' As to its *practical* purpose, it falls into 2 main categories: (1) as a preliminary stage in the creation of a work of art, picture, fresco, sculpture, etc.; or (2) as a finished work of art in itself—the water-colour drawing being an important example. (1) can be further subdivided into: the sketch showing main lines of composition; the detail study of figures or costume; the finished drawing or 'cartoon'

transferred to wall or canvas. Again, some old masters, perhaps in competition with others, produced finished drawings to show their patrons what the finished painting would look like. Otherwise, and apart from its function as a preparatory study, artists have always valued drawing as a personal exercise and intimate means of expression; alternatively as the most suitable medium for certain types of finished work, e.g. topography, caricature. *See also* CARICATURE. *See* C. M. Ellwood, *Pen Drawing*, 1927; A. Gladstone-Jackson, *The Right Way to Human Figure Drawing and Anatomy*, 1948.

2. Mathematical D. is essentially utilitarian and needs practical skill and, in advanced work, involves knowledge of physical laws and construction detail. The ability to use D. instruments such as rulers, scales, compasses is required. In architecture, the ability to prepare accurately measured and scaled plans, elevations, sections, and isometric drawings is essential. A knowledge of perspective (lineal) is also useful. Mathematical drawing is used in connection with aircraft construction, shipbuilding, locomotive building, automobile construction, and many other industrial undertakings. *See also* ENGINEERING DRAWING.

Drawsko (Ger. *Dramburg*), tn of Poland, in Koszalin prov., on the Drawa, 48 m. SSW. of Koszalin (q.v.). Until 1945 it was in Pomerania. There is a woollen industry. Pop. 3500.

Drayton, Michael (1563-1631), poet, b. Hartshill, Warwickshire. He entered the family of Sir Henry Goodere, near Tamworth, as a 'proper goodly page' and seems to have settled in London about 1590 or 1591. There is some evidence that Anne, daughter of Sir Henry Goodere, afterwards wife of Sir Henry Rainsford, was 'Idea' who inspired D.'s first pastorals, *Idea, the Shepherd's Garland*, 1593, and his first sonnets, *Idea's Mirror, Amours in Quaterzains*, 1594. Another patroness was Lucy Harrington, who became Countess of Bedford. To her before her marriage D. dedicated his *Legend of Matilda and Endimion and Phoebe*, 1595. Between 1597 and 1602 D., by that time in high repute, was doing theatrical hack-work for Henslowe (q.v.) and among his other and earlier associates were Dekker and Munday and, somewhat later, Webster and Middleton. D.'s historical poems began with the *Legends* of historical personages, *Piers Gaveston*, 1593, *Matilda*, 1594, and *Robert Duke of Normandy*, 1596. In the heroic poem *Mortimeriados*, 1596, his theme was again the political troubles of Edward II's reign. Written in rhyme-royal stanzas, this, his first poem of length and importance, appeared as *The Barons' War* in the revised ed. of 1603. Written in ottava rima in its remodelled form, it is a rather tedious narrative of episodes and loses by comparison with Marlowe's dramatic treatment of the subject in *Edward II*. The inequalities and rudeness of style in this narrative disappear in D.'s *England's Heroical Epistles*, 1597, historical poems written on the model of Ovid's *Heroides*

and containing some of his very finest lines. Equally national in spirit is his ballad of 'Agincourt,' first pub. with his odes in *Poems Lyricall and Pastoral*, 1606. Few, however, read with pleasure his ponderous *Poly-Olbion*, which, according to Francis Meres, he had begun in 1598, and which he himself aptly describes as a 'Herculean toil.' For in it he undertook a 'chorographical description' of everything of antiquarian and topographical interest throughout Great Britain. This vast work at least demonstrates the unsuitability of the Fr. classical metre (couplets of Alexandrines) for Eng. verse. Yet D. could write a poem of the grace and charm of his *Nymphidia*, 1627, a mock-heroic fairy poem which is the inspiration of many of Herrick's lyrics; the pastorals *The Shepherd's Sirena* and *The Quest of Cynthia*, love idylls; and one splendid sonnet, 'Since there's no help, come let us kiss and part,' which Rossetti proclaimed 'almost the best in the language, if not quite.' Among his last poems were *The Muses Elizium*, 1630, and a few *Drine Poems* on O.T. themes, in decasyllabic couplets. The editing of *The Works of Michael Drayton* in 5 vols. with introductions and notes, etc., by K. Tiltotson and B. H. Newdigate, completed in 1941, is a masterpiece of minute and comprehensive scholarship. *See also* O. Elton, *Michael Drayton: a Critical Study*, 1903; B. H. Newdigate, *Michael Drayton and His Circle*, 1941.

Drayton-in-Hales, *see* MARKET DRAYTON.

Dreadnought, Brit. battleship, 490 ft long, of 17,950 tons, with speed of 21 knots. The first of this since famous class was launched and completed at Plymouth (1906), the designs having been accepted in 1905. It gave its name to a class of modern battleship, and was in fact a synonym for an ironclad or battleship carrying 10 12-in. guns and a number of 12-pounder quick-firing anti-torpedo-boat guns, and propelled by steam turbines. *See also* BATTLESHIP; SUBMARINES.

Dream may be defined as the manifestation of a conscious process during sleep. During sleep conscious activity is, under ordinary circumstances, entirely in a state of suspense; the sensory nerves no longer perform their usually active duties, the action of the heart becomes slower, the brain is at rest, and during this period gets rid of the waste tissue and is restored to fresh activity. Our faculties, however, need not all be in an equal state of inactivity: it is possible to perform a number of quite ordinary actions whilst in a state of sleep, e.g. soldiers have often marched for some considerable distance whilst, to all intents and purposes, in a deep sleep. We dream, then, principally because the suspension of mental activity is not complete. It has been held that sleep is never so profound as to be dreamless, but this is a theory which cannot be proved. On the other hand, it has been held that we dream only during those periods of falling asleep and awakening during which our mental activities are in a semi-conscious state. This, again, is a

theory which cannot be actually proved, but may to some extent be disproved, since it is well known that manifestation of dreaming has been noticed in cases where the subject was in a deep sleep. Further, in many cases sleepers suddenly awakened have aroused themselves with difficulty from a D. That all our powers of judgment are inactive during a D. cannot be held as true, since on occasion we find that we desire to prolong a D. of peculiar happiness, whilst we can arouse ourselves from one which terrifies us by its horror. D.s, whilst resembling in many ways the process of conscious activity, on the other hand differ characteristically from the experiences of our waking life. Time, space, and order are not to be found during our D.s, though on examination they are seen to possess an inner coherence. Also the events which occur to us during these periods leave a great impression on our mind for the time being, although we may on awakening remember little or nothing of the experiences undergone during sleep. That the activities of the day, or the immediate time preceding, have influence on our D.s is undoubted. Incidents trivially passed over during our waking experience form often the basis of a D.; details forgotten in the routine of the day will occur time and time again during sleep. Problems in mathematics have been solved, legal decisions given, and even sermons have been produced during sleep. Coleridge's poem *Kubla Khan*, however, was composed as the result of a vivid opium D., and was written immediately on awakening. All creative writers draw on the material of D.s, often undisguisedly. Experiments have been made in order to test the effect of the senses in D.s, and it has been proved that D.s can easily be related to the immediate sensory cause. Certain drugs, such as opium, and hashish, have peculiar effect upon the character of D.s, whilst the physical state of the body also can often give peculiar effect to the D.s. 'The nightmare, or "anxiety dream," may be due to the presence of undigested food in the stomach; other uncomfortable D.s may be caused by inability to breathe properly, or by an uncomfortable position in sleeping. The state of the brain is also an important factor. D.s are in some cases not only thought out but actually acted by the dreamer; cases of this kind, such as sleep-walking, the performance of acts during sleep which the sleeper has no recollection of after waking, and sleep-talking, are all phenomena of this state of mind. Amongst ant peoples D.s were regarded as of divine origin, the interpretation of D.s took an active part in the life of the nation, and the 'seer' was regarded with awe by the people of the nation. The whole matter of the interpretation of D.s was put on a scientific basis in the 20th cent. by the work of Sigmund Freud (q.v.) and his followers. The D. is regarded by Freud and the psychoanalysts of all schools as the royal road to the 'unconscious' mind, the correct diagnosis of the state of the latter being the first step in mental therapeutics. See J. W. Dunne, *An Experiment with*

Time (a non-psychoanalytic explanation of dreaming), 1927; S. Freud, *The Interpretation of Dreams* (Eng. trans. by A. A. Brill, from 8th Ger. ed., 1950; R. Fliess, *The Revival of Interest in the Dream*, 1953. See also PSYCHOANALYSIS).

Drebbel, Cornelius van (1572-1634) claimed, erroneously, to have been the joint-inventor with Santorio of the thermometer, but was famous among his credulous contemporaries rather for his empirical inventions, such as a boat for rowing under water, in which the passenger could read without artificial light, than for his real discoveries. A pensioner of Emperor Rudolph II and tutor to Ferdinand II's son, he owed his release from imprisonment in Austria (in consequence of a revolution) to James I of England. He passed the rest of his life in England. Besides his water thermometer D. discovered a bright scarlet dye, afterwards used with effect in the Gobelins manufactories, and devised improvements in the microscope and telescope.

Dred Scott Case, The, most important decision of the U.S.A. supreme court, handed down in 1857, and one of the contributing causes of the Civil war. D. S. was a Missouri slave, taken by his owner in 1834 into Illinois (where slavery was prohibited), and later into Minnesota (then part of the Wisconsin Territory). D. S. had married and had 2 children while on free soil, but he and his family were later taken back to Missouri.

In 1846 he sued for his freedom on the ground that his residence in a free state had given him the standing of a freeman. The supreme court of Missouri held that on return to Missouri the status of slavery re-attached to him and that he had no standing in court, but the U.S.A. circuit court before whom the case came in 1850 decided that as a citizen of Missouri D. S. had standing in court, but that he was still a slave.

The case was argued before the supreme court of U.S.A. in 1855 and 1856, and the decision (not unanimous) that D. S. was not a citizen, that the constitution guaranteed security in private property and the value of such property in a slave could not be constitutionally invalidated in any state, even by the Federal gov., roused the most intense feeling throughout the country and made it clear that slavery would not be abolished along constitutional lines. Chief Justice Taney had not only remanded S. to slavery, but had gone out of his way to proclaim the Missouri compromise void and denied the right of congress to make slaves or their descendants citizens. He virtually said that the Negro had no rights that white men were bound to respect.

Dredging Machine, machine for cleaning and deepening the entrances to or channels of rivers, canals, docks, and harbours, by removing the mud or rock from the bottom.

1. *The grab dredger* is used only where the amount of mud is small, or where time is not of too great importance. It consists of a pair of heavy iron jaws

hinged together at the top, and slung by chains over a crane, which is usually mounted on a float, although it may be worked sometimes from the shore. The 'grab' is lowered to the sea bottom with the jaws held open by means of side chains. As the hoisting chain is slackened so under its own weight the 'grab' sinks into the mud. The side chains being then slackened and the hoisting chain drawn upwards, the two jaws close together and so bring up a quantity of mud with them; the 'grab' is hauled up and swung so that the mud may be discharged into a barge,

so that the machine is drawn back across the bank. As the buckets are turned over by the top tumbler they immediately discharge the mud into a shoot. Usually this shoot projects over the side, and so the mud is discharged into 'hopper' barges, fitted with trapdoors on the bottom. Sometimes the D.M.s are built with a hopper well, so that they carry their own mud and deposit it. It is evident, however, that such hopper dredgers lose time when compared with the others, for they have to proceed to the 'dumping ground,' whereas the

Tyne Improvement Commission

BUCKET-LADDER DREDGER

the jaws being opened again by means of the side chains.

2. *The bucket-ladder machine* consists of a long ladder, one end of which is fixed high above the deck. The other end projects downwards through a well in the float, and is held by a chain which runs around a 'topping lift' which enables the ladder to be lowered or raised to the depth required. This ladder is usually placed in the centre of the float, although there are *double ladder machines*, the 2 ladders being side by side, and *side ladder machines*, in which the ladders project over the sides of the float so that they may be used close to dock-walls, etc. In all cases, however, an endless chain of buckets passes round the ladder, which is fitted with tumblers at each end. The top tumbler is moved by a system of steam gearing. Meanwhile the machine is moored by bow and stern cables with further cables over both bows and quarters, and as the buckets revolve, so cutting mud up from the bottom, the chains on one side are hauled in while the others are slackened. So the D. M. is gradually drawn right across the bank to be cut. When this has been done the D. M. is hauled a little further forward, and the process repeated by hauling in the chains on the other side,

ordinary dredger is continually dredging and filling other 'hopper' barges. *See also CONVEYORS.*

(3) *The suction dredger* is fitted with a centrifugal pump, with a flexible suction pipe, which is dropped to the sea bottom. Through this the sand or mud is pumped up and discharged either into other barges or into its own hopper well, if it is provided with one. *See E. C. Shankland, The Dredging of Harbours and Rivers, 1931.*

Dreikanter, or *Ventifacts*, pebbles, often resembling brazil nuts in shape, which show a number of flat facets meeting in sharp keels. These faceted surfaces are produced by natural sand blast—i.e. by the abrasive action of sand carried in the wind. D. are formed only where a supply of dry sand, which is not held down by a cover of vegetation, is available. They are therefore typical of deserts.

Dreiser, Theodore (1871-1945), Amer. novelist and playwright. *b.* Terre Haute, Indiana, 12th child of poverty-stricken and piously Catholic parents of Ger. descent. Educ. at local schools, and at Indiana Univ., he was on the staff of the *Chicago Daily Globe*, 1892; dramatic editor and travelling correspondent of the *St Louis Republic*, 1893-4; editor of *Smith's Magazine*, 1905-6; managing

editor of *Broadway Magazine*, 1906-7; and editor-in-chief of Butterick pub., 1907-10. His first novel was *Sister Carrie*, 1900, which was suppressed and denounced as immoral because of its sordid realism. His next was *Jennie Gerhardt*, 1911. Then came *The Financier*, 1912, and *The Titan*, 1914—2 parts of a trilogy intended to portray the career of Charles Tyson Yerkes, the traction millionaire. Other works include: *A Traveller at Forty*, 1913; *The Genius*, 1915; *Plays of the Natural and Supernatural*, 1916; *Twelve Men*, 1919; *The Hand of the Potter*, 1919; *Hey Rub-a-Dub-Dub* (essays and philosophy), 1920; *The Colour of a Great City*, 1923; *An American Tragedy*, 1925; *Moods* (verse), 1926; *Chains* (lesser novels and stories), 1927; *Thoreau*, 1939; *America is Worth Saving*, 1941; and *The Bulwark* (posthumously), 1946. His autobiographical *A Book about Myself*, 1922, was repub. as *Newspaper Days*, 1931. See also F. O. Matthiessen, *Theodore Dreiser*, 1951.

Drenthe, prov. of the Netherlands, S. of Groningen and Friesland. The surface is low and covered with wide heaths and peat. Some parts of the prov. are intensively cultivated, and sheep and cattle are raised. The cap. is Assen. Area 1030 sq. in. Pop. (1954) 296,403.

Drepana, see TRAPANI.

Dresden: 1. Dist. (*Bezirk*) of the Ger. Democratic Rep. (E. Germany), bounded N. by Kottbus, E. by Poland, S. by Czechoslovakia, and W. by Karl-Marx-Stadt and Leipzig (qq.v.). Area 2952 sq. m.; pop. 1,984,000.

2. Ger. city, cap. of the dist. of D., and former cap. of Saxony (q.v.), on the Elbe (q.v.), 98 m. S. by E. of Berlin. In 1270 Henry the Illustrious, Margrave of Meissen, chose D. as his cap., and its prosperity increased rapidly when, after the div. of the Saxon lands in 1185, it became the seat of the Albertine line. It suffered severely during the Seven Years War (q.v.), and again during Napoleon's campaign of 1813, when he won his last great victory at D., at the cost of 15,000 dead and wounded and 12,000 prisoners to the allies and a loss of 10,000 to the Fr. During the revolution of 1849 there was desperate street fighting from 3-6 May, and the old opera house was burnt down. In 1866 the city was occupied for a time by the Prussians. During the Second World War D. was reduced to ruins in a devastating series of air-raids in early 1945. Most of the destruction occurred in one night, that of 13-14 Feb., when there were 2 raids on the city; in these 2 raids 25,000 people were killed and 30,000 more injured. When the Russian troops of Marshal Koniev entered D. on 8 May, they found the Prager, Augustus, Moritz, and Ring Strassen to be more paved roads between ruins. The centre of the city was dead—6 sq. m. of the inner tn had been wrecked. The destruction extended to some of the suburbs in the S. and W., and some 27,000 houses and 7000 public buildings had been completely destroyed, among them half the churches and half the

schools. The rebuilding of the city was started almost immediately after the end of the war. D. lies on both banks of the riv.: on the l. b. are the Friedrichstadt and Altstadt, and on the r. b. are the Neustadt (in reality the older part) and the Antonstadt. There are fine parks and riverside promenades. To Herder the city was the 'German Florence,' a description justified by its magnificent art collection—the 'Zwinger' collection alone containing Raphael's 'Madonna di San Sisto'; Correggio's 'La Notte' and 'Mary Magdalene'; 'The Adoration' of Paul Veronese; Titian's 'Tribute Money'; and paintings by Claude Lorraine, Rembrandt, Van Dyck, and Rubens. This famous collection was begun by the Elector Augustus I (q.v.), but its true founder was Augustus III (q.v.), who in 1745 bought the unique Modena Gallery, containing 2400 pictures by It. and Flem. masters. It was from D. that rococo art spread in the 18th cent., and the city was formerly renowned for its baroque buildings; of these few are left. Among the buildings of note which escaped complete destruction are the baroque Hofkirche, 1739-51, the Renaissance royal palace, 1530-5, and the opera house.

The prin. industries are the manuf. of machinery, optical and musical instruments, cigarettes, and glass. Porcelain is also manufactured, but the famous 'Dresden china' has been made at Meissen (q.v.) since 1710. Pop. 500,000.

Dresden China, a term used in Eng. from the 18th cent. onwards, for Meissen (q.v.) porcelain. The mark 'Dresden' appears on modern forgeries of Meissen.

Dress (from O. F. *dresser*, to set out, to arrange; Lat. *dirigere*, to direct), the general term for the clothing of men and women, or, when used more specifically, the garment of a woman that is worn outside.

D. in its earliest form probably consisted of the skins of animals, with the hair or fur sometimes turned inside, or sometimes turned outwards. Cave art suggests that European peoples of the Palaeolithic and earlier Neolithic periods wore some such D. But skill in weaving textiles for clothing has appeared at an early stage in most civilisations, and in primitive times these textiles were either hung from the shoulders or wound round the body in straight strips as they came off the loom. The D. of the Assyrians and Egyptians consisted of arrangements of rectangular pieces of woven material, often pleated; feathered garments were sometimes worn. Wool was used as well as linen in the N. of Europe, and linen, cotton, silk, or wool, or a mixture of silk and wool, in the S. of Europe, in India, and in China. Some peoples in extremely cold climates, such as the Esquimaux, continue to wear mainly skins as their D.

The prin. articles of D. in classical Greece were the *chiton*, a basic garment of sev. kinds, worn long by women and shorter by men; the *himation*, similar in shape to a large oblong shawl, which could be draped in a variety of ways; and

the *chlamys*, a similar but smaller garment. The girdle was also an important part of feminine D. In Rome the usual basic male garment was the tunic, over which the *toga* (q.v.) was worn on all formal occasions. Ladies wore garments similar to those worn in Gk classical times. In the N. of Europe (as in Persia, Mongolia, and parts of N. America) men, and sometimes women, wore long trousers or hose (q.v.) beneath a short tunic. Trousers, first despised by the Romans as 'barbarian' wear, were later adopted in Italy in the early Middle Ages, and appeared first as military or working-class D., and later, in the form of tight hose, as an essential part of male D.

Early medieval D. consisted of 2 or 3 garments, still of rectangular shape, worn over each other. At the beginning of the 14th cent., and coinciding with the first signs of the Renaissance spirit in other fields, 'tailoring'—the cutting of stuff—appeared for the first time, and by the end of the century a form of masculine D. had been evolved which fitted the body all over like an outer-skin. Women's D., developing along the same lines, fitted the torso down to the hips from which point a skirt fell in folds to the ground. This tailored conception of men's and women's D. remains the fashion for the W. civilisation to this day—there has never been a return to the primitive rectangular form of D. With the appearance of tailoring the older idea of a long D. for the upper classes disappeared as far as men were concerned, or rather survived only as a vestige in the official or ceremonial D. of ruler, priest, scholar, judge, alderman, etc. Women's D. continued to touch, or almost touch, the ground, until their general enfranchisement in the early years of the 20th cent.

Frequent changes in D. seem to have occurred from the earliest times (a phenomenon recognised by the word 'fashion,' q.v.), though first of all mainly in comparatively small details. From the Renaissance onwards changes have been more drastic, and 'romantic' periods, when D. has been varied in design, heavily ornamented and has not followed the lines of the body, but has striven to create a new idea of man, have alternated with 'classic' periods when D. has been on the whole uniform, with subdued ornamentation, and has followed, and sometimes emphasised, or idealised, the body's shape. The achievement of the tailored 'outer-skin' at the end of the 14th cent. was followed in the early 15th by the invention of a D. which, instead of reflecting the shape of the body beneath, was designed to produce an artificial shape as remote as was practicable from the natural shape. This fashion coincided with the 'International Gothic' period in the visual arts. From the middle of the 15th cent. until the beginning of the 16th D. for men consisted of a close-fitting jacket covering the torso and arms, tight hose covering the legs and hips, and a loose removable over-coat or cloak. Women's D., which, like men's, had earlier been

fantastically unnatural in shape, returned once more to the 'classic' idea of a close-fitted upper-part and a skirt wide enough to allow freedom of movement. The D. of the 16th cent. showed once more a romantic disposition, and towards the century's end clothes which violently contradicted the lines of the body reappeared. Huge 'ruffs' (q.v.) filled in the space between the head and the shoulders, upper parts of sleeves were puffed out, spherical breeches covered men's thighs: women wore bodices like inverted cones and skirts mounted over drum-shaped farthingales (q.v.). D. was especially exaggerated in the N. of Europe, where the Gothic temperament tends to prevail at all periods. In contrast, the D. of the middle of the 18th cent. once more expressed a classic spirit. Hair was powdered a uniform grey, and both men's and women's D. followed, and in some respects emphasised, the body's shape, but never contradicted it.

Until the end of the 18th cent. men and women of the upper class could, and as a rule did, wear bright colours, rich materials, lace, and embroidery, but the coincidence of the Fr. with the Industrial revolution produced a new 'democratic' conception of male D., sober in colour and made of heavy woollen cloth. The outward difference between upper and lower class was in this way considerably lessened and has not been resumed. With the growing demand for the emancipation of women throughout the second half of the 19th cent. women's D. developed, side by side with characteristically feminine clothes, a more 'mannish' type of D. which consisted of a tailor-made jacket worn over a shirt and a plain skirt, usually made of cloth in a dark or neutral colour. This tailored costume, the counterpart of the modern man's suit, has remained popular. With the employment of women in many fields previously reserved for men during the First World War, women's skirts were, for the first time in the Christian era, shortened, until, for a few years in the middle of the 1920's, they reached no further than the knee. As a result of this change, silk, rayon and later nylon stockings in flesh colour have continued to be worn by all women, and great attention has been paid to the design of shoes. Following the First World War men's clothes began gradually to lose the stiff sombre formality of the 2nd half of the 19th cent., and to become more varied and colourful. This modification has not, however, meant a return to the aristocratic silks of the 18th cent., or the abandonment of the uniformity in clothes used for business or ceremonial occasions, but rather the introduction of extra garments into the male wardrobe which are chiefly used as leisure D. The 19th cent., with its generally romantic climate, was expressed in the constantly changing D. of women, which at almost all times during the last two thirds of the century was ponderously ornamented and romantic in design, with no emphasis on the natural shape of the body. Men's D., having become 'democratic,' remained

almost a frozen fashion, though minor changes did take place. The Aesthetic movement of the late 19th cent. was reflected in self-consciously 'artistic' types of D. and in an attempt to introduce reforms in the interest of 'beauty' into men's clothes. These reforms were belatedly successful in producing some of the modifications which began to appear in the early 20th cent., such as the introduction of soft tweeds and coloured shirts, and the general softening of the outline in at least one item of sports D.—the 'Norfolk jacket.'

Centres from which fashions have emanated have varied through the ages. Archaic Gk dress was certainly based on Egyptian design; the Rom. Empire borrowed its fashions from Greece; Byzantium combined Christianised Rom. D. with oriental elements. Florence and Paris seem to have been simultaneously the 2 centres from which fashions spread northwards and eastwards in the 14th cent., and Burgundy became a rival to both in the 15th cent., until, with the fall of Charles the Bold, Paris gradually resumed its lead. Both men's and women's fashions were centred on Paris until the beginning of the 19th cent., when England, as the leading industrialised nation, estab. itself as the authority on men's clothes, leaving Paris still the centre from which women's fashions emanated. Between the two 20th-cent. world wars, America became an important influence in the design of men's clothes, and in some respects captured the lead from England.

In certain periods the design of D. has been particularly inventive. Probably the 4th cent. AD in Byzantium was one of these. Certainly the 2nd and 3rd decades of the 15th cent. in Italy, when men took on the silhouette of birds of fantastic plumage, was another, and at about the same period women's headdresses in the N. of Europe became huge and varied in shape. The Elizabethan ruff was ubiquitous and has never been repeated, and neither have the 'full-bottomed' wigs of the later 17th cent. The 19th cent. saw more drastic changes in the design of women's D. than any other 100 years, but the shortening of their skirts in the 20th cent., and the introduction of the idea of tailoring in the 14th, have been the two most revolutionary changes that have taken place. In the 20th cent. between 1930 and 1957 less change occurred in women's D. than in any other period of equal length since the middle of the 14th cent. The 2nd half of the 19th cent. was equally unchanging in men's D.

Styles of D. have at certain periods, and in certain areas, become frozen for varying lengths of time, so that a recognisable regional D. has come into being. This type of D. has never actually remained entirely static, but has always been slightly modified by the pressure of current fashion in other places. Such regional fashions have usually been the sign of a backward community, or of a community temporarily isolated by poli-

tical or geographical circumstances from more progressive or mobile neighbours. With the development of facilities for travel and communication, regional D. has almost disappeared from Europe, except where it has been artificially kept in being by local patriotism. It is noteworthy that as far as can be discovered England has never had a characteristic D., though regional D.s have existed in Ireland, Scotland, and Wales. For certain purposes styles of D. are deliberately 'frozen' in order to produce a stable uniform to distinguish a certain individual or group within a community: undress military uniforms have usually been adapted from sporting or hunting D. and have been kept static in design for some time; religious communities have often remained faithful to the most sober type of D. of the moment of the estab. Organisations such as Freemasons, Boy Scouts, or the Salvation Army, as well as persons whose occupations have an official standing in society, such as policemen and postmen, have their own recognisable uniforms which modify very slowly. Long robes have been regarded as lending dignity to men in high official positions; wigs have been retained from the 18th cent. for legal D. and the ceremonial D. of servants in some countries. There has been a great increase in the 19th and 20th cents. in the number of special forms of dress in which special sports are performed: tennis, cricket, football, bathing, and many other leisure-time activities have their own special D. There is also a strict etiquette as to what shall be worn on what occasion, and an understanding of correct forms of D. is an important part of good manners.

D. in communities outside the European tradition has not, as a rule, followed the European pattern, but all D. has developed in the same way, from the early use of animal skins to the later practice of wearing rectangles of woven material, until, in some communities, the more elaborate idea of shaping stuff to fit the body has emerged. In hot climates D. among primitive peoples has in some places appeared to consist of a purely decorative arrangement of strings or beads, but it is probable that such D. has always had a purpose that is more than decorative, and that it is some sort of distinguishing mark. The D. of some of the most ancient civilisations, the Minoan for instance, is difficult to reconstruct from the surviving works of art that have come down to us, but there is no reason not to think that certain of the ancient peoples reached a high degree of sophistication in the design of their clothes. Where trousers have been worn outside Europe, e.g. in China, they have not necessarily been worn by men, but often by women, while men have worn skirts. There does not, in fact, seem to be any essentially masculine or essentially feminine form of D. See J. R. Planché, *The Cyclopaedia of Costume*, 1879; F. W. Fairholt, *Costume in England*, 1896; M. G. Houston and F. S. Hornblower, *Ancient Egyptian, Assyrian, and Persian*

Dress, Academic. It is unlikely that scholars wore a recognisable D. until the early univs. were sufficiently well estab. to be in a position to draw up statutes for

the general conduct of both staff and students. From the time, however, from which the earliest statutes have survived, some rules as to D. have been included. These rules have followed the general principle that students must wear a simple, sombre, and inexpensive uniform, while masters, doctors, and rectors must be richly and expensively dressed.

Fourteenth-cent. statutes of the univ. of Florence insisted that students, whether noble or citizens, clerics or laymen, should wear long black woollen gowns, not too ample in cut and costing not more than 22 florins. Bologna in 1432 required students to wear black gowns of 'statutory cloth,' closed at the sides and fastened with a hook or pin at the neck. The rector, on the other hand, must line his gown and cape with a fur no less expensive than miniver or ermine in the winter, and with silk in the summer. Doctors were to wear long, ample, expensive gowns of 'muriche tintas,' a costly dye of a reddish purple colour. At Padua in the 15th cent. the Rector of Arts wore scarlet silk (often damask) in summer, and scarlet cloth, fur-lined, in the winter; while the Rector of the Jurists wore cloth of gold or gold-brocade and ermine. Doctors of Divinity wore violet tippets; in other faculties not only rectors but all doctors were allowed gold chains. In 15th-cent. It. univs. doctors wore a round cap lined and turned up

with ermine, and undergraduates the 'chaperon,' that fashionable cap of the early part of the cent. which consisted of a padded ring with 2 long hanging ends. These caps were later, as in the case of the similar cap which is a part of the Garter robes, worn slung over the shoulder, and a plain felt cap was worn on the head.

Following Italy, all anct univs. have drawn up similar statutes, including provisos that undergraduates should wear

Univs. which are modern foundations do not, as a rule, require their undergraduates to wear gowns, as the older univs. still do, but most of them have adopted a graduates' uniform—a black cap and gown, borrowed in design from the cap and gown of the anct univs., and with a hood which varies in colour with the faculty to which the graduate is attached. Chancellors and rectors of modern univs. usually wear scarlet or

Antonio da Budrio and his Pupils: Bolognese, early Fifteenth Century

distinctive gowns and caps, the design of which was always a modified version of the fashionable D. at the time when the statutes were drawn up. Masters and doctors have always been directed to wear silk and fur, and special colours have been associated with different faculties. The design of caps and gowns and the colours assigned to the faculties have varied therefore from univ. to univ. according to the date of estab. In the course of time these A. uniforms have become modified or conventionalised in shape, as, for instance, in the case of the Eng. 'mortar-board,' worn by both graduates and undergraduates, which is a modern stiffened version of a soft fashionable cap of the 2nd half of the 15th cent. Doctors in England wear a velvet cap which has kept more of its original character.

black gowns of rich material heavily braided with gold. The same practices are followed by most Amer. univs.

See H. Rashdall, *Universities of Europe in the Middle Ages* (new ed. by F. M. Powicke and A. B. Emden), 3 vols., 1936, which gives a reasonably comprehensive description of the A. D. in the various countries.

Dressmaking, the art or occupation of making dresses. The name dress is usually applied to any outer, complete feminine garment except a coat and skirt; it is sometimes restricted to a bodice and skirt, made up separately and later joined together at the waist, as distinguished from a robe or gown, which is generally made in one piece. The pattern of dresses depends entirely on the prevailing fashion, but the general characteristics of dresses suitable for

different occasions are, as a rule, very similar. Day, or street, dresses are usually shorter than formal afternoon or evening dresses. Day dresses are made of firm and durable material for winter wear; and cotton, linen, or rayon for summer wear. Formal afternoon dresses are made of fine woollens, velvets, or silks (natural or synthetic); while evening dresses are usually made in taffetas, satins, silks (natural or synthetic), tulle, lace, etc. The materials best suited for draping are the softer silks and woollens, etc., whereas taffetas, brocades, moiré, tulle, etc., stand away from the figure and look well in very full skirts and well-fitting bodices. Some materials are specially treated to resist creasing; and fabrics made from artificial fibres such as nylon, terylene (Dacron), and orlon have durability, strength, resistance to moth and mildew, and shaping qualities, under heat and moisture, formerly found only in woollen materials. They are also remarkably quick-drying. The present skirts for day wear have lengthened from the knee-length of 1946 to mid-calf. Ballerina, ankle-length, or full-length skirts are usual for evening wear; and trains are sometimes worn at weddings or state occasions.

The general procedure in D. is practically the same whatever the prevailing fashion may be. The type of dress having been decided upon according to the occasion for which it is required, suitable material should be selected, and the wearer's build (i.e. whether tall or short, slim or stout), age, and colouring must be carefully considered in relation to this. The rather short or stout figure should avoid big designs, horizontal stripes, yokes, tiered skirts, and frills, whereas the tall slim woman can wear these styles which tend to detract from her height. Widths of materials vary, cotton and rayon fabrics being from 27 to 36 in., and woollen materials usually from 42 to 54 in. Children's dresses are usually made of washable lightweight non-shrink material, with a mixture of wool and cotton or rayon, varying from 27 to 36 in. wide. Silks and velvets vary in width from 27 to 36 in. The amount of material required depends upon the style of the dress and on the cutter's ability to lay out the pattern economically on the material. Day frocks take from 3½ to 4½ yds of 36-in. material, and formal afternoon and evening dresses can take from 5 yds to 9 or more yds of material, dependent upon the fullness and style of the skirt and the length. Material for evening wear should be chosen in artificial light.

The dressmaker may of course be of amateur or professional status. If an amateur, she will begin by selecting a paper pattern from the pattern books pub. by the prin. paper pattern manufacturers and available to her through the shops; this she will make up in her own home. A pattern of this kind will be cut according to standard measurements. But the dressmaker may equally well be in the employ of a large estab., where the

pattern will first be drafted out from a designer's sketch (this is true of the wholesale manufacturer and of the *couturier*). Where a garment is made for an individual client particular care is taken to ensure accurate balance as well as correct measurements. For a normal figure only one side of the pattern is cut; in the case of any slight disproportion or one-sided deformity, the 2 sides are best cut separately. The pattern should be partially tacked together and tried on the client before the material is cut; any necessary adjustments may be made at this stage. Throughout D., both in the cutting of the pattern and of the material, it is imperative that an ample margin be left, any superfluous turnings being cut off when the garment nears completion. All fine materials, whether woollen, silken, or of artificial fibres, should be mounted on a suitable lining where the chosen style is a well-fitted one, and it is customary to line at least the bodice of a dress even where the skirt is full and flowing in order to keep the shape. Cotton garments are rarely lined, though sometimes the skirt may be stiffened by an underskirt of tarlatan or other similar material. At the houses of the foremost *couturiers* it is customary first to make the model in a light-weight lining material (a *toile*) before it is cut in the fabric selected by the designer. The cutting of the primary pattern to fit the client is frequently omitted if the skill of the dressmaker is sufficient to cut the lining accurately at once. But when a primary pattern has been accurately fitted on the client it should next be placed on the lining, care being taken to observe the straight and bias of the weave. The outline is then marked through, being pierced either with a stiletto or by a piercing wheel, and indications given of darts, pleats, gathers, tucks, and positions for embroidery. Tucks should be made before the material is cut. When the lining has been cut the material itself is cut out from the lining (with allowance for draping or folds). Each piece of material being matched to its lining, the 2 are tacked to each other, and the doubled material fitted together to form the back and front of the garment, bodice and skirt being kept separate at this stage. When the back and front of the bodice have been attached at the shoulders and beneath the arms, and the darts placed as indicated in the pattern, the bodice should be tried on and any necessary adjustments made. Boning is required in most *decoupage* styles, and the bones are inserted in the bodice lining. The seams are then joined, machined, and neatened, either by trimming with a pinking shear, or by oversewing, or by binding with thin silk or cotton. The sleeves (cut out and made up separately) are fitted at the same time as the bodice. The making of bodices and skirts is generally in the hands of 2 quite separate bodies of workers in large estabs.

To-day the dress trade consists mostly of wholesale houses. Owing to the high cost of labour, the individual tailor and

small dressmaker are disappearing. Ready-made clothes, designed by experts, and even by some of the most noted names in *haute couture*, are made in a wide range of sizes for commercial distribution. Paris still leads the world of fashion, but London, Rome, Florence, Vienna, New York, and Madrid are all gaining in importance, and Brit.-made materials are widely used by leading *couturiers*. Irish designers have recently shown interesting collections in locally-made fabrics.

To obtain a truly professional finish the home dressmaker must be prepared to take a thorough course of instruction, and every facility for this is now offered in the numerous domestic science schools, in the polytechnics and technical schools of London and the provs., in women's institutes and other educational centres.

Fashions change so swiftly that works on all but the fundamental principles of D. soon become out of date. A few books, however, which would be helpful to the student are: Margaretta Byers, *Designing*, 1939; R. K. Evans, *Dress: The Evolution of Cut and its Effect on Modern Design*, 1939; Eleanor King, *Successful Home Dressmaking*, 1952; Winifred Parker and Dora Seton, *Essentials of Pattern Drafting and Modelling*, 1952; Marian Corey, *McCall's Complete Book of Dressmaking*, 1954; M. B. Picken, *Singer Sewing Book* (2nd ed.), 1954; also *Vogue's New Book for Better Sewing*, 1953.

Prevailing fashions can be noted in the current issues of numerous periodicals for women, such as *Vogue*, *Vogue Pattern Book*, *Harper's Bazaar*, the *Queen*, *Vanity Fair*, *Weldon's Ladies' Journal*. See also DRESS; EMBROIDERY; FASHION; NEEDLEWORK; TAILORING.

Dreux, Fr. tn, cap. of an arron., in the dept of Eure-et-Loir, on the Blaise. It was once the chief city of the Gallic Durocasses. There is a beautiful church, partly 12th cent., with fine windows. In the precincts of the ruined castle is an exquisite chapel, built in 1816 as a sepulchre for the Orléans family (see ORLÉANS, DUKES OF). Shoes are manufactured. Pop. 14,200.

Drevet, Pierre Joubert (1661-1739), Fr. engraver, studied under Germain Audran at Lyons, and then under Gerard Audran at Paris. In 1696 he became engraver to the king, and an academician, 1707. His best portraits include those of Louis XIV, Cardinal Fleury, the Dauphin, Robert de Cotte, and Boileau.

Drevet, Pierre Joubert (1697-1739), son and pupil of above, surpassing his father. He was admitted to the Academy 1729. His portrait of Bossuet after Rigaud, 1723, is considered his masterpiece. Other works are portraits of Lecouvreur, Bernard, Cardinal Dubois, and Pucelle. 'La présentation au temple' is the best of his historical subjects. His engravings are mostly after Coypel, Boullongne, Restout, and Rigaud. See A. Firmin Didot, *Les Drevet*, 1876.

Drew, Samuel (1765-1833), writer, known as the 'Cornish metaphysician.' After a wild youth he joined the Wesleyan

Methodists (c. 1785) and became a local preacher. He early won fame by his *Remarks on Paine's 'Age of Reason'*, 1799, followed by *Essay on the Immateriality and Immortality of the Soul*, 1802. He ed. the *Imperial Magazine* from 1819. See autobiographical sketch prefixed to *Essay on the Identity . . . of the Body*, 1809.

Dreyfus Affair, The, notorious Fr. miscarriage of justice, in which anti-Semitism was a prominent factor. It covered the years 1894-1906. Capt. Alfred D. (1859-1935) was the son of a rich Jewish manufacturer in Paris. He entered the army, became an artillery capt., and was attached to the general staff. In 1894 he was arrested, accused of giving military secrets to the Ger. Gov. He was tried by court-martial sitting in secret, was found guilty, and condemned. He was degraded and transported to Cayenne, Devil's Is. His condemnation roused throughout the whole of France a great wave of anti-Semitism, and the majority of Frenchmen probably believed firmly in D.'s guilt in the early stages. Only his own relatives, and a minority of Radical intellectuals, notably Zola and Clemenceau, continued to assert his innocence. Some time after D.'s conviction, Piquart, a new head of military intelligence, decided that the document which had allegedly been written by D. was a forgery, the actual writer being most probably a Capt. Esterhazy. But the military authorities refused to act, presumably because, having once found D. guilty, they felt that a re-trial would be injurious to the prestige of the whole army. Piquart continued to press for action, and was subsequently sent out of the way to the hinterland of Tunis. In 1897 Esterhazy was accused of being the real author by Capt. D.'s brother. Esterhazy was tried by court-martial and acquitted, 1898. To Zola, as to all the Dreyfusards, it had now become apparent that the military staff would not allow justice to be done until forced to do so by pressure of public opinion. Zola, in an open letter, 'J'accuse . . .', to the president announced this fact in plain hard language. He was tried for libel, convicted, and fled the country. But his conviction was tantamount to a victory. Zola had achieved his object. As he said, with clear foresight: 'Truth is on the march and nothing can stop it.' The case was taken up by Clemenceau, and one of the documents was proved to have been forged. Henry, the chief of the intelligence dept, was placed under arrest, and immediately afterwards cut his throat, having confessed that he had fabricated the document. The struggle was now against the whole army, and for a short time the rep. itself was in danger. Brisson's cabinet, however, transferred the case to the Court of Cassation, and another court-martial was held at Rennes, where D. was again convicted, but obviously this was merely the last struggle of the military party, since extenuating circumstances were admitted and the sentence reduced. This was followed almost immediately by a free

pardon. The only common-sense conclusion which could be reached was that Esterhazy and Henry were the real culprits, and that the army was too obstinate to admit an obvious fact. The proceedings against D. were finally quashed in 1906, and he was again restored to the army, being given the rank of major. He was awarded the Legion of Honour in 1919. Piquart, who had suffered demotion on account of his consistent support for D., was also promoted. There is a considerable literature on the D. A., but see especially J. Reinach, *Histoire de l'affaire Dreyfus*, 1901-11; E. Zola, *Vérité*, 1903; A. Dreyfus, *Souvenirs et correspondance publiés par son fils*, 1936; L. M. Friedman, *Zola and the Dreyfus Case*, 1937; G. Chapman, *The Dreyfus Case: a Reassessment*, 1955; and M. Paléologue, *Journal de l'affaire Dreyfus*, 1956.

Dreyse, Johann Nikolaus von (1787-1867), Ger. locksmith and inventor; worked in a musket factory in Paris (1809-14), and on his return founded an ironware factory in Sömmerda. He manufactured percussion caps under a patent (1824), and invented improved firearms, notably the muzzle-loading needle-gun (1827), and the breech-loading one (1836). Adopted by the Prussian Army (1840), its superiority was shown in the war with Austria (1866). The modern repeating rifle has replaced it.

Driers, see PAINTS and VARNISHES.

Driffelt, Great, see GREAT DRIFFIELD.

Drift, Afrikaans (q.v.) word for a riv. crossing, or ford, in common use throughout S. Africa and the Central African Federation.

Drift, name applied loosely to recently formed superficial deposits laid down on the earth by rivers and by the Pleistocene ice sheets.

Drift, Continental, see CONTINENTAL DRIFT.

Drift Net, see FISHERIES.

Drill (*Mandrillus leucophaeus*) is a baboon of the same genus as the mandrill, but it differs from this hideous creature in the absence of bright colours on its muzzle and nose. It is a ferocious inhabitant of W. Africa.

Drin, riv. of Albania, formed by the joining at Kukës of the Black D. (rising in Lake Ohrid) and the White D. (rising in the Albanian Alps). It flows thence W. into the Adriatic.

Drina: 1. Riv. of Yugoslavia which rises in Montenegro and joins the Sava 65 m. W. of Belgrade. Length c. 250 m.

2. Prov. of the Yugoslav rep. of Montenegro (q.v.).

Drinker Respirator, see AEROTHERAPEUTICS.

Drinkwater, John (1882-1937), poet and playwright, b. Leytonstone, Essex. Educ. at the City of Oxford School, he worked in an insurance office for 12 years, being moved in 1901 to Birmingham. His first book, *Poems*, appeared in 1903, and was followed in 1906 by *The Death of Leander*. In 1909 he left insurance for literature, and was one of the founders in 1913 of the Birmingham Repertory Theatre. He

was best known for his chronicle plays, which include *Abraham Lincoln*, 1918; *Mary Stuart*, 1921; *Oliver Cromwell*, 1921; *Robert E. Lee*, 1923; and *Robert Burns*, 1925. *Bird in Hand*, 1928, is a comedy. His work had an important influence on the revival of serious drama. Among his numerous books of verse may be mentioned *Olton Pools*, 1916; *New Poems*, 1925; and *Summer Harvest*, 1933. He wrote a number of biographies, including studies of Byron (*The Pilgrim of Eternity*), 1925; Cromwell, 1927; Pepys, 1930; and Shakespeare, 1933; and 2 autobiographical works, *Inheritance*, 1931, and *Discovery*, 1932.

Dripstone, in Gothic architecture, a stone moulding projecting over the head of a doorway or window-opening, in order to throw off rainwater.

Driver, Samuel Rolles (1846-1914), divine and Heb. scholar. After a brilliant career at Oxford, he became Regius prof. of Hebrew and canon of Christ Church, 1883. D. was a member of the O.T. revision committee, 1876-84. His publs. include *An Introduction to the Literature of the Old Testament*, 1891; commentaries and notes on *Leviticus*, 1894, *Deuteronomy*, 1895, *Daniel*, 1900, *Genesis*, 1904; *A Hebrew and English Lexicon of the Old Testament* (with F. Brown and C. A. Briggs), 1906; *Modern Research as Illustrating the Bible*, 1909.

Driving (of animals). Many animals are used for traction in various parts of the globe, but the most common are the horse, the mule, the ass, and the ox; in very cold climates the reindeer and the dog are also utilised. Ever since man possessed domesticated animals he has made use of them in this manner: an element of sport has also been associated with D. from very early times. Thus the Romans were very fond of chariot races, as also were the Greeks. The custom of D. for pleasure, without racing, is of comparatively modern development; such a pleasure would have been impossible before Macadam and Telford revolutionised road-making. Spring carriages and level roads were a necessary corollary, but when these existed there sprang up a great number of D. clubs in Britain, of which the Bensington Driving Club, founded in 1807, was the pioneer. The most usual method of D. is with 1 horse; when 2 horses are driven, they are either abreast (the customary way) or in tandem; 4 horses are driven in 2 pairs, the foremost pair being the 'leaders', the other the 'wheelers'. Practice is essential in order to become a good driver, though the art of handling horses is also to some extent innate and instinctive.

Driving Licences. The Road Traffic Act, 1930, empowers co. and co. bor. councils to act as licensing authorities and to issue D. L. on payment of a fee of 5s. The Road Traffic Act, 1934, provides for tests of competence to drive, the fee for a test being £1 (2s. 6d. in the case of a test taken in an invalid carriage, a mowing machine, a pedestrian controlled vehicle, or vehicles exempt from duty under section 7 (4) of the Vehicles (Excise) Act,

1949). Details of the driving test are prescribed in the Motor Vehicles (Driving Licences) Regulations, 1950; an applicant for a test must satisfy the driving examiner, a Ministry of Transport official, that he is fully conversant with the *Highway Code* (see *HIGHWAY, Road Traffic Acts*) and that he is competent to drive, without danger to and with due consideration for other road users, a vehicle of the same class or description as that on which he is tested. Epilepsy, sudden attacks of disabling giddiness or fainting, or inability to read at a distance of 25 yds in good daylight (with the aid of spectacles if worn) a motor-car number plate containing 6 letters and figures, is a complete bar to the issue of a driving licence. D. L. must under penalty be signed by their holders. The Road Traffic Act, 1956, provided for a scheme whereby D. L. would be issued for 3 years at a cost of 15s., instead of the former 1 year at a cost of 5s.

Drocourt-Quéant Switch, in the First World War a key position of the Hindenburg line. It was the Brit. objective in the battle of Arras of April 1917, but was not taken. In Sept. 1918, after extremely bitter fighting, the 'switch' was, however, taken by storm.

Droeshout, Marten (Martin) (fl. 1620-1651), engraver, b. London of Flem. parents settled in England; worked chiefly for booksellers and engraving portraits. His most famous production is the engraved portrait of Shakespeare, prefixed to the first folio ed. (1623) of his plays. This was probably copied from the original painting made by D.'s uncle, which was discovered in 1892, and placed in the Shakespeare Memorial Gallery at Stratford-on-Avon. Other portraits were of Villiers, duke of Buckingham, the marquess of Hamilton, Dr Donne, John Fox, and Sir Thomas Overbury.

Drogheda (ancient **Droichead Atha**, the bridge of the ford), seaport, market town, and municipal bor. (till 1885 a parl. bor.) on either bank of the Boyne, 4 m. from its mouth in the Irish Sea, on the Great Northern Railway, 31½ m. from Dublin, in the cos. of Meath and Louth, Rep. of Ireland. The St Lawrence gateway still remains of the ancient walls, and there are relics of the Augustinian abbey (1206) and the Dominican monastery (1224). When Cromwell captured the town in 1649 most of the garrison were butchered. In 1690, after the famous battle of the Boyne, D. surrendered to William III. It forms the gateway to the valley of the Boyne, a place of historical and archaeological interest. The salmon fishery in the Boyne has its centre here, and agric. produce is shipped to Liverpool. The depth of water alongside the N. quay is 21 ft at highest and 14 ft at lowest tide. Recently the former flourishing linen and damask industries have been revived, and manufs. include cement, industrial oils, boots, margarine, beer, and flour. Pop. 16,779.

Drohobych (Ukrainian **Drohobych**, Polish **Drohobycz**): 1. Oblast in Galicia (W. Ukraine) adjacent to the Polish frontier,

on the N. slopes of the Carpathian Mts, traversed by R. Dniester and partly covered with mixed forests. It has oil, natural gas, and salt deposits. There are oil and gas extraction and chemical and food industries. The principal towns are D., Horislav. Area, 4000 sq. m.; pop. 1,000,000 (mostly Ukrainians).

2. Cap. and econ. centre of the above, 40 m. SW. of Lvov. It is the centre of the oil industry in the Ukraine (since 1900), a railway junction, and a local cultural centre. It has been known since the Middle Ages. Pop. (1931) 33,000 (before the war mostly Jews and Poles, now Ukrainians).

Drohobycz, see **DROGONYCH**.

Droichead Atha, see **DROGHEDA**.

Droit Administratif, that system of law which in France gives an over-riding authority to the state tribunals over the ordinary law. It exists also in other European states, but is not so marked a feature as in France. There is no precise equivalent in English; but it is defined in general terms by the Fr. authorities as 'the body of rules which regulate the relations of the Administration or of the Administrative authority towards private citizens.' D. A. is in fact that portion of Fr. law which determines: the position and liabilities of all state officials; the civil rights and liabilities of private individuals in their dealings with officials as the representatives of the state; and the procedure by which those rights and liabilities are enforced. The modern D. A. of France has grown up and assumed its existing form during the 19th cent., being the outcome of more than a cent. of revolutionary and constitutional conflict. The essential characteristics of D. A. are: the rights of the state are determined by special rules, i.e. as opposed to the ordinary law; the ordinary law courts have no jurisdiction in matters concerning the state, and administrative litigation is thus determined by the administrative courts; the coexistence of judicial courts and administrative courts results in a conflict of jurisdiction in which the latter courts prevail; and state officials are protected against the ordinary law. See A. V. Dicey, *Law of the Constitution*, 1885; G. Jéze, *Les Principes généraux de droit administratif*, 1904; Seissier, *La Responsabilité de la puissance publique*, 1906. See also **STATE, ACTS OF**.

Droit de Seigneur, see **JUS PRIMAE NOCTIS**.

Droits of Admiralty, see **ADMIRALTY, DROITS OF**.

Droitwich, town and municipal bor., on branch lines of 2 railways, 6 m. NNE. of Worcester, in Worcestershire, England. It is famous for its brine springs or 'wyes', which are mentioned in the Domesday Book. The brine is used in connection with the treatment of rheumatism and allied complaints, and in an open air sea-bathing lido. Pop. 6632.

Drôme, dept. of SE. France, bounded on the N. and NE. by Isère, on the E. by Hautes-Alpes, on the SE. by Basses-Alpes, on the S. by Vaucluse, and on the W. by the Rhône. Apart from the wide and

fertile Rhône valley, the dept is composed of offshoots of the Alpes Cottiennes (see ALPS). The mt. valleys are frequently steep and irregular, and the hill slopes are in some places fertile and wooded, whereas in others they are dry and barren and support nothing except sheep. The chief products are maize, potatoes, buckwheat, mulberries, fruit, truffles, and wine (l'Hermitage, Châteaufort). There are silk, leather, chemical, foodstuff, tanning, and paper industries. The chief tn is Valence (q.v.), and other tns of importance are Die, Nyons, Montélimar, Crest, and Romans. Area 2533 sq. m.; pop. 275,300.

Dromedary, or *Camelus dromedarius*, species of camel which is distinguished

DROMEDARY

by its solitary hump, *C. bactrianus* having two. It is a large ruminant which occurs in Arabia and is never found wild; the hump is adipose (fatty), and the body is covered with hair. See also CAMEL.

Dromia, genus of crabs in the family Dromiidae, has well-defined orbits into which the eyes can be retracted; the 4th and 5th pairs of trunk-legs are small and are held dorsally, and the carapace is shaggy. *D. vulgaris* is found on Brit. and Mediterranean shores.

Dromore, par. and tn of NW. co. Down, N. Ireland, on R. Lagan, 17 m. from Belfast. The present cathedral was erected after the destruction of the tn in the insurrection of 1641, and has the tombs of Jeremy Taylor (1613-67) and other bishops. Linen is manufactured. Pop. 2400.

Drone, see BEE.

Dronfield, par. and tn of Derbyshire, England, 6 m. from Chesterfield, on the R. Drone, in a colliery dist. Iron and steel goods are manufactured. Pop. 7500.

Dronning Maud Land (Queen Maud Land), long. 20° W. to 45° E. and in Antarctica (q.v.); claimed by Norway. Norwegian and Ger. expeditions visited the area before the Second World War; in 1949-52 the Norwegian-Brit.-Swedish expedition explored the 'Maudheim' area.

Much valuable scientific research was done. See L. Christensen, *Such is the Antarctic*, 1935; J. Gjaever, *The White Desert*, 1954.

Dronte, obsolete name, of Dutch and Fr. origin, for the dodo (q.v.).

Drop-forging, or die-forging, a process which has replaced the old drop-hammer used in swaging die-work, striking up sheet metal, etc. Many of the operations performed at the smith's anvil can be done better and more quickly by such a machine as the die-forging. A white-hot mass of metal is placed in the die, and the blows of the hammer force it into the same shape as the die; the metal goes into the die as a shapeless mass, so that when hammered some of it is squeezed out of the side of it, and if this is not checked will prevent the die from closing, and so spoil the stamping. To obviate this possibility the metal is placed on a die of the same shape as the object, but pierced right through; when hit by the hammer the forging is forced through the die, thus leaving the stripped fln of metal behind, and the forging is then proceeded with. In the manuf. of automobiles, aircraft, and other machines having many small parts the forgings are stamped so accurately that very little metal is wasted by machining in the shops, thereby saving both time and money. See H. Hayes, *Drop Forging and Drop Stamping*, 1923; S. Johnson and J. Warby, *Drop Forging Practice*, 1937.

Dropsy, shortened form of *hydropsy*, an abnormal accumulation of serous fluid in the tissues or cavities of the body. Serum is the colourless liquid constituent of blood, and under normal conditions is exuded through the walls of the blood capillaries into the tissues; a part of the exuded fluid is returned to the blood-stream by the veins and some by the lymphatics. When from any cause serum is exuded in abnormal quantity or is not returned to the blood stream to a sufficient extent, collections of fluid are apt to form. D. is therefore not a disease itself so much as a sign of dysfunction due to disease. Half of the cases of general D. are due to heart disease, and many are due to kidney disorders. Other causes may be weakening of the walls of the capillaries, by which exudation is increased, or, in the case of local D., any obstruction of a vein which causes increased blood pressure. *Oedema* is D. of the tissues rather than the body cavities and may be limited in area; *Anasarca* is the term applied to generalised D. of the subcutaneous tissues. *Ascites* (q.v.) is an accumulation of serum in the abdominal cavity. *Hydrocephalus*, or water on the brain, is an accumulation in the brain-cavities. *Hydrothorax* is a D. in the pleural cavities. *Hydropneumothorax* is an accumulation in the membranous sac enclosing the heart.

Dropwort, common name for the perennial herb, *Filipendula vulgaris*, family Rosaceae, occurring in dry pastures in Britain. Has small white flowers resembling those of the meadow-sweet. Water-dropworts are *Oenanthe*

fastuosa, *Or. lachenalii*, *Or. crocata*, and *Or. aquatica*, all toxic umbelliferous plants.

Drosera, genus of the Sundew family (Droseraceae) which comprises nearly 100 beautiful insectivorous plants, growing in boggy places in all parts of the world. The leaves are covered with glandular hairs, whereby insects are trapped and digested. In Britain there are 3 perennials, *D. intermedia*, a common bog-plant; and *D. anglica*, found chiefly in Ireland; and *D. rotundifolia*, the common or round-leaved sundew. The latter is an acrid and caustic plant used in Italy in making the liquor called Rossoli. See INSECTIVOROUS PLANTS.

Droste-Hülshoff, Annette Elizabeth, Frein von (1797-1848), Ger. poetess, b. near Münster. Although she is now considered one of the greatest Ger. nature poets, she was not recognised in her lifetime. Her book of nature poems *Heidebilder*, 1844, is realistic in its exact description of the countryside. She was also preoccupied with the supernatural, as is shown by her cycle of religious poems *Das geistliche Jahr, nebst einem Anhang religiöser Gedichte*, 1860, and her short story *Die Judenbuche*, 1842. Her *Gesammelte Werke* was pub. by Schulte-Kemminghausen (5 vols., 1925-30). See L. Schücking, *Annette von Droste-Hülshoff, ein Lebensbild*, 1862; K. Schulte-Kemminghausen, *A. von Droste-Hülshoff*, 1939; Th. Steinbüchel, *A. von Droste-Hülshoff*, 1950. See also her letters pub. by Schulte-Kemminghausen, 1944.

Drouais, family of Fr. artists, the 3rd being the most famous:

Hubert (1699-1767) was intimate with Nattier. Van Loo, and Oudry. His portraits include those of the painter Christophe and of the sculptor Robert le Lorrain.

François Hubert (1727-75), son of above, painted children's portraits, and did much work in Louis XV's reign. Examples are portraits of Mme de Pompadour, Mme du Barry, Mme Clotilde, Marie Antoinette. His 'Child playing with a Cat,' 1767, is characteristic.

Jean Germain (1763-88), son of above, pupil of David and Brenet. He won the Academy prize (1874) with 'Christ at la Cananéenne.' While in Rome he painted 'Marius à Minturnes,' 'Philoctetes on the Island of Lemnos,' and 'A Wounded Gladiator.' See Chaussard, *Notice sur Drouais*.

Drouet, Jean Baptiste, Comte D'Erlon (1765-1844), Fr. soldier, b. Reims. He fought for the rep. and the empire, playing an outstanding part in the Peninsular campaign. When Napoleon escaped from Elba he seized and held the citadel of Lille for him, and subsequently commanded the first *Corps d'Armée* at Waterloo. D. left France at the restoration, but returned after the July revolution, being made governor of Algiers (1834-5) and a marshal (1843).

Drought, or **Drouth** (O. E. *drugað*, from *drugian*, to dry), dryness, want of rain or water. The term is especially applied to such lack of rain and moisture as affects

the earth and its fertility, preventing the growth of plants. 'Periods of more than 14 consecutive days without measurable rain' were fixed by Symons (1838-1900) as the exact time that must elapse without rain to cause an 'absolute drought.' See Symons' *British Rainfall* pub. annually since about 1863, and his *Meteorological Magazine*. From about 1714 to 1750 severe D.s in England brought calamitous results with famine threatened and a series of devastating epidemics. There is reason to believe that even more acute D.s occurred in the Middle Ages, when at least twice the R. Thames could be crossed dryshod; there is said to have been no harvest in 1177. Hardship, famine, and disease are often caused by D. and the cholera year of 1854 was very dry. In recent years England has had 2 major droughts, in 1921 and 1933-34; and a critical position was reached also in 1947 when, although rainfall until the end of July was heavier than normal, the following 3 months were dry, and events suggested that improvement in the methods of conserving water is necessary. The Sahara and Kalahari deserts of Africa, the Gobi desert of Central Asia, Great Salt Lake district in N. America, and certain regions of India and China suffer from D. nearly all the year round. The regions which suffer from almost continual D. are often shut off by high mountain ranges from the influence of winds carrying moisture. So far, meteorology has not advanced to the stage at which it is possible to forecast droughts in normally humid regions for any appreciable period ahead. See C. E. P. Brooks and J. Glasspoole, *British Floods and Droughts*, 1928; I. R. Tannehill, *Drought: its Causes and Effects*, 1948.

Drowning. The cause of death by D. is asphyxiation, and the entrance of water into the lungs. After death the skin of a drowned person presents the appearance known as 'goose skin,' or *cutis anserina*, the face is exceedingly pale, a frothy liquid is found in the lungs and air passages, and water in the stomach; froth is also present at the mouth and nose. Complete insensibility supervenes in from 1 to 2 mins., and death in about 5 mins., though persons have been known to recover who have been immersed for a considerable length of time. The D. person rises to the surface by his own efforts a variable number of times, not necessarily the three of the popular fallacy. Dr W. Hawes was instrumental in founding the Royal Humane Society (q.v.) which has been the means of rendering the principles of life-saving widely known. The methods for the restoration of persons apparently drowned are described under ARTIFICIAL RESPIRATION. When the patient is coming round, hot water bottle should be applied; on his regaining consciousness teaspoonfuls of hot water, brandy, etc. can be administered. In older times D. was a 'capital punishment; it was abolished in England about 1620, in Scotland in 1685, in Switzerland 1652, in Austria 1776, and in Ireland 1777. For methods of rescuing persons

who are D., see under SWIMMING, *Life-saving*.

Droylsden, par. and tn of Lanes, England, 4 m. from Manchester. The manufs. of cottons and chemicals are important, and there are drugworks and paint manufs. Pop. 26,660.

Droz, Antoine Gustav (1832-1895), Fr. novelist, b. Paris. He studied painting, but turned to literature with articles in *La Vie parisienne*. He was author of sev. popular and brilliant novels: *Monsieur, Madame et Hébé*, 1866; *Entre nous*, 1867; *Le Cahier bleu de Mlle. Cibot*, 1869; *Les Étangs*, 1875; *Tristesses et sourires*, 1884.

Drug, any simple medicinal organic or inorganic substance, used as an ingredient of a mixture or by itself. In a more restricted sense, applied to narcotics such as opium or hashish. The narcotic control conventions are administered by an international authority, the Permanent Central Opium Board. Anxieties recently expressed by the Board serve to emphasise the apparent success of Brit. measures for controlling the use of dangerous D.s. Measures controlling the consumption in Britain of a range of dangerous D.s. were strengthened by regulations which came into force on 1 Jan. 1949. The regulations restrict the authority to dispense dangerous D.s., and impose on pharmacists the responsibility for satisfying themselves of the genuineness of all prescriptions which they dispense for a dangerous D. D. addiction does not present a serious problem in the United Kingdom. The prin. D.s. of addiction are morphine, heroin, and petidine. Few use cocaine and the number who do so is decreasing. The domestic manuf. of dangerous D.s. is controlled by a system of licensing, and supervision is exercised by Home Office inspectors over persons authorised to possess and use dangerous D.s.

Drugget (Fr. *droguet*), common felt or coarse woollen fabric, often printed on one surface. The heavier kinds are chiefly used for covering carpets (hence called 'crumb-cloths'), as a substitute for carpets, or as a lining or border. The lighter kinds are used for table-covers. A strong dress-fabric of this name was formerly used largely for petticoats and workmen's aprons.

Druids, caste of priests among the Celts of ant. Gaul, Britain, and Ireland about whom there are many traditions, no doubt largely modified by legend, especially in the case of the Irish. The long accepted derivation of D. from the Gk *Drus*, oak, is now doubted. The Welsh and Breton *derwydd* and *drouic* are not original forms. The Lat. *druidi* points to a Gaulish *druids*, Irish *drui*, *druid*, connected with learned, knowing. Caesar gives the first circumstantial account of the D.: he tells us that all nobles and men of dignity in Gaul were among them; they were the law-givers and priests; the caste was not hereditary; the chief D. was elected; they could inflict heavy punishment for disobedience; they had a written language, believed in the immortality of the soul, and were learned in astrology and the natural sciences. Caesar may have over-

estimated their powers. Britain was their H.Q., only a yearly meeting being held in Gaul; the Gaulish novices came for training to Britain. Human sacrifices were generally attributed to D., and they practised divination by the flight of birds and by the dying convulsions of their victims. The oak tree was sacred, and all its fruits, especially mistletoe; religious ceremonies were performed in oak groves. Pliny describes their practising of medicine and sorcery, and their cutting the mistletoe, robed in white, with golden sickles, and sacrificing white bulls. Strabo tells of their golden collars and armlets, describing them as bards and soothsayers. Tacitus records their last stand, AD 61, in Mona (Anglesey); their sacred groves were cut down, and the suppression of D., the object of Rome since Augustus, was accomplished, at any rate in England and Wales. Their later history is confined to Ireland. Anct. Irish literature has many tales about them, much overlaid with legends and traditions of the early Christian struggle with paganism. They are credited with sorcery and witchcraft, and with power of changing the weather; the archdruid appears as a leaping juggler, tossing swords and balls in the air; in a famine, the D. would bid the son of a sinless married couple to be sacrificed and his blood mixed with the soil; Druid enchantment caused the death of King Cormac; they were also bards and poets. There are also legends of the struggle of the D. against St. Patrick and St. Columba. See P. W. Joyce, *Social History of Ancient Ireland*, 1903; D'Arbois de Jubainville, *Les Druides et les dieux Celtiques*, 1906; D. Wright, *Druidism*, 1924; T. D. Kendrick, *The Druids*, 1927.

Drum, musical instrument of percussion. Although it is said to have been introduced into Europe about the time of the Crusades, nevertheless instruments which strongly resemble it were known during the early days of the Rom. empire. Obviously one of the most primitive of musical instruments, it forms almost exclusively the sole musical instrument of some savage peoples. The tom-tom, a form of D. played with the fingers, is the chief music of many primitive tribes, and this instrument is also known to have existed in Egypt considerably more than 1000 years BC. There are 3 main varieties of D.: (1) the common or side-D., (2) the bass-D., and (3) the kettle-D.; but variant forms of each type occur, such as the tambourine, a variant of (1), the tenor-D. of (2), and the naker, of (3), this last a primitive form used on horseback. The side-D. is, as its name implies, worn at the side of the player, and is played upon the upper head with 2 sticks. It is a military and orchestral instrument, like the bass-D., which is very similar in construction, but larger. The latter is played with 2 sticks, both sides being used. The only instrument of real musical value is the kettle-D. This instrument is composed of a cauldron-shaped shell or kettle of copper or brass, over the mouth of which is drawn tightly a single head of skin attached to an iron ring. By means of

screws it is possible to tune this D. within narrow limits, and this is the only D. producing notes of definite pitch. In a full orchestra 3 are usually found, 1 with a compass from F to C, the 2nd from B to F on the bass stave, the 3rd intermediate. A variety of sticks covered with different materials can be used to produce a harder or softer impact. The kettle-D. is carried by the cavalry, this being the only use made of it in military circles.

Drum-major, the 1st or chief drummer in a regimental band, the officer who leads a drum-corps or band, directing its movements, and regulating the pace when on the march. He attends to the bugle calls and teaches the under-drummers. The D. ranks with the sergeants of the

was opened in 1910 by Jesse Gouge. D. was named after Samuel D., a pioneer of the Alberta coalfields. Incorporated as a vtl. in 1913, as a tn in 1916, and as a city in 1930. Prin. industries are coal-mining and dairy products. Pop. 2574.

Drumlins, or **Drumlings** (from *drum*, ridge), in geology, smoothly rounded, oval hills of compact, unstratified, glacial drift or boulder-clay, apparently deposited and piled up beneath the Pleistocene ice-sheets. They are usually about $\frac{1}{2}$ m. long, 100 to 200 ft high, the longer axis always lying parallel to the former local glacial motion. They occur in America in Massachusetts, round Boston harbour, in W. New York, SE. Wisconsin, and the lake region, and in the parts of Europe and

MODERN DRUMS

Military bass drum: narrow shell side drum, shown upside down to expose the snares; and orchestral kettle drum and sticks.

line. His official designation, from 1881, was sergeant-drummer or sergeant-piper (as the case might be), the reversion to the old name being made by the War Office in 1928. The rank is over 3 centuries old and is to be traced as far back as 1632, in which year it is mentioned by a music writer named Cruso; 7 years later there was a D. on the strength of the Royal Scots, and a few years later on that of the Coldstream Guards.

Drum of the Ear, see **TYMPANUM** and **EAR**.

Drumcliff, par. of NW. Sligo co., Rep. of Ireland, on the D. Bay, 4 m. from Sligo. It has a carved Celtic cross and a round tower. D. is the burial-place of the poet W. B. Yeats. Pop. 5000.

Drumclog (Gaelic, ridge of stone), moorland tract of Lanarkshire, Scotland, 17 m. from Lanark. An obelisk commemorates the defeat of Claverhouse by the Covenanters, or Cameronians (1679), near London Hill. See *Scott's Old Mortality* for a description of the battle.

Drumheller, city of Alberta, Canada, 85 m. NE. of Calgary on the Calgary-Saskatoon and Calgary-Edmonton lines of the Canadian National Railway, close to the famous Dinosaur Valley. Coal was first discovered in the D. valley near the mouth of Rosebud Creek at Rosedale by Peter Fidler in 1793. The first coal mine

Asia lying N. of the terminal moraine of the Continental ice-sheet. A good example exists between Belfast and Lisburn, Ireland.

Drummond, George (1687-1766), soldier. He fought against the Pretender at Sheriffmuir (1715). He was lord provost of Edinburgh for the first time in 1725, being chosen 6 times in all. D. was energetic in resisting the rebels of the '45 outbreak, joining Cope after the surrender of Edinburgh.

Drummond, Henry (1851-97), scientist and theologian. He travelled widely, *Tropical Africa*, 1888, and *Travel Sketches in our New Protectorate*, 1890, being the resulting works. His *Natural Law in the Spiritual World*, 1883, and *The Ascent of Man*, 1894, were attempts to reconcile evangelical Christianity and evolution. D. was a man of great personal fascination, but his reasoning in his scientific works is by no means unassailable.

Drummond, James (1816-77), historical and genre painter, studied under Sir Wm Allan (q.v.) at Edinburgh. His first exhibit in the Royal Scottish Academy was 'Waiting for an Answer', 1834. He became a R.A., 1852, and curator of the Scottish National Gallery, 1868. Among his best works are 'The Vacant Chair', 1837, 'The Porteous Mob', and 'The Covenanters in Greyfriars Churchyard.'

Drummond, James (1835-1918), Unitarian theologian, educ. at Trinity College, Dublin. He became a colleague of Gaskell at Manchester (1859-69), and then professor of theology at Manchester New College, London (1869), succeeding Martineau as principal (1885-1906), and moving with the college to Oxford (1889). His works include *Introduction to the Study of Theology*, 1884; *Via, Veritas, Vita*, 1894; *The Pauline Benediction*, 1897; *Life and Letters of Dr. Martineau* (with C. B. Upton), 1902; *Character and Authorship of the Fourth Gospel*, 1904; *Studies in Christian Doctrine*, 1908; *Paul: his Life and Teaching*, 1911.

Drummond, Sir James Eric, see PERTH. 16th EARL OF.

Drummond, Thomas (1797-1840), inventor and administrator, entered the Royal Engineers in 1815, but in 1820 accepted Col. Colby's offer to join him in an ordnance survey of Great Britain. It was in 1825 near Belfast that he first tested the power of his lime-light apparatus (Drummond light), being able to see it at a distance of 67 m., and 4 years later he adapted it for use in lighthouses. D. also invented an improved 'heliostat,' a mirror especially designed to facilitate the turning of rays of light in a certain direction. Appointed superintendent of the boundary commission in 1831, he became under-secretary for Ireland in 1835, when he discharged his duties so as to win universal respect. See also HELIOGRAPH.

Drummond, William (1585-1649), poet, b. Hawthornden. He obtained his M.A. degree at Edinburgh Univ., studied law and literature in Bourges and Paris, and spent the greater part of his life at his 'sweet and solitary seat' of Hawthornden, dividing his life between poetry, royalist pamphlets, and melancholy. There he was visited by his friend Ben Jonson, and preserved notes which, first printed in full in 1832 as his *Conversations*, form a pleasant and instructive chapter of literary hist. D. has been called the Scottish Petrarch because of his passionate sonnets (1616) inspired by the early death of his first love, Mary Cunningham; yet he is in no sense a national poet, for his inspiration and much of his sensuousness are drawn from Spenser, and his poems prove him to have been well acquainted with the works of Sidney and many It. poets. *Flowers of Simon*, 1623, contains his 'Cypresse Grove,' a musical poem on death, which best preserves the quiet gloom of D.'s mind, and is free from extravagant conceits which sometimes mar his verse. Others of his works are *Forth Feasting*, 1617, and, in prose, *The History of Scotland, from the year 1423 until the year 1542*, 1655, known also as *History of Scotland during the Reigns of the Five Jameses*. See D. Masson, *Drummond of Hawthornden*, 1873; A. Joly, *William Drummond de Hawthornden*, 1935.

Drummond, William Hamilton (1778-1865), poet and Unitarian minister, b. Larne, Antrim. He wrote poems, *The Battle of Trafalgar*, 1806; *The Giant's Causeway*, 1811; *The Pleasures of Benevo-*

lence, 1835; *Ancient Irish Minstrelsy*, 1852; an Eng. metrical trans. of Irish ballads in J. Hardiman's *Irish Minstrelsy*, 1831; polemical works, such as *The Doctrine of the Trinity*, 1827; *Original Sin*, 1832; and biographies of A. H. Rowan, 1840, Michael Servetus, 1848, and others.

Drummond, William Henry (1854-1907), Canadian poet, b. Antrim. In 1864 he went to Canada with his parents; he was educ. at Montreal High School, and studied medicine at Bishop's College, Lennoxville, becoming Prof. of Medical Jurisprudence. Much of his verse was written in the Eng. dialect spoken by the Fr. Canadians, his works including *The Habitant*, 1897; *Phil-o-Rum's Canoe*, 1901; *The Voyageur*, 1905; and *The Great Fight*, 1908.

Drummondville, city in Quebec, Canada, 47 m. NW. of Sherbrooke. Prin. industries are synthetic textiles, clothing, and electrical apparatus and supplies. Pop. 26,400.

Drummoissie Moor, see CULLODEN.

Drunkenness, or **Inebriety**, may vary from a state of hilarity, mental excitement, or exaltation to complete coma or unconsciousness, ending possibly in death. It may be an occasional lapse or an habitual and chronic state of alcoholism. It may be the cause of foolish and disorderly behaviour, or the symptom of deep-seated fatal diseases, or of insanity. It may lead to a fine for a condition of helplessness in the streets, or to a long term of imprisonment or capital punishment for brutal assault or a murder. Medically or physiologically D. is a condition of intoxication or poisoning due to the consumption of an excessive amount of alcohol, either in rapidly taken doses, or spread habitually over a period of time, with a cumulative effect. The outward signs of alcoholic intoxication, the thickness of speech, blurred or double vision, inability to maintain equilibrium, etc., are due to paralysis of various parts of the nervous system. Pathologically it includes acute alcoholism, in various stages leading to complete coma, delirium tremens, and chronic alcoholism with its most usual results of various profound nervous disorders, impaired digestive powers, cirrhosis of the liver, etc. A proof of the effect of alcohol on the nervous system is found in the fact that in post-mortem examinations traces of it may be found in the cerebrospinal fluid when it has disappeared in every other organ. The modern treatment for D. is on psychological lines, the theory being that D. is usually an attempt to escape from, and is thus a symptom of, mental conflict. If the underlying cause can be cured the D. disappears. Viewed racially it may at once be recognised that D. is far more prevalent among the races of N. damp, and cold climates than in the S. Scandinavia, N. Russia, and Scotland are in marked contrast to Italy, Spain, Portugal, and S. France. The comparison of national drink bills, based on consumption per head, is usually fallacious; it is the kind of alcohol taken, i.e. whether light wines or beers or ardent spirits, and

the manner of consumption, i.e. as part of the daily diet or crowded into a few hours, that make the difference as far as the national health is concerned. The inter-relation of hereditary alcoholism is not thoroughly worked out. To some the result of past alcoholism should tend to an immunisation, racially if not individually. In the eyes of the law, D. does not affect a man's civil capacity; he may make contracts, wills, marriages, etc., as long as he is capable of knowing what he is doing and no undue advantage is taken of his state. So, too, as regards criminal responsibility, but in those crimes where a criminal intention is essential, his state may be taken into consideration. *See also* CRIMINAL LAW. As an offence in itself, the law looks first to the effect: it is not an offence to be drunk *per se*, but only if it be accompanied by disorderly conduct in a public place or leads to a breach of the peace; or it is an offence to be drunk and incapable in a public place, or drunk in a licensed house, or when in charge of a vehicle of any kind or the like. Stringent laws regulate the offence of selling drink knowingly to drunken persons or to known inebriates, or of permitting drunken persons to remain on licensed premises. Finally, the law takes into account habitual drunkards in the technical phrase, inebriates. They may be voluntarily committed to abstain from visiting licensed houses for a maximum period of 2 years, which can be extended on application.

Drury, Dru (1725-1803), naturalist. His cabinet collections of home and foreign insects were much prized, and his writings did much for the advancement of entomology. Linnaeus, J. E. Smith, Kirby, and others thought very highly of D. His chief works are: *Illustrations of Natural History*, 1770-82; *Directions for Collecting Insects in Foreign Countries*, 1800; *Thoughts on the Precious Metals* . . . 1801; *Exotic Entomology* (ed. by J. O. Westwood with Memoir), 1837. Moses Harris drew the many plates and figures accompanying these works.

Drury, William Price (1861-1949), soldier and author, b. Devonport. He joined the Royal Marines, in which he rose to be a lieutenant-colonel, after much service abroad; from 1900 to 1901 he was with Naval Intelligence. He wrote a successful play, *The Flag Lieutenant*, 1908; *In Many Ports: the Memoirs of a Marine*, 1926; and *Eight Bells*, 1932. He was awarded the C.B.E.

Drury Lane, London street connecting Aldwych and High Holborn, possibly on the site of a road going back to Dan. times, taking its present name from Drury Place, a 15th-cent. house owned by the Drury family. In this house the earl of Essex (q.v.) planned his rebellion of 1601. On its site in 1804 Philip Astley (q.v.) built the Olympic Pavilion. It was in D. L., just by its theatre, that Nell Gwyn (q.v.) sold oranges from a very early age. It was one of the earliest places visited by the Great Plague. Many famous names are connected with this once aristocratic quarter, among them John Donne,

Charles Lamb, and Thomas Campbell. *See also* ALDWYCH; DRURY LANE THEATRE.

Drury Lane Theatre, famous London playhouse in Covent Garden, the oldest existing in London and the first theatre in the world to receive a royal charter, deriving its name from Drury Lane (which runs behind it), once owned by the Drury family. It was originally called Theatre Royal, Brydges Street (now Catherine Street). A patent was granted by Charles II in 1663 and Killigrew opened there the same year with his company called the 'King's Servants.' A fire destroyed this first house (1672), and it was rebuilt by Wren (1674). In 1682 the 'Duke's Servants' under Davenant joined Killigrew, and both companies played together at Drury Lane. There was a secession under Betterton to Lincoln's Inn Fields (1694), and by 1709 the theatre was closed. Collier took over the management in 1710, Lacey in 1744, soon being joined by Garrick. Among noted actors who performed here in the 18th cent. were Colley Cibber, Doggett, Wilks, Quin, Macklin, Pritchard, Kitty Clive, 'Peg' Woffington, and Mrs Siddons. Garrick was manager from 1746 to 1776, opening with Dr Johnson's prologue (1747), and the triumphs of himself and his company renewed the prosperity of the theatre. In 1784 Kemble made his first London appearance as Hamlet, becoming manager in 1788. The house was pulled down in 1791, reopened by Sheridan (1794), but again burnt down in 1809. The present house, built by Wyatt, was opened in 1812, with a prologue by Lord Byron. The committee's advertisement for this prologue gave rise to the *Rejected Addresses* of J. and H. Smith. The interior was rebuilt in 1822, the present seating capacity being about 2500. Kean and Macready won fame here in the early 19th cent. Famous for ann. pantomimes held there under the management of Sir Augustus Harris and Arthur Collins, for musical comedy, and spectacular pieces and melodrama, such as *Ben Hur*, 1902; *The Whip*, 1909; *Everywoman*, 1913; *Cavalcade*, 1932. In 1917 it was used by Sir Thomas Beecham for opera. Now it is entirely devoted to musical plays. *See* Pepys's *Diary*, 1663; E. Stirling, *Old Drury Lane*, 1881; J. Doran, *In and About Drury Lane*, 1881; W. Macquenn-Pope, *Theatre Royal: Drury Lane*, 1946.

Druses (Druzes), anet race and religious sect of Syria, of much-disputed origin. Their numbers are impossible to estimate with any degree of accuracy, but they have been assessed at 110,000. They live chiefly in the mt regions of Lebanon and Anti-Lebanon and in the dist. of Hauran. They call themselves 'Muwahhidin' (Unitarians), but are known to others as 'Druses,' a name probably derived from Ismail Darazi or Durzi (confessor of Hakim), their first apostle in Syria. He was forced to flee for refuge to Lebanon, 1016, after preaching publicly the divine incarnation in Hakim, one of the 7 cardinal beliefs of the sect. Others connect the name 'Druses' with various

Arabic words. Hamzé, a Persian disciple of Hakim, gave the Druse faith its settled form. They mingle teachings of the Pentateuch, the Christian gospels, the Koran, and the Sufi allegories, and believe in one God. They hold that the Deity has on no fewer than 10 occasions been made manifest in human form, the last occasion being in the person of Hakim, the Nero-like Fatimite Caliph of Egypt (966-1021). One tenet of their faith is that the number of souls is definite, and that when one man dies his spirit assumes another fleshly cloak and lives a life conditioned by classes of Akals (Initiated) and Djahils (Uninitiated). Both classes look forward, as a prelude to the end of the world, to an Armageddon between Islam and Christendom, and celebrate their religion in mysteries. A most fanatical and warlike people, they have revolted against all their rulers—the Turks, the Egyptians, and in late years the Fr.; yet they discourage proselytism. Mohammed is not accepted by them as an incarnation of the Deity. In the 17th cent. Emir Fakr-ed-din Maan II, a noted Druse leader and the most famous figure in the hist. of the race, annexed Beirut and Sidon, and menaced Damascus. He intrigued with the Christians, and was executed by the Turks (1635). In the 18th cent. the Turks and D. revolted against Egypt, and the famous Emir Meshir was exiled to Malta, dying at Constantinople, 1851. From 1840 to 1860 there was endless bitter strife between the D. and the Maronite Christians. After the Maronite Massacres of 1860 the Fr. interfered (1861), and in 1864 the European Commissioners drew up a new constitution for Lebanon under a Christian governor chosen by the Porte, Daoud Pasha being the first. He founded an educational estab. at Abey. There was a fierce revolt in 1925 against the Fr., who held the mandate for Syria, and the revolt was crushed with extreme severity by Gen. Sarrail. Their main stronghold is now in Lebanon but there are some in Syria and Israel. See L. Stein, *Syria*, 1925; P. K. Hitti, *The Origins of the Druse People and Religion*, 1928.

Drusus, Marcus Livius: 1. Rom. tribune of the plebs in 122 BC, but a supporter of the aristocracy. After threatening to veto a popular measure proposed by Gaius Gracchus, his democratic colleague, he proposed almost the same measure himself in order to prove to the people that the patricians were their best friends. The success of this policy earned him the consulship in 112, and the title 'patron of the Senate.'

2. Son of the preceding: tribune in 91 BC. He pursued the same course as his father, but was baffled in the execution of his purpose, which was to broaden the constitution and admit the Italians to citizenship. In consequence he formed a conspiracy, but was assassinated. This led to the Social war.

Drusus, Nero Claudius (Germanicus) (38-9 BC), Rom. general, adopted son of Augustus and younger brother of Tiberius. Horace, in one of his odes, has celebrated D.'s campaign against the Rhaeti and

Vindelici, who threatened the Gallic frontiers, but historically D. is remembered for the subjugation of Germany by his victories over the Usipetes, Sugambri, Chatti, and Suebi, and by the fact that he was the first Rom. general to reach the Elbe. Had not an accident caused his death in early manhood, it seems likely that his winning manners, strategical genius, and brilliant success would have enabled him, had he chosen, to seize the imperial throne.

Drusus Caesar (c. 15 BC-AD 23), son of the Emperor Tiberius and Vipsania Agrippina. After being twice consul, and winning victories in Pannonia and Germania, he was given (AD 22) the tribunician authority by his father, a sign that one day he would inherit the empire. But he d. early in life, being slowly poisoned by the ambitious Sejanus, who had also seduced Livia, his wife.

Druzes, see DRUSES.

Dry-cleaning, operation for cleaning textile and similar materials and fabrics, and articles made of them (e.g. garments, curtains, etc.), without the use of water. It depends on the fact that oils and grease are soluble in certain organic liquids, such as petrol, acetylene tetrachloride, carbon tetrachloride, alcohol, and acetone, and that when the greasy substance has been thus removed the residual particles of dirt may be eliminated by brushing, by the use of vacuum extractors, or by other mechanical means. The great advantage of D. is that it does not spoil the shape of the articles cleaned, and very rarely affects their colour in any way. Modern D. plants operate on a large scale, and economy is effected by recovering the solvents after use. In early days the process of D. was attended with serious risks of fire owing to the inflammable nature of the solvents employed, but the advance of chemical research has provided the dry-cleaner with excellent non-inflammable liquids; these are quickly replacing the solvents formerly employed. For home use light petroleum, or 'petroleum ether,' is a good general solvent, but it very readily takes fire, so that it must be employed with caution. See M. Struan, *Home Dry-cleaning and Laundrywork*, 1933.

Dry Farming. In those areas where the rainfall is limited it is necessary to adopt special measures in order to secure the fullest benefit from all natural sources of irrigation. Experience has shown that the twofold problem of trapping all the rain that falls and of securing that it shall not easily trickle away is best met by treating the upper surface and the lower soil in 2 different ways. The surface soil is broken up and treated in a manner that makes it specially permeable by moisture so that as much as possible of any rainfall shall be immediately absorbed; while the lower soil is kept in a clogged and clay-like condition that retains the water thus secured.

Dry-point, see ENGRAVING.

Dry Rot is a condition of timber in buildings which causes it to become soft, crack into roughly cubical pieces, and

then crumble into a dry powder; during this process drops of water exude from the wood. Almost all kinds of timber may be attacked. In Europe it is caused especially by *Merulius lacrymans*, which is called the D. R. fungus. Other fungi may also cause it, especially *Lenzites sacpiaria* in America. *M. lacrymans* at first appears growing on the surface as a white thread-like growth, and at the same time penetrates the wood, destroying its tissues. Later the growth on the wood thickens and parts of it become reddish-brown and pitted and form reproductive structures, the fruit bodies, on which

resistant to D. R.; timber of W. red cedar is not attacked.

Dryads (Gk *drus*, oak), the nymphs of the trees. Each tree (especially oak) had its own particular D., whose life was bound up with it—hence Hamadryad (*hama*, together).

Dryas, family Rosaceae, contains 2 species of evergreen Arctic plants. *D. octopetala*, the mt. avens, grows in Alpine dists. of Europe, on Scottish and Irish mts, and in Yorkshire. The plant is procumbent, with simple leaves, a woody stem, and white flowers; after fertilisation the style grows feathery, and the

DRYBURGH ABBEY

W. F. Mansell

spores are produced; these fall and form a reddish-brown powder below; they germinate under damp, acid conditions, and again form the fungus. Root-like, grey, brittle strands, which may be as thick as a lead pencil, are also formed; these may penetrate the mortar between stones and bricks, and grow for several feet. By this means the fungus may spread throughout the building. D. R. may be prevented by the use in buildings of well-seasoned timber, damp-proof courses in the lower parts of the walls, and by adequate ventilation under floors and behind panelling; leakage in roofs from water pipes should have immediate attention. Treatment consists of the removal of soft and decayed wood and its replacement by wood which has been treated with a fungicide, e.g. creosote, 5 per cent solution in water of magnesium silico-fluoride or sodium fluoride; various phenol compounds have also been used. The fungal strands in walls may be isolated by a covering of concrete on the inner surface. Heart wood of oak and teak is very

fruit is oval and long-tailed. *D. depressa* has been found in Ireland.

Dryburgh (Gaelic *Dàrach-brnach*, bank of oaks) **Abbey**, beautiful monastic ruin in SW. Berwickshire, Scotland, on the R. Tweed, 4 m. from Melrose. It was founded about 1150 for Premonstratensian canons by Hugo de Morville, constable of Scotland. Burned by Edward II (1322), it was partly restored by Robert Bruce. Under Richard II it again suffered (1385), and was reduced to ruins by Bowes and Latoun (1544), and by the Earl of Hertford's expedition (1545). The style is mainly Decorated. St Mary's aisle in the N. transept has the tombs of Sir Walter Scott (1771-1832), J. G. Lockhart his biographer, and Field Marshal Earl Haig. The abbey was presented to the nation in 1918.

Dryden, John (1631-1700), poet, dramatist, critic, b. Aldwinkle, Northamptonshire. He was descended on both sides from families which had at this time strong leanings towards the Puritans and against the monarchy. He was educ.

at Westminster School under the famous Dr Busby, and proceeded from there to Trinity College, Cambridge. In 1649 had appeared his first contribution to poetry in the shape of an elegy on the death of Lord Hastings. In 1654 he took his B.A., and in the same year his father died, leaving him property worth about £60 a year. He seems to have remained at Cambridge during the following 3 years, although this is not quite certain. In 1657, at any rate, he seems to have taken up his residence in London, where, in all probability, he lived under the protection of his cousin, Sir Gilbert Pickering. In 1659 appeared his stanzas commemorative of the death of Cromwell. In 1660 he pub. *Astræa Redux* in honour of the Restoration, and followed this up by a panegyric in honour of King Charles's coronation in the following year. Without attempting any disguise, he proclaimed frankly that he was endeavouring to obtain as much money as he could, and in a preface to 4 of his plays he owed that he would force his genius to perform that which the humour of the public demanded. The taste of the public was not over choice, and yet D., in his attempt to satisfy that public taste, overstepped even the wide limits of decency of the Restoration age. This is not altogether to be wondered at, since he was forcing his genius to perform something for which it was totally unsuited. *The Wild Gallant*, 1663, was a failure, but *The Rival Ladies*, produced in the same year, was more of a success. In that year he also collaborated with Sir Robert Howard in the composition of *The Indian Queen*, and in the following year he married the Lady Elizabeth Howard. In 1665 appeared from D.'s pen alone *The Indian Emperor*, which was a great success. In 1666 appeared his poem *Annus Mirabilis*, which commemorated the Dutch War and the Great Fire.

Between the appearance of this poem and 1681, D. appears to have confined himself entirely to stage plays. He wrote many during this period, and these plays may be divided into two distinct classes: the one following the general tendency of the day and attempting to make up by their ribaldry for their want of genius; the other, dramas founded upon striking incidents in the hist. and mythology of the world. In the former, for reasons already given, he was almost uniformly unsuccessful, in the latter his success was really popular. Amongst the plays which he produced at this time are: *Secret Love*, 1667, *Sir Martin Mar-all*, 1667, *An Evening's Love*, 1668, *Tyrannick Love*, 1669, *The Conquest of Granada by the Spaniards*, 1670, *Marriage à la Mode*, 1671, and *The Assignment: or Love in a Nunnery*, 1672. The extravagant boasting of the preface to *The Conquest of Granada* was the cause of the production of *The Rehearsal*, a play written in burlesque principally by the Duke of Buckingham. In 1668 D. had pub. the greatest of his critical works, the excellent *Essay on Dramatic Poesie*, and in 1670 he had become poet laureate. In 1674 he attempted to turn *Paradise Lost* into rhymed

couplets, having, it is said, the permission of Milton 'to tag his verses.' *Aureng-Zebe* was the last of his rhymed plays, and was pub. in 1676. In 1677 appeared *All for Love*, a version of the story of Antony and Cleopatra, but written from an entirely different point of view from that of Shakespeare. A comparison of the two plays leaves us entirely convinced that Shakespearian drama was the highest form, but it gives us also a very much greater opinion of D. than can be obtained from any of his other plays. Other plays which D. wrote subsequently to this are: *Oedipus*, 1678; *Troilus and Cressida*, 1679; *The Spanish Friar*, 1680; *The Duke of Guise*, 1682; *Albion and Albanius*, 1685; *Amphitryon*, 1690; *King Arthur*, 1691; *Cleomenes, The Spartan Hero*, 1692; and *Love Triumphant*, 1694.

D. now adopted satire as the instrument of his genius, and pub. in 1681 *Alsa'om and Achitophel*. This satire was written from the court point of view, probably with the idea of gaining favour for himself, and was certainly immensely popular. He had not the faculty of delicate satire, but the blows which he struck were hard. His next satire was *The Medal*, 1682, a poem written in savage commemoration of the medal struck when Shaftesbury was acquitted. He attacked and attempted to demolish Shadwell in the poem *Mac Flecknoe, or a Satyr upon the True-Blew-Protestant Poet, T. S.*, 1682. In 1682 appeared *Religio Laici*, which attacked the Papists and still more bitterly urged on the persecution of the Non-conformists. On the accession of James II in 1685, D. became a Catholic. By many his conversion has been held to be the result of sincere conviction, while, on the other hand, the majority hold that it was merely another example of his time-serving characteristics. Be that as it may, he wrote a poem, *The Hind and the Panther*, 1687, in which he strongly advocated the faith of his new religion. The Revolution of 1688 found him still unchanged, and as a result of his Catholicism he lost his office of poet laureate, and had to fall back upon his pen for his living. In 1693 appeared some trans. of Ovid and Homer, and almost immediately afterwards he set to work on a complete trans. of Virgil, which appeared in 1697. This was followed by the famous second 'Ode on St. Cecilia's Day.' His last work, pub. a few months before his death, was the *Fables*, principally founded on the stories of Boccaccio and Chaucer. During the later part of his life he had been dependent on the trans. for his daily bread, and he also seems to have received presents from his friends. As a translator he rendered Virgil, Juvenal, Ovid, and Chaucer, and the best of his prose is the preface to his *Fables* of 1700, in which, in the year he died, he introduced some of his trans. to the public. Although deprived of his position as laureate, he still continued to be recognised as the greatest living poet, and he lived without fear of molestation from the gov. and respected by all. He was buried in Westminster Abbey.

By his conversion he became the literary parent of the greatest poet of the succeeding age, Pope. His genius is undoubted, and showed itself principally in his ability to imitate and to excel those whom he imitated. He had no great originality, yet his position as one of the greatest of our poets remains. He established, yet he excelled all. In the heroic couplet, the deca syllabic quatrain, and in blank verse, he displays equal mastery. But it was in the heroic couplet that he wrought his most striking effects. His couplet lacks the chiselled precision of form and epigrammatic brilliance achieved by his successor in verse satire—Pope—but has a richer and more vital content; and as a master of prosody D. ranks with the greatest of all Eng. poets. Like Johnson, D. was the literary dictator of his age, presiding at Will's Coffee House in unquestioned supremacy among the contemporary wits. Among the collected eds. are: complete works ed. by Sir W. Scott, 1808, 1821, revised by G. Saintsbury, 1882-92; poems, ed. by W. D. Christie, 1870, and B. Dobree, 1934; plays, ed. by W. Congreve, 1717, and M. Summers, 1931-2; prose, ed. by E. Malone, 1800, and W. H. Hudson, 1912. Bibliography by H. Macdonald, 1939. See G. Saintsbury, *Dryden*, 1881; R. Garnett, *The Age of Dryden*, 1895; M. Van Doren, *The Poetry of John Dryden*, 1920, 1931; Sir W. Raleigh, 'John Dryden and Political Satire', in *Some Authors*, 1923; T. S. Eliot, *Homage to John Dryden*, 1924; C. Hollis, *Dryden*, 1933; N. B. Allen, *The Sources of John Dryden's Comedies*, 1935; D. N. Smith, *John Dryden*, 1950.

Drying Machines, devices for drying textile materials. Those for drying printed calicoes or long webs of similar fabrics usually consist of a series of revolving metal cylinders heated from within by steam. The machine commonly used in bleaching or laundry works is formed of two drums or cylinders open at the top. The articles to be dried are placed in the inner one, which is made to revolve at high speed. The moisture is forced out by this centrifugal action through the perforated sides of the inner into the outer drum, whence it is drained off by means of a pipe. Open-air or hot-chamber drying usually completes the process. The ordinary 'wringer' or 'mangle' has 2 rollers mounted parallel one above the other, with an adjustment by means of which the distance between them can be varied. The Blackman air-propeller is used for drying wool by drawing heated air through it. Slightly different apparatus is used in paper manu.

Dryopes, Pelasgic tribe who first settled round Mt. Oeta, in Thessaly, Greece, in the dist. called after them 'Dryopis', extending N. to the R. Spercheius.

Dryophis (Gk *drus*, an oak; *ophis*, snake), generic name of the whip-snakes, non-venomous reptiles, native to W. Africa and India.

Dual Monarchy, name given to the Austro-Hungarian Empire, formed by the union of Austria and Hungary, 1867.

The 2 countries became separate states after the First World War. Their joint ruler was king of Hungary and emperor of Austria.

Dual Number, grammatical term denoting a form of a noun, pronoun, or verb employed with regard to 2 things. Thus in Greek the dual form of *gigas*, giant, is *gigante* and the plural *gigantes*. The D. N. existed in Sanskrit, Arabic, and Hebrew, but in Latin we only find it in 2 words, *duo*, two, and *ambo*, both. The D. N. is rare in the Teutonic languages. In O. E. the dual forms exist in the declension of *ic*, I, and *ou*, thou, only. They are, of the former, nom. *wit*, acc. *uncit*, *unc*, gen. *uncer*, dat. *unc*; of the latter, nom. *git*, acc. *incit*, *inc*, gen. *incer*, dat. *inc*. In Gothic, they are found in the declension of *ik*, I, and *pu*, thou, and in the verbs. For example, the second person imperative of *sôkjan*, to seek, has 3 numbers: sing. *sôkei*, dual *sôkiats*, plur. *sôkeip*.

Dualism (Lat. *duo*, two), philosophical term applied to any system of thought which rests on 2 co-existent and independent principles. It is the opposite of Monism. The earliest dualist was Plato, who held that good truly exists, but in combination with evil, which is non-existent. Aristotle believed form and matter to lie at the bottom of all things. Descartes, arguing from his proposition 'Cogito, ergo sum,' maintained the absolute I. of consciousness or thinking (*res cogitans*), and extension (*res extensa*). In theology, D. assumes the separate existence of 2 underlying principles, good and evil, as in the doctrine of Zoroaster which postulates 2 contending deities, Ormuzd and Ahriman. In Christian theology arises the difficulty (but not impossibility) of reconciling the omnipotence and perfect goodness of God with the existence of evil and pain. See A. Schweitzer, *Christianism and Ethics*, 1923.

Du Barry, Marie Jeanne Bécu, Comtesse (1746-93), mistress of Louis XV: b. Vancoeurs, Mense. She entered a milliner's shop in Paris at 16, and became the mistress of the dissolute Jean, Comte du Barry, through whom she met Louis XV. Her beauty and wit attracted the attention of the king, who before long made her his official mistress at court, after a merely formal marriage with Jean's brother Guillaume. She had complete influence over the king for the rest of his reign and was in virtual control of gov. policy. After Louis' death in 1774 she was obliged to live in retirement at Luciennes, and on the outbreak of the revolution she came to England to raise money, 1792, but was arrested and guillotined on her return, 1793. See her memoirs (ed. and abbreviated), 1930. See also lives by K. von Schulmacher, 1932, and E. Breitner, 1938.

Du Bartas, Guillaume de Saluste (1544-1590), Fr. poet, b. Montfort. Armagnac; followed the profession of arms; served Henry IV, and died from wounds received at the battle of Ivry. His religious poem, *La Semaine, ou Création du monde*, 1578, which was probably imitated from

Tasso's *Sette Giornate*, went through 30 eds. in 6 years, and was trans. into 6 languages. He was greatly admired by Spenser. Indirectly he served to enrich the Eng. language by compounding words which were imitated by Sylvester (his translator), Chapman, and Sir Philip Sidney.

Dubbo, tn in Lincoln co., New S. Wales, Australia, situated on the Macquarie R. It is a railway junction and the centre of a flourishing wheat-growing and pastoral dist. Pop. 12,370.

Du Bellay, see BELLAY, JOACHIM DU.

Dubica, fort. tn of Croatia, Yugoslavia, on the Una. It was the scene of battles between the Austrians and Turks in 1788. Pop. 3200.

Dublin: 1. Cap. of the Rep. of Ireland, stands at the mouth of the R. Liffey, on the Irish Sea. It lies in lat. 53° 20' 38" N., and in long. 6° 17' 30" W., and is 138 m. W. of Liverpool. An ancient city—it has been identified by some as the *Eblana* mentioned by Ptolemy—it is the natural outlet from, and entrance to, the great Central Plain of Ireland, and was destined to be a cap. The name derives from the Gaelic *Dubh Linn*, or 'dark pool,' but a still older name, *Balte Atha Cliath*, 'the town of the ford of the hurdles,' is the form currently used in modern Irish.

D. extends along D. Bay from Howth (q.v.) on the N. to Dun Laoghaire (q.v.) on the S., a distance of approximately 14 m., but the centre of the city is siraple in plan. O'Connell Street, formerly Sackville Street, its widest and most imposing artery, is divided in two by the Nelson Pillar, D.'s prin. landmark, and runs from N. to S., crossing the Liffey, flowing due E., at O'Connell Bridge, and joining then with Westmoreland Street, which leads to College Green, the hub of the traffic. College Green is dominated on one side by Trinity College (D. Univ.) and on the other by the Bank of Ireland, formerly the old Parliament House. To the right, Dame Street leads to D. Castle, the City Hall, and Christchurch. Ahead is Grafton Street, leading to St Stephen's Green, whilst a left turn at the entrance to Grafton Street leads eventually to Merrion Square and the gov. buildings. Between Grafton Street and Merrion Square E., and parallel to both, are Dawson Street, in which is the Mansion House, the official residence of the Lord Mayor, and Kildare Street, in which are Leinster House, seat of Dáil Éireann (q.v.), the national parliament, the National Library, and the National Museum.

St Patrick is said to have visited D. in 448 and to have converted many of its pagan inhab., but the Danes (Ostmen or Norsemen) are regarded as the real founders of the city. The Danes began their marauding raids towards the end of the 8th cent., and D., which was captured by Olaf the White in 852, was one of their first permanent settlements in Ireland. The Dan. influence rose and fell for the next 150 years, but it was finally broken when King Brian Boru defeated the Norsemen (who had gathered from the Orkneys and elsewhere for a

trial of strength) at the battle of Clontarf, outside D., in 1014. Nevertheless, D. remained very largely a Dan. city, and when the Normans (who came to Ireland as the allies of the infamous and justly-banished Dermot McMurrough, king of Leinster) captured it in 1170, it had an Irish archbishop, St Laurence O'Toole, but a Dan. governor, Asculf. The infant city was then on the S. side of the Liffey, and some of the dispossessed Danes founded a small settlement (Oxmantown) on the N. bank of the riv. D. had begun to grow. King Henry II came to D. in 1171 to curb his own barons and receive the homage of some of the Irish chiefs. He wintered in an *ad hoc* palace built, the old chronicles say, 'of peeled osiers,' entertained lavishly, gave D. its 1st charter, granted the city as a colony to the people of Bristol, and appointed Hugh de Lacy to govern it in his name. The Normans built Christchurch Cathedral on the Dan. foundation, and in 1190 John Comyn, the 1st Norman archbishop, began a 2nd cathedral, St Patrick's, just outside the city walls. The pop. of D. was then less than 10,000 (it was 64,000 in 1688, 168,000 in 1798, and reached half a million early in the 20th cent.).

D. Castle—the term was later to become a synonym for Brit. rule—was completed in 1220. At this time, and for centuries after, D. was the chief fortress of 'the Pale,' a narrow coastal strip (its boundaries varied with the fortunes of war, but it stretched roughly from Dundalk to the Wicklow Mts, and for 20 m. inland) in which the Eng. writ ran. Neighbouring chiefs carried off its cattle at intervals, or exacted 'Black Rent' for leaving them in peace. It was to chastise one of these chiefs that Richard II landed at Waterford with an army of 34,000 men, but the Irish guerillas harried the Eng. all through Wicklow, and after a breathing space in D., Richard sailed home again (1394).

The Reformation reached Ireland in 1535, when a Protestant, Dr Brown, became archbishop of D., and the D. Parliament passed the Act of Supremacy in 1536. The new doctrines made little headway in the rest of the country, but were pressed with some rigour in the city. In 1591 Trinity College (D. Univ.) was founded on the site of the confiscated monastery of All Hallows. James II, from whom the Irish Catholics expected toleration and restitution, was welcomed in D. in 1689, but he left the country hurriedly after his defeat at the Boyne, leaving the Irish and the Fr. to fight his battles. Soon afterwards the victorious William of Orange visited D., and presented a chain of office to the lord mayor.

D. grew considerably during the Restoration, but the 18th cent. was the time of its greatest development and elegance. Many wide squares and the streets were built then, and the aristocracy patronised art and letters. The Royal Dublin Society was founded in 1750 to encourage trade and culture, and its achievements justified in time the verdict of Lord Chesterfield: 'It did more good

to Ireland with regard to Art and Industry than all the laws that could have been framed.' The Irish Parliament, hitherto subservient to the Brit. House, became fully independent in 1783 (mainly because of pressure by the Volunteers, an armed force raised originally to protect Ireland from possible Fr. invasion during the revolt of England's Amer. colonists). Trade flourished, and D. prospered and grew. But D. wilted proportionately after the passing of the Act of Union and the death of its parliament. The wide streets and squares remained, but the great Georgian houses began to decay, and some of them are tenements now.

Amongst D.'s famous buildings is the Old Parliament House, begun in 1729 to the design of Sir Edward Lovat Pearce, surveyor-gen. of Ireland, and regarded as one of the finest specimens of 18th-cent. architecture. The E. portico, erected in 1785, was designed by Gandon, who also designed the Custom House (1791), on the N. quays, perhaps D.'s finest building. The Custom House was burned in 1921, during the War of Independence, but was splendidly restored, and the new building retains the grace and beauty of the old. The Parliament House was acquired by the Bank of Ireland in 1804, and although structural alterations have been made since then, many of the old features and chambers have been retained.

The Roman Catholic Pro-Cathedral in Marlboro' Street, adjacent to O'Connell Street and the Nelson Pillar, is built in Grecian-Rom. style, and was completed in 1825, some years before the granting of Catholic Emancipation, the chief protagonist of which, Daniel O'Connell, 'the Liberator,' became D.'s 1st Rom. Catholic mayor in 1841. The 2 older cathedrals are Church of Ireland.

Leinster House, Kildare Street, now the meeting place of the Dáil (q.v.) and Senate, was built by the 1st duke of Leinster in 1745, and rented by the Royal Dublin Society in 1815. With the national museum and national library it forms 3 sides of an open square fronting on Kildare Street.

Other notable D. buildings are the Four Courts, begun in 1786 by Thomas Cooley but finished by Gandon, and the General Post Office (designed by Francis Johnston), a granite building with an Ionic portico of Portland stone. The Four Courts was almost completely destroyed during the Civil war (1922) that followed the signing of the Anglo-Irish Treaty, but has since been reconstructed. The General Post Office was the H.Q. of the Irish Volunteers during the Easter Rising of 1916, when it was shelled by a gunboat on the Liffey and destroyed by fire. It, too, has since been rebuilt, and its impressive main hall contains a memorial to the men of 1916 in the shape of a statue of Cuchulainn (one of Ireland's legendary heroes), on the base of which is inscribed an excerpt from the Declaration of the Republic read by Padraic Pearse from the steps of the General Post Office. St Michan's Church, Church Street, a 17th-cent. building near the Four Courts,

is noted for its vaults, in the dry atmosphere of which certain bodies have been preserved for centuries. One of the bodies is said to be that of a Crusader, and visitors who can stand the touch of age-old leathery skin are sometimes allowed to 'shake hands with the Crusader.' Amongst notable 20th-cent. D. buildings are the Dept of Industry and Commerce building in Kildare Street, built in 1942, and—almost in the shadow of the Custom House—the 'Busarus,' or Central Bus Station (1953), in the upper storeys of which, behind an enormous glass frontage, are the offices of the Dept of Social Welfare.

In literature and the arts, D. has much to boast of. Garrick and Mrs Siddons played in its Crow Street and Smock Alley theatres. Handel conducted the 1st performance of *Messiah* in Fishamble Street in 1742, and Goldsmith, Farquhar, and Congreve were students at Trinity College; Richard Brinsley Sheridan was b. in Dorset Street, Oscar Wilde in Merrion Square, Thomas Moore in Angier Street, and G. B. Shaw in Sygne Street. Other famous Dubliners include James Clarence Mangan, W. B. Yeats, Charles Lever, Sheridan le Fann, Dean Swift, Sean O'Casey, and James Joyce. The Abbey Theatre (q.v.), opened in 1904, has a world reputation and is linked with the names of Lady Gregory, Yeats, the brothers Fay, T. C. Murray, Sean O'Casey, Barry Fitzgerald, and F. J. McCormick. The Gate Theatre (1928) is perhaps not so well known outside Ireland, but it has produced many fine plays and fine players. Its big names are Michael MacLiammóir and Hilton Edwards, and it knew the young Orson Welles. The Feis Ceoil, an ann. D. musical festival, has a high reputation, and amongst those who won their earliest laurels at its competitions were John McCormack and Margaret Burke-Sheridan.

The National Gallery, Merrion Square, adjacent to Gov. Buildings and Leinster House, has pictures by Fra Angelico, Michelangelo, Titian, Rubens, Van Dyck, etc., as well as works by such modern Irish painters as Jack B. Yeats, Lavery, and Orpen. The Municipal Gallery of Modern Art, which occupies what was once the tn house of Lord Charlemont in Parnell Square, was opened in 1907 and reconstructed in 1933. It owes much to the generosity of Sir Hugh Lane, who was lost on the *Lusitania* (1915), and who, in an unwitnessed codicil to his will, left to the D. Municipal Gallery his collection of 39 continental paintings then on loan to London's National Gallery. Much controversy has raged over these pictures, which still remain in London, and a room in the D. Municipal Gallery awaits their return. The National Library, in Kildare Street, was founded in 1877 with a collection donated by the Royal Dublin Society, and now has some half-a-million vols. Facing it is the National Museum, which has a splendid collection of antiquities, including the Tara Brooch, the Ardagh Chalice, and the Cross of Cong (q.v.). Trinity College Library (1601) has more

than 500,000 books, and receives a copy of every book pub. in Britain. Amongst its anct MSS. is the incomparable *Book of Kells*, a superb example of the beautifully ornamented script of the early Irish monks. The Royal Irish Academy, Dawson Street, has the finest collection of old Irish MSS. in the country, whilst Marsh's Library, near St Patrick's Cathedral, which was founded by Archbishop Marsh in 1707, is the oldest public library in Ireland.

whisky. Since the estab. of the Irish Free State (1922) sev. large tobacco factories have been built, and many smaller industries, including textiles and electrical goods, begun. Despite the multiplication of factories (gov. policy is to encourage industry), D. remains an administrative and distributing centre. It is very obviously the cap. of an agric. country, and its most important artery is that which leads from the cattle market near the Phoenix Park to the cross-

Irish Tourist Association Inc.

DUBLIN: O'CONNELL STREET AND THE RIVER LIFFEY

D. has 2 univs.: D. Univ. or Trinity College (q.v.); and the National Univ. of Ireland (q.v.) founded in 1909, and linked with the name of Cardinal Newman. 1st rector of the Catholic Univ., from which it evolved. The D. college of the National Univ. of Ireland, known as Univ. College, D., is situated in Earlsfort Terrace, adjacent to St Stephen's Green, on the W. side of which is the College of Surgeons, which grants degrees in medicine and dentistry. There are many secondary schools in and about the city, including Blackrock College, Belvedere College, Castleknock College, Loreto College, D. High School, Alexandra College, etc. Most are Rom. Catholic, and run by religious communities.

Though not an industrial city, D. has one of the biggest breweries in the world (Guinness's), and its Chamber of Commerce estab. in 1783. Other important industries include the making of biscuits, poplin (this industry was estab. by refugee Huguenots), woollens, and

channel boats. There are now over 4½ m. of quays, and the port is controlled by the Port and Docks Board (1868). D. is also the H.Q. of the civil service, banks, army, and police. Civil service depts are housed in Gov. Buildings, Merrion Square (formerly the Royal College of Science), Kildare Street, St Stephen's Green, the General Post Office, the Custom House, and elsewhere. D. is the transport centre of the Rep., being linked by rail with Cork, Galway, Sligo, and Wexford, these services being run by Corus Iompair Éireann (q.v.) or C.I.E., which also has services to all parts of the country. The Great Northern Railway connects D. with Belfast and Londonderry. The Royal Canal and the Grand Canal (now controlled by C.I.E.) join with the Shannon and the Barrow. Prin. steamship routes are D. to Liverpool (Brit. and Irish Steam-packet Co.), Dun Laoghaire to Holyhead (Brit. Railways), and D. to Glasgow. There are sailings also to London, Douglas, and elsewhere. Aer Lingus,

which operates a fleet of Viscounts and Rolls-Royce-powered Friendships, has regular air services to London, Glasgow, etc., and also to Holland, France, Spain, Belgium, Germany, Switzerland, and Italy. One internal service is operated between D. and Shannon Airport (q.v.) near Limerick, to connect with transatlantic planes. The D. airport at Collinstown (5 m.) is tasteful in design and well equipped. During 1956 459,000 passengers passed through the airport, now among the busiest in Europe.

D. has a backdrop of hills (the D. Mts), a long coastline, and many seaside suburbs or near neighbours, including Sutton, Howth, Portmarnock (championship golf course), and Malahide on the N., and Blackrock, Dun Laoghaire, Dalkey, and Killiney on the S. The Phoenix Park (q.v.), formerly W. of the city, and now almost enclosed by it, has an area of 1760 ac. and a circumference of 7 m. In it are the official residence of the president (Aras an Uachtaráin), the Papal Nunciature, and the Amer. Legation. A racecourse adjoins the park. In the N. suburb of Glasnevin (noted also for its cemetery, in which Parnell, O'Connell, Arthur Griffith, Michael Collins, and many other national figures are buried) are the Albert Agric. College and the Botanical Gardens (50 ac.). Rathfarnham, 4 m. S. of the city centre, is the gateway to the D. Mts. There are excellent roads across the mts, breathtaking views, and great stretches of bog and heather. At their foot is Glenasmole, 'the Glen of the Thrushes,' a beauty spot famous in legend and site of the Bohernabreena reservoirs.

Three shows are held annually in the grounds of the Royal Dublin Society at Ballsbridge, the best known being the horse show, held in Aug., which features bloodstock sales and international jumping competitions, and is the outstanding event of D.'s social year. There are race meetings at Baldoy (5 m. from the city centre), Leopardstown, and the Phoenix Park, and international football matches are played at Lansdowne Road (Rugby) and Dalymount (Association Football). The Gaelic Athletic Association has its headquarters at Croke Park, where the national games of hurling and Gaelic football are played. The All-Ireland County Finals, played on Sundays, attract crowds of 80-90 thousand. During 'An Tóstal' (q.v.), a national festival held in May, Ireland is officially 'at home' to visitors, and D. has many special cultural and athletic attractions. Tourist promotion is the business of 'An Bord Fáilte Éireann' (*fáilte* means welcome), which absorbed 'Fogra Fáilte,' a kindred body, in 1955, and which has activities ranging from the pub. of brochures and the grading of hotels to erecting plaques on ruins of historic interest. Like the electricity board and C.I.E., which also have their H.Q. in D., 'An Bord Fáilte Éireann' is gov. controlled.

Over the years, D. has spread outwards and incorporated some of its smaller

neighbours. The townships of Glasnevin, Clontarf, and Drumcondra became part of the city in 1900, the urb. dists. of Rathmines and Pembroke in 1930, and the township of Howth in 1942. In 1930 the powers and functions of the D. Municipal Council were vested in D. Corporation, consisting of 35 elected members and a city manager. Later the number of members was increased to 45, 9 of whom are aldermen and the rest councillors. The centre of civic administration is the City Hall, which is situated facing Parliament Street and on the short hill leading from D. Castle to St Patrick's Cathedral. The City Hall (1779) was formerly the Royal Exchange, and was acquired by the Corporation in 1851. D. has 102 royal charters, the first granted in 1172 and the last in 1727. Pop. 522,000. See J. T. Gilbert, *A History of Dublin*, 1854-9; D. A. Chart, *The Story of Dublin*, 1932; Christine Longford, *A Biography of Dublin*, 1936; Constantia Maxwell, *Dublin under the Georges*, 1936; *Dublin Civic Week Handbook*, 1937; Stephen Gwynn, *Dublin Old and New*, 1938; Eric Whelpston, *The Book of Dublin*, 1948; John Harvey, *Dublin, a Study in Environment*, 1949; Richard Hayward, *Leinster and the City of Dublin*, 1949; Ireland, *An Illustrated Guide* (An Bord Fáilte Éireann).

2. City, co. seat of Laurens co., Georgia, U.S.A., with cottonseed oil mills, wood-working industries, etc. Pop. 10,230.

Dublin Fusiliers. The Royal, formerly the 102nd and 103rd Foot. Both regiments had their origin in independent companies of Foot raised in India by the E. India Co. during the 17th cent.; they were regimented about the middle of the 18th cent. The 102nd were previously the R. Madras F. and the 103rd the R. Bombay F. They were given their numbers on being transferred to the Crown after the Indian mutiny. In 1881 they were linked to form, respectively, the 1st and 2nd Battalions the R. D. F., which were disbanded in 1922. A distinguished member of the Madras regiment was Ensign Clive (later Lord Clive), the victor of Plassey. Both regiments took a leading part in all the Indian campaigns, and gained great distinction during the Indian mutiny, 'Neil's Bluecaps' and the 'Old Toughs,' as they were called, always being to the fore. In the S. African War they were especially conspicuous at Wagon Hill, near Ladysmith; indeed it was largely in commemoration of the bravery of the D. F. and other Irish regiments in the S. African War that the Irish Guards were raised. During the First World War the regiment raised 11 battalions, which served in France, Flanders, Gallipoli, Egypt, and Palestine.

Dubois, Eugène (1858-1941), Dutch surgeon, discoverer of the skull of *Pithecanthropus erectus* (q.v.) in Java, 1891.

Dubois, Guillaume (1656-1723), Fr. cardinal and statesman, b. Brive, Limousin. In 1687 he was appointed tutor to the young duke of Chartres (afterwards regent duke of Orleans), and managed to win royal favour by arranging a marriage

in 1692 between his pupil and Mademoiselle de Blois, the legitimised daughter of Louis XIV. He became an ambas. in London, and on his return (1701) secretary to his former pupil, and councillor of state (1715). By this time he had acquired tremendous influence over the regent, and practically held the reins of power in his own hands. D. reversed Louis XIV's policy of friendship with Spain. He negotiated the Triple and Quadruple Alliances (1717, 1718) and forced Philip V of Spain to dismiss Alberoni. D. secured for himself the archbishopric of Cambri (1719) and was made a cardinal in 1721. See life by L. Wiosener, 1891, and E. Bourgeois, *Le Secret au Régent et la politique de Dubois*, 1909.

Dubois, Paul (1829-1905), Fr. sculptor, first studied law, then entered Toussaint's studio in 1856. 'Saint Jean Enfant,' 1860, 'Saint Jean-Baptiste' (bronze), 1863, and 'Narcisse au Bain,' 1867, were among his earlier works. 'Le Chanteur florentin,' exhibited 1865, 'Le Connétable de Montmorency,' 1886, and the equestrian statue 'Jeanne d'Arc,' 1895, are some of his finest productions. The beautiful 'Tombeau du Général Lamoricière' in Nantes Cathedral is one of his best-known works. After 1873 D. became known as a portrait-painter, 'Mes Enfants' being exhibited in 1876. He painted in Henner's manner, and produced busts of Heimer, Dr. Parrot, Baudry, and others.

Dubois, Théodore (1837-1924), Fr. composer, studied at the Paris Conservatoire, winning the Grand Prix de Rome in 1861. He was choir-master of the church of St Clotilde 1863-68, then at the Madeleine, of which he became organist in 1877. He became prof. of harmony at the Conservatoire, 1871; prof. of composition, 1891; and director, in succession to Ambroise Thomas, 1896. He wrote extensively for the church, the stage and the concert-room.

Dubois, city of Clearfield co., Pennsylvania, U.S.A. It is an important manuf. tn, with iron works, machine shops, and coal mines. Pop. 11,500.

Du Bois-Reymond, Emil (1818-96), Ger. physiologist and scientific historian, studied at Berlin and Bonn. He was prof. at the London Royal Institute for 3 years, with Faraday as his patron, and succeeded Müller in the chair of physiology at Berlin, 1858. His researches in animal electricity and the functions of the nerves are especially famous, and he may be said to have created experimental physiology. Among his works are: *Untersuchungen über tierische Elektrizität*, 1848-84, *Über tierische Bewegung*, 1851, *Über die Grenzen des Naturerkennens*, 1872, and *Vorlesungen über die Physik des organischen Stoffwechsels*, 1900. See T. W. Englemann, *Gedächtnisrede*, 1898.

Dubréka, or Doubreka, station of Fr. Guinea, W. Africa, under direct Fr. gov. since 1882. It has much trade with the interior, and good coffee plantations.

Dubicrius, St. see Dyrwig.

Dubrovnik (It. *Ragusa*), tn in Croatia, Yugoslavia, on the Adriatic, at the foot of

Mt Srdj. It is said to have been founded in the 7th cent. In the Middle Ages it became an independent rep., and a great commercial city rivaling Venice. Later it was the centre of Serbo-Croat culture (see YUGOSLAVIA, *Serbo-Croatian Literature*). Incorporated by Napoleon into his new prov. of Illyria (q.v.), it passed to Austria after the Congress of Vienna (q.v.) in 1814, and to Yugoslavia after the First World War. D. is a very picturesque tn; its anc. ramparts remain, and it is overlooked by sev. fortresses. There is a 17th cent. cathedral, and there are many anc. churches, 2 palaces, a 16th cent. custom-house, and a 15th cent. clock-tower. 5 m. SE. of the tn is the seaside vil. of Cavtat on the site of the Rom. city of Epidaurus. D. is the most popular resort on the Dalmatian coast, and has manufs. of textiles, leather-goods, and liqueurs. Pop. 19,100. See Angus.

Dubuque, city, cap. of D. co., Iowa, U.S.A., port on Mississippi R. opposite Illinois-Wisconsin state line and 170 m. WNW. of Chicago. It is a rail and highway centre, and has had a city manager since 1920. The oldest settlement in Iowa (1833), and formerly a lead and zinc mining centre, D. has limestone quarries, railway shops, shipyards, and meat-packing plants, and manufs. tractors, machinery, and radio parts. It is the seat of Loras College, Clarke College, the Univ. of D., and Wartburg Theological Seminary. Also of interest are D. Art Association and St Raphael's Cathedral. Pop. 49,700.

Du Cange, Charles Dufresne, Sieur (1610-88), Fr. scholar and historian, b. Amiens, educ. at the Jesuit College there, later studying law at Orleans. His most famous work is his Lat. glossary, 1678, which was followed by a Gk glossary, 1688. He also ed. the works of sev. Byzantine historians. Other works include *Histoire de l'empire de Constantinople sous les empereurs français*, 1657, and *Historia Byzantina*, 1680.

Ducat, gold coin, which came into currency about AD 1100, and seems to have been named from a word in the inscription which the Apulian coins of 1140 bore: 'Sic tibi, Christe, datus quem tu regis, iste ducatus' (Christ, thou rulest this duchy: to thee be it dedicated!). The D. which Venice struck in 1280-4 later became known as the zecchino or sequin. Introduced in the 14th cent. to Hungary and Bohemia, and adopted in 1559 by the Imperial diet of Germany into the monetary system of the empire, its currency later extended all over W. Europe. The value was about 9s. 4d., but D.s varied in weight and amount of alloy. It. silver D.s were worth 3s. 4d.

Duccio di Buoninsegna (active 1278, d. 1319) It. painter, was the first of the Sienese painters to abandon the Byzantine style of painting, and may justly be regarded as the founder of the Sienese school. It was he who began the decoration of the pavement of the Sienese cathedral with figures in marble inlay in 'chiaroscuro' (q.v.), and the famous altarpiece he executed for this cathedral

between 1308 and 1311 is the only unquestioned work of his still remaining. Painted on both sides, this huge picture (14 ft by 7 ft) represents on the one face the Virgin and Child, and on the other 27 episodes from the life of Christ. The fine "Transfiguration" in the National Gallery may be part of the predella. D. worked also for churches in Florence, Pisa, Lucca, and Pistoia, painting often on gold ground. The "Rucellai Madonna," in Santa Maria Novella, Florence, is probably his. He ranks as one of the most important forerunners of the great Italians.

Du Chaillu, Paul Belloni (1835-1903), Africa explorer and author, b. at St Petersburg; of Fr. Huguenot parentage, educ. in Paris. He early went to the Gabon country, Africa, where his father was a trader. After spending some years in America, he undertook a botanic and zoologic expedition to the Ogowé basin (1855-9). His descriptions of the Abongo pygmies and gorillas (of which he was the first to secure specimens) of the interior in *Explorations and Adventures in Equatorial Africa*, 1861, were discredited by many as mere exaggerations. Later investigations, however, proved the truth of his natural hist. discoveries. In 1863-5 he visited Ashango Land, and the Ngunye Falls, the resulting work being *A Journey to Ashango Land*, 1867. D. C. explored N. Europe (1872-3), and travelled in Russia (1898-1902). Other works are *Lost in the Jungle*, 1869, *The Country of the Dinosaurs*, 1870, *The Land of the Midnight Sun*, 1881, *The Viking Age*, 1889, and *Tvor the Viking*, 1893, are attempts at proving the Scandinavian origin of the Brit.; his last work was *The World of the Great Forest*, 1900.

Duchango, Gaspard (1662-1756), Fr. etcher and engraver, b. Paris. He was a pupil of Jean Audran, and became one of the most noted engravers of his period. The "Io," "Danaë," and "Leda of Correggio" are 3 of his most celebrated works.

Duchenne, Guillaume Benjamin Amand (1806-75), Fr. neurologist, b. Boulogne. He studied medicine in Paris and, after qualifying in 1831, returned to practise in Boulogne. He lived in Paris from 1844 until his death; he never sought a hospital or teaching appointment, preferring to visit various hospitals from day to day, thus acquiring a considerable experience, especially of nervous diseases. He became interested in electrophysiology and in his *Électrisation Localisée*, 1855, classified the electrophysiology of the muscular system. A further monumental work on this subject was *Physiologie des Mouvements*, 1867. He was the first to employ faradic currents in the treatment of nervous diseases and was the creator of electrodiagnosis and electrotherapy. He described several types of paralysis and muscular atrophy, to some of which his name has been attached. His *Mécanisme de la Physiologie Humaine*, 1862, an electrophysiological analysis of facial expression, is one of the greatest contributions to the study of physiognomy. An Eng. trans. of selections from his works, 1883, includes a life.

Duchesne, Père, see HÉBERT, JACQUES RENE.

Duchov (Ger. *Dux*), Czechoslovak tn in the region of Ústí nad Labem (q.v.). It is at the foot of the Erzgebirge (q.v.), and manufs. glass and porcelain. There are lignite mines near. Pop. 8300.

Duchy of Lancaster, see LANCASTER, HOUSE AND DUCHY OF.

Ducis, Jean François (1733-1816), Fr. dramatic poet. He is chiefly noted for his adaptations of Shakespeare, which, however, were based on already existing translations, and altered to suit the taste of the time. He succeeded Voltaire in the Fr. Academy in 1779. His collected works appeared in 1827. See J. J. Jusserand, *Shakespeare en France*, 1898.

Duck, name given to birds of the family Anatidae, which contains also both swans

DUCKS

From top downwards: Mallard, Japanese penguin duck, Australian musk duck, Chinese mandarin duck.

and geese; it should properly be applied to the female, the male bird being a drake, but it is frequently used to include both sexes. The species are aquatic and have short webbed feet and scaly legs; the bill is broad, depressed and rounded at the tip. There is a great variety exhibited in the coloration of the 50 odd species, and many are very handsome birds. They inhabit N. regions of the world, and as they frequent lakes and seas their food consists of such creatures as fish, frogs, and worms. *A. platyrhynchos*, the wild D. or mallard, is the species from which all domesticated D.s have taken their origin.

For domestic use see POULTRY; and articles on different species.

Duck-billed Platypus, Duck Mole, Ornithorhynchus paradoxus, Australian mammal which, with the 2 spiny ant-eaters, forms the primitive group, Monotremata (q.v.). Except for the fact that the young are produced from eggs, and for the flat beak-like mouth, D. P. bears no resemblance to a bird. It lives in long burrows on the banks of rivers. The eggs are laid 2 at a time in a small chamber at the end

of the burrows. These eggs have a non-calcareous shell, but like those of birds and other egg-laying vertebrates have a yolk. The young hatch very soon (about 8-10 days) after the eggs are laid, and are at first naked and blind. At the age of 5 months the young are weaned. In an early stage, the short fleshy bills are provided with teeth; these are lost as the animal matures, and hard horny patches developing in each jaw take their place. The oval, flattened body becomes clothed with fur, which is well adapted to an aquatic existence, and the feet are webbed. The fore-limbs are provided with 5 powerful claws with which the animal burrows. The broad, flat tail is short, and the total length of the body is about 20 in. A horny spur on the hind foot, which is able to inflict a poisonous wound, occurs only in the male.

Ducking-stool, strongly made wooden arm-chair, fixed to the end of a long wooden beam, in which offenders, such as scolding wives, shrews, and sometimes quarrelsome married couples, were seated, fastened in by iron bands, and immersed in water, the beam being placed at the edge of the pond or riv. and working on the see-saw principle. In many dists. dishonest bakers and brewers were punished by this ducking system. The earliest record of it is at the beginning of the 17th cent., and it was in use in England as late as the 19th cent., the last recorded cases being a Mrs Gamble at Plymouth in 1808, Jenny Pipes, 1809, and Sarah Lecke, 1817, of Leominster, though the last's sentence could not be carried out as there was no water in the pond at the time.

Duckweed, **Duck's Meat**, family Lemnaceae, a genus of small floating aquatic weeds, found on stagnant water, of which *L. gibba*, Gibbous D., *L. polyrrhiza*, Great D., *L. trisulca*, Ivy D., and *L. minor*, common D., are found in Britain.

Duckworth, Sir John Thomas (1748-1817), adm., served in N. America, and the W. Indies. In 1794 he won distinction in Howe's great victory over the Fr. off Ushant. In 1800 he became rear-adm.; commander-in-chief at Jamaica, 1802. D. defeated the Fr. off St Domingo, 1806. He was sent to dictate terms to the Porte, 1807, and falling in his mission retreated from the Turks, forcing the passage of the Dardanelles. From 1810 to 1813 he was governor of Newfoundland; he was knighted in 1813.

Duclaux, Agnes Mary Frances, née Robinson (1857-1944), poetess and novelist, b. Leamington. She married Prof. James Darmesteter, and, after his death, Prof. Duclaux, 1901. Her works include: *The Crowned Hippolytus of Euripides*; with *New Poems*, 1881; *Life of Emily Brontë*, 1883; *An Italian Garden: A Book of Songs*, 1886; *Collected Poems*, 1902; *The Return to Nature*, 1904; *Life of Émile Duclaux*, 1907; *The French Ideal*, 1911; *Madame de Sévigné*, 1914; *A Short History of France*, 1918; *Life of Victor Hugo*, 1920; *La Pensée de Robert Browning*, 1922; *Life of Racine*, 1925; and *A Portrait of Pascal*, 1927.

Duclos, Charles Pinot (1704-1772), Fr. author, b. Dinan, Brittany, sent at an early age to study at Paris. He began by writing short stories and novels, e.g. *Mme de Luz*, 1741, and *Confessions du comte de ...*, 1742. His first pub. of importance was his *Histoire de Louis XI*, 1745, and this was followed by *Considérations sur les mœurs de ce siècle*, 1751. He became a member of the Fr. Academy at the early age of 43, and succeeded Voltaire as historiographer of France. In the same year (1755) he was appointed permanent secretary of the Academy. See I. Lebourgo, *Duclos*, 1902.

Ductility, property of some metals, such as gold, silver, copper, iron, etc., which renders them capable of being extended by hammering or drawing, without breaking. Glass also possesses the property when in a semi-molten state, and quartz, when in an intensely hot state, can be drawn out into such thin fibres as to be almost invisible to the naked eye. Wollaston showed that by forming a platinum core inside a silver wire, afterwards drawing out the silver wire, he could, by dissolving the silver coating, obtain a finer platinum wire than he could otherwise have done by drawing out the platinum directly. The wire was so fine that it could only be seen when an electric current was sent through it and made it glow.

Ductless, or Endocrine, Glands. The function of a gland is the secretion of an individual product or products, which in many cases passes by means of a duct into a body cavity or to the surface; in the case of the D. G., however, the secretion passes into the blood by means of capillaries or lymphatic vessels. The secretions of the D. G.s are known as hormones (q.v.) and their function is to bring about specific changes in distant cells and organs. Thus the adreno-cortico-trophic hormone secreted by the pituitary gland (q.v.) influences the activity of the adrenal cortex (see SUPRARENAL). Examples of D. G.s are the thyroid, parathyroid, thymus, spleen, and adrenals. Their function is described under the appropriate headings. See also BIO-CHEMISTRY.

Duddington, par., vil. and loch in Midlothian, Scotland. D. was the II.Q. of Prince Charles before the battle of Prestonpans; it has a 12th cent. Norman church, where Sir Walter Scott was an elder. The loch, a well-known bird sanctuary, lies at the base of Arthur's Seat (q.v.). Pop. of par. 6000.

Duddon, riv. of England, which rises in the Wrynose, on the borders of Cumberland and Lancs. At Broughton it widens out into an estuary of over 2 m. wide, eventually losing itself in the Irish Sea. Salmon and trout are found above the mouth.

Duden, Konrad (1829-1911), Ger. lexicographer. He advocated a unified Ger. orthography, and compiled the *Rechtschreibung der Buchdruckereien deutscher Sprache*, 1903, and *Orthographisches Wörterbuch der deutschen Sprache*. These 2 eds. were later combined under the title of

Rechtschreibung der deutschen Sprache und der Fremdwörter, 1915. D.'s orthographical work was soon in common use in Germany, Austria, and Switzerland. From 1929 onwards the dictionary was referred to as *Der groasse Duden*, and many eds. have been pub.

Dudevant, Madame, see SAND, GEORGE.

Dudinka, tn in the Krasnoyarsk kray (Siberia), cap. of the Taymyr (q.v.) National Dist., and a riv. port on the Yenisey 250 m. from its mouth, accessible to sea vessels. It serves as the port of Noril'sk (q.v.) industrial area.

Dudintsev, Vladimir Dmitriyevich (1918-), Russian author. He received legal training. He fought in the Second World War and was severely wounded, then worked as public prosecutor at a military court and as industrial correspondent of a newspaper. His first literary attempts were influenced by Proust and Joyce. In 1950-5 he wrote his famous novel *Not by Bread Alone* (Eng. trans. by Edith Bone, 1957), a severe and merciless exposure of the Soviet social and political system and a hint to the 'Idealists,' who are shown to be struggling against it in various spheres of life, to band together and to concentrate on the political side. The pub. of the novel in 1956 was enthusiastically welcomed by the intellectual opponents of the regime as a revival of Critical Realism in Russian literature, and it was a major factor of widespread student unrest.

Dudley, Dud (1599-1684), iron-master, the originator of the use of pit coal for fuel in place of wood, which caused a profound change in the methods of iron-founding.

Dudley, Sir Edmund, see EMERSON, SIR RICHARD.

Dudley, Sir Henry Bate (1745-1824), earlier **Bate**, Eng. dramatist and journalist, b. Fenny Compton, Warwickshire. On completing his education he took orders and succeeded his father in the living of N. Farnbridge. He was one of the first editors of the *Morning Post*, estab. in 1772, his contributions frequently leading him into quarrels, and earning for him the nickname of the 'Fighting Parson.' He wrote 8 plays, including the farce *High Life Below Stairs*. D. also founded and ed. *The English Chronicle*, 1779, and the *Morning Herald and Daily Advertiser*, 1780. He was made a baronet in 1813.

Dudley, John, see NORTHUMBERLAND, DUKES OF.

Dudley, Robert, see LEICESTER, EARL OF.

Dudley, Thomas (1576-1653), colonial governor of Massachusetts, b. Northampton, England. In 1630 he sailed to America with Governor John Winthrop to settle in New England, D. himself being appointed deputy-governor. D. had great influence in Massachusetts, and was governor 4 times; he was one of the earliest promoters of Harvard College. He had little religious tolerance, being a stern Puritan. For an account of his Amer. voyage see A. Young, *Chronicles of Massachusetts Bay*, 1846. His son, **Joseph Dudley** (1647-1720), colonial governor of

Massachusetts, was b. in Roxbury, Massachusetts, and graduated at Harvard College, 1665. He was sent to London to prevent the revocation of the Charter of Massachusetts by Charles II. He secretly used his influence against his mission, to his own advancement. His whole rule was unpopular and his actions dishonourable.

Dudley, municipal co. and parl. bor. (D. with Stourbridge), 9 m. NW. of Birmingham, in a detached part of Worcestershire. Abundance of coal, ironstone, limestone, and refractory clay made D. of industrial importance from medieval times. Coal-mining existed in AD 1272, while the hand-wrought nail trade fl. in the early 16th cent., and D. has long been an important centre for coal-mining and iron-smelting; heavy engineering and glass- and brick-making have developed more recently. To-day mining has ceased and the largest industries are clothing manuf. and light engineering. D. has a co. cricket ground and a famous zoo, housed among the ruins and in the grounds of the 11th-cent. castle. Near by are the remains of a 12th-cent. priory. D. has technical and teachers' training colleges, and a fine civic centre. Pop. (1934) 65,239.

Dudley Limestone, see WENLOCK BEDS.

Dudok, Willem Marinus (1884-), Dutch architect, b. Amsterdam. R.I.B.A. Royal Gold Medallist, 1935. In 1915 he was appointed director of works at Hilversum, where he designed the tn hall (1938-51) and other buildings which have greatly influenced European architecture. Other works include the IJlenkorf Store at Rotterdam, 1929-30; the Dutch Hostel at the Cité Universitaire, Paris, 1927-8; sev. housing schemes; and many industrial and commercial buildings.

Dudweiler, tn of the Saarland, on the Sulz, 5 m. NE. of Saarbrücken (q.v.). It is a coal-mining centre, and has manufs. of electrical and precision equipment. Pop. 26,100.

Duel and Duelling (Lat. *duellum*, from *duo*, two), in modern significance an arranged combat between 2 persons to avenge an insult, a reflection upon the honour, or to settle matters of private dispute for which the law provides no remedy or such as is not deemed satisfactory. The person aggrieved is the challenger, and the preliminaries and all the arrangements of the combat are settled by the 'seconds,' the supporters of each party. The choice of weapons lies with the challenged party. The combat of 2 single persons to decide great questions dates back to prehistoric times; the tales of Hector and Achilles, of David and Goliath, indicated the practice, but the D. proper must be traced to a Teutonic institution, the judicial combat of 'wager of battle,' a form of legal trial of questions in dispute, which was regarded as an appeal to God to decide the justice of the quarrel or dispute. The custom spread over NW. Europe and in 516 the Burgundian king Gundobald legalised the judicial D. D. was condemned by Pope Nicholas I (858-67) and by many succeeding popes. The judicial combat

was formally abolished by Act of Parliament only in 1818, after the case of *Thornton v. Ashford*. In 1386 a judicial combat in the presence of Charles VI of France between one Jacques Legris and Jean Caronage led to the defeat of the former and the subsequent discovery of the real guilty party, a blow to the popular belief in the justice of the D. from which it did not recover. D. thus came to its present form as a means of settling private quarrels, especially among the gently born or the military classes; it was most prevalent in France, especially from the time of Francis I. It had grown to such an extent, and so many men of noble birth were slain, that in 1626 Richelieu confiscated the property of duellists and banished them from France. Stronger measures were required, and beheading was resorted to. In Great Britain, D. did not become fashionable till the Restoration. The fatal D. between Lord Mohun and the duke of Hamilton is familiar from Thackeray's *Henry Esmond*. In the eyes of the law, a challenge to a D. is a breach of the peace, a fatal result is a homicide, whether murder or manslaughter, and the seconds are accessories. Many historic D.s have been fought, as those between Pitt and Tierney, Canning and Lord Castlereagh, O'Connell and D'Esterre, the duke of Wellington and Lord Winchelsea. In 1840 Lord Cardigan wounded Capt. Tuckett, was tried by the House of Lords, and acquitted. At the present day D. still occurs in France, but rarely with fatal or serious results. In pre-war Germany, apart from the fencing bouts (*Mensur*) of the various student corps or clubs at the univs., the D. was of great importance for military officers. Though D.s were forbidden by law, an officer who refused a challenge, after a decision of a court of honour, must still fight or leave the army. See also *Fencing*. See M. Sutcliffe, *The Practice, Proceedings, and Lawes of Armes*, 1593; F. Bacon, *The Charge touching Duels*, 1614; J. Cockburn, *History and Examination of Duels*, 1677, 1720; S. Stanton, *The Principles of Duelling: with Rules*, 1790; A. F. Steeking, 'Fencing and Duelling,' in *Shakespeare's England*, 1916.

Duero, see **Douro**.

Duet (from It. *duetto*, and Lat. *duo*, two). In music, denotes a composition designed for 2 singers or 2 players whose parts are of equal importance. Instrumental D.s may be written for similar or different instruments; vocal D.s for voices of equal or different pitch.

Dufaure, Jules Armand Stanislaus (1798-1881), Fr. statesman, b. Sanjon. Under Guizot he became councillor of state (1836) and minister of public works (1839). Later, he was minister of the interior and minister of justice. In 1876 he became premier, but his policy ran counter to that of the senate and the president. He resigned, but was again premier 1877-9.

Dufay, Guillaume (c. 1400-74), Flem. composer of church music. He learnt music as a chorister at Cambrai Cathedral, and became a singer in the Papal Choir in

Rome. From 1440 to his death he was probably more or less continually attached to the cathedral of Cambrai, where he d.

Duff, Alexander William George, see **FIFE, DUKE OF**.

Duff, John Wight (1866-1944), classical scholar, b. Dundee. From 1891-93 he was assistant prof. of Greek at Aberdeen, and from 1893-8 prof. of classics and Eng. at Newcastle. He pub. *A Literary History of Rome*, 1909, 1927; *Writers of Rome*, 1923; *Minor Latin Poets* (with A. M. Duff), 1934; and *Roman Satire: Its Outlook on Social Life*, 1936; besides various articles in journals and magazines on Gk travel, trans. from Lat., etc.

Duff Cooper, see **NORWICH, VISCOUNT**.

Duff, or Wilson, Islands, group of 11 small is. in the Pacific Ocean, lying to the NE. of Santa Cruz.

Duffel, in in the prov. of Antwerp, Belgium, on the R. Nèthe. Pop. 13,000.

Dufferin, Helen Selina, Lady (1807-67), song-writer, granddaughter of Sheridan the dramatist. In 1813 she was taken by her parents to the Cape of Good Hope, but returned to England on her father's death in 1817. In 1825 she married Commander Blackwood, who succeeded as Baron Dufferin in 1839. After his death 2 years later she accompanied her son, the marquis of Dufferin and Ava, on his travels. In 1862 she married George Hay, earl of Gifford, on his death-bed. In 1863, after a trip up the Nile, she wrote *Lisplings from Low Latitudes*. Her songs, including the famous 'Lament of the Irish Emigrant,' were pub. in 1894.

Dufferin and Ava, Frederick Temple Hamilton-Temple Blackwood, 1st Marquis of (1826-1902), diplomat, b. Florence and educ. at Eton and Christchurch, Oxford. In 1860 he was appointed Brit. commissioner in Syria, where his ability and judgment were warmly recognised. From 1872 to 1878 was deputy governor-general of Canada, and in 1879 became Brit. ambas. at St Petersburg, afterwards filling the same position at Constantinople, Rome, and Paris. From 1884 to 1888 he was viceroy of India. In 1897 he was induced by Whitaker Wright to accept the chairmanship of the London and Globe Finance Corporation, and its subsequent financial collapse, for which he was not responsible, and the death of his eldest son in the S. African war embittered his last years. See life by Sir A. Lyall, 1905.

Duffield, small tn and par. in Derbyshire, England, 5 m. NW. of Derby, situated on the R. Derwent. Pop. 3000.

Dufftown, vil. in Banffshire, Scotland, founded by James Duff, earl of Fife, in 1817. It is a popular resort for invalids, and has whisky distilleries and lineworks. Pop. 1500.

Duffy, Sir Charles Gavan (1816-1903) at an early age drifted into journalism. Going to Dublin to study for the Bar, he founded in 1842 the *Nation*, which from the first became the organ of Young Ireland (q.v.). In season and out D. therein demanded the cleavage of the union, and sought to band his countrymen together to re-estab., by force if necessary, the

Irish Parliament. For preaching open rebellion D. was arrested in 1843, but the juries disagreeing, he was discharged. He revived the newspaper after his release, but the cause of Irish unity at that time seeming hopeless, in 1855 he abandoned the struggle. He went to Australia, entered the Victorian Parliament, and after holding minor offices, in 1871 became prime minister for a short time, and later speaker of the House of Assembly. He wrote sev. books on Ireland, including *Ballad Poetry of Ireland*, 1843, and issued a vol. of interesting *Conversations with Carlyle*, 1892.

Dufour, Guillaume Henri (1787-1875), Swiss gen. and cartographer, b. Konstanz, who, after service in the Fr. Army, reorganised the Swiss Army, which he commanded in the war which broke out in 1847 between the Protestants and Rom. Catholics on the question of the suppression of the Catholic Sonderbund. D. quickly brought hostilities to a close, thereby preventing the intervention of foreign powers; and his friendship and negotiations with Napoleon III were later instrumental in dispelling a threatened war with Prussia. In 1864 he presided over the international conference which framed the so-called Geneva convention as to the treatment of the wounded in time of war, etc. But the most important work of his life was commenced in 1833, when the Diet commissioned him to supervise a trigonometrical survey of Switzerland, which he accomplished with complete success at intervals between 1842 and 1865.

Dufourspitze, highest peak of Monte Rosa group on the Swiss-It. S. border. It has an altitude of 15,217 ft. and was named after Gen. Dufour (q.v.).

Dufrénoy, Pierre Armand Petit (1792-1857), Fr. mineralogist and geologist, became prof. of mineralogy and director of the École des Mines, and prof. of geology at the École des Ponts et Chaussées. In conjunction with Élie de Beaumont, with whom he travelled through France, England, and Spain, D. pub. *Voyage métallurgique en Angleterre*, 1827.

Dufresne, Charles, see DU CANGE.

Dufresnoy, Charles Alphonse (1611-66), Fr. historical painter and writer, b. Paris. He imitated Poussin and the It. masters, and he was a good colourist, but his name is mainly remembered in connection with his writings, the chief of which, *De arte graphica*, a lat. poem, a critical treatise on the practice of painting, had European renown.

Dufy, Raoul (1877-1953), Fr. painter and designer, b. Le Havre, where he studied art. Cézanne, Matisse and the Cubists all influenced him, but he developed a free and personal way of painting which had great charm and gaiety, his work being inspired by sport, the theatre, regattas, and spectacles of various kinds. The Luxembourg acquired his 'Paddock at Deauville' in 1932. He also illustrated books, designed silks for Bianchini Frier and a series of

tapestries; also decorations for the Electricity Pavilion, Paris Exhibition, 1937, and sev. stage settings.

Dugdale, Sir William (1605-85), Garter King of Arms, at an early age showed a love for antiquarian research. Through friendly influences he was in 1638 appointed a Pursuivant-Extraordinary, and in the following year Rouge Croix Pursuivant with rooms in the Herald's College and a salary of £200 a year. During the Civil war he went from library to library quietly amassing material for the important works upon which he was engaged, viz. the *Monasticon Anglicanum*, the 1st vol. of which appeared in 1655, and the 3rd and last 18 years later; *The Antiquities of Warwickshire*, 1656; and *The Baronage of England*, 1675-6. D. is not always to be relied upon for accuracy, but he rendered learned and valuable service to students of antiquity. His autobiography was first pub. in 1713, but the ed. to consult is that of 1827 (ed. by W. Hamper), to which is added his diary and correspondence.

Dugong, or Halibore, genus of the mammalian order Sirenia, or sea-cows. The few species are aquatic, usually marine, and in diet they are herbivorous; the existing forms are found in the Red Sea, Indian Ocean, and near Australia. They bear some resemblance to whales, e.g. in the notched tail and reduced nasal bones, lack of posterior limbs, and in the short neck, but in most of their characteristics they are quite unlike these mammals. The D. attains a length of 8 ft. and it is said to have originated the idea of the mermaid, for the female has 2 mammae, holds its young to its breast by means of one of its nailless flippers, and often raises its head out of the water. The teeth of this animal are 5 or 6 molars on each jaw, 2 incisors on the upper and 4 on the lower jaw. D.s differ from the other Sirenian, the manatee, in having the tail shaped like a whale's flukes and the jaws turned downwards to house a pair of tusks.

Duguay-Trouin, René (1673-1736), Fr. sea-captain, b. St. Malo. Originally intended for the Church, he abandoned the idea, and went to sea in 1689 on the outbreak of the war with England and Holland. He displayed great courage and made brilliant captures of Eng. and Dutch ships. In 1697 he entered the Fr. Navy as commander, distinguishing himself in the war of the Sp. Succession, his most famous action being the capture of Rio de Janeiro in 1711. He subsequently served with the army, attaining the rank of lieutenant-general.

Du Guesclin, Bertrand, see GUESCLIN.

Duhamel, Georges (1884-), Fr. novelist, b. Paris. He began his literary career as poet, essayist, and dramatist. He qualified as a doctor of medicine, and served in the First World War as a surgeon; the extremes of physical and mental suffering he witnessed lent him added force as a writer of anguished war books, passionately advocating the rights and majesty of the individual soul, his *Civilisation*, pub. in 1918, gaining for him the Prix Goncourt. But it is his later

novels that have won most recognition. The cycle *l'ie et aventures de Salavin* (5 vols.), 1920-32, Eng. trans. under the title of *Salavin*, 1936, are profound studies of a man who is the idealist in every man, and who tries to live up to a worthy philosophy of life and fails. His 10 vol. masterpiece, *Chronique des Pasquier*, 1933-43, presents human beings, not as they try and fail to be, but as they actually are, drawn with a realism tempered by sensibility, humour, and sympathetic understanding. The '*Pasquier Chronicles*' were trans. into Eng. by Béatrice de Holthoer. Later novels include *Patrice Périot* and *Cry Out of the Depths*. He became a member of the Fr. Academy (permanent secretary 1943-6) and of the Academy of Medicine and president of the Alliance Française. Other works include: *Les Plaisirs et les Jours*, 1922, a charming study of childhood; *Le Voyage de Moscou*, 1927; *Scènes de la Vie Future*, 1930; numerous essays and 4 vols. of autobiography. See D. Saurat, *Modern French Literature*, 1946; A. Terisse, *G. Duhamel*, 1951.

Duikerbok, *Cephalophus*, genus of small African antelopes (q.v.) with crested heads, large muzzles, and short, conical horns in the males only.

Duilius, Gaius, Rom. gen. who defeated a Carthaginian fleet off Mylae in 260 bc. This was the first naval victory the Romans had ever gained, and the memory of it was perpetuated by a column (*columna rostrata*) adorned with the beaks of the captured ships.

Duino, see **TRISTE**.

Duirinish, par. in the NW. of the Is. of Skye, in Inverness-shire, Scotland, 18 m. long by 15 m. wide, area 80,067 ac., pop. 2600. Lady Grange, a Jacobite heroine, was buried near a pillar called the Trying Stone of Trumpan. Dunvegan Castle is the seat of the Macleods of Macleod. This par. was celebrated for its pipers. The hills called 'Macleod's Tables' rise from the peninsula of D.

Duisburg (-Hamborn), Ger. tn in the Land of N. Rhine-Westphalia (q.v.), at the confluence of the Rhine and the Ruhr (qq.v.). Hamborn, a N. suburb, was incorporated with D. in 1929. D. is an anct tn. and in the Middle Ages belonged to the Hanseatic League (q.v.). It had a univ. 1655-1802. Two interesting old churches still remain, in one of which, the 14th-cent. *Sanktadelkirche*, is the tomb of Gerhard Mercator (q.v.). After the First World War the tn was occupied by Fr. troops from Mar. 1921 until Aug. 1925. During the Second World War great destruction was wrought in the tn by bombing attacks on industrial plants, while the damage sustained by the riv. docks and railway marshalling yards affected rail and riv. communications for hundreds of m. Amer. troops reached the suburbs on 30 Mar. 1945; when the tn fell, on 13 April, two-thirds of it was in ruins. Since the end of the war there has been a great deal of reconstruction, and D. is again the largest inland port in Europe; its harbour has 30 basins and 25 m. of quays. The tn is a great centre of the iron and steel industry, and has also

copper, chemical, textile, and tobacco industries. Pop. 472,800. See **RUHRORT**.

Dukas, Paul (1865-1935), Fr. composer, b. and d. Paris, studied at the Conservatoire. He taught the orchestral class there in 1910-13 and was then appointed prof. of composition, teaching there and at the Ecole Normale de Musique until his death. He wrote very little, composing slowly and with extreme care. His largest works are the opera *Ariane et Barbe-bleue*, 1907, the ballet *La Péri*, 1912, a symphony in C major, 1896, and the most popular *L'Apprenti sorcier*, 1897, a symphonic scherzo on Goethe's poem.

Duke (Lat. *dux*, a leader, Fr. *duc*) first came into use as a formal title when Constantine called military governors of provs. either counts or D.s. to distinguish them from the administrators of justice and finance. Under the Franks the D.s., who often ruled sev. provs., became very powerful, while the counts, who had once been the most distinguished of the prov. commanders, now became their lieutenants. Thus the E. Frankish empire was split up into the dukedoms of Swabia, Saxony, Bavaria, Franconia, and Lorraine, and similarly the W. into the duchies of Aquitaine, Burgundy, Gascony, Normandy, and the Ile de France. Although with the strengthening of monarchies the substantial powers of the D.s. waned, the latter still rank next to princes of royal blood. The Black Prince was the first Eng. D., being granted by his father the duchy of Cornwall, 1337, whilst the 1st Scottish king to confer the title was Robert III, who made his 2 sons D.s. of Rothesay and Albany respectively, 1398.

Duke of Albany's Regiment, see **SEA-FORTH HIGHLANDERS**.

Duke of Cornwall's Light Infantry, The, formerly the 32nd and 46th Regiments, which were linked together in 1881 to form the D. C. L. I. The 32nd was formed in 1702 as marines, and was present at the capture of Gibraltar in 1704. Served in Spain in 1705 under Lords Peterborough and Galway. Fought at Dettingen (1743) and Fontenoy (1745). Under Moore it fought at Corunna, and under Wellington during sev. battles of the Peninsular campaign. For its distinguished conduct during the Indian Mutiny it was made into a Light Infantry regiment. The 46th was raised in 1741, and served for many years in America, W. Indies, and India; in Crimean campaign, Egyptian campaign of 1882, on Nile 1884-5, and in S. Africa 1899-1902. Raised 15 battalions for First World War, which served in France, Flanders, Macedonia, Palestine, and Aden. In the Second World War the D. C. L. I. took part in the battle of Normandy and other battles on the W. Front. Other units fought on the It. front. It was especially prominent in the dour fighting for Goeh and on the Roer riv. and other battles in the advance to the Rhine and beyond. The D. C. L. I. will be amalgamated with the Somerset Light Infantry, by 1959.

Duke of Edinburgh's Regiment, see **WILTSHIRE REGIMENT**.

Duke of Wellington's Regiment (West Riding). The, formerly 33rd and 76th Foot. The 33rd was raised in 1702 and served in various campaigns in Spain and Flanders and at Dettingen. The future duke of Wellington commanded the regiment in 1794-5 and was later its colonel. It served under him at Waterloo. At his death in 1852 the regiment was given the title 'Duke of Wellington's' and granted his crest and motto as a badge. It also served in the Crimea. The 76th was raised in 1787 and served with great distinction in India, at Seringapatam, Allypore, Leswarree, and Deig. Later it went to the Peninsula and afterwards to Canada. The regiments were linked in 1881, and gained honours in the S. African War, 1899-1902. During the First World War 21 battalions were raised, which served in France, Flanders, Italy, Gallipoli, and Egypt. In the Second World War 1 battalion especially distinguished itself in the fight for Hill 102, just S. of Bristol, in the battle of Normandy (1944). The 7th Battalion, as part of the 147th Brigade of the 49th Territorial Div., also distinguished itself in Normandy. Later the regiment fought in the Nijmegen area. In the previous year the regiment added fresh laurels to its list by its part in the campaign of the First Army in Tunisia, notably in their gallant action at Banana Ridge (20 April). Other units of the regiment fought in the Burmese campaigns.

Duke of York's Monument, erected 1830-3 by public subscription in memory of the 2nd son of George III (see YORK, FREDERICK AUGUSTUS, DUKE OF). It stands in Waterloo Place, Pall Mall, London, on the site of Carlton House, which had belonged to his brother George IV when Prince Regent. The column, 124 ft high, was designed by Benjamin Wyatt, and the 14-ft statue surmounting it is by Sir R. Westmacott.

Duke of York's Royal Military School, Dover, a boarding school for the education of soldiers' sons from age 9 to 18. Strength 450 boys. Founded at Chelsea in 1801 by Frederick, duke of York (1763-1827), it was moved to Dover in 1909.

Duke of York's Theatre, in St Martin's Lane, London, England. It was opened in 1892 as the 'Trafalgar Square,' but later received its present name. Among the more notable plays first staged here were Pinero's *Letty*; Barrie's *Peter Pan* and *What Every Woman Knows*; Galsworthy's *Justice*; the farce *Brewster's Millions*; and the detective drama *Arsène Lupin*.

Duke Town, see CALABAR.

Duke University, institution for higher education at Durham, N. Carolina, U.S.A., founded in 1838 and known 1859-1924 as Trinity College, reorganised in 1924 as D. U. with an endowment from James B. Duke. It includes Trinity College (for men), the women's college, a college of engineering, a graduate school of arts and sciences, a divinity school, and schools of law, medicine, nursing, and forestry. With a teaching staff of 648

there were 5000 students in 1955. The libraries contained 1,100,000 vols. in 1954. Associated is the Duke Univ. Press.

Duker, Carl Andreas (1670-1752), Ger. classical scholar, studied under Perizonius at Franeker and subsequently brought out the 2nd ed. of Perizonius's *Origines Babylonicae et Aegyptiacae*, 1736. D.'s *magnum opus* was his ed. of Thucydides, 1731.

Dukeries, The, area in the N. of Sherwood Forest (q.v.), Notts, England, made up of estates originally belonging to 4 ducal families, comprising the parks of Welbeck, Clumber (now National Trust property), Thoresby, and Worksop.

Dukes, Ashley (1885-), dramatist and stage manager, b. Bridgewater, Somerset, son of a clergyman. Educ. at Manchester and Munich Univs., he became dramatic critic for various periodicals. During the First World War he served with the Machine Gun Corps. In 1933 he became manager of the Mercury Theatre, London, and in 1937 was appointed prof. of drama of the Royal Society of Literature. Among his plays are *The Man with a Load of Mischief*, 1924; *One More River*, 1927; *Such Men are Dangerous*, 1928; *Match-makers' Arms*, 1930; and *House of Assignment*, 1937. His books include *Modern Dramatists*, 1911; *The Youngest Drama*, 1921; *Drama*, 1926; and an autobiography, *The Scene is Changed*, 1943.

Dukes, Sir Paul (1889-), author and musician, b. Bridgewater, Somerset, brother of Ashley D. (q.v.). Educ. at Caterham School and Petrograd Conservatoire, he was head of the Brit. Intelligence Service in Russia during the First World War, and was afterwards *Times* correspondent in E. Europe. In 1920 he was made a K.B.E. His pubs. include *Red Dusk and the Morrow*, 1922; *The Story of 'ST 25'*, 1938; *An Epic of the Gestapo*, 1940; *Come Hammer, Come Sickle*, 1947; and *The Unending Quest*, 1950.

Dukhobors, or Doukhobors, Russian Nonconformist sect, whose name, meaning 'wrestlers with (i.e. against) the Spirit,' was given to them by the Orthodox archbishop of Ekaterinoslav in 1785. Their peculiar doctrines derive from Russian sectarian mysticism, heterodox Protestantism, and Rosicrucian Freemasonry. From 1755 to 1864 their leaders claimed to be reincarnations of Christ, whom they believe to have been only an inspired man, whose sufferings were merely exemplary, not redemptive. They reject the Trinity, except as modal manifestations of the one deity, and attach little importance to the Bible, as corrupt, their own doctrines being enshrined in their sectarian Psalter. They deny the fall, original sin, and the need of grace and salvation. They believe in the pre-existence of the soul and in reincarnation. They are strict non-resisters, do not believe in private property, and deny the right of the state to levy taxes, register births and marriages, or demand military service. Their heretical and anarchist views led Alexander I to banish them to Taurida, and

Nicholas I to Transcaucasia (1840-50). There they came in contact with Count Leo Tolstoy, who had great influence on their faith. In 1898-9, helped by him and the Eng. Quakers, they migrated to Canada and were settled in Saskatchewan. Their anarchism led to frequent conflicts with the Canadian state. Their last leader, Peter Verugin, d. in 1938. In 1940 they numbered c. 17,000, and had fallen into 3 groups, the strict observers, those inclined to merge into Canadian Protestantism, and the near-Communist. See J. F. C. Wright, *Slave Bohemians, The Story of the Dulchobors*, 1940; S. Bolshakoff, *Russian Nonconformity*, 1950; *The Doukhobors of British Columbia*, Brit. Columbia Univ., 1956.

Dukinfield, municipal bor. of Cheshire, Englund, 6 m. E. of Manchester. It is situated in a manufacturing dist., with cotton and calico printing works, iron foundries, and engineering, brick and tile, and rope works. Area 1723 ac.; pop. (1954) 18,445.

Dulac, Edmund (1882-1953), illustrator, b. Toulouse. As 'Edmond' D. he was educ. at Toulouse Univ.; he studied law for 2 years, and drawing and painting at Toulouse art school, and in Paris. He illustrated books from 1905, and exhibited portraits at the Paris salon, 1904-5. In 1912 he became 'Edmond' D., a naturalised Brit. subject. In his illustrations he adapted and westernised the colour and spirit of Persian art with conspicuous skill and success. Illustrations pub. include *The Iliad*, 1907; *Shakespeare's Tempest*, 1908; *Rubáiyát of Omar Khayyám*, 1909; *The Sleeping Beauty and other tales*, 1910; *Poe's The Hells and other Poems*, 1911; *Edmund Dulac's Fairy Book*, 1916; Hawthorne's *Tanglewood Tales*, 1918; weekly cartoons in *The Outlook*, 1919; *The Kingdom of the Pearl*, 1920; *Treasure Island*, 1927; *The Fairy Garland*, 1928; *Gods and Mortals in Love*, 1936; and postage stamps for the Fr. Provisional Gov., 1944.

Dulcigno, see ULCINJ.

Dulcimer, one of the oldest musical instruments, being found in Assyrian mural decorations. The different notes are obtained by striking wires, stretched with tuning pegs across a horizontal sound-chest, with 2 cork-headed hammers. The Hungarian *cimbalom* is an elaborate variant of it, and it is, so far as the hammer principle is concerned, a forerunner of the modern piano.

Du Ligier de la Garde, Antoinette, see DESHOULIÈRES, MADAME.

Dülken, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 20 m. W. of Düsseldorf (q.v.). It has metallurgical and other industries. Pop. 19,000.

Dulles, John Foster (1888-), Amer. statesman, b. Washington, D.C., and graduated from Princeton Univ., 1908; George Washington Univ., 1911. He also studied at the Sorbonne, Paris, 1908-9. D. was admitted to the New York Bar, 1911. He was a member of the U.S.A. delegation to the San Francisco Conference on World Organisation, 1945, and was

one of the U.S.A. delegates to the U.N., 1946, 1947, and 1950. He served in an advisory capacity to the secretary of state at various councils of foreign ministers. As special representative of the president, with the rank of ambas., he negotiated the Jap. Peace Treaty, 1951. On Eisenhower's election, D. was appointed secretary of state in 1952. His attitude on far E. and middle E. affairs has clashed with that of Britain on sev. occasions.

Dülmen, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 47 m. NNE. of Düsseldorf (q.v.). It has ant. fortifications, and once belonged to the Hanseatic League (q.v.). There is an animal reserve in which live the last wild horses in Germany. Pop. 14,000.

Dulong, Pierre Louis (1785-1838), Fr. physicist and surgeon, b. Rouen, pupil of Berthollet and Thenard. Early distinguished for the discovery of nitrogen trichloride, in the preparation of which he lost an eye and 2 fingers. Collaborated with Berzelius in the synthesis of water by the method of passing a current of dry hydrogen over red-hot copper oxide. But it is rather as a physicist that he acquired fame, particularly by his experiments in the theory of heat, to which he applied himself constantly from 1818. He also evolved the air nanometer for measuring the density of gases and the cathetometer for measuring small differences of level.

Dulse, popular name given to 2 species of edible seaweeds, *Rhodymenia palmata* and *Uluidia edulis*.

Duluth, port city, cap. of St Louis co., Minnesota, U.S.A., on rocky bluffs at W. end of Lake Superior, at mouth of St Louis R. Icebound 4 months in the year, it leads in the shipment of iron ore, grain, flour, and dairy products, and manufs. farm and telephone equipment, wood and metal products. It has the commission form of gov. The college of St Scholastica and the D. branch of the univ. of Minnesota are here. Other points of interest: 27-m. Skyline Parkway, Aerial Lift Bridge over D. ship canal, D. public library, D. playhouse, D. symphony orchestra, children's museum and art centre. Pop. 104,500.

Dulverton, par. and tn of W. Somersetshire, Eng., 21 m. W. of Taunton. It is a fishing and hunting resort, and is the H.Q. of the W. Somerset Yeomanry. Pop. 1500.

Dulwich, residential suburb of London, and a parl. div., forming the S. part of the bor. of Camberwell (q.v.). The manor of D. once belonged to the abbey of Bermondsey, and was eventually acquired by Edward Alleyn, the founder of D. College (q.v.). D. was a vil. until developed in the 19th cent., and it still retains something of its former character. The Picture Gallery, a small but important collection with a fine representation of the Dutch school, was originally founded by Noel Desenfans, who bequeathed it to Sir Francis Bourgeois (q.v.); with additional pictures the latter bequeathed it to D. College. D. Park, a

fine open space, was presented to the public in 1890. Pop. 60,000.

Dulwich College, public school for boys, founded at Dulwich in 1619 by Edward Alleyn, the Elizabethan actor-manager, as the College of God's Gift. The foundation was originally for a master, a warden, 4 fellows, 12 poor scholars, and 12 almshouse people. In 1857 the college was reconstituted by a special act of parliament, and formed into D. C. and Alleyn's School (also in Dulwich).

Duma (Russian 'deliberation'), name of various representative assemblies in pre-Soviet Russia, such as the Boyars' D. (see BOYARS), the tn councils, and the State D. The latter was estab. by the 1906 Constitution as a lower house of the legislature (the upper being the State council, which had existed since the early 19th cent.). All property-owners and taxpayers were enfranchised, and except in the 5 largest cities elections were indirect, through electoral colleges based on social classes. Ministers were not responsible to the D., though they could be questioned by its members. The D. could initiate legislation and no law could become effective unless passed by the D. and the State council, and signed by the emperor. There were 4 D.s between 1906 and 1917. The first 2 had large radical anti-gov. majorities and were speedily dissolved; a change in the electoral law ensured that the next 2 had right-wing majorities. Although imperfect from the point of view of democratic requirements and effectiveness, towards the end of the period the D. was developing into a properly working parliamentary institution. Upon the abdication of Nicholas II in Feb. 1917 the provisional committee set up by the D. entrusted Prince Lvov (q.v.) with the formation of a provisional gov. (q.v.). See B. Pares, *Russia and Reform*, 1907; S. N. Harper, *The New Electoral Law for the Russian Duma*, Chicago, 1908; W. F. Dodd, *Modern Constitutions*, vol. 2, 1909; A. Levin, *The Second Duma*, New Haven, 1940.

Dumaguete, cap. tn of the prov. of Negros Oriental, is. of Negros, Philippine Is., on the Tañon Strait. It lies in a fertile agric. dist., and is an important commercial centre and the seat of Silliman Univ. It exports copra, hemp, and sugar. Pop. 24,838.

Dumangas, city in the prov. of Iloilo, Panay, Philippine Is. It produces rice. Pop. 22,336.

Dumanjug, tn in the prov. of Cebu, is. of Cebu, Philippine Is., on the W. coast on Tañon Strait. It grows coconuts and corn. Pop. 19,630.

Dumas, Alexandre, père (1803-70). Fr. novelist and playwright, b. Villers-Cotterets, son of Gen. D., a Creole: he lost his father when he was only 4 years of age and, for a time, led a chequered life, until, goaded by poverty, he went to Paris to seek his fortune. Later, while serving as a clerk to the Duc d'Orléans, he devoted his leisure to play-writing. His success was immediate, for the vaudeville, *La Chasse et l'Amour*, which he wrote in collaboration with 2 friends, was produced at

the Ambigu Comique in the autumn of 1825. Thus encouraged he composed plays, writing comedy, drama, tragedy, in prose and in verse, with equal facility, until the production of *Madame de Chamblay* in 1868. Some of the plays were good; others were absurdly bombastic; some, such as *Kean*, 1838, frankly (and unconsciously) ridiculous; but whatever their merits or demerits, the author's knowledge of the stage was generally equal to making them successful for the moment. It is, however, not D. the playwright who is now remembered, but D. the novelist. In fiction his first effort was

ALEXANDRE DUMAS (PÈRE)

Souvenirs d'Anthony, 1835, a collection of short stories; this was followed by *Isabel de Bavière*, and *Adèle*, 1839. The most famous of all his books is the *Montesquieu* series—*Les Trois Mousquetaires* (8 vols.), 1844, *Vingt Ans après* (10 vols.), 1845, *Le Vicomte de Bragelonne* (26 vols.), 1848-50. The 2 other prin. series are: (1) *Joseph Balsamo*, 1846-8, *Le Collier de la Reine*, 1850, *Angé Pitou*, 1853, *La Comtesse de Charny*, 1853-5; (2) *La Reine Margot*, 1845, *La Dame de Monsoreau*, 1846, *Les Quarante-Cinq*, 1848. *Le Comte de Monte Cristo* appeared in 12 vols. in 1845. In the novels mentioned D. is at his best. *Les Trois Mousquetaires* is one of the world's masterpieces. Its faults are obvious, but are of little importance in face of the overpowering merits of the book. The weaknesses of exaggeration, bombast, historical blunders are outweighed by the wonderful high spirits, the miraculous adventures, hair-breadth escapes, splendid fights, indomitable courage, continued resourcefulness of the heroes of D. D'Artagnan, Athos, Porthos, and Aramis, Milady, Chicot, and the rest have taken their place in the world's literary portrait gallery. D. was epic in his writings. He conceived largely, and executed his conception on the grand scale. He lets his characters reveal

themselves as the story proceeds, never halting to indulge in psychological studies. Yet these are living human beings, not only the outstanding figures on the vast canvases, but those who occupy minor positions. D. was unhappy in his marriage and wasted all his fortune in gross extravagance. He d. at Puy, near Dieppe, broken in health and impaired in intellect, ministered to by his son and daughter. D. wrote his own *Mémoires* as far as 1832 (22 vols., 1852-4), but they cannot be regarded as a very trustworthy guide. His complete dramatic works were pub. in 5 vols. in 1874. See J. Lucas-Dubreton, *La vie d'A. Dumas, père*, 1928; H. Gorman, *The Incredible Marquis*, 1929; J. Charpentier, *Alexandre Dumas*, 1947; A. Craig Bell, *Alexandre Dumas*, 1950.

Dumas, Alexandre, fils (1824-95), Fr. dramatist and playwright, natural son of A. D., père. His whole career presents a strange contrast to that of his father, and the same may be said of his literary productions. He shows, after the preliminary period in which he sowed his wild oats, a moral force and earnestness that make his plays almost social sermons. His true literary experience begins with the pub. of *La Dame aux Camélias* in 1848. Not only does this novel treat the common romantic theme (as in Victor Hugo's *Marion Desorme*) of the courtesan brought back to virtue by honest love, it also furnishes some autobiographical notes. His succeeding novels, though all readable, are commonplace. The dramatisations of *La Dame aux Camélias* and *Diane de Lys*, first played in 1852 and 1853 respectively, mark an epoch in his own career and in that of the Fr. stage. Henceforward, though he did not give up the novel, his best work was given to the drama, and his success was great. Almost all his 17 plays are masterpieces of construction and style. Each of them on its appearance gave rise to lively discussion, which he treats in his celebrated prefaces. In *Le Demi-Monde*, 1855, he treats the social question arising from the existence in society of this class. He strikes the same note of warning to the youth of France in the plays *L'ami des Femmes*, *La Princesse Georges*, *L'Étrangère*, and other reforms in the social or legal sphere are also advocated in *Le Fils Naturel*, 1858, and *Un Père Prodigé*, 1859. In 1874 he was made a member of the Institute. Other important plays include: *La Question d'argent*, 1857; *Les Idées de Madame Aubray*, 1867; *Une Visite de noces*, 1871; *Dante*, 1885. See C. Noel, *Les Idées socialistes dans le Théâtre de Dumas fils*, 1912; P. Lamy, *Le Théâtre de Dumas fils*, 1928.

Dumas, Jean Baptiste André (1800-84), Fr. chemist, b. Alais, studied chem. in Geneva, and was carrying on original research before he was 21. In 1823 he migrated to Paris. In 1824 he founded the *Annales des Sciences Naturelles*. Under the Second Empire he served for a time as master of the mint (1868). His idea of substitution (metalepsis), which he supported by proving the similarity in

properties between acetic acid and trichloroacetic acid (where chlorine has replaced the original hydrogen), assisted largely in the correction of the atomic theory, whilst he also discovered ingenious methods of ascertaining the amount of nitrogen in organic compounds, and of estimating the densities of gases. His works include *Traité de chimie appliqué aux arts*, 1828; *Leçons sur la philosophie chimique*, 1883; and *Essai de statique chimique des êtres organisés*, 1845.

Du Maurier, Daphne (1907-), novelist, b. London. A daughter of Sir Gerald du M. (q.v.), she wrote his life in *Gerald*, 1934, and a record of 3 generations in *The du Mauriers*, 1937. In 1932 she married Lt.-Col. F. A. M. Browning, D.S.O., who became comptroller of Princess Elizabeth's household. Her novels include *The Loving Spirit*, 1931; *I'll Never Be Young Again*, 1932; *The Progress of Julius*, 1933; *Jamaica Inn*, 1936; *Rebecca*, 1938; *Frenchman's Creek*, 1942; *Harbour Hill*, 1943; *The King's General*, 1946; *My Cousin Rachel*, 1951; *Mary Ann*, 1954; and *Scapgoat*, 1957. *The Apple Tree*, 1952, is a book of short stories.

Du Maurier, George Louis Palmella Busson (1834-96), artist and writer, b. Paris, was the son of a Fr. émigré and an Eng. mother. After studying chem. at Univ. College, London, and art in Paris and Antwerp, where he lost the sight of one eye, he settled in London in 1860. His drawings appeared in *Once a Week* and *Cornhill Magazine*, but it is as a *Punch* artist that he lives. In its pages he drew pretty women, spruce nurse-maids, happy children, and proud fathers just as they ought to appear in 'good society,' but he also satirised alike the Victorian Philistine ('Sir Gorgius Aldes') and the devotees of the Aesthetic craze. His novels, including *Trilby*, 1894, and *The Martian*, 1897, share the charm and wit of his illustration. *Trilby*, his most famous work, was based on his experiences at Gleyre's art school in Paris, 1856-7, where he was the friend of Poynter and Whistler. See T. Armstrong, *Reminiscences of du Maurier*, 1912; Daphne du M., *The du Mauriers*, 1937.

Du Maurier, Sir Gerald (1873-1934), actor-manager, knighted in 1922, was the younger son of George du M. He made his stage debut at the Garrick Theatre, 1894, and was in Barrie's *The Admirable Crichton*, 1902. He was the original Capt. Hook in *Peter Pan*, 1904. Other successes were in *Raffles*, 1906; *Bulldog Drummond*, 1921; *Behold we Live*, 1932. Films: *Escape*, 1931; *I was a Spy*, 1933; *Catherine the Great*, 1934. He was actor-manager at Wyndham's Theatre for many years.

Dumb Cane, or *Dieffenbachia seguine*, genus *Araceae*. The plant occurs in tropical America, and has an acrid juice, which causes dumbness in one who chews the stem. The natives made use of this in the torturing of slaves.

Dumbarton, burgh and co. tn of Dumbartonshire, Scotland, on the R. Leven near its confluence with the Clyde, 14½ m. NW. of Glasgow. Formerly the cap. of

Strathclyde, it was named *Dunbreacan* (fort of the Britons) by the Gaels. The fortress and castle on the basaltic Rock of D. (240 ft) are rich in historical interest. Wm Wallace was confined within its walls in 1305, and in 1571 it was captured, after a brilliant assault, by Crawford for King James. After Clydebank it is by far the most important shipbuilding centre in the co., and there are also extensive engineering works, brass and iron foundries, an aircraft factory, and a modern distillery. Pop. 23,700.

Dumbarton Oaks Conversations, C. on world organisation between Britain, U.S.A., Russia, and China, at Dumbarton Oaks near Washington, from 21 Aug. to 7 Oct. 1944. The outcome of these talks was agreement on tentative proposals for the estab. of a general international organisation, under the title of the United Nations, which should serve as a basis of discussion at a future full U.N. conference. It was also agreed that the charter of this organisation ('U.N.O.') should provide for the purposes, principles, membership, and prin. organs of the organisation. These purposes were, primarily, to maintain international peace and security and to take effective measures for the prevention and removal of threats to the peace and the suppression of acts of aggression or other breaches of the peace, and to bring about by peaceful means settlement of international disputes which might lead to a breach of the peace. These purposes, and the principles on which the organisation was to be based, are reproduced in the charter adopted at the San Francisco Conference (n.v.) held in June 1945. The D. O. talks were pub. as Cmd 6560 (H.M.S.O.), 1944.

Dumfriesshire, see DUMFRIES-SHIRE.

Dumbness. By the ancients D. was thought to be, not the natural result of deafness, but the consequence of some brain trouble, or incapacity of the vocal organs, and by some was imagined to be possession by an evil spirit. Pedro Ponce de Leon (1520-84), a Spaniard, was the first instructor of the deaf and dumb, teaching many of them to speak, read, and write. There are 3 prin. methods in the instruction of the deaf and dumb: the oral, the sign and manual, and the combined method. The oral method instructs by and through speech; the pupils learn to pronounce the elemental sounds of the language, and to read from the lips. The 2nd method is by a language of signs, and the 3rd combines speech, lip-reading, writing, and signs. See also DEAF AND DUMB.

Dumb-Dum, or **Dam-Dam**, tn of W. Bengal state, India, 7 m. from Calcutta. It was the H.Q. of the Bengal artillery from 1783 to 1853, and is reputed to be the place of origin of the soft-nosed bullets called after it. The cantonment is now largely derelict. It is the site of the aerodrome for Calcutta.

Dumfries, burgh and co. tn of Dumfriesshire, Scotland, on both banks of the R. Nith, 33 m. NW. of Carlisle, formed by the amalgamation of 2 tns., D. and Maxwelltown, in 1929. Two foot and 2 traffic

bridges span the riv.; the 1st stone foot-bridge (c. 1425) probably replaced a wooden bridge built in 1280. The site of the Franciscan monastery where Bruce slew the Red Comyn is now partly built on: at Castledykes a stone marks the site of the old castle of D. which Bruce captured after the Red Comyn's death. Greyfriars Church stands on the site of the old castle of the Maxwells. SW. of D. is Sweetheart Abbey, whose last abbot, Gilbert Brown, is believed to have been the original of Scott's *The Abbot*. The abbey was founded in 1275 by Devorgilla, who with her husband also founded Balliol College, Oxford. Here in 1300 Edward I received the papal bull ordering him to cease the oppression of Scotland. At the County and Commercial Hotel is the room where Prince Charles Edward held a levée in 1745. Six m. N. of the tn is Ellisland Farm, occupied by Burns from 1788 to 1791; he then moved to D. where he d. in 1796. His body lies under the mausoleum in St Michael's churchyard. There are relics of Burns, Carlyle, and Scott in the Burgh Museum. Burns House, Hole of the Wa' Inn, and Glove Inn. The Midsteeple in High Street, once the court house, is the place of the trial of Elsie Deans, described in *The Heart of Midlothian*. Near by is a statue of Henry Duncan, founder of savings banks. J. M. Barrie was educ. for some years at the academy here, and some of the imaginative games that he played and directed in the neighbourhood were reflected later on in the legend of *Peter Pan*. There are important cattle marts, and manufs. include ardl (I.C.C.I.), rubber, agric. machinery, and hosiery. Pop. 26,300.

Dumfriesshire, border co. of Scotland, bounded on the N. by the coos. of Inverclyde, Peebles, and Selkirk; on the E. by Roxburgh; on the S. and SE. by Cumberland and the Solway Firth; and on the W. by Kirkcudbright and Ayr. There are numerous traces of early Brit. settlements, and of the Rom. occupation, including Rom. fortifications at Birrens. At Ruthwell is preserved a remarkable 7th-cent. cross. The co. has associations with Burns and Carlyle. The N. of the co. is highland, including White Combe (2695 ft) and the Lowther Hills (2377 ft). The valleys of the 3 prin. rivs., the Nith, Annan, and Esk, divide the co., flowing from N. to S. In the N. lies Loch Skene (1750 ft above sea-level), giving rise to the beautiful waterfall called Grey Mare's Tail. Railways ascend Nithsdale and Annandale, and Eskdale as far as Langholm. Cattle and sheep rearing are the chief occupations; hosiery manuf. and woollen milling are also carried on. Dumfries is the co. tn; Annan, Langholm, Lochmaben, Lockerbie, Moffat, and Sanquhar are other burghs. The co. returns 1 member to Parliament. Area 1073 sq. m.; pop. 85,660.

Dümichen, Johannes (1833-91), Ger. Egyptologist. His series of learned works on Egypt, including *Geographische Inschriften altägyptischer Denkmäler*, 1865-85, was the fruit of extensive travel and

original research, especially into inscriptions.

Dumnonii, see DAMNONII.

Dumont, Alberto Santos-, see SANTOS-DUMONT.

Dumont, François: 1. (1688-1726) Fr. sculptor, b. Paris and d. Lille. He studied under his father, and first gained distinction with a figure of David, and of a Titan. He afterwards executed a number of monuments and works for churches, and d. as the result of a fall while erecting the tomb of the duke of Melun. His son Edmé executed the well-known statue of Milon of Crotona testing his strength, which is in the Louvre.

Other members of this artist family were Edmé's son, *Jacques Edmé D.* (1761-1844) and grandson, *Augustin Alexander D.* (1801-84). See G. Vattier, *Une Famille d'Artistes*, 1890.

2. (1751-1851) Fr. miniature-painter. Executed portraits of Louis XVI and his queen, and Charles X. Many of his best works are in the Louvre.

Dumont, Pierre Etienne Louis (1759-1829), Fr. writer. His *Souvenirs sur Mirabeau*, 1832, is of interest, both because the author was a personal friend of the Fr. statesman—he is said to have composed some of Mirabeau's speeches—and because it gives the impression which the Fr. Revolution made upon a discerning eye-witness. See J. Martin, *Etienne Dumont, 1759-1829*, 1942.

Dumont d'Urville, Jules Sebastian César (1790-1842), Fr. navigator. b. Condé-sur-Noircau, was an accomplished linguist and student of entomology and botany. It was he who discovered and recognised the priceless Venuus de Milo. The find occurred during a hydrographic survey of the Mediterranean in 1820. In 1830 he was in charge of the ship which took Charles X to England. In 1838 he sailed for the Antarctic and discovered Joinville Is., Louis Philippe Land (now Trinity peninsula), and later (1840) Terre Adélie. The narrative and scientific results of his voyage of 1837-40 were pub. in 23 vols. of text and 7 atlases as *Voyage au Pôle sud et dans l'Océanie*, Paris, 1851-4. See *Bulletin de la Soc. de Géogr.*, Vol. 19, 1843.

Dumouriez, Charles François (1739-1823), Fr. gen., b. Cambrai. In 1757 he entered the Fr. Army and fought under his father, a commissary royal, during the Seven Years War. He was afterwards sent as an envoy to Poland and Sweden, but while engaged in the latter country he fell into disgrace, and, being recalled, was imprisoned in the Bastille. On the succession of Louis XVI he was released, and was soon made commandant of Cherbourg, where he did much to improve the naval administration. On the outbreak of the revolution he took the popular side, ultimately becoming connected with the Girondins, by whose influence he was made minister of foreign affairs. He resigned this post to receive command of the army in the N., and carried on a successful campaign against the duke of Brunswick. It was by his exertions that the latter was defeated at the battle of Valmy, and France was saved from the dangers of in-

vasion. Later in the same year he pressed into the Austrian Netherlands and won the victory of Jemappes. In 1793 his career of conquest came to an end. He had attempted to make arrangements for the restoration of the monarchy, and he was charged with treason. Four commissioners were sent to arrest him, but he captured them and took refuge with the Austrians. He was not able to remain there long, and wandered throughout Europe with a price on his head, settling finally in England, where he assisted in the preparation of plans for the defence of the country against Napoleon. Of his numerous pubs. the most important is his *Mémoires*, 1796.

GENERAL DUMOURIEZ

Dumping. In its restricted business meaning D. refers to the method of disposing of superfluous stock at a low price where its sale will not affect the regular business. But in its wider economic meaning it denotes the export sale of a commodity at a price lower than that in the domestic mkt. It became prominent in the 19th cent. Cartels or trusts used D. to kill competition. But it is a common complaint of industries facing competition from imported goods that the imports are being sold 'below cost': this charge is as difficult to establish as it is to refute, because it is difficult to lay down what the level of costs are that should be covered by the prices. Laws imposing additional duties on dumped goods have been passed in Canada, in the Union of S. Africa, in U.S.A., Great Britain, Australia, and New Zealand.

Dun, a fortress or fortified hill, often appears as an element in Celtic place names, one of the most famous being Dumbarton, originally Dun Breton, i.e. the fortress of the Britons, which was the cap. of Strathclyde, the Brit. or Celtic part of unct Scotland. Other similar formations are Dunbar, Dunformline, Dumfries, and Dundalk.

Dun, *Oxbird*, or *Calidris alpina*, species of Charadriidae which inhabits the N.

parts of both the Old and the New World, and frequents flat coasts and tidal rivers of Britain. The colours of this sandpiper are reddish black, white, and grey, and both bill and feet are black; in winter the plumage is grey and white. In habit it is gregarious.

Dun Laoghaire (formerly **Kingstown**), tn, bor., and seaport of Dublin co., Rep. of Ireland, situated on Dublin Bay, 6 m. from the city. It is the mail-packet station for communication with Holyhead, and has a royal harbour, which may be entered by vessels drawing 24 ft at any state of the tide. D. L. is a popular holiday resort, with 3 yacht clubs; it is also a fishing centre. Pop. (of bor.) 47,963.

Duna, see **DANUBE**.

Düna, see **DVINA**.

Dünaburg, see **DAUGAVPILS**.

Dunaföldvár, tn of Hungary, in Tolna co., on the Danube (q.v.), 28 m. NNE. of Szekszárd (q.v.). It is a riv. port and market tn, and has hemp, flax, and fishing industries. The insurgents were in control of the tn during the anti-Russian risings of Oct.-Nov. 1956. Pop. 11,500.

Dunajec-San, **Battles of**, The R. & D. and S. both run N. from the Carpathians in Galicia. During the First World War their direction, and the fact that Tarnow is situated on the former and Przemyśl on the latter, brought them into prominence. In their advance the Russians swept over these areas in Sept. 1914, and reached Tarnow. The fact that the Russians had been reinforcing their Carpathian front at the expense of the Tarnow area decided the Central Powers to attempt a break-through at that place, which, had it succeeded, would have 'rolled up' the Russian forces on the Carpathians. The Germans withdrew a number of divs. from the W. front, and these, together with an Austro-Hungarian force, the whole under the command of Gen. von Mackensen, were concentrated in Galicia for the operation. The attack opened on 2 May 1915, and, owing to the intense preparatory bombardment, the Russians gave way almost everywhere, and the lower Dunajec was crossed during the same day. The tactical combinations of their opponents were too much for the Russians. Tarnow was evacuated on 5 May, after a desperate struggle. The Russians were attacked again on 8 May, and by the night of 12 May the Central Powers were threatening their positions on the San, particularly Przemyśl. By 24 May the struggle for the fortress had begun, and by the first week of June they were forced back from the San.

Dunant, Jean Henri (1828-1910), Swiss philanthropist. See **RED CROSS**. For his biography see E. Hart, *Man Born to Live*, 1953.

Dunash ben Labarat (930-70), Jewish poet and grammarian, b. Bagdad. Not only was he one of the first to treat grammar scientifically, but he also wrote the earliest known specimen of metre in the Jewish language, his verse being an imitation of the Arabic.

Dunbar, Agnes, see **BLACK AGNES**.

Dunbar, Earls of, **Cospatrik** was created 1st earl of D. by his kinsman, Malcolm III., and in 1072 received from him the grant of the tn of D. with the surrounding lands of Lothian.

Patrick (1284-1368), 10th earl, sheltered Edward II in 1314 after the battle of Bannockburn at D. Castle. He married 'Black Agnes,' the sister of the Randolph who led the centre of the Scottish forces at that battle. 'Black Agnes' herself is famous for her defence of D. Castle against the Eng. under Salisbury in 1337, when she successfully held the castle for 5 months.

George, the 12th earl, was deprived of his title and estates by James I of Scotland in 1434. In 1605 the title was revived in favour of George, 3rd son of Alexander Home of Manderston.

Dunbar, William (c. 1460-c. 1520), greatest of the old Scottish poets, is generally supposed to have been born in E. Lothian and educ. at St Andrews. Practically nothing is known of his early life, and little of his later. He early entered the order of the Friars Minor (Franciscan), but gave this up in disgust. Thereafter he appears to have been employed by James IV in some court and political business. His chief poems are *The Thistle and the Rose* (The Thistle and the Rose), in which he celebrates James's marriage with Margaret Tudor (1503); *The Dance of the Seven Deadly Synns*, an allegory, before 1508; *The Golden Targe*, 1508, another allegory; and various lyrics of which the most notable is (c. 1507) *The Lament for the Makaris* (poets of Scotland and England). In all these there is true poetry. In his allegorical poems D. follows Chaucer in his setting, and is thus more or less imitative and conventional: in his satirical pieces and lyrics he takes a bolder flight and shows his native power. His comic poems are somewhat gross. The date and circumstances of his death are uncertain, some holding that he fell at Flodden, others that he was alive as late as 1530. Other works are *The Morte and The Nightingale*, and *The Flouting of Dunbar and Kennedy*. D. is described by Sir E. Gosse as 'the largest figure in English literature between Chaucer and Spenser.' He has strength, swiftness, humour, and pathos, and his descriptive touch is vivid and full of colour. There are eds. of his poems by D. Laing, 1834; J. Small, 1893; J. Schipper, 1894; and W. M. Mackenzie, 1932. See also J. Paterson, *Life and Poems of Dunbar*, 1880; J. Schipper, *William Dunbar: Sein Leben und Gedichte*, 1884; C. Steinberger, *Étude sur William Dunbar*, 1908; R. A. Taylor, *Dunbar*, 1932; J. W. Baxter, *William Dunbar: a Biographical Study*, 1953.

Dunbar, burgh and fishing port of E. Lothian, Scotland, 29½ m. ENE. of Edinburgh by rail. There are 2 harbours at the entrance of the Firth of Forth. The castle and Grey Friars monastery, which dates back to 1218, are both picturesque ruins. The former was captured by Edward I (1296), and offered refuge to Edward II after Bannockburn (1314), to the unfortunate duke of Albany (1479), and twice to Mary Queen of Scots. Close

by is the scene of the battle of Dunbar (1650). Pop. 4000.

Dunbartonshire, co. of Scotland, bounded on the N., E., and SE. respectively by the cos. of Perth, Stirling, and Lanark, on the S. by the Clyde, and on the W. by Loch Lomond (a beautiful salt-water inlet) and Argyll; there is also an enclave of the co. to the E., bounded on the N. by Stirlingshire and on the S. by Lanarkshire. There are traces of the Antonine Wall, estab. under the Rom. occupation c. AD 142 to link the forts built by Agricola and to hold back the N. tribes. The co. is mountainous in the W. and NW., with Ben Vorlich (3092 ft), Ben Vane (3004 ft), and at least 10 other peaks over 2000 ft; in the S. rise the Kilpatrick Hills. The chief rvs. are the Clyde, with its affluent the Leven, and the Kelvin; the prin. glens of the uplands are Glens Sloy, Douglas, Luss, and Fruin. The splendid scenery of Loch Lomond attracts many visitors. Large dairy farms have been estab. in the co. and highly intensive cultivation is successfully adopted. Coal is mined at Kirkintilloch; Clydebank and Dunbarton (the co. tn) are engaged in ship-building; and Alexandria, Renton, and Bonhill are concerned with bleaching, Turkey-red dyeing, and printing cottons and other fabrics. Strathleven industrial estate, lying between Dunbarton and Alexandria, has manufs. of clocks and adding machines. The co. returns 2 members to Parliament. Area 244 sq. m.; pop. 164,300.

Dunblane, burgh and mrkt. tn on Allan Water, 14 m. SSW. of Crieff, in W. Perthshire, Scotland. Woollen goods are manufactured, but the chief interest of the tn is historic. The cathedral, which was rebuilt in 1240 by Bishop Clemens, is in the Early Pointed style, with a fine W. window. An account of St Blaas and of the early foundation of the See of D. may be found in the works of Dowden and A. O. Anderson. D. was an important place in the Middle Ages; being not only the seat of an old diocese, but, lying near Stirling, where Eng. kings often resided, it played no small part in our national hist. See A. B. Barty, *The History of Dunblane*, 1945.

Duncan I (d. 1040), king of Scotland, succeeded his grandfather (on his mother's side) Malcolm II in 1034. He was regarded as an usurper by many of his subjects and his title contested, notably by Macbeth, who killed him in 1040.

Duncan II (d. 1094), king of Scotland, son of Malcolm Canmore, whom he succeeded in 1093. He was supported in his claim to the throne by England against his rivals Edmund and Donald Bane. D. was murdered at Donald Bane's instigation.

Duncan, Henry (1774-1846), founder of savings banks, b. Lochrutton, Kircudbrightshire, Scotland. He was intended for a commercial life, but left it for the Church, and in 1798 was ordained minister of Ruthwell in Dumfriesshire. He was remarkable for the breadth of his views and the diversity of his interests. He was capt. of a company of volunteers, an ardent antiquarian and geologist, the

publisher of a popular series of tracts entitled *The Cottage Fireside*, the editor of *The Dumfries and Galloway Courier*, and the author of *The Sacred Philosophy of the Seasons*, 1836. His most important labours were connected with the estab. of savings banks, the first being instituted at Ruthwell in 1810, and later, through his efforts, they were estab. all over the country. See life by his son, 1848.

Duncan, Isadora (1878-1927), Amer. dancer and pioneer in the revival of '18 classical poses and barefoot dances with flowing draperies; b. San Francisco, she had appeared on the Amer. stage before emigrating with her family to Europe. She was appreciated more in Europe than in America. In 1904 she founded a school in Berlin, and visiting Russia in 1905 she created a strong impression on Fokine and thus, through him, her art had an influence on ballet. Her life was, however, marred by tragedy: in 1913 her 2 children, with their nurse, were drowned in the Seine at Neuilly as the result of a motor accident; in 1921 she married the young Russian poet Serge Yessenin, whom she divorced 2 years later; and in 1927 she herself was strangled by her own scarf while motoring. Her memoirs, *My Life*, were pub. in 1927. See P. Magriel (ed.), *Isadora Duncan*, 1948.

Duncan, Robert Kennedy (1868-1914), Amer. chemist; b. Brantford, Ontario, Canada. Prof. of chem. at Washington and Jefferson College, 1901-6. From 1906 he was prof. of industrial chem. at the univ. of Kansas; and from 1910 director of industrial research—taking, at the same time, the same positions in Pittsburgh Univ. He discovered and patented a new process for manuf. phosphorus; a new low-melting glass; and processes for decorating glass. Initiated in 1907, at univ. of Kansas, a scheme of industrial fellowships, which has since grown to remarkable proportions there and at Pittsburgh. Pubs.: *The New Knowledge*, 1905; *The Chemistry of Commerce*, 1907; *Some Chemical Problems of To-day*, 1911.

Duncan, Ronald (1914-), poet and playwright, educ. in Switzerland and at Cambridge. His plays include *This Way to the Tomb*, 1945; *The Rape of Lucretia*, 1946; *The Eagle Has Two Heads*, 1946; *Stratton*, 1948; and *The Tipuwaite*, 1948. Among his other pubs. are: *The Dull Ass's Hoof*, 1941; *Postcards to Prunella*, 1942; *Journal of a Husbandman*, 1944; *Home Made Home*, 1947; *Jon's Journal*, 1948; *The Mongrel and Other Poems*, 1950; *The Blue Fox*, 1952; and *Where I Live*, 1953. He also ed. the *Songs and Satires* of the earl of Rochester and Pope's *Letters*.

Duncan, Thomas (1807-45), Scottish painter, b. Kinclaven, Perthshire. He studied at the Trustees' Academy, Edinburgh, and in 1830 was elected a member of the Royal Scottish Academy and in 1843 an associate of the Royal Academy, London. His prin. pictures represent scenes from Scottish hist., and illustrate Scottish life and character. Examples are to be seen in the National Gallery of Scotland.

Duncan de Cérissant, Mark (d. 1648), writer of Lat. verse. He entered the service of Sweden, and was Swedish ambas. to France in 1645, but renounced his position and his Protestantism and went to Rome. In 1647 he met the Duc de Guise, and accompanied him to Naples as secretary. He d. of a wound received in an engagement with the Spaniards while aiding Guise in his attempt to take Sicily from Spain. His fame as a Lat. versifier was great; the most celebrated of his poems being the *Carmen Gratulatorium*, on the marriage of Charles I of England and Henrietta Maria.

Duncan of Campdown, Adam, 1st Viscount (1731-1804), adm., b. Lundie, Angus, Scotland. He received his earliest education at Dundee, and in 1746 was placed under Capt. Haldane in the frigate *Shorcham*. Assisted in the attack on Goree, a Fr. settlement in W. Africa. In 1795 he hoisted his flag as commander-in-chief of the North Sea, and began harassing the Dutch. On 11 Oct. 1797 he gained a decisive victory over the Dutch, and in recognition of his services he was created Viscount D. of C. and Baron of Lundie, and was also granted a pension of £3000 to himself and the next 2 heirs to the title.

Duncansby Head, promontory (210 ft) forming the N.E. extremity of Caithness, Scotland, 18½ m. N. of Wick and 1½ E. of John o' Groat's house.

Duncker, Maximilian Wolfgang (1811-1886), Ger. historian, b. Berlin. In 1857 he became prof. of hist. at Tübingen, but was recalled to Berlin in 1859, becoming counsellor to the crown prince in 1861, and director of the state archives from 1867 to 1874. His place among Ger. historians rests chiefly on his *Geschichte des Alterthums*, 1852-7 (Eng. trans. by E. Abbott, 1877-82). Other pub. include: *Origines Germanicæ*, 1840; and *Die Krisis der Reformation*, 1845.

Dundalk (Gaelic *Dun Dealgán*), cap. of co. Louth, Rep. of Ireland, on the R. Castleton, near its entrance into D. Bay, 12 m. SW. of Newry. It is a railway centre for the Great N. railway, and there are important works belonging to the railway. There is also in normal times a weekly service of steamers to Liverpool. A considerable trade in dairy and agric. produce and live stock is carried on; there are also mills for flax-spinning, breweries, and distilleries. The fisheries are important, especially the salmon-fishing industry. Pop. 19,000.

Dundas, Sir David (1735-1820), gen. and writer on tactics, b. Edinburgh. He entered the army in 1752, and was aide-de-camp to Gen. Elliott in 1760-1 in the campaigns in Germany. Every year he was present at the manoeuvres of the Fr., Prussian, and Austrian armies, and in 1788 pub. the results of his observations of their tactics in *The Principles of Military Movements, chiefly applicable to Infantry. His Rules and Regulations for the Formation, Field Exercises, and Movements of His Majesty's Forces*, 1792, were pub. as the official orders for the army, and were followed by *Rules and Regulations for the Cavalry*, 1792. It was under these rules

and regulations that the battles of Moore and Wellington were fought. He was made governor of Chelsea Hospital in 1804, and commander-in-chief of the army 1809-11.

Dundas, Henry, 1st Viscount Melville (1742-1811), politician, educ. at Edinburgh Univ. At the age of 24 he was appointed solicitor-general for Scotland. In 1774 he became a member of parliament, and in the next year was made lord-advocate. He vigorously opposed any concession being made to the Amer. colonies while they were in arms against the mother country, and in 1778 he supported a motion for the repeal of the Massachusetts charter. Later he was home secretary in Pitt's administration, and in 1794 secretary for war, with Wm Windham as secretary-at-war. He was in 1802 created Viscount Melville, and 2 years later returned to office with Pitt as first lord of the admiralty. Charged with malversation in 1806, he was impeached, but acquitted on all charges, and his name, which had been struck off the roll of privy councillors, was restored. See life by C. Matheson, 1933.

Dundas, tn of Wentworth co., Ontario, Canada, at the head of Burlington Bay, Lake Ontario. It has large mills worked by water, and manufs. leather, paper, flour, machinery, tools, and textiles. Pop. 8295.

Dundas Castle, mansion in Dalmeny par., W. Lothian, Scotland, built on a low ridge called D. Hill about 1½ m. SSW. of South Queensferry. The estate was held by a family of Dundas from about 1124 until 1875, and D. C. sustained a siege in 1449. It now belongs to Sir Stewart Stewart-Clark, Bart. The castle was partly rebuilt by James Dundas of D. (1793-1881), and with its thick walls and vaulted chambers is one of the finest and best preserved baronial fortalices in Scotland.

Dundee, John Graham of Claverhouse, Viscount (c. 1649-89), soldier. He served as a volunteer in the Fr. army and in the Dutch army under the Prince of Orange, where he obtained a cornetcy in 1674 for saving the life of the prince at the battle of Seneffe. In 1677 he returned to England and obtained a captaincy in the regiment of the marquis of Montrose, charged with enforcing the penal laws against the Scottish Covenanters. Graham's attempt to disperse an armed force of Covenanters at Drumclog ended in his defeat, and was the signal for a serious and general rising. He was more successful at Bothwell Bridge (1679), and afterwards made a tour through the SW. cos. in search of rebels, routing a company at Aird's Moss and killing the leader, Cameron. In 1682-4 he suppressed the Covenanters of Dumfries, Annandale, Kirkcudbright, Ayr, and Lanark with the severity enjoined by the gov., killing, robbing, and starving them when they would not submit. In 1688 he was appointed 2nd in command of the Scottish army, and was ordered S. with his forces to protect the Stuart throne and oppose the landing of William of Orange. In the same year

James II created him Viscount Dundee. After James II's flight to France D. returned to Scotland and was indefatigable in supporting the Stuart cause. In July 1689 he organised the Highlands against the new regime and defeated the gov. forces under Hugh Mackay (q.v.) at Killiecrankie, where D. himself was mortally wounded. See M. Napier, *Memorials and Letters of Graham of Claverhouse*, 1859-62; and lives by M.

underwent much improvement in the course of the last cent. It possesses many fine buildings, among which are the City Square buildings, and the Albert Institute, designed by Sir Gilbert Scott. Other important edifices are the Royal Exchange, St. Paul's Church, Univ. College (St. Andrew's Univ.), Caird Hall, and the Technical Institute. There are sev. fine parks, chief of which are Camperdown Park of approximately 150 ac.; the

DUNDEE FROM THE LAW

Morris, 1888; C. S. Terry, 1905; I. MacLaren, 1908; G. Daviot, 1937; and A. S. H. Taylor, 1939.

Dundee, city, a royal parl. and municipal burgh and seaport in the co. of Angus, Scotland, situated on the N. shore of the Firth of Tay. It was once strongly fortified. On account of the prominent part taken by its citizens in forwarding the work of the Reformation, it is often given the title of 'The Scottish Geneva.' On 28 Dec. 1879 part of the Tay Bridge (which connects D. with Fifeshire) and the train passing over it were blown into the riv., with the loss of over 70 lives. The tn, which is Scotland's 4th largest city, stands on a gentle slope, rising from the water's edge to the hill known as the Law (571 ft.). The estuary opposite the tn is nearly 2 m. wide, and its shipping is important enough to make D. the 2nd port of Scotland. The tn is well built, and

Baxter Park; and Balcay Park on the hill of Balcay. The chief industry of Dundee consists in the manuf. of lute and heavy linen fabrics such as sailcloth. There are also manufs. of cordage, fine linen, confectionery, marmalade, cash registers and accounting machines, watches, plastics, etc. Some shipbuilding is carried on, and mill-wright work, and there are marine and other engineering works: steam boilers, engines, and textile machinery, etc., are manufactured. There are also extensive sawmills. D. is the chief centre of the lute trade. The tn of Bronghty Ferry is included in the burgh of D. Pop. 177,333 (1951). See J. Thomson (continued by J. MacLaren), *The History of Dundee*, 1874; A. Maxwell, *Old Dundee: ecclesiastical, burghal and social, prior to the Reformation*, 1891; A. C. Lamb, *Dundee, its quaint and historic buildings*, 1895; Brit. Association,

A Scientific Survey of Dundee and District, 1939; Bonnie Dundee and Round About, 1953.

Dundonald, Earls of, see COCHRANE, DOUGLAS and THOMAS.

Dundonald, tn in the par. of D., Ayrshire, Scotland. D. Castle, erected in the 12th cent., where Robert II., the 1st Stewart sovereign, d. in 1390, and Old Auchans Castle are ruins. Pop. 1600.

Dundrennan, vil. of Kirkcudbrightshire, Scotland, 5 m. S.E. of Kirkcudbright, with

them along the ground, sometimes with a movement as smooth as flowing liquid, and sometimes with a skipping motion. A D. has a gentle windward slope and a steep leeward descent; the rolling grains being driven up a gentle incline and falling steeply into the hollow below. Moving sands are in many places altering the surface of the land; the continuous blowing of a steady wind in one direction frequently covering fertile tracts with this arid deposit, moving at the rate of from

High Commissioner for New Zealand

DUNEDIN: THE OCTAGON, WITH ST PAUL'S ANGLICAN CATHEDRAL AND THE TOWN HALL

the ruins of an anct Cistercian abbey (1142). Pop. 100.

Dundrum, vil. 6 m. S. of Dublin. Rep. of Ireland, on the road to the Wicklow Mts.

Dune, mound or ridge of loose sand heaped up by the wind on the seashore or occasionally on the shore of an inland lake and on the banks of a riv. The name is also used for the wide stretches of sand in an inland dist. of low rainfall. Among the minerals which occur among sand deposits, quartz is by far the most common and of the longest duration, as it is comparatively hard, has practically no cleavage, is insoluble in water, and does not readily decompose, while the other grains decompose comparatively rapidly. In general, the sand grains which form the D.s are rounded, owing to mutual attrition during transport; the greater the distance travelled the smoother and rounder the grains. The wind which heaps up the D.s seldom carries even the smallest grains in suspension, but rolls

60 to 70 ft in one year. The average height of coastal sand D.s is from 200 to 300 ft, but in the crescent-shaped sand D.s of the Sahara they sometimes rise to a height of 600 ft in a wide belt of sand called 'Igidi' or 'Gidi,' from the Berber word for D.s, and are separated by depressions, sometimes below sea-level, called 'Juf.' Little can be done to arrest the progress of moving sand D.s, but they can be fixed to a certain extent by planting *Carex arenaria*, and similar plants with long creeping roots. Particular attention is given to this form of conservation in the Netherlands, because at some points on the Dutch coast the sand D.s form the only protection for inland dists. against the sea, which is often at a higher level than the land. See E. R. Matthews, *Coast Erosion and Protection*, 1934; H. A. Ragnold, *The Physics of Blown Sand and Desert Dunes*, 1941; J. A. Steers, *The Coastline of England and Wales*, 1946.

Dunedin, cap. of the dist. of Otago, is the fourth largest city in New Zealand,

situated at the head of Otago harbour 15 m. from the sea. The harbour is accessible to vessels drawing 25 ft right up to Dunedin, while Port Chalmers, 9 m. N.E. by rail, handles the shipping drawing over 25 ft up to 30 ft 6 in. Spread over 7 hills, D. has a beautiful setting, and has preserved much of the native forest in laying out the Town Belt and public gardens. D., founded by Scots and given the anc name of the Scottish cap., is regarded as the most Scottish city outside Scotland. D. is an important education centre, the univ. of Otago catering for students of arts and science, medicine, law, dentistry, home science, physical education, commerce, and mining. In addition there are a teachers' training college and many secondary schools and colleges (public and private). The city has a number of fine buildings, notably the post office, tn hall, First Church, Knox Church, univ. of Otago, and the Otago Boys' High School. Local industry covers a wide field, for in and around Dunedin are found woollen mills and clothing factories, engineering works, agric. implement makers, gas and electric range factories, soap works, lime and cement works, a rope and twine factory, printing works, iron foundries, paper mills, aerated water and cordials manufacturing plants, fertilisers and allied products manufacturers, boot and shoe works, the only iron rolling mills in the Dominion, the manuf. of wax matches, tanning and fellmongering, sawmilling, ink-making, production of hardware and woodware for building purposes, canning and preserving works, butter and cheese making, wax paper manuf., basket manufacturing, flour mills, and a linseed oil factory. Shipbuilding, one of the oldest industries, is now being revived, together with its associated trades, such as the overhauling and repairing of ships. 1948 marked D.'s centenary and many important events were held to celebrate the occasion. Pop. 99,326. See illustration.

Dunedin and Stenton, Andrew Graham Murray, 1st Viscount and Baron (1849-1942), lawyer and statesman, b. Edinburgh, son of Thomas Graham Murray, of Stenton, Fordie, and Locholly, Perthshire, writer to the signet and sheriff of Aberdeen. Educ. at Harrow and Trinity College, Cambridge. He was called to the Scottish Bar in 1874; sheriff of Perthshire, 1890-1; lord-advocate of Scotland, 1896-1903; secretary for Scotland, 1903-5; lord justice general and lord president of the court of session, Scotland, 1905-13; raised to the peerage in 1905; viscount, 1926.

Dunfermline, Sir Alexander Seton, 1st Earl of (c. 1555-1622), statesman. He studied at the Jesuit College, Rome, but gave up this proposed admittance to the priesthood, and studied law in France, being called to the Scottish Bar in 1577. He helped to arrange the union between England and Scotland. He was created earl of D. in 1608.

Dunfermline (Gaelic, the fort on the crooked linn), city of Fifeshire, Scotland,

on the Firth of Forth, 16 m. NW. of Edinburgh. The fine Norman nave, which is all the Reformers spared in their assault on the abbey (1560), now forms the vestibule of the New Abbey Church. Malcolm Canmore and Margaret, who were married in D. (1070), were buried in the abbey, which for over 2 centuries afterwards was the recognised place of royal sepulture. The tomb of King Robert Bruce is in the New Abbey Church. D.'s greatest benefactor was Andrew Carnegie, who presented the tn with Pittencrieff Park and Glen, and a free library, besides an ann. income of £25,000. Since 1718 the tn has been busily engaged in the linen industry, especially in the manuf. of damasks, and it now manufs. a wide range of textiles. Rosyth Royal Naval dockyard (q.v.) is in the city, and there are rich coal deposits. Pop. 46,000.

Dungannon, tn of co. Tyrone, N. Ireland, 13 m. S. of Cookstown. It was the home of the O'Neills, kings of Ulster. There are manufs. of linen goods, glass fabrics, earthenware firebricks, and tiles, also a trade in corn and flax. There is a large cattle and pig market. Pop. 5700.

Dungarvan, urb. dist. and seaport tn of co. Waterford, Rep. of Ireland. It is situated on the bay of D. There are fisheries, a leather industry, manufs. of glue and gelatine, and a trade in dairy and agric. produce. The legend runs that the tn was spared by Cromwell because a woman drank his health at the gateway. Pop. 5400.

Dungeness, small low headland on the S. coast of Kent, England, 10½ m. SE. of Rye, with a lighthouse, coastguard station, and a small fort. Lloyd's signalling station is near.

Dungeon, or **Donjon** (Late Lat. *dominionem*, from *dominus*, a lord), the prin. tower or keep (q.v.) of a Norman castle. The modern use of the word 'dungeon' for a prison is derived from the position of the Norman prison in the ground storey of the 'donjon'.

Dungiven, mrkt tn in the co. of Londonderry, N. Ireland. Near it are the remains of an Augustinian priory founded in 1100. The quartz crystals known as D. diamonds are found nearby. D. is surrounded by mt, glen, and riv. scenery of impressive grandeur. Pop. 950.

Dunglas, promontory on the R. Clyde, Scotland, 2½ m. ESE. of Dumbarton. It is a rocky headland, supposed to have been the site of a Rom. station, and the end of the Antonine Wall. It has ruins of the castle of the Colquhouns of Luss, and a monument to Henry Bell (1767-1830), the pioneer of steam navigation in Britain.

Dunholme, see DURHAM.

Dunkeld, tn of Perthshire, Scotland, on the N. bank of the R. Tay, 15½ m. by rail from Perth. A bridge of 7 arches (which was opened in 1808) here spans the riv. The tn is said to have derived its name from a Culdee church, founded in 815 by Constantin, king of the Picts. Opposite D. is Little D., famed for its waterfalls. The cathedral, founded 1107, once the seat of the Scottish primates, contains a

recumbent figure, in armour, of the Wolf of Badenoch. The most celebrated bishop was Gavin Douglas, translator of Virgil. The choir is still used as the par. church. Pop. 1000.

Dunkerley, William Arthur, see OXENHAM, JOHN.

Dunkers, Dunkards, Tankers, or Dippers, familiar names for the Ger. Baptist Brethren, now known as the Church of the Brethren (see BRETHREN, CHURCH OF THE).

Dunkery Beacon, hill in Somerset, England, 1700 ft high, the highest point on Exmoor. Owned by the National Trust.

Dunkirk (Fr. Dunkerque; Flem. Duinkerke), most northerly seaport of France, in the dept of Nord, at the entrance to the Strait of Dover (q.v.). It is a naval, mercantile, and fishing port, and stands at the junction of 4 canals, which give it communication with the whole of E. France. The tn, Flem. in appearance, suffered severely in both world wars—in particular during the Second World War. The most notable of the old buildings of the tn which are still in existence are the fine 15th-cent. belfry, 190 ft high, which is said to contain the most beautiful carillon in France, and the church of St Eloi, parts of which date back to 1590. On the Place Jean-Bart, the centre of the tn, stands a statue of Jean Bart (q.v.), who was a native of D. There are boat-building, steel, textile, oil, soap, and food-stuff industries. Seaborne trade is largely with ports of NW. Europe, and there are ferry and other connections with England. The fisheries (cod from Iceland, and herring) are important. D. is said to owe its foundation to a church built by St Eloi in the 7th cent. in the dunes here; hence its name 'Church of the Dunes.' It was sacked by the Eng. in 1388. In 1658 it was taken by Cromwell, but was sold to Louis XIV by Charles II in 1662 for 5 million francs. Louis fortified the harbour, and D. became of great strategic importance. In 1793 it was vainly besieged by the Eng. During the First World War D. became a base for Brit. aircraft, mainly to deal with Ger. air raids on England. The base was estab. in 1914, and expanded with the needs of the war. After the latter part of 1915 the D. station was also used as a base for offensive raids against the Germans; working in close co-operation with the aircraft on the W. Front, it achieved notable successes, both in fighting and in bombing. Although it was one of their objectives, the Germans never reached D., having been brought to a standstill at Nieuport, 20 m. E. The words 'ville héroïque sert d'exemple à toute la nation' were added to the arms of the tn in 1917. During the Second World War D. achieved fame by the successful evacuation of the Brit. Army from its beaches in 1940, after the ill-fated campaign on the W. Front in that year. The Brit. forces, together with some allied contingents, began to withdraw to the Fr. coast on 29 May. Some 220 Brit. naval vessels and more than 660 others, mostly small boats, took part in the transportation of the troops from D. to England. By 3 June the evacuation of

over 337,000 Brit. and allied troops had been completed for the loss of 6 destroyers and 24 minor war vessels. All the military transport and about 1000 guns were also lost. After the end of the war, on 4 Mar. 1947, an Anglo-Fr. Treaty of Alliance, to subsist for 50 years, was signed at D. by Mr Ernest Bevin (q.v.) and M. Bidault. A war memorial was unveiled at D. by Queen Elizabeth the Queen Mother in July 1957. Pop. 17,000. See EUROPE—HISTORY DURING THE SECOND WORLD WAR; and WESTERN FRONT IN SECOND WORLD WAR. And see E. K. Chatterton, *The Epic of Dunkirk*, 1940; J. Masefield, *The Nine Days' Wonder*, 1941. 2. City of Chautauque co., New York, U.S.A., on Lake Erie, 38 m. SW. of Buffalo by rail. It has a good harbour, fisheries, and manufs. machinery, motors, agric. implements and other iron goods, silk, tool steel, and glass. Pop. 18,000.

Dunleer, vil. of co. Louth, Rep. of Ireland, 9 m. N. of Drogheda.

Dunlin, see DUN.

Dunlop, John Boyd (1840–1921), re-inventor of the pneumatic tyre, which was first patented by one Thompson in 1846. B. Dregghorn, Ayrshire, Scotland. Went to Belfast 1867, and while working as a veterinary surgeon devised the D. tyre, 1888. He sold out to Harvey du Cros in 1889, removed to Dublin in 1892, and kept a drapery estab. at Ball's Bridge, where he d. See DUNLOP RUBBER COMPANY LIMITED.

Dunlop, par. of Ayrshire, Scotland, 8 m. NNW. of Kilmarnock, which gave its name to a popular cheese. Pop. 1256.

Dunlop Rubber Company Limited commemorates in its present name, which it adopted in 1901, the invention by John Boyd D. (q.v.) in 1888 of the 1st practicable pneumatic tyre. The original company was founded in Dublin in 1889 under the name of the Pneumatic Tyre and Hoofths Cycle Agency Limited. In its early days the company concentrated exclusively on the manuf. of cycle tyres, but it soon extended its activities to include the manuf. of car tyres. By 1900 D. tyres were being manufactured in France, Germany, Canada, New Zealand, and Australia. The company continued to expand steadily. In 1908 a start was made on the manuf. of rims and wheels, and in 1910 the first D. rubber plantations in Malaya were acquired. In 1915 the company founded its own cotton mills for the manuf. of tyre cord. In 1916 the giant tyre factory of Fort D. was built at Erdington, Birmingham. The 2 world wars resulted in still further expansion. A number of other rubber companies joined the D. Group, which to-day manufs. not only tyres of all kinds and sizes, but belting, hose, sports goods, rubber footwear, clothing, Dunlopillo, motor and cycle accessories, aeroplane accessories, engineering components, and a variety of floor-covering materials. It has throughout the world 94 factories and 100,000 employees. The authorised cap. is £40,000,000.

Dunluce, Earl of, see ANTRIM, MARQUESS OF.

Dunmanway, mkt tn 16 m. W. of Bandon, in co. Cork, Rep. of Ireland. Pop. 1600.

Dunmore: 1. Vil. and watering place of co. Waterford, Rep. of Ireland, on Waterford harbour and 10 m. S.E. of Waterford. Pop. 800 (summer).

2. Banking post-bor. in Lackawanna co., Pennsylvania, U.S.A., on the Erie and Lackawanna railroads, adjoining Scranton. The tn was incorporated in 1862. It is an important centre for anthracite coal, iron, and bricks, and has flourishing silk industries. Pop. 20,305.

Dunmow: 1. *Great Dunmow*. Small mkt tn in Essex, England, on the R. Chelmer, 13 m. N. of Chelmsford. It is

THE DUNMOW FITCH CHAIR IN WHICH CLAIMANTS SAT

thought to be the site of the Rom. station of Caesariomagnus. The fine par. church, of the 13th-15th cents., contains a curious gallery in the S. aisle. The tn hall was built in 1578 and enlarged in 1855. There is a bacon factory. Pop. 3629.

2. *Little Dunmow*, two m. E. of Great D., owes its importance to a priory of Austin canons, founded 1106. The par. church consists of the S. aisle of the chancel of the cruciform priory church, the foundations of which have been partially excavated. The D. Fitch of Bacon was instituted in 1244 by Robert de Fitzwalter as a prize to any married couple who 'will go to the priory, and kneeling on two sharp pointed stones, will swear that they have not quarrelled nor repented of their marriage within a year and a day after its celebration.' The first recorded award was made in 1445, and successful claimants still continue to come forward, although the award was not made during the Second World War. See W. Andrews, *History of the Dunmow Fitch*, 1877; J. W. Robertson-Scott, *The Strange Story of the Dunmow Fitch*, 1909. Pop. 430.

Dunmurry, vil. of co. Antrim, N. Ireland, on the Glenwater, 4½ m. S. by W. of Belfast. It has linen manufs. Pop. 4000.

Dunn, Samuel (d. 1794), Eng. mathematician. He is chiefly noted as the inventor of the 'universal planispheres or

terrestrial and celestial globes in plano.' Author of *The New Atlas of the Mundane System*, 1774; and *The Navigator's Guide to the Oriental or Indian Seas*, 1775.

Dunnage, name given to the loose logs of wood that are placed between the cargo in the hold of a ship to keep it steady.

Dunne, Finley Peter (1867-1936), Amer. humorist, b. Chicago. He became a newspaper reporter in 1885; city editor of the *Chicago Times*, 1891-2; was on the staff of the *Chicago Evening Post* and *Times Herald*, 1892-7; and was editor of the *Chicago Journal*, 1897-1900. He is well known as the creator of 'Mr Dooley,' the incomparable Irish-Amer. philosopher of Archey Road. The sayings of this character on social and political questions first appeared in the *Chicago Journal*, and were collected in 1898 under the title of *Mr Dooley in Peace and in War*. This was followed by *Mr Dooley in the Hearts of his Countrymen*, 1898; *Mr Dooley's Philosophy*, 1900; *Mr Dooley's Opinions*, 1901; *Observations by Mr Dooley*, 1902; *Dissertations by Mr Dooley*, 1906; and *Mr Dooley Says*, 1910. See E. Killis, *Mr Dooley's America*, 1941.

Dunne, John William (1875-1949), Brit. philosopher, served in the Yeomanry during the Boer War. Later he made a number of aeronautical experiments. As a result of studying the problems of existence he propounded the philosophical theory of serialism, which he worked out in a number of books, *An Experiment with Time*, 1927; *The Serial Universe*, 1934; *The New Immortality*, 1938; and *Nothing Dies*, 1940.

Dunnet Head, most N. point on the mainland of Great Britain. It is a rocky peninsula in Caithness, Scotland, 346 ft high, with a lighthouse on its summit, and the small fishing vil. of D. on the S.W. of the bay.

Dunnose, rocky headland on S.E. coast of the Isle of Wight, England.

Dunnville, banking vil. and port of entry in Haldimand co., Ontario, Canada; on the Grand R. and the Grand Trunk Railway, 40 m. S.S.E. of Hamilton. It is an important agric. dist. and the tn has lumber interests. Pop. 4803.

Dunois, Jean, Comte de (c. 1403-68), Fr. soldier, commonly known as the 'Bastard of Orléans,' being the natural son of Louis, duke of Orléans (brother of Charles VI), and Marie of Enguien. He fought at Beaugé (1421) and Verneuil (1424), and defeated the Eng. at Montargis (1427). He held Orléans till the arrival of Joan of Arc in 1429, and with her won the battle of Patay. He laid siege to Chartres and Lagny in 1432, and drove the Eng. from Paris in 1436, and later from Normandy and many cities in Guienne. He joined the league of rebellious nobles in 1464, and, as a result, Louis temporarily deprived him of his estates.

Dunois, Fr. dist., part of Beauce (q.v.). Its prin. tn is Châteaudun (q.v.).

Dunolly, mining tn in Victoria, Australia, 126 m. N.W. of Melbourne, with knitting mills and wheat storage plant.

Dunoon, burgh and popular watering-place of Argyll, Scotland, on the Firth of

Clyde, 7½ m. W. of Greenock. There are ruins of a castle, formerly the seat of the Stewarts. It was the site of hanging of 36 Lamonts by the Campbells in 1643. There is a monument to Robert Burns's Highland Mary, who was born in D. The tn is pleasant and well built, with a steamboat pier and esplanade, and is the scene of the ann. Cowal highland games. Pop. 9940.

Dunraven and Mount Earl, Windham Thomas Wyndham-Quin, 4th Earl of (1841-1926), Eng. politician, b. Adare Abbey. In 1902 he was chairman of the Irish Land Conference, and became president of the Irish Reform Association. He strongly advocated the policy known as 'devolution,' which was denounced by the gov., with the result that the chief secretary of Ireland, Mr Wyndham, resigned from office in 1905. D. was a keen yachtsman, and twice tried, without success, for the America Cup, in 1893 and 1895. His pubs. include: *The Irish Question*, 1889; *Self-Instruction in the Theory and Practice of Navigation*, 1900; *The Crisis in Ireland: Federal Union through Devolution*, 1920; and *Past Times and Pastimes*, 1922.

Dunrossness, peninsula in the extreme S. of the is. of Mainland, Shetland, Scotland, which terminates in Sumburgh Head. The par. includes Fair Is. Pop. 2700.

Duns, police bor. and co. tn of Berwickshire, Scotland, 15 m. W. of Berwick-on-Tweed, set in impressive Border scenery. Duns Scotus and Thomas Boston were natives. In 1639 Gen. Leslie, with his army of Covenanters, encamped on D. Law, a high mound rising some 700 ft. Formerly the spelling was Dunse. Pop. 2030.

Duns Scotus, Johannes (1265 or 1274-1308), medieval philosopher. His bp. is uncertain, Duns in Berwickshire, Dunstane in Northumberland, and Dunum (Down) in N. Ireland all claiming that honour. He became a Franciscan and studied and lectured (about 1301) at Oxford. In 1304 he moved to Paris, and 3 years later the doctor's degree was conferred upon him by the univ., and he was appointed regent of the theological school. In 1308 he was despatched to Cologne to found a univ. and d. there a few months after his arrival. D. S. acquired the title 'Doctor Subtilis' on account of his dialectical ingenuity and wit. In philosophy he revived nominalism in a mitigated form and denied the real distinction between essence and existence. In theology he strongly upheld the doctrine of the Immaculate Conception. He taught that no one could attain to a pure knowledge of theology by reason alone, that revelation must form part of that knowledge. During the Revival of Learning the Scotists, we are told, 'ragged in every pulpit,' and thus 'Dunsmen' gave the word 'dunce,' meaning a dullard, or ignoramus. Scotus wrote commentaries on the Bible and on Aristotle, and the *Sentences* of Peter Lombard, called *Opus Ozontense*, or *Anglicanum*. A complete ed. of his works was pub. in 13 vols. by

Luke Wadding at Lyons, 1639; reprinted (Paris), 26 vols., 1891-5. This ed., however, is uncritical and contains works that are undoubtedly spurious. Vols. I and II of a new ed. by C. Balic were pub. in 1951. See E. Longpré, *La Philosophie du B. Duns Scot*, 1924; E. Gilson, *Jean Duns Scot*, 1952.

Dunsany, Edward John Moreton Drax Plunkett, 18th Baron (1878-1957), poet and playwright, b. London. Educ. at Eton and Sandhurst, he succeeded to the title on his father's death in 1899. During the Boer War he served with the Coldstream Guards, and in the First World War was a capt. in the Inniskilling Fusiliers. In the Second World War he held the Chair of Eng. Literature at Athens. His first book was a novel, *The Gods of Pegana*, 1905; other novels are *Time and the Gods*, 1906; *The King of Elfland's Daughter*, 1924; and *The Wise Woman*, 1933. In 1909, on Yeats's invitation, he wrote a play, *The Glittering Gair*, for the Abbey Theatre, and followed it with many others, including *The Golden Doom*, 1912; *A Night at an Inn*, 1916; *The Laughter of the Gods*, 1919; *The Tents of the Arabs*, 1920; *If*, 1921; *Alexander*, 1925; *Mr Faithful*, 1927; *The Old Folk of the Centuries*, 1930; *Lord Adrian*, 1933; and *Plays for Farth and Air*, 1937. These plays are intellectual dreams; they deal in mythology, but it is a mythology of the author's own. He also pub. 2 vols. of verse, *Fifty Poems*, 1930, and *Mirage Water*, 1939; and a series of autobiographical works, *Patches of Sunlight*, 1938; *While the Sirens Slept*, 1944; *The Sirens Wake*, 1945; and *To Awaken Pegasus*, 1949.

Dunscore, vil. of Dumfriesshire, Scotland, 10 m. NW. of Dumfries, and noted for the fact that Burns and Carlyle once lived there. Pop. 1600.

Dunsinane, one of the Sidlaw Hills in Perthshire, Scotland. It has an elevation of 1012 ft. and is situated 8½ m. N.W. of Perth. On its summit are the remains of 'Macbeth's Castle,' where Siward, earl of Northumbria, is supposed to have defeated Macbeth in 1054. See Shakespeare's *Macbeth*, IV, I.

Dunsink, hill 4 m. NW. of Dublin, on which is the observatory of Trinity College.

Dunstable, John (?-1453), composer, astrologer, and mathematician. He seems to have been a canon of Hereford Cathedral and prebendary of Putson Minor in the same diocese for about 20 years from 1419, but these posts probably did not require continuous residence, for he was much abroad in the service of the duke of Bedford and already one of the most famous composers of his time on the Continent, as is shown by a Fr. poem written in 1437. He influenced Dufay, the other great musician of the period. He was 'modern' for his time, even in church music, the only part of his output that has survived, the secular song 'O rosa bella' being probably wrongly ascribed to him. A collected ed. of his work appears in *Musica Britannica*.

Dunstable, in 36½ m. NW. of London, in the S. of Beds. It is connected by

branches with 2 main railway lines. Since the 18th cent. it has been chiefly engaged in the manuf. of straw hats and now has also considerable printing works, and manufs. of sparking plugs. Very large sums of money are being invested in the motor industry. D. is linked with hist., because its Augustinian priory, founded by Henry I in the early 12th cent., was the scene of the first miracle play performed in England; because Cranmer here annulled Catherine of Aragon's marriage (1533); and because until 1643 it possessed an Eleanor Cross. The church of St Peter and St Paul is a remnant of the old priory. On the nearby D. Downs is the London Zoological Society's Whipsnade zoo, and the H.Q. of the London Gliding Club. Pop. 8900.

Dunstaffnage, ruined castle in Argyll, Scotland, on Loch Etive, 2½ m. NNE. of Oban. According to tradition it was the royal seat of the Dalriadian kings, and the Stone of Destiny was held here before its removal to Scone. D. was captured by Robert Bruce in 1308, and became the stronghold of the Campbells and Macdonalds. It formed an Eng. military station during the risings of 1715 and 1745, and for a while was the prison of Flora Macdonald in 1746. The duke of Argyll is the hereditary keeper of the castle, and Campbell of D. is the hereditary capt.

Dunstan, Saint (c. 910-88), archbishop and statesman, b. at or near Glastonbury, in Somerset, of noble parents. After receiving a careful education he was taken by his uncle, Aldhelm, to Athelstan's court. He did not remain there, however, but retired to a hermitage near Glastonbury, where he devoted himself to a life of prayer and austerity. In 943, on the accession of Edmund, D. was called from his retirement and made abbot of Glastonbury, where he rebuilt and restored the abbey. The next king, Edred, gave D. almost unlimited power, and the prelate used this to reform the Benedictine order in England and strictly enforce eccles. discipline. For a time D. lost his influence, but it was soon regained, and in 961 he was made archbishop of Canterbury. He maintained almost absolute power during the reigns of Edgar and Edmund, but his credit and influence declined after the murder of the latter prince. He retired to Canterbury, where he d. His feast is on 19 May.

Dunstanburgh Castle is situated on the Northumbrian coast, England, 8 m. NE. of Alnwick. The cliffs are basaltic in structure, and the quartz crystals found in the neighbourhood are called D. diamonds.

Dunster, picturesque mkt. tn. in Somerset, England, 23 m. NW. of Taunton, with an anct castle and yarn market. Pop. 1200.

Dunsterville, Major-General **Lionel Charles** (1865-1946), soldier, who entered the Royal Sussex Regiment in 1884, reaching rank of maj.-gen. in 1918. He transferred to the Indian Staff Corps in 1887, and held various important staff appointments. Served in the Waziristan, 1894-5, NW. Frontier (India), 1897-8,

China, 1900, and First World War campaigns. Commanded Dunster Force, expedition to Baku, which was detached from Mesopotamian Expeditionary Force from Jan. to Sept. 1918. D. was Kipling's original of 'Stalky.' He wrote *Adventures of Dunster Force*, 1920; *Stalky's Reminiscences*, 1928; *More Yarns*, 1931; and *Stalky Settles Down*, 1932.

Duntocher, tn. of Dunbartonshire, Scotland, 8 m. NW. of Glasgow, manufacturing farm tools. Pop. 3000.

Duntun, John (1650-1733), bookseller, b. Grafton, W. Sussex, who had a business at the Sign of the Raven, near the Royal Exchange, London. He pub. a number of political pamphlets and squibs on the Whig side, and an interesting autobiography, *The Life and Errors of John Duntun*, 1705, ed. with a memoir by J. Nichols, 1818.

Dunwich, par. and vil. of E. Suffolk, England, situated on the coast, 4½ m. SW. of Southwold. Formerly the cap. of E. Anglia, a thriving seaport, with a bishop's seat and a king's palace, D. is now merely a small watering-place. A bishopric was estab. here about 630 by Sigebert, who built a royal palace for himself and a church for the new bishop, Felix. But the sea gradually encroached on the tn, and in the reign of Edward III destroyed 400 houses. There are remains of a 13th-cent. Franciscan priory, and the ruins of a 12th-cent. chapel near the present church. D. sent 2 members to parliament from 1296 to 1832; the corporation was not abolished until 1886, and by 1920 there were less than 200 inhabs. Pop. 150.

Duodecimals, system of arithmetical notation where the local value of a digit increases by powers of 12 as it moves to the left, instead of by powers of 10 as in the ordinary or decimal notation. Two extra symbols are required, one to denote 10 and one to denote 11. The advantage of such a system, if universally adopted, arises from the fact that 12 splits up into the small factors 2.2.3. This method of notation was used by the Babylonians and other anct peoples, and remains to-day in measures of quantity, i.e. dozen (12), gross (12 × 12 = 144); in the divs. of the clock; Eng. currency (12d. = 1s.), etc. *D. arithmetic*, as practised by surveyors, is a system by which the calculation of square measure and cubic measure is reduced to operations in the powers of 12. The table for square measure is 12 sq. in. = 1 superficial prime; 12 superficial primes = 1 sq. ft. That for cubic measures is 12 cub. in. = 1 solid second; 12 solid seconds = 1 solid prime; 12 solid primes = 1 cub. ft.

Duodenal Ulcer, see ULCER.

Duodenum, see DIGESTION and INTES-TINES.

Duparloup, **Félix Antoine Philibert** (1802-78), bishop of Orléans, b. St Félix, near Chambéry, Savoy. Ordained a priest in 1825, he became a vicar of the Madeleine, Paris, and for a time tutor to the Orléans princes. Later he founded the famous academy at St Hyacinthe. In 1849 D. was appointed bishop of Orléans. He was one of the most energetic and

influential Fr. bishops of his day. Though a staunch defender of the temporal power of the popes, at the Vatican council he was a leader among those who opposed the definition of the doctrine of infallibility. His educational doctrines had a far-reaching influence, and he wrote many books on the subject to propagate his theories. Among these are: *Méthode générale du catéchisme*, 1841; *De l'Éducation*, 1850; *De la Haute Éducation intellectuelle*, 1855; and *L'Enfant*, 1869. D. was a leader of the moderate Catholics, and his writings on eccles. and religious subjects include *La Souveraineté pontificale*, 1860; *Le Mariage chrétien*, 1869; and *Histoire de Notre Seigneur Jésus Christ*, 1870. The *Journal intime de Mgr. Dupanloup* was ed. by Branchereau in 1902. See lives by F. Lagrange (Eng. trans. by Lady Herbert, 1885); E. Faguet, 1914.

Duparc, Henri (1848-1933), Fr. composer, b. Paris. He was educ. by the Jesuits at the Collège de Vaugirard, where he learned pianoforte from César Franck, and afterwards took private lessons in composition from the same master. His few works include a symphonic poem, *Lénore*, and a nocturne, *Aux Étoiles*, but he is chiefly remembered for 16 songs, among them 'Invitation au voyage' and 'Phydilé.' He was a fierce critic of his own work and destroyed a number of compositions. He retired to Switzerland, suffering from neurasthenia, and d. almost 50 years after his last pub. composition.

Duperrey, Louis Isidore (1786-1865), Fr. navigator, b. Paris. He accompanied Freycinet on his voyage of exploration in the N. Pacific (1817-20), and on his return to France he was given the command of the *Coquille*. In 1822-5 he explored parts of Australia and New Guinea, and on his return pub. *Voyage autour du monde*, 1826-30.

Dupin, André Marie Jean Jacques (1783-1865), Fr. statesman and jurist, b. Varzy, Nièvre. In 1811 he was appointed to serve on the commission charged with codification of the laws of the empire, and in 1815 he sat for a few months in the chamber of deputies on the side of the Liberal opposition. He was made *procureur-général* after the revolution of 1830. He was president of the chamber 8 times between the years 1832 and 1848, resigning in 1848 on failing to secure the crown for the young count of Paris. The emperor restored him to his former office in 1857. His many works include *Libertés de l'Eglise Gallicane*, 1824, which was placed on the Index.

Dupleix, Joseph François, Marquis de (1697-1763), governor-general of Fr. India, b. Landrecies, Nord, France. In 1715 he went to India in the service of the Fr. E. India Company and in 1720 was elected a member of the council at Pondichéry. In 1742 he was appointed governor-general of Fr. India. When war broke out between France and England in 1744, D. strove to obtain the ascendancy of France in India by making overtures to the Indian princes. He laid

siege to Fort St David (1747), and spread his troops over the Carnatic. He attempted the subjugation of the S. of India, and at one time was proclaimed its viceroy by the inhab. His plans were, however, defeated by Clive, and he was summarily recalled by the Fr. Gov. in 1754, and was never rewarded for the undoubted service he rendered to his country. See Tibulle Hamont, *Dupleix, d'après sa correspondance inédite*, 1881; H. Castounet, *Dupleix, ses expéditions et ses projets*, 1888; G. B. Malleson, *Dupleix* (in the *Rulers of India* series), 1890; and the lives by E. Guérin, 1908, and J. Bid-dulph, 1910.

Duplex Querela (Lat. 'twofold complaint'), process in eccles. causes, consisting of an appeal from an authority to one above it, as from a bishop to an archbishop, and from an archbishop to the sovereign in council.

Duplicate Ratio, the proportion or R. which the squares of any numbers bear in relation to that of the radical quantities. If 3 quantities be continued proportionals, the R. of the 1st to the 3rd will be a D. R. of the R. of the 1st and 2nd. Thus if 3 : 12 :: 12 : 48, then 3 : 48 :: 1 : 16, which is the D. R. of 3 : 12.

Dupnizza, see MAREK.

Dupont, Pierre (1821-70), Fr. poet, b. Lyons, son of a blacksmith, but being left an orphan at the age of 5, he was brought up by the village priest. In 1839 he went to Paris, and 3 years later his poem *Les deux anges* received a prize from the Academy. His best-known songs, many of which he set to music himself, are: 'La Chanson de blé,' 'La Vache blanche,' and 'Le Braconnier.' They were collected under *Chants et chansons*, 1852-4, and *Chants et poésies* (7th ed. 1862). See C. Lenient, *Poésie patriotique en France*, 1889.

Dupont de Nemours, Pierre Samuel (1739-1817), Fr. economist and statesman, b. Paris, negotiated with the Eng. commissioner the recognition of the independence of the U.S.A. Went to U.S.A. in 1799, where he was employed by Jefferson. His family settled in U.S.A., where they estab. themselves at Powder Mill in Delaware, in the production of gun-powder. The business grew, and by 1903 the descendants of D. de N. controlled 100 companies; in 1915 E. J. Du Pont de Nemours & Co. was founded in Delaware and became a leading Amer. chemical firm with many and varied interests, among them the production of nylon and artificial fibres.

Düppel, Denmark, see ДУППОЛ.

Dupré, Giovanni (1817-1869), Tuscan sculptor, of humble Fr. origin, b. Sionna. As a boy he was put to hard manual toil, but was early fortunate in obtaining the help of the Rom. priesthood, who gave him the means of studying sculpture. Some busts of cardinals shown in Rome made a sensation. These were followed by the figures of 'Abel and Cain,' a work which was shown at the Paris Salon in 1855. Among his best works were the 'Triumph of the Cross' and the bust of Mme Dora D'Istria. He d. in poverty. See life by H. S. Frieze, 1888.

Dupré, Jules (1811-89), Fr. painter, *b.* Nantes. He was the son of a porcelain manufacturer, and worked first in his father's and later in his uncle's china factory. D. belonged to the romantic school of landscape painters, and painted nature best in her tempestuous moods. On his visit to England in 1831 he learnt much from Constable's pictures; he was also influenced by Théodore Rousseau. D.'s best-known works are: 'The Forest of Fontainebleau,' 'Morning and Evening,' His 'Crossing the Bridge' is in the Wallace Collection, London. See life by J. Claretie, 1879.

Dupré, Marcel (1886-), Fr. organ-virtuoso and composer, and one of the greatest improvisators. Organist at Notre-Dame, Paris, and he became director of the Conservatoire in 1954.

Dupuy de Lôme, Stanislas Charles Henri Laurent (1816-85), Fr. naval architect, *b.* Plœmeur, near L'Orient. He studied at the École Polytechnique and in England. He designed the first Fr. war steamer, the *Napoléon* (1848-52), and invented methods of changing sailing men-of-war into steamers. During the siege of Paris he planned a steering balloon, but the siege was over before it was put to any use. He was appointed inspecteur-général du Matériel de la Marine in 1866, was elected a member of the Academy of Sciences in 1866, and a senator for life in 1877.

Dupuytren, Guillaume, Baron (1777-1835), Fr. surgeon, *b.* Pierre-Buffière, Haute Vienne; struggled with poverty until, in 1801, he received a coveted anatomical appointment in Paris. His connection with the Hôtel-Dieu dates from 1808, and in 1815 he became chief surgeon. He was an indefatigable student, especially of morbid anatomy, enjoying a high reputation for the skill with which he performed a number of difficult operations, and as a teacher. His *Leçons Orales de Clinique Chirurgicale*, 4 vols., 1832-4, includes all his important clinics at the Hôtel-Dieu. He *d.* a millionaire. Biography by L. Delhoume, 1935.

Duquesne, Abraham, Marquis (1610-1688), Fr. adm., *b.* Dieppe. He first joined the merchant service, and took part in the defeat of the Spaniards at the capture of the Lerins Is. (1637). He also fought at Guetaria (1638), Coruña (1639), Tarragona (1641), and Barcelona (1643). In 1676 he defeated the combined fleets of Spain and Holland off Stromboli, for which victory he was made a marquis by Louis XIV. He also bombarded Algiers (1682-3) and Genoa (1684), and did much service to his country by reorganising the Fr. fleet. See A. Jal, *Abraham Duquesne et la marine de son temps*, 1873.

Duquesne, city of Allegheny co., Pennsylvania, U.S.A., 10 m. SE. of Pittsburgh, on the Monongahela R., and on the Pennsylvania Railroad. It has steel works and blast furnaces. Pop. 17,620.

Duquesne, Fort, Fr. fort and trading-post built in 1754 on the site where Pittsburgh now stands. The Brit. expedition against it under Braddock was repulsed in 1755, but in 1758 Gen. Forbes captured

it from the Fr., and in the following year began the building of Pittsburgh and Fort Pitt, in honour of Wm Pitt, the prime minister of Britain.

Duquesnoy, François (1594-1644), a Flem. sculptor, of Brussels, commonly known as François Flamand or (It.) Il Fiamingo. He chiefly excelled in modelling children. He executed groups of children for the high altar at St Peter's, Rome; a 'Concert of Cherubim' in the church of the Holy Apostles, Naples; 'St Susanna,' in the Loretto church at Rome; and 'St Andrew,' in the basilica of St Peter's.

Duralumin, trade name applied to alloy of aluminium (94 per cent), containing also copper (approximately 4 per cent), manganese, magnesium, and silicon. It was invented in 1906 by Wilson, and for many years was the strongest of light aluminium alloys, having the then peculiar property of hardening spontaneously after a special heating process. But since then (c. 1925) various other alloys having similar properties have been developed. In its strongest state D. is as good as mild steel, but not so ductile and only one-third of its weight. It resists atmospheric corrosion but requires protection against sea water. The term is sometimes used to include the class of wrought aluminium-copper-magnesium alloys of the age-hardenable type. See ALLOY.

Duramen, in botany, is the heartwood or older internal portion of the secondary wood, as distinguished from the outer sap-wood (*alburnum*).

Durance, riv. of SE. France, which rises in the dept of Hautes-Alpes, and flows SW. past Briançon in a series of gorges. In its lower reaches it is much canalised for irrigation purposes, and its course becomes NW. It finally enters the Rhône 3 m. below Arvignon (q.v.). Its chief trib. is the Verdon. Length 225 m.

Durand, Charles Auguste Emile, see CAROLUS-DURAND.

Durango: 1. Mountainous state of N. Mexico, 47,691 sq. m. in area, with a pop. of 629,900. The rugged peaks of the Sierra Madre cross the W., where grizzly bears, wolves, deer, and wild turkeys are found. Cotton is also indigenous. The Toltecs believed that the god of the air had taught them its use, and it is still one of the great staples of D. Corn, tobacco, fruits, and sugar cane are also produced, and cattle- and sheep-breeding are carried on. Cerro de Mercado, just outside D. city, is an iron mt., nearly 1 m. in length. There are also rich gold, silver, and copper mines.

2. Cap. of D. state, c. 500 m. from Mexico City on the Central Highway, and some 6200 ft above sea-level. It enjoys a matchless climate and is a resort as well as an industrial centre, at the junction of 2 of the main routes crossing the country. It has an 18th-cent. cathedral, palace of the state gov., and mint. The industries are metallurgy, especially iron and steel, cotton, and processing of stock and agric. products. The children's health-play-ground is famous. Pop. 23,400.

3. Sp. tn in the prov. of Vizcaya, on the D. riv. Pop. 10,000.

Duránis, or **Durránis**, the dominant race of Afghans, comprising the Zirak and the Panjpai. They inhabit the N. slopes of the Safed Koh.

Durant, **William James** (1885-), Amer. philosopher, b. North Adams, Massachusetts. Educ. at St Peter's College, Jersey City, and Columbia Univ., he became Prof. of Philosophy at the univ. of California. After the success of his book *The Story of Philosophy*, 1926, he wrote *The Case for India*, 1930; *The Tragedy of Russia*, 1933; and a vast work *The Story of Civilisation*, which appeared in successive vols.—*Our Oriental Heritage*, 1935; *The Life of Greece*, 1939; *Caesar and Christ*, 1944; and *The Age of Faith*, 1950.

Durant, city in Bryan co., Oklahoma, U.S.A., 19 m. NE. of Denison. It is an agric. centre, and has cotton and cottonseed oil industries. It is the seat of the Southeastern State College and Oklahoma Presbyterian College for women. The tn received a charter in 1904. Pop. 10,541.

Durante, **Ser**, poet of Tuscany, b. in the early part of the 13th cent. He wrote an adaptation of the *Roman de la Rose* in 233 sonnets called *Il Fiore* (ed. Mazzatini, 1888).

Durazno: 1. Dept. of Uruguay, crossed by the Cuchilla Grande del D. Vast numbers of sheep and cattle are pastured in the dist. Area 5525 sq. m.; pop. 100,000.

2. Cap. of D. dept., on the Yi R., a road and railway junction, 105 m. N. of Montevideo, with dairying, flour milling, and meat-packing industries. Pop. 27,000.

Durazzo (Albanian **Durrës**) (ancient **Epidamnus** and **Dyrrachium**), port on the bay of D., 60 m. S. of Sentari (Shkodër), in Albania. The main industries are ship-building, bricks, milling, and tobacco. Epidamnus was founded in the 7th cent. BC by settlers from Corinth and Corcyra. The Romans, who seized it early in the 4th cent. BC, called it **Ithyrrachium**. It was a favourite harbour at which to embark Rom. troops sailing eastward, and it was here that Pompey gained a short-lived triumph over Caesar, before his defeat at Pharsalus (48 BC). It was destroyed by an earthquake in AD 345, and was besieged and taken in 481, 1082, and 1185. D. belonged to Venice from 1392 to 1501, and then to the Turks until 1913. From it the retreating Serbs were shipped to safety in 1915 by Fr. vessels. During the It. invasion of Albania, 1939, It. troops landed at D. Pop. 41,000.

Durban, port and 3rd largest city in S. Africa, the commercial centre of Natal prov., lies in a landlocked tidal bay and ranks among the greatest ports of the world. The enclosed harbour has an area of 6 sq. m. and 6 m. of quays. The average depth of water alongside the commercial wharves is 30–36 ft. but some have a depth of 40–42 ft. There are graving docks, a floating dock, and a grain elevator (42,000 tons capacity) at Congella wharf. The pre-cooling store holds 1800 tons of citrus and deciduous fruit. The port is equipped with electrically driven

appliances capable of loading 2100 tons of coal per hr. There is a whaling station and 2 factories for processing in the bay. In addition to D.'s importance as a port there is considerable industry in the city and environs, including the manuf. of soap, paint, matches, textiles, clothing, rope, paper, chemicals, enamel ware, furniture, tyres, glass and plastics. There are also sugar retheries, important engineering works, and large railway workshops. It is a popular seaside resort boasting of a climate during the winter months similar to the Fr. Riviera. The beautiful surrounding country adds to its attraction as a holiday resort. All varieties of sub-tropical fruits grow here. Civic buildings rank with any in the S. hemisphere. D. was founded in 1824 by Lieut. F. G. Farewell, who secured a cession of land from the Zulu chief, Chaka. In 1835 it was named D. in honour of Sir Benjamin D'Urban, the then governor of the Cape. Ambitious plans exist for future development. The city's airport is at Reunion (8 m. S.), where there are daily services to main tns in South Africa. Pop.: Whites, 177,000; Bantu, 196,500; Asiatics, 214,400; Coloured, 24,900.

Durbar (from Persian *darbar*, meaning 'court' or 'audience'), the executive council of a prov. or state of India and formerly used in this sense by Indian rulers, who discussed state administration and other business in D. During Brit. rule the word was most commonly applied to such ceremonial gatherings or festivals as Lord Lytton held at Delhi in 1877, for the purpose of proclaiming Queen Victoria Empress of India. Delhi was the scene of similar state functions in 1903 and 1912, when Edward VII and George V were proclaimed emperor.

Düren, Ger. tn in the *Land* of N. Rhine-Westphalia (q.v.), on the Roer, 32 m. SSW. of Düsseldorf (q.v.). It dates from the times of the Carolingians (q.v.). During the Second World War, in the early months of 1945, it became the centre of most bitter fighting for the Roer R. The Americans occupied half the tn on 24 Feb. and the remainder some days later. When it was finally taken the greater part of the tn was in ruins (see WESTERN FRONT IN THE SECOND WORLD WAR). Since the end of the war there has been a great deal of reconstruction work. Metal goods, textiles, paper, and glass are manuf. Pop. 35,000.

Dürer, **Albrecht** (Albert) (1471–1528), famous Ger. painter and engraver, b. Nuremberg, son of a goldsmith. A leader of the Ger. school of painting, he was also considered the inventor of the art of etching and of printing woodcuts in 2 colours. His copper-plate engravings are especially famous, and he ranks higher as a master of linear design than as a painter. In 1486 he became a pupil of the painter Michael Wöhlgenuth. From 1490 to 1494 he went on a tour, probably through Germany, visiting Strasburg, Colmar, Basel, and Venice, where Mantegna's works impressed him greatly. Water-colour landscapes, the product of his

journeys, are now greatly esteemed. On his return he married Agnes Frey, but their union is thought to have been an unhappy one. For a time he probably worked in Wohlgemuth's studio, but by 1497 had one of his own. D. went to Venice, 1505-7, where he painted 'The Martyrdom of St Bartholomew.' In 1512 he became court painter to Maximilian I, and painted for him 'The Virgin with many Angels.' He was deputy for Nuremberg at the Augsburg Diet, 1518, and painted Maximilian's portrait there. In 1521-2 D. and his wife visited the

those of Raphael, Melanchthon, Erasmus and himself. His drawings include such classics as the 'Hare' (Albertina), 1502, and magnificent portrait drawings (e.g. in the Brit. Museum). The series of engravings known as 'The Passion in Copper' was done between 1508 and 1513. All D.'s work is marked by a powerful imagination, impeccable craftsmanship, and also the enquiring spirit of the Renaissance, though it influences never submerged the Germanic character of his art. D. wrote on geometry and perspective, on mensuration (1525), on fortification (1527); *Vier Bücher über die Proportion* appearing in 1528. See Lady E. Eastlake, *Five Great Painters*, 1883; G. L. Schefer, *The Artist's Married Life*, 1848; D. Burekhardt, *Dürers Aufenthalt in Basel*, 1892; M. Zucker, *Albrecht Dürer*, 1900; H. Wölfflin, *Die Kunst Albrecht Dürers*, 1905; W. Waetzolot, *Dürer and his Times* (new ed.), 1955.

Duress (from Lat. *duritia*, harshness), a legal term for 'constraint.' It is open to a defendant to advance a plea of D. if he has been driven by menace (*per minus*) of death or bodily harm to commit some act which would normally constitute a crime or misdemeanour. The constraint may also consist of imprisonment.

D'Urfey, Thomas (1653-1723), poet and dramatist, b. Exeter, of Huguenot descent. A well-known man-about-town, he was a companion of Charles II and lived on into the reign of George I. He is best known by his collection of songs, *Pills to Purge Melancholy*, 1719-20. Addison describes him as 'a diverting companion' and 'a cheerful, honest, good-natured man.' His plays include: *The Siege of Memphis*, 1676; *Madame Fickle*, 1677; *The Virtuous Wife*, 1680; and *The Campaigners*, 1698. See C. L. Day, *The Songs of Thomas D'Urfey*, 1934.

Durga, or **Devi** (Sanskrit 'Inaccessible'), in Hindu mythology the daughter of Himavat (the Himalayas) and the wife of Siva. She is depicted with 10 armed hands, a kindly face, and attendant lions to suggest the ferocity of her nature. Bloody sacrifices are offered her, whilst her birthday, annually celebrated at the great festival of Durga-puja or Dussera ('ten days') in the 6th Hindu month, is especially important in Calcutta.

Durham, John George Lambton, Earl of (1792-1840), statesman, educ. at Eton, and afterwards served in the 10th Hussars. He entered parliament as a Whig in 1813. In 1828 he was raised to the peerage, taking the title of Baron D. In 1830 he became a member of the cabinet as Lord Privy Seal. The liberality and ultimate success of the Reform Bill are said to be chiefly due to him, his enthusiasm for reform gaining him the nickname of 'Radical Jack.' He went to Russia in 1835 as ambas., and remained there 2 years, after which he was sent to Canada as governor-general (1838). His immediate task was to inquire into the causes of unrest in the provs., but though he successfully quelled all discontent he remained in Canada only 5 months, resigning owing to criticism in England of

ALBRECHT DÜRER

A self portrait at the age of 26

Netherlands and won the patronage of Charles V. He favoured the doctrines of the Reformation and was a friend of Luther. The mural decorations of Nuremberg city hall—'The Calumny of Apelles' and 'The Triumph of Maximilian'—were designed by D. Among his most famous engravings are: 'Adam and Eve', 1504; 'The Nativity', 'The Great Horse', and 'The Little Horse', 1505; 'Melancholia' and 'St Jerome in his Study', 1514; 'The Knight, Death, and the Devil', 1513; 'The Prodigal Son', 1503. Noted woodcuts are: 'The Apocalypse' (16 subjects, including the Revelation of St John), 1498; 'The Greater Passion' (12 subjects); 'The Lesser Passion' (37 subjects). Among his best pictures are: 'The Feast of the Rosary', 1506 (now in Strahow monastery, near Prague); 'Martyrdom of the 10,000 Christians', 1508 (Vienna Gallery); 'Adoration of the Magi', 1504 (Uffizi, Florence); 'Adam and Eve' (Florence), 'Adoration of the Trinity', 1511 (Imperial Gallery, Vienna); 'The Four Apostles', 1526 (Munich Gallery); 'Crucifixion', 1511. Among his portraits are

his lenience towards the ringleaders of the rebellion in Lower Canada. But his famous report, issued in 1839, led to the Union of Upper and Lower Canada and the institution of a common legislative assembly responsible to the executive council. See DURHAM REPORT. See life by S. J. Reid, 1906.

Durham: 1. Maritime co. of N.E. England, bounded on the N. by Northumberland, on the E. by the North Sea, on the S. by Yorks, and to the W. by Westmorland and Cumberland. In the W. are highlands belonging to the Pennines, rising to 2300 ft; this dist. is mostly barren moorland. Loamy fertile soil lies about the prin. rivs., the Tyne, Tees, and Wear. Sheep are pastured on the foothills of the Pennines. Coal-mining and shipbuilding are the chief industries; Sunderland, Jarrow, South Shields, Stockton-on-Tees, and West Hartlepool (qq.v.) are the prin. shipbuilding centres. Iron founding, steel production, chemical manuf. and engineering are also carried on. D. city (q.v.) is the co. tn. Part of the kingdom of Northumbria from the mid 6th to the early 9th cent., D. was a co. palatine until 1836. The co. returns 9 members to Parliament, and the 6 parl. bors. return 7 members. Area 1015 sq. m.; pop. 1,463,416.

2. Co. tn of D., England, 12 m. S. of Newcastle. Both the cathedral and the castle are magnificently situated on a tall rocky peninsula almost encircled by the R. Wear. In the year 995, Bishop Aldhun and his community of monks brought the incorrupt body of St Cuthbert hither from Chester-le-Street, guided, so legend relates, by a girl looking for her lost dun cow. The site was then called *Dunholme* (Hill Island). D. stood on the main line of Scottish invasions E. of the Pennines and so the community of St Cuthbert was deliberately developed into a powerful buffer between Scots and Eng. The bishops became important secular rulers, holding sway over a 'county palatine' and having many royal privileges. They had their own army which they often led in person. They also had their own courts, councils, and judges, of which traces remain in the D. Court of Chancery and the Halmote Court. The bishop's palatinate powers were reduced progressively down to the time of Wm van Mildert (1826-36), who is reckoned the last of the 'prince bishops.' The cathedral as it now stands was begun in 1092 by Bishop Wm of St Carleph. It is a stately building with its massive Norman nave, its late Norman Galilee chapel, its Early Eng. Chapel of the Nine Altars and its Perpendicular tower. It housed a Benedictine monastery in its precincts until 1540. Of the monastic buildings remaining, the most interesting is the dormitory, built about 1400 and with the original oak roof still intact. This room is now used as a library and museum and contains various anct MSS., the famous Conyers falchion, fragments of A.-S. crosses and other objects of interest. Leading from it is the 'loft,' in which are kept the Cuthbert relics, fragments of the

coffin made for the saint in 698, his own portable altar and pectoral cross, and the oldest needlework in England, in the shape of the stole and maniple presented to St Cuthbert's shrine by King Athelstan in 934. The cathedral occupies the S. side of Palaco (or Place) Green. This green, like the castle and most of the other buildings round it, now belongs to D. Univ. The building nearest the castle gate, now part of the univ. library, was once the exchequer built by Bishop Neville in 1450. Next door is the library built by Bishop Cosin in 1669 for the use

W. F. Mansell

THE NAVE OF DURHAM CATHEDRAL.

of the diocesan clergy. On the opposite side are the 17th-cent. almshouses, now univ. lecture-rooms, also Cosin's work. The most remarkable features of the castle are the Norman chapel and the Norman gallery and doorway, all dating back to 1072: the Great Hall, also a Norman foundation, though the present structure was erected by Bishop Hatfield in the early 14th cent.; the kitchens built in 1499 and still used; and the Black Staircase built by Cosin in 1665. The tn hall in the market place is modern (1851) and has some good modern stained glass. In the same building is the original guildhall where the city freemen held, and still hold, their meetings, for 8 of the 16 medieval freemen's guilds still survive. In the lobby are a portrait, a statue and some clothing of Joseph Boruwlaski, a Polish dwarf, 39 in. in height, who d. in Durham in 1837, at the age of 98. The mayor's chamber has 18th-cent. panelling and a fine Jacobean overmantel. Of the churches of D., the most remarkable are St Oswald's built in the 11th cent., but badly restored; St Margaret's, with considerable late Norman remains; St Giles at the top of Gilesgate, built in 1112; and

St Mary-le-Bow with 18th-cent. screen and wainscoting. The 2 main bridges, Framwelgate and Elvet, both date from the 12th cent. The buildings at the S.E. end of the latter show traces of the chapel of St Andrew which once stood there. Prebend's Bridge was put up in 1771. From it the visitor has one of the best views of the picturesque banks which form a beautiful setting for the cathedral and the canon's houses. The view from South Street which stands on the opposite bank must be among the finest of its kind in Europe. D. is rich in Georgian houses of which there are many in the N. and S. Baileys, in Old Elvet and in South Street. A number of them have fine staircases. Among the other interesting places is the café at No. 39 Silver Street, once the house of Sir John Duck, a 17th-cent. butcher's apprentice who made good; it has a particularly fine staircase. In the near neighbourhood are Kepler hospital, now a farm, founded in 1112 as a religious estab., and Sherburn Hospital, a 12th-cent. leper hospital; now, much altered, it is a combined hospital and almshouses. The site of the battle of Neville's Cross, where the Eng. defeated the Scots in 1346, is on the N. outskirts. The chief occupations are local gov., the distributive trades and coal-mining (though there are no pits in the immediate vicinity). The local trades include a carpet factory, 2 organ factories, and a sweet factory. Assizes and quarter sessions are held here. The chief educational estabs. include the univ. (q.v.), an old estab. public school for boys known as D. School, a high school for girls, 2 grammar schools and various others. Pop. 19,283. *Sec. G. Home, Durham Cathedral, 1935; G. H. Cook, Portrait of Durham Cathedral, 1948.*

3. Co. seat of D. co., North Carolina, U.S.A., 25 m. NW. of Raleigh. It has a great trade in tobacco and manufs. cigars and cigarettes, having one of the largest tobacco factories in the world. It also has large cotton and hosiery mills, and manufs. paper boxes, pharmaceuticals, and machinery; lumber and grain milling are also important. It is the seat of Duke Univ., the North Carolina College for Negroes, and Lincoln Hospital for Negroes. Pop. 71,311.

Durham, University of, founded 1832 by Bishop Van Mildert and the dean and chapter, and opened 1833. The College of Medicine and the College of Physical Science in Newcastle upon Tyne were associated with the univ. in 1851 and 1871 respectively; women were admitted to degrees from 1896. The univ. is now organised in 2 divs., viz. the Durham Colleges (8 colleges and 2 non-collegiate societies with a total of about 1200 students) and Newcastle (King's College, including the medical school, with about 3000 students). The faculties of arts, science, education, and music are common to both divisions; theology is taught in D. alone, and medicine, applied science, agriculture, law, and economic studies in Newcastle alone.

Durham, or Shorthorn, Breed, see CATTLE.

Durham Light Infantry, The, formerly 68th and 106th regiments, linked in 1881 to form the D. L. I. 68th formed in 1756 as 2nd Battalion, 23rd Regiment, but became 68th in 1758. Served mainly in France, West Indies, and Gibraltar, and joined Wellington's army in Peninsula in 1811. Later served in North America, Crimean War, and Maori War in New Zealand (1864). The 106th Regiment was raised in India by the East India Co. in 1826 as 2nd Bombay European Regiment. Served at Scinde and Aden and in 1857 in Persian Expedition, and during the Indian Mutiny. After the mutiny it was transferred to the Brit. estab. as 106th Regiment and came to Eng. in 1871. Fought in Egyptian campaign of 1884-5. The D. L. I. served in South African campaign of 1899-1902 and was in the Ladysmith relief column. During the First World War it raised some 37 battalions which served in France, Flanders, Italy, Macedonia, Egypt, on NW. Frontier of India, and at Archangel. The regiment also served in the Third Afghan War in 1919 against the ex-king Ammanullah (q.v.). The D. L. I. fought on the W. Front and in Burma in the Second World War. The 10th and 11th Battalions were part of the 49th Territorial Div. and, together with the Tyneside, Scottish, and various Yorks units, they distinguished themselves in the battle of Normandy, in the capture of Rauray and Bayeux. One battalion was part of the garrison troops on the Is. of Cos.

Durham Report, sequel to the rebellions in Canada of 1837-8. The rebellions failed because most Reformers, though bitterly opposed to 'Family Compact' rule (i.e. the rule of a small minority of wealthy and influential people), would not join an armed rising. But the Brit. Gov. nonetheless took prompt action by appointing the earl of D. (q.v.), one of England's foremost public figures, to be governor-general of Canada with the mission of preparing recommendations for reforming the gov. of the Canadas so as to end the strife which for years had torn them into warring factions. Baffling problems awaited him: the assemblies of Upper and Lower Canada had been suspended; numerous political prisoners filled the gaols; violence on the Amer. border threatened to flare up into actual warfare. D. spent 5 months in Canada, mostly in Quebec, and through his staff collected a great deal of information which he subsequently used in his R. On 28 June 1838 he freed all the political prisoners except a few, whom he banished to Bermuda; but in naming a particular place of exile he exceeded his powers, and when the Brit. Gov. weakly disallowed his order he resigned, to the great chagrin of the Canadian people, with whom he was popular.

Hloom and disappointment would have marked the close of his mission had it not been for the R., on the preparation of which he expended intense energy. Two months after his return it was completed and laid before parliament. It touched on all the provs., but paid most attention

to conditions in the two Canadas. To end the crisis there D. put forward 2 prin. recommendations: the union of Upper and Lower Canada, and the introduction of responsible gov. He favoured union because the separation of the provs. since 1791 had caused many disputes and had made impossible, for example, the completion of the St Lawrence canals. Moreover, he thought that conflict between France and England was the root of the trouble in Lower Canada and that union would resolve the difficulty by reducing the Fr. to a minority in the new gov. and assimilating them to the Eng. Canadians in language and laws. These views on the Fr.-Canadians are the least successful part of the D. R., though much of what D. remarked here was well founded, as for instance the Fr.-Canadians' lack of training in self-gov. But, as the future proved, the difficulties between the Fr. and Eng. Canadians could only be solved by developing co-operation and a sense of responsibility on both sides. The most important of the recommendations of the D. R. was responsible gov. on the model of the Brit. system of cabinet gov. adapted to colonial conditions. To avoid a clash between the executive council and the instructions sent to a governor, the R. proposed to limit the power of the colonial gov. to local affairs, in which the Brit. Gov. had no desire to interfere. Four matters were to be kept under control of the imperial gov.: foreign affairs, the regulation of trade, land grants, and the form of gov. The distinction, however, of first advocating responsible gov. belongs to Robert Baldwin of Upper Canada, who had been urging it for some years. Baldwin wrote to D. while he was in Canada and convinced the governor-general that responsible gov. would be effective. D.'s contribution, however, was equally essential; for by his R. he forced it on the attention of the Brit. Gov. and people and thereby ensured that it would be given a trial. His other recommendations, if less important, were essential to his aims: to train people in democratic gov. he advocated the estab. of local and municipal gov. and elected councils. He also recommended the extension of education because 'general education is necessary to the establishment of a strong popular government.' If the D. R. is not above criticism, its merits far outweigh its defects, and it is rightly regarded as one of the most important constitutional documents in the hist. of the Empire. For it upheld the ideal of colonial self-gov. as one to be cherished, not feared and suppressed. It pointed to the possibility of a strong Brit.-Amer. nation. To-day, for these reasons, the author of the R. is numbered among the founders of Canada. The R. was at once approved by the home gov., but responsible gov. was not achieved immediately. The Family Compact groups were most hostile to it and many people on both sides of the Atlantic thought it was merely a step in the disintegration of the Empire. Almost 10

years of political strife for Canadian Reformers passed before the nature of responsible gov. was understood and the necessity for its full and free acceptance recognised. See G. W. Brown, *Building the Canadian Nation*, 1942; Sir R. Coupland, *The Durham Report*, 1945.

Durio, genus of Bombacaceae, is indigenous to the Malay Archipelago. *D. zibethinus* is a large and lofty tree with smallish, alternate leaves, and yields the fruit known as durian. The durian is remarkable for the delicacy and richness of its flavour and the offensiveness of its odour, which has been compared with that of decaying onions.

Durius, see DUERO.

Dürkheim, Bad, Ger. spa in the Land of Rhineland-Palatinate (q.v.), 37 m. S. by W. of Mainz (q.v.). It has an arsenical spring, and is the centre of an important vine-growing dist. Pop. 11,000.

Durlach, Ger. tn in the Land of Baden-Württemberg (q.v.), an E. suburb of Karlsruhe (q.v.). It has a castle (now a museum) which was the seat of the margraves of Baden-D. from 1656 to 1715.

Dürnstein, or **Dürrenstein**, Austrian vil. in the prov. of Lower Austria, on the Danube, 4 m. W. of Krems. It has many ant. buildings and is overlooked by the ruins of a castle in which Richard I (q.v.) was imprisoned (1192-3). Pop. 600.

Durocortorum, see REIMS.

Durostorum, see SILISTRIA.

Durra, **Dhurra**, or **Doura** (Arabic *durah*), a native name of *Sorghum milgare* v. *durra*, an ann. plant grown in Africa, Asia, India, and warm countries for its large, almost globose grain; also known as Indian millet and Egyptian rice corn, and yellow milo and Jerusalem corn are forms of it. The name is also applied to the flour made from the grain, which makes an inferior bread to that of wheat. See SORGHUM.

Dürrenstein, see DÜRNSTEIN.

Durrës, see DURAZZO.

Dursley, tn of Gloucestershire, England, 15 m. S. of Gloucester. Once famous for cloth manufacturing which still flourishes at a mill in Cam, 1 m. N.; prin. industries are the manuf. of agric. implements, engines, pumps, and electric motors. The reformer Fox, bishop of Hereford, was born here in 1496. D. gives its name to a rural dist. Pop. (with environs) 9000.

Duruy, Jean Victor (1811-94), Fr. historian and politician, b. Paris, of working-class origin. From 1863 to 1869 he was minister of public instruction. During his 6 years in office he modernised the curricula of lycées and colleges, instituted secondary education for girls, and founded the 'conférences publiques.' His *Histoire des Romains* (Eng. trans.), 1883-6, is his most outstanding pub.

Duse, Eleonora (1858-1924), It. actress, b. Vigevano; only child of Alessandro Vincenzo D., a Venetian actor (the son of the actor, Luigi D.). She was on the stage from childhood, and toured continually. During her first season of success at Naples, with *Les Fourchambault* by Augier, she was deserted by her lover,

Martino Cafilero; and the boy to whom she gave birth at Turin lived for only a few days. In 1881, at Florence, she married Tebaldo Checchi, a fellow-actor. At the Carignano Theatre, Turin, she scored a success (immediately after a Bernhardt season) with *La Princesse de Bagdad* by Dumas fils. Later she returned with her husband to Turin, where a daughter was born. The company visited S. America; and at Rio de Janeiro she separated from her husband on account of her passion for Flavio Andô, a young actor who had joined them. Checchi soon afterwards d. in a consular post at Lisbon and left her a legacy. On return to Europe the company was disbanded, and she formed a new one, with Andô as its head. She began to tire of the old-fashioned Dumas plays, and came under the influence of Ibsen. She created the part of Santuzza in *Cavalleria Rusticana*. D. rivalled Bernhardt in Paris in 1897. After her relations with Andô had cooled, she was associated for 5 years with D'Annunzio (q.v.) in an attempt to revive classicism in the It. theatre. Many of his plays were written for her. She played such different rôles as Juliet, Francesca du Rimini, Marguerite, Camille, Fernande, Magda, Paula Tanqueray, and Ellida in Ibsen's *Lady from the Sea*. She would have nothing to do with make-up—relying on her natural liveliness of feature, voice, and gesture. She retired from the stage in 1909. Owing to war losses she returned to it in 1921, and repeated her triumphs in Italy, London, and America. She d. of influenza at Pittsburgh, Pennsylvania. See E. A. Rheinhardt, *Das Leben der Eleonora Duse*, 1930.

Dushambe, see STALINABAD.

Dusek, Jan Ladislav (1700–1812), Bohemian pianist and composer. He was an accomplished pianist at the age of 5 and an organist at 9. Was a choir boy at the convent of Jihlava, attended a Jesuit college, and afterwards took his degree in philosophy at the univ. of Prague. For some time he supported himself as organist, and having made a name at Amsterdam as a pianist of remarkable virtuosity and delicacy of touch, he became prof. of music to the stadtholder at The Hague. Whether he played in Berlin, St Petersburg, Milan, or London, D. invariably attracted large audiences. His attempt to found a music-publishing business in London was a complete failure, and he was obliged to take refuge from his creditors in Hamburg. In 1803 he became an intimate friend of Prince Louis Ferdinand of Prussia, himself a good musician and minor composer, who fell in battle in 1806. From 1807 till his death D. directed the concerts of Prince Talleyrand in Paris. But he undermined his constitution by drinking heavily, in a vain effort to rouse himself from the excessive languor to which his obesity had reduced him. He wrote many pianoforte concertos, much chamber music, and a large amount of piano music in which the instrument is used in a novel and congenial way. His 38 sonatas show many striking anticipations of later composers.

Düsseldorf, city of W. Germany, on the r. b. of the Rhine (q.v.), cap. of the *Land* of North Rhine-Westphalia (q.v.). It was made a city by the duke of Berg (q.v.) in 1288 (but one of D.'s churches dates back to the 8th cent., and there are still the remains of a palace of the emperor Frederick I. q.v.), and it became the cap. of the Duchy in 1385. In 1609 it passed to the Palatinate (q.v.), and in 1815 (after a short period under the duke of Berg, during the reorganisation of Germany by Napoleon I. q.v.) was incorporated into Prussia (q.v.). After the First World War it was occupied by the Fr., 1921–5. In the years before the Second World War it became the administrative cap. of the Ruhr (q.v.); most of the iron and steel, heavy engineering, and armaments plants of the Ruhr dist. had their head offices and administrative depts in the city. It suffered widespread devastation during the Second World War, and when it fell to the Allies in 1945 more than half of the city was in ruins (see below). The work of reconstruction was begun immediately after the war.

The fortifications of the city were destroyed by order of Napoleon at the beginning of the 19th cent., and converted into promenades. The city is now one of the best laid out in Germany, with fine squares and beautiful gardens. The prin. street is the Königsallee, a mile long, lined with offices, excellent shops, and restaurants. There are sev. ant. churches, including the Lambertikirche, which dates from the 13th cent. The old tn hall was begun in 1567, and there is a new tn hall, completed in 1953. Some of the modern industrial architecture of the city is very fine. D. has sev. museums and art collections, an artists' colony, and an academy of fine arts. It was the bp. of Heine, Peter von Cornelius, and Friedrich Jacobi (qq.v.); and among the residents of the city have been Goethe, Brahms, and Robert Schumann (qq.v.). The riv. harbour (4 basins) is busy, and there are iron, steel, machinery, textile, chemical, glass, and foodstuff industries. Pop. 633,500. During the Nazi regime (see GERMANY, *History*) the prin. industry of D. was the making of armaments, the largest war plant concerns being the Rheinmetall-Borsig Factory, making guns, shells and other armaments; the Mannesmann-Röhren Werke, making iron and steel tubes, submarine mine cases and the like; and the J. G. Schiewitzke Plant, making torpedoes and torpedo tubes. It was therefore an important target for Brit. bombers during the Second World War, especially from 1943 onwards. On 3 April 1945 the Germans blew up the 3 bridges of D. to save the city from capture, but it fell to the Allies soon afterwards. See WESTERN FRONT IN SECOND WORLD WAR.

Dust, small particles of earth, etc. which are moved by the slightest air-currents. Even in a room which has been kept spotlessly clean the existence of D. can be demonstrated when a strong beam of sunlight enters by a window. The D.

of the atmosphere consists of tiny fragments of minerals, organic matter, carbon, and ash from burning substances, volcanic D., salt from sea-spray, and D. formed by the disintegration of meteors on their way through the atmosphere. D. was formerly considered a nuisance without any redeeming qualities, but J. Aitken, in 1880, demonstrated that it combined with its disadvantages sev. useful functions. When air containing water vapour is cooled to the point of saturation, the water vapour does not condense at once unless there is some solid substance for it to condense upon. In suitable conditions some particles in the atmosphere can become nuclei or centres for the condensation of water. These minute globules form clouds, mists, and fogs, and on coalescing form drops of rain. Aitken devised an instrument for counting the nuclei in a known vol. of air. The results show that concentrations of nuclei are very variable, from 100 per c.c. in very clear air to about 100,000 per c.c. in the air of large cities. Many modifications of the sun's light are due to D. Without it we should have no twilight, no blue sky, no gorgeous sunsets, and none of the chiaroscuro effects which make scenery charming. On the other side of the account, D. presents to-day a most serious technical problem in many industries because of explosion risks and health hazards. In a certain mixture of air and suspended fine D. an explosion of great violence may occur in the presence of a spark or flame, and preventive measures must be taken, e.g. in flour-mills, saw-mills, and mines. More serious is the effect of D. on health: miners, particularly of anthracite, are susceptible to D. diseases, and other industries are not without their dangers. It is the cause of various skin diseases, and of bronchial ailments in the cotton industry, with attendant risks of poisoning.

Dusuns, tribe of N. Borneo (q.v.), numbering 117,867 out of the total native pop. of 243,009 (1951 census).

Dutch Antilles, see WEST INDIES.

Dutch Architecture, see BELGIAN AND DUTCH ARCHITECTURE.

Dutch Art. The phrase here mainly denotes the A. of the Netherlands from the end of the 16th cent. to about 1700. Much of the architecture and sculpture of the Low Countries was destroyed by Protestant vandalism in the 2nd half of the 16th cent., but see BELGIAN AND DUTCH ARCHITECTURE.

It is, however, the work of Dutch painters which must be considered among the glories of European civilisation; and throughout that work 2 themes predominate, Dutch home life and republican freedom. In the late 16th and early 17th cents. D. A. was influenced by It. Renaissance and baroque art. Thus Cornelisz (1562-1638) (q.v.) tried to reproduce the style of Raphael, but without marked success. His 'Bacchus and Ceres' at Dresden and 'Prodigal Son' at Budapest exemplify the effect of seduction in the guise of classical myth and moralistic art respectively. Abraham Bloemaert (c.

1564-1651) (q.v.) painted in the baroque style. He owed something to Titian, as may be seen in his 'Shepherdess with Grapes' at Karlsruhe. His pupil Gerard van Honthorst (1590-1656) (q.v.) painted portraits of royal personages and other celebrated individuals. 'Those of Queen Elizabeth of Bohemia and George Villiers, 1st duke of Buckingham, are in the National Portrait Gallery. He is, however, more esteemed for powerful effects of lighting in which he anticipates Rembrandt. Jan van Goyen (1596-1656) (q.v.) was one of the founders of a school of painters specialising in picturesque naturalistic landscape. Among his most celebrated pupils was Nicholas Berchem (1624-83) whose 'Old Port of Genoa,' 'Jupiter with Nymphs on Ida,' and 'Musical Shepherdess' are in the Wallace Collection. Mention must be made of a distinct group of painters famous for their studies of lower and middle class life, emphasising particularly its gay and carefree aspect. Among them were Dirk Hals (c. 1589-1656) (q.v.), Adriaen Brouwer (1605-38) (q.v.), Flem. painter of tavern scenes who worked in Holland, Adriaen van Ostade (1610-85) (q.v.) whose 'Alchemist' is in the National Gallery, and (to-day very highly esteemed) Jan Steen (1626-79) (q.v.) his pupil Jan Molenaer (c. 1610-68), a pupil of Frans Hals. Besides tavern groups he painted scenes from wealthy bourgeois life, and his significance in the latter genre lies in the fact that such works as 'The Family Feast' at Amsterdam and 'Musical Pastime' in the National Gallery were forerunners of the D. *tableaux de modes* which were later developed by Gabriel Metsu (1630-67) (q.v.) and Gerard Ter Borch (or Terborgh) (1617-81) (q.v.). The latter was a prolific artist who expended minute exactness upon details of dress and furniture. In portraiture he reveals the influence of Velázquez. The National Gallery possesses a splendid example of his work in 'The Peace of Munster' (see NETHERLANDS, History). Yet another group of painters is remarkable for what has been called 'Architectural Art.' Handsome interiors are the features of such pictures as 'Young Woman in a 'Court-yard' and 'Peepshow Cabinet' (both in the National Gallery) by Samuel van Hoogstraten (1627-78). Pieter de Hooch (c. 1632-c. 1681) (q.v.) shows affinities with Vermeer. His quiet court yards and interiors full of reflected light in which figures are beautifully placed are splendid in tone and design. See, e.g., his 'Interior of a Dutch House,' National Gallery.

Three names in D. A. tower above all others: Hals, Rembrandt, and Vermeer. Frans Hals (1580-1666) (q.v.) is one of the greatest portrait painters of all time, and as a colourist he had no superior in his age. He shows little trace of foreign influence and specialised in studies of laughing children and types of Haarlem low life. His most important works are the portrait groups of the Haarlem Civic Guards, and his 'Laughing Cavalier' in the Wallace

Collection is justly one of the most celebrated pictures in the world.

Rembrandt Harmensz van Rijn or Ryn (1606-69) (q.v.) stands as one of the great geniuses of the race. From the first he was an etcher of the highest skill and closely studied the It. masters in such originals as he could buy. Rembrandt has been called the artist of old age, and indeed his incomparable 'Head of an

and 'Lady Standing at the Virginals' (National Gallery). A masterpiece is the 'View of Delft' (The Hague). Vermeer was almost forgotten for 2 centuries, but to-day his exquisite colour, lighting, and placing are justly appraised.

The D. achievement in landscape (with Seghers, van Goyen, Cuyp, Koninck, Ruysdael, and Hobbema) is also great. In flower, still-life, and animal painting,

W. F. Mansell

VERMEER'S 'LADY STANDING AT THE VIRGINALS'
National Gallery, London

Old Woman,' in the National Gallery, is among the finest works in that collection. In portraiture, subject painting, landscape, in his depth of light and shade, and his superb drawings and prints he is one of the world's greatest masters.

Jan Vermeer, van der Meer, or Jan van Delft (1632-75) (q.v.) in his earlier period was influenced by the school of Rembrandt, but he later developed a more personal style, characterised by a delicate subtlety and harmony of treatment, and less bold colouring. To the first period belong 'Christ with Martha and Mary' (National Gallery of Scotland), and 'Woman and Soldier' (Dresden). Among later works are 'The Coquette' (Brunswick), 'Lady at a Casement' (New York),

in architectural and seaport subjects, there is a great number of minor masters. In the 19th cent. there was a fresh expression in painting, with Josef Israels (1824-1911), J. B. Jongkind (1819-91), and the brothers Maris and Vincent van Gogh (1853-90). In modern art D.A. has its place with the group De Stijl, equally interested in new architecture, design, and painting. Piet Mondrian (1872-1944) is at the present time widely esteemed as an abstract painter.

Magnificent examples of D. A. are to be found in all the prin. galleries of Europe and America; but the supreme collection is housed in the Rijksmuseum at Amsterdam. (See also individual names.) See G. H. Marius, *Dutch Painting in the*

Nineteenth Century, 1908; W. Bode, *Great Masters of Dutch and Flemish Painting*, 1909; E. Fromentin, *Masters of Past Time* (trans.), 1912; R. H. Wilenski, *Introduction to Dutch Art*, 1927.

Dutch Art Museums. The Netherlands schools of painting have pride of place in the Rijksmuseum, Amsterdam (built in the late 19th cent.). The nucleus of the collection consisted of pictures belonging to the House of Orange. Other and later accessions were the collections of Adriaen van der Hoop and Baron van der Poll acquired in 1880 and collections from the various guild houses. All the Dutch masters are represented here in abundance, although many of their works are found in the galleries of other countries. It is generally held that Rembrandt's somewhat misnamed 'Night Watch' is the *pièce de résistance*. It was painted in 1642 and is the master's largest picture. Other favourite Rembrandts here are 'The Syndics'—a group of D. merchants in conference—and 'The Jewish Bride.' There are sev. of the choicest paintings of Vermeer, among them his very popular 'The Letter' and 'The Little Street.' A series of rooms is designed to show the change and development of D. culture. The Kröller-Müller Museum devoted to Van Gogh, and Rembrandt's house in Amsterdam, now converted into a museum, should also be mentioned.

The Mauritshuis at The Hague dates from the 1630's when it was the residence of Count John Maurice of Nassau, but the building only became a gallery in 1821 when it was used to house the remainder of various collections of the princes of Orange which had survived the vicissitudes of war. Here again, as at Amsterdam, the outstanding work is by Rembrandt, namely his sombre and dignified 'The School of Anatomy'; and hardly less famous are his 'Susannah Bathing,' 'Simeon in the Temple'—a miracle of composition and light—and 'David Playing the Harp before Saul.' Yet equally popular are Jan Vermeer's 'View of Delft' and 'Head of a Young Girl' and Paul Potter's 'Bull'—large in scope and treatment. Other well-known pictures here are the genre study, 'Young Housekeeper,' by Gerard Dou, a pupil of Rembrandt, and a view of Haarlem by Jacob Ruisdael. 'The Oyster Feast' by Jan Steen, and also a number of pictures by Ostade, Ter Borch, Wouwerman, and others.

Among the few non-D. works are portraits of Isabella Brant and Hélène Fourment by Rubens and works by Holbein, Van Dyck, and Velázquez. Here may be mentioned the Haarlem Museum Gallery, which is largely a Frans Hals memorial, but also contains some portrait groups by Ter Borch, and paintings by Van der Helst and Brouwer. The Boymans Museum, Rotterdam, is another fine collection of the national arts, containing works of both old and modern masters.

Dutch Auction, an A. in which the article to be sold is first put up at the

maximum price. If there is no offer, the price is then lowered by stages until a bid is made.

Dutch East India Company, founded by charter from the Netherlands States-General, 1602, to regulate D. trade in the Indian Ocean, and to assist in the war of independence against Spain and Portugal. As well as having a monopoly of trade between the Straits of Magellan and the Cape of Good Hope, it was empowered to maintain armed forces, erect forts and factories, wage wars and enter into treaties in the name of the States-General, to coin money, and to wield full administrative, judicial, and legislative authority over the area of its operations. H.Q. were estab. at Batavia in 1619, and by the mid 17th cent. the C. had almost completely monopolised trade in the Indian Ocean, with govts. at Amboyna, Banda, Ceylon, Java, Macassar, Malacca, and Ternate, and a colony at the Cape of Good Hope. The expense of maintaining the trade monopoly against Brit. and Fr. competition gradually weakened the C. and it was dissolved in 1798, at the time of the conquest of Holland by the Fr. revolutionary armies. See P. Valentyn, *Beschryving van en en nieuw oost Indien*, Amsterdam, 1724.

Dutch East Indies, or Netherlands Indies, name formerly given to Asiatic possessions of the Netherlands, now all in Indonesia (q.v.). See G. T. Raynal, *Histoire philosophique et politique des établissements et du commerce des européens dans les deux Indes*, 1780; D. J. H. Nyessen, *The Races of Java*, 1929; E. S. de Klerck, *History of the Netherlands East Indies*, 1938; J. W. Nystrom, *Surinam*, 1942; A. Hyma, *The Dutch in the Far East*, 1942; H. J. van Mook, *The Netherlands East Indies and Japan*, 1944; J. S. Furnival, *Colonial Policy and Practice: a Comparative Study of Burma and Netherlands India*, 1948; D. Wehl, *The Birth of Indonesia*, 1948.

Dutch Guiana, see NETHERLANDS GUIANA.

Dutch Literature. During the late middle ages literary activity was concentrated almost entirely in the Flem. part of the country. Its spread was fostered by the growth of national feeling at the time of the Reformation and the newly-won independence. The most brilliant writer of this period, generally called 'de gouden eeuw' (the golden century), was J. van den Vondel (q.v.) (1587-1679), an outstanding poet, whose successful tragedies are still performed. Important contemporaries are the popular allegorist and moralist Jacob Cats (q.v.) (1577-1660); the more satiric humanist C. Huygens (1596-1687); P. C. Hooft (q.v.) (1581-1647), the author of beautiful lyrics, and an important hist. of the Netherlands; and G. A. Bredero (1585-1618) who excelled in witty comedies and farces. This rich classical period of D. L. ended in the last decades of the 17th cent. J. Luyken (1649-1712), a melancholic mystic, may be considered to be the last important poet of the 'golden century.' In the 18th

cent. L. declined, being mostly imitative of Fr. models, but a major exception is W. Langendijk (1683-1756), writer of numerous good farcical comedies. The first decades of the 19th cent. witnessed the rise of romanticism. Willem Bilderdijk (q.v.) (1756-1831), A. C. W. Staring (q.v.) (1747-1840), and H. Tollens (1780-1856) are the most characteristic figures of this transitional period. Da Costa (q.v.) (1798-1860) trans. Fr. and Eng. romantic poets and introduced them to D. readers. The romantic movement in Holland was encouraged by a literary periodical *De Gids* (*The Guide*), ed. by Bakhuizen van den Brink (1810-65), and E. J. Potgieter (1808-75). The latter was a successful poet and novelist as well as a critic, and greatly influenced the growth of a national L. van Lennep (q.v.) (1802-68) first trans. Walter Scott into D. and wrote some remarkable historical novels, while important contemporary novelists were Limburg Brouwer (1795-1847), Anna Bosboom-Toussaint (q.v.) (1812-86), and Alberdingk Thijm (1820-89). At this time a group of brilliant writers, including especially N. Beets (q.v.) (1814-1903) and P. Hasebroek (1812-96), were founding their work on Eng. models, but revealed their native originality in their observation of D. life. In 1860 the *Nederlandsche Spectator* appeared, a weekly review associated especially with M. P. Lindo (1819-1877), an Englishman by birth, and C. Vosmaer (1826-88), an art critic and poet. In 1860 was pub. E. D. Dekker's romance, *Max Havelaar*, an indictment of D. colonisation. Dekker (q.v.) had a great influence on the succeeding generations, who greeted in him their pioneer. W. Kloos (1859-1938), F. van Eeden (1860-1932), A. Verwey (1865-1937) (qq.v.), and the sensitive van Deyssel (1864-1952) were fervent adherents of art for art's sake and associated in a periodical, *De Nieuwe Gids* (*The New Guide*), in opposition to the superannuated *Guide*. Its first pub. in 1885 marked another literary event in the second half of the 19th cent., inaugurating a prolific movement in which the poet H. Gorter (1864-1927), the novelists L. Couperus (q.v.) (1863-1923) and J. van Looy (1855-1930), and the dramatists H. Heijermans (1864-1924) and Jan Fabritius (b. 1871) (qq.v.) stand out as pre-eminent. Later writers are I. Querido (1873-1932), author of naturalist novels, the poets P. C. Boutens (1870-1943), J. H. Leopold (1865-1927), and Henriette Roland Holst (1869-1953), and the novelist A. van Schendel (1874-1946). Among the poets of the last few decades should be noted: Adama van Schelteme, G. Gossaert, J. C. Bloem, J. Greshoff, Werumeus Buning, J. Slauerhoff, H. Marsman, J. Engelman, A. Donker, M. Nijhoff, and A. Roland Holst. Among the novelists are numbered: A. van der Leeuw, N. van Suchtelen, A. Coolen, S. Vestdijk, J. F. Fabritius Jr., F. Bordewijk, A. den Doolaard, A. Helman, and T. de Vries.

After the war a group of young authors became known, among them A. H. Nijhoff,

Hella Haasse, Anna Blaman, Alfred Koesmann, and Adriaan van der Veen. Some of their novels deal with the Ger. occupation, and a number of their works have been trans. into Eng. At the same time Gerrit Achterberg, Guillaume van der Graft, Koos Sehuur, and Hans Lodeizen should be mentioned as outstanding post-war poets. Lodeizen became known posthumously, and is called the predecessor of the generation known as the *Viijftigers* (Fifties), a group of young poets under the leadership of Simon Vinkenoog. The latter was the editor of a literary magazine called *Blurb*; he also ed. an anthology, *Atonaal*, with poems by Remco Campert, Hans Andreus, Hugo Claus, Gerrit Kouwenaar, Jan G. Elburg, Lucebert, and himself. See also FLANDERS, *Flemish Language and Literature*. See J. van Ginneken, *Handboek der Nederlandse Taal*, 1913-14 (on literature); A. J. Barnouw, *Holland under Queen Wilhelmina*, 1923; J. de Graaf, *Le siècle littéraire en Hollande et el naturalisme français, 1880-1900*, 1938; R. A. Kolléwijn, *Nederlandse spelling, geslacht en verbuiging*, 1942; C. G. N. de Voors, *Geschiedenis van de Nederlandse Taal*, 1943; W. L. M. E. van Leeuwen, *Dichterschap en Werkelijkheid*, 1946; A. den Besten, *Stroomgebied*, 1954.

Dutchman's Breeches, see DICENTRA.

Dutens, Joseph Michel (1765-1848), Fr. engineer, was appointed chief engineer of the dept of Léman in 1805, and assisted in constructing the railway via the Simplon Pass. His *Mémoires sur les travaux publics de l'Angleterre*, 1819, was the fruits of his appointment to study the inland navigation of England.

Du Toit's Pan, see DIAMOND.

Dutt, Romesh Chandra (1848-1909), Indian writer and civil servant, was a native of Calcutta, and was educ. at Presidency College before he came to England and studied at Univ. College, London. Having passed with the highest distinction into the Indian Civil Service (1871), he rose to become divisional commissioner in 1894, being the first Indian to hold this post. In 1897 he retired from the service, and from 1904 to 1906 acted as revenue minister of the Baroda state. He wrote on the economic hist. of his country from 1757 until 1900, trans. Sanskrit writings into Eng. verse, including the *Mahabharata*, 1898, and the *Ramayana*, 1900, and pub. many novels in his native Bengali. See life by B. N. Gupta, 1911.

Dutt, Toru, or Tarulata (1856-77), Indian author, was a Christian girl of Calcutta, who, like Marie Bashkirtseff, developed in her girlhood a literary genius which showed small sign of immaturity. For over 3 years (1869-73) she was abroad in France and England. With her sister Aru D., who also d. very young, she wrote *A Sheaf Gleaned in French Fields*, 1876, containing Eng. versions of Fr. poems, and she also trans. into Eng. passages from the Sanskrit *Vishnupurana*. Her novel in Fr., *Le Journal de Mlle D'Anvers*, was pub. after her death. Sir E. Gosse ed. her *Ancient Ballads and Legends of Hindustan*, 1882.

Dutton, Edward Payson (1831-1923), Amer. publisher. He founded and became first president of the firm of E. P. Dutton and Company in 1852 in Boston, Massachusetts, and moved to New York City in 1870. John Macrae, senior (1866-1944), became president in 1923, having in 1906, with J. M. Dent of London, launched *Everyman's Library*, the world's largest library of great books. Elliott B. Macrae (1900-) became president in 1944.

Duty, see EXCISE DUTIES and CUSTOMS DUTIES.

Duumviri, name applied in the Rom. republic to a magistracy of two: (1) *Duoviri Sacrorum* were the first 2 men to whom was entrusted the charge of the Sibylline books; they were eventually superseded by *decemviri* (q.v.). (2) *Duoviri navales* were specially elected for the purpose of equipping or recruiting the navy. (3) *Duoviri Jure Dicendo* were men with the highest judiciary powers in municipal tns. (4) *Duoviri Aede Dedicandae* were elected for the purpose of dedicating a temple. (5) *Duoviri Perduellionis* in early times tried those accused of treason.

Duval, Claude (1643-70), highwayman, b. Dompont, Normandy, and came over to England as servant to the duke of Richmond after the Restoration. Eventually he was hanged for his crimes, but his epitaph in Covent Garden Church, London, duly recorded his gallantries:

'Here lies Du Vall: Reader, if male thou art,
Look to thy purse: if female to thy heart.'

Duveyrier, Henri (1840-92), Fr. traveller, b. Paris, studied Arabic, and from 1857 to 1862 explored the Sahara, and lived for sev. months with the Tuareg, whose manners and speech he described in his *Exploration du Sahara: les Touareg du Nord*, 1864. He also interested himself in the 'shats' of Algeria and Tunis. In 1881 he pub. *La Tunisie*.

Dux, see DUCHCOV.

Duxbury, city of Plymouth co., Massachusetts, U.S.A., on D. Bay, 30 m. SE. of Boston. The cable line laid across the Atlantic in 1869 from Brest, France, terminates here. In 1872 an imposing monument was erected on Captain's Hill to Miles Standish, one of the first settlers. The house of his son, Alex Standish, built in 1666, is still standing. Pop. 3167.

Duze, see DIETZE.

Dvina, name of 2 rvs. in Russia: 1. The N. D. is formed by the confluence of the rvs. Sukhona and Yug. and flows NW. into the D. gulf of the White Sea. Length (with Sukhona) 820 m.; drainage area 138,000 sq. m. Its chief trbns. are the Vychedga and the Pinega; the main ports are Archangel and Kotlas. The N. D. is chiefly used for floating timber; it was the chief route of the Muscovite foreign trade in the 16th-17th cents.

2. The W. D. (Latvian *Daugava*, German *Düna*) rises in the Valday upland near the source of the Volga, and flows W. into the Gulf of Riga. Length 637 m.; basin 33,000 sq. m. The chief ports are

Riga, Daugavpils, Vitebsk. Navigation is limited by shallows. The W. D. was of great importance in the Middle Ages as part of the trade route from Scandinavia to Byzantium. During the First World War it was an effective barrier against Ger. offensives in 1915-16.

Dvinsk, see DAUGAVPILS.

Dvořák, Antonín (1841-1904), Bohemian musical composer, b. of humble parents at Nelabozevs. Destined at

ANTONIN DVOŘÁK E.N.A.

first to follow his father as an innkeeper and butcher, his remarkable talent for music so attracted the attention of his first teacher that he was sent to the Prague organ school in 1857. He joined the orchestra of the Bohemian Provisional Theatre at Prague in 1862, and 11 years later became organist of the church of St Adalbert in that tn. During this time he wrote many songs, overtures, and symphonies, and in 1874 produced his opera *King and Charcoal-Burner*, which was not a success; he composed diligently in this period when he was, for a time, under the strong influence of Wagner. His first success came outside the theatre, in 1873, his *Hymnus* with text by Halek being well received. Then, through the influence of Brahms, Vienna became interested in his work, and after the pub. of his *Moravian Duets* and particularly his *Slavonic Dances*, 1878, his fame spread into most countries. He was appointed director of the National Conservatory of Music in New York (1892-95), and in 1901 director of the Prague Conservatory. The most successful of his choral works produced in

England was *Stabat Mater*, 1883. Visited England sev. times up to 1887, conducting *The Spectre's Bride*, the *Requiem*, and *St Ludmila*. After his appointment in New York the influence of negro folk-music became evident in such works as the *New World* symphony and the string quartet Opus 96. In his last years he somewhat eschewed symphony and chamber music for opera and symphonic poems. D. had great creative power; 'intellectual control' is subordinated to elemental expression. At times a certain melancholy and religious fervour characterise his work, which shows a very wide range. He is often compared with Smetana, for both represent in Czech music the typically national-classical generation. Other well-known works of D. are the operas *The Devil and Kate*, 1899, and *Rusalka*, 1901, the symphonies in D minor, Opus 70, and G major, Opus 88, the overture-trilogy *Amid Nature, Carnival, and Othello*, the splendid cello concerto and much of the admirable chamber music. See Karel Hoffmeister, *Antonín Dvořák* (Eng. trans.), 1928; Paul Stefan, *The Life and Work of Anton Dvořák* (Eng. trans.), 1941; V. Fischl, *Antonín Dvořák: his Achievement*, 1943; A. Robertson, *Dvořák* (Master Musicians), 1944; O. Sourek, *Antonín Dvořák: his Life and Works* (Eng. trans. by Daphne Rushbridge), 1952.

Dvůr Králové (Ger. *Königinhof*), Czechoslovakia in the region of Hradec Králové (q.v.), on the Labe (see ELBE). Here, in 1817, were discovered the controversial *Königinhof MSS.*, said to be 13th-cent. poems in Czech; T. G. Masaryk (q.v.) demonstrated that these are forgeries. There are brewing, milling, and textile industries. Pop. 13,700.

Dwale, see *ATROPA*.

Dwarf (from A.-S. *dwæorg*), an individual considerably below normal size. The causes of dwarfism are somewhat obscure; in most cases heredity plays an unimportant part and the general diminutiveness of all the structures is not readily explainable by any known defect in the nutritional conditions of the embryo. A distinction should be drawn between pygmies, where small stature is normal to the race, and individuals who fall considerably short of the size of their parents. True D.s should further be distinguished from rickety D.s, where the deficiency is not general, but can be attributed to a more or less local condition. Such cases usually exhibit a bent spine and misshapen lower limbs, while the head and other structures may be of normal size, the effect of the whole being as a result grotesque. Even the true D.s are found to possess heads and chests large in proportion, though many famous D.s are said to have presented in miniature the proportions of a well-built normal man. While giants are often constitutionally feeble, the dwarf condition is not usually accompanied by other physical and mental defects, except that very diminutive individuals are not uncommonly sterile.

Famous Dwarfs. Owing to their dainty

appearance and lively intelligence, D.s have often been the favourite attendants of persons of high position, and hist. records many instances of the high value set upon diminutive persons by wealthy European and Oriental monarchs. The Egyptian Pharaohs undoubtedly used members of the dwarf tribes of equatorial Africa as court attendants. It is also recorded that Ptolemy Philadelphus had as tutor the poet Philetas of Cos, who was said to be so small that he had to wear leaden weights to avoid being blown away. Julia, niece of Augustus, had 2 D.s, Coropas and Andromeda, each of whom was 2 ft 4 in. in height. Mary I of England had a page named John Jarvis who

E.N.A.

THE WEDDING GROUP: GENERAL TOM THUMB AND LAVINIA WARREN

was 2 ft high. A fair amount of information is obtainable concerning the life of Jeffery Hudson, who was born of normal parents in 1619 at Oakham, Rutland. At 9 years of age he was 18 in. high and well proportioned in every way. He was introduced to Charles I and his queen in a pie which was brought to the dinner table, and was adopted into the service of the royal family. He became a soldier in the Royalist cause, and is said to have fought 2 duels, 1 with a turkey-cock and 1 with a full-sized antagonist, whom he shot dead. At 30 years of age he was 3 ft 9 in. high, having grown, so he announced, during his imprisonment by Turkish pirates, who ill-treated him. He d. in 1682 at the age of 63. Queen Henrietta Maria also had 2 D.s, Richard and Anne Gibson, who were married at the instance of the queen and had children of normal size.

As a lucrative form of stage presentation D.s were popular for a long period. Of all D.s Tom Thumb (d. 1883) (called Gen. Tom Thumb) was the most famous; he travelled the world over, and was presented to royalty. He was a man of good address, well mannered, and generous. He retired, having made much money, but when he heard that his great chief, Barnum, was in financial difficulties and facing ruin he immediately went to

him, although well advanced in years, and suggested another tour. Barnum took advantage of this and made a fresh start. A D. called Miss Morgan, the celebrated Windsor Fairy, was popular in the late 18th cent.; she weighed only 18 lb. It was claimed that George III conferred on her the title of Lady, and she probably had as much right to that title as Tom Thumb had to his generalship. Elliston, for years lessee at Drury Lane, once exhibited a Dutch D. named Simon Paap at a room in Piccadilly, but he did not draw the public. Lydia Walpole was a famous D. at the fairs in the early 1800's, and so was Jonathan Dawson, who was 3 ft high when he reached the age of 50. There was from time to time a good deal of trickery over D.s, who were often trained children who disappeared from the stage when they began to grow too big. Perhaps the last 2 famous D.s were It, brothers named Magei; one claimed to be a count and the other a baron. They prepared little plays, boxed, and fought duels, and were seen in Britain in 1898.

The Dwarf in Mythology. The folk tales of most countries include accounts of diminutive people, usually with superhuman attributes. It has been suggested that such accounts have their origin in the existence of pygmy races in Europe in the Neolithic period, but the widespread nature of the fairy legend hardly needs such explanation. The fairy is by no means always pictured as of diminutive size. The true fairy, or invisible spirit, is probably a little person simply in order to explain the difficulty of seeing him. It is otherwise, however, with the D.s of Teutonic legend. These are people of grotesque appearance, often malicious and of marvellous cunning in the working of metals. D.s amongst the ignorant and superstitious have been credited with supernatural powers, especially those individuals who are deformed. For D. races see PYGMIES. See W. Bodin and B. Hershey, *World of Midgets*, 1935.

Dwarfing Trees, art introduced some centuries ago by the Japanese. The tiny trees have all the appearance and characteristics in miniature of the same species growing freely in the open; they sometimes live as long as 250 years. They are best grown from seed, and the treatment consists of frequent pruning of shoot and root, twisting and bending of the branches, insufficient nourishment, the use of small pots so as to confine the roots and anything which can paralyse vitality without actually killing the plant.

Dwarka, maritime tn of Saurashtra state, India, in the extreme NW. of Kathiawar. D. is one of the 7 great places of pilgrimage for Hindus, and is reputed to have been founded by Krishna as his cap. The temple of Dwarkanath, which is a title of Krishna, is believed by many Hindus to have been built in one night.

Dwight, Timothy (1752-1817), Amer. clergyman and poet, b. Northampton, Massachusetts. A precocious child, he could read the Bible at the age of 4, and at 13 he entered Yale, where from 1771 to 1777 he was a tutor. From 1783 to 1795

he was Congregationalist minister at Greenfield Hill, Connecticut. His poem *America*, 1772, was followed by *The Conquest of Canaan*, the first Amer. epic, and *Greenfield Hill*, 1794, a poem in the 18th-cent. tradition. In 1795 he was appointed president of Yale, and wielded great influence, being nicknamed 'Pope Dwight.' Yale dates its modern era from his administration. See C. E. Cunningham, *Dwight, a Biography*, 1942.

Dwina, see DVINA.

Dwygyfylchi, see PENMAENMAWR.

Dyaks, or **Dayaks**, certain tribes inhabiting Borneo. They may belong to the same race as the Malays. See D. or

E.N.A.

DYAK WARRIOR

Ibans are the most numerous of the races of Sarawak. In 1940 the census showed 52,759 men, 57,101 women and 57,712 children, a total of 167,572. There is much conjecture as to the origin of these people, but it is certain that they are not indigenous to the country. They are most numerous in Sarawak and Labuan and from there have spread to Brunei and to North Borneo in recent years. The Ibans are a vigorous healthy race who dwell in long houses containing as many as 40 families. They have little native culture but are quick to learn, and have borrowed customs and ideas freely from many races, including Europeans, with whom they have come in contact. Normally they plant hill padi, felling large areas of jungle for the purpose, but in recent years they have adopted irrigation and, especially in the Kanowit Dist., have been very successful. They own large areas of rubber, and being of a thrifty nature some of them are men of considerable wealth. Land D. in 1940 numbered about 37,000, and are only

found in Sarawak. Their origin is obscure, but it is of interest to note that relics of Hindu culture have been found in the Samarahan and that some Land D. tribes, alone of the inhab. of Borneo, burn their dead. They are a peaceful people and for many years were oppressed by the Brunei nobles and raided by the Sea D., and it was their pitiful state that first roused the sympathies of Sir James Brooke. The D. are slightly built, and in colour lighter than a typical Malay. They are very strenuous and persistent workers and have a cheerful disposition. Their chief industries are weaving and spinning, dyeing, and the manuf. of iron and steel implements. The practice of head-hunting is now unknown. In warfare their chief weapons were the blowpipe and a long spear or a curved sword. See C. Bode, *Head-Hunters of Borneo*, 1882; H. L. Roth, *The Natives of Sarawak and British North Borneo*, 1896; W. O. Krohn, *In Borneo Jungles*, 1927; T. Harrison (ed.), *Borneo Jungle: An Account of the Oxford Expedition to Sarawak*, 1938; Agnes Keith, *Land Below the Wind*, 1939.

Dyas, see PERMIAN.

Dybbel (Ger. Düppel), vil. of S. Tutland (Slesvig), Denmark, on the peninsula of Sundewitt, 15 m. N.E. of Flensburg. It was the site of a struggle between the Danes and Germans in 1848-50, and was bombarded by the Prussians in 1864.

Dyce, Alexander (1798-1869), critic and scholar, b. Edinburgh. He was educ. at Edinburgh High School and Exeter College, Oxford. He took holy orders, but in 1825 settled in London and devoted his time to literature. His first pub. was *Select Translations from Quintus Smyrnaeus*, 1821. He is famous for his annotated eds. of the early dramatists and poets, which include Peele, 1828 and 1839; Webster, 1830; Greene, 1831; Middleton, 1840; Beaumont and Fletcher, 1843-6; and Marlowe, 1850. His scholarly ed. of Shakespeare appeared in 1857. D. also ed. the poems of Shakespeare, Pope, Akenside, and Beattie, and the critical and theological works of Richard Bentley. With Collier, Halliwell, and Wright he founded the Percy Society, and for the Shakespeare Society pub. 2 early plays which he had discovered, namely *Timon* and *Sir Thomas More*. His *Recollections of the Table Talk of Samuel Rogers*, 1856, must also be mentioned. He attacked Payne Collier's ed. of Shakespeare in *Remarks on Mr J. P. Collier's and Mr Charles Knight's Editions of Shakespeare*, 1844, and *Strictures on Mr Collier's New Edition of Shakespeare*, 1859, which cost him his friendship with his fellow writer. D. left his valuable library, which contained many rare books, to the S. Kensington Museum, London. In the *Catalogue*, pub. in 1875, is a 'biographical sketch,' by John Forster.

Dyce, William (1806-64), artist, b. Aberdeen. Trained in Edinburgh, London, and Rome, he was influenced by the early Florentine masters and also by the Ger. 'Nazarenes,' then settled in Rome. This made for an earnest style of painting,

precise in detail, in which he was a precursor of the Pre-Raphaelites. 'Titian's first essay in Colouring,' 1859, and 'Pegwell Bay,' 1861, are 2 outstanding pictures, though he is also noted for the Arthurian frescoes in the robing-room of the House of Lords.

Dyck, Sir Anthonis (Antony) Van, see VAN DYCK.

Dye, a substance, usually coloured, which is used to impart colour to other materials such as textiles, paper, plastics, etc. This colour must be reasonably permanent (fast) to removal by rubbing, the action of water, soap, solvents, and other detergent agencies; and to chemical or physical alteration through action of light, heat, gas fumes, or action of chemicals to which it may normally be subjected. D.s are usually applied for these purposes by processes of dyeing. Formerly obtained from various natural sources, D.s are now almost entirely produced by chemical synthesis.

Dyeing consists essentially in the solution of a D., some chemical modification of a D. or chemicals that can form D.s by interaction, in water or other solvents, and treatment of the substance to be coloured with these solutions. In general, the molecules of the D. are held between the molecules of the body being dyed by physical or chemical forces, and this is the distinction between dyeing and other forms of coloration. **Dyeing** (technical) is the uniform coloration of textiles by D.s; **printing** (textile) is local coloration by essentially the same processes as dyeing, to form single- or multi-coloured prints.

Dyeing has been practised for many centuries, as evidenced by the discovery of dyed mummy cloths, etc. Until the middle of the 19th cent. only a few, natural D.s were available, the majority of which required a mordant (q.v.) for their application. The dyeing process was often laborious and the range of colours limited. Following the discovery of the first successful synthetic D. (mauve) by W. H. Perkin in 1856, a very large number of easily applied, synthetic D.s of many chemical types, covering a much wider colour range and often of improved fastness, have been introduced. Naturally, the production and use of natural D.s has fallen considerably and now represents only a fraction of the total output.

D.s and D.-forming products are selective in their relations to different kinds of fibres, a given D. being absorbed from solution by some and not by others. When the D. is absorbed it is said to have an 'affinity' or to be 'substantive' to the fibre.

Classification of Dyes.—D.s may be classified either according to the method by which they are applied or according to their chemical constitution. The first method of classification also takes into account the different types of textile fibres. These comprise cellulosic (cotton, flax, viscose, rayon, etc.), cellulose derivatives (cellulose acetate), protein (wool, silk, casein, and groundnut protein, etc.), and purely synthetic fibres (nylons, Terylene, acrylic polymers,

etc.). For each class of fibres only a limited range of D.s may be successfully applied.

Classification by Application Method.

1. **Basic D.s.**—The majority of the early synthetic D.s belong to this class, e.g. mauveine and magenta. Other important examples are methylene blue and the rhodamines. They include many D.s which give clear, vivid dyeings of great beauty, but many of them are easily faded by light. Partly for this reason they have now become less popular. They have a natural affinity for protein fibres, to which they are applied from a slightly acidic dyebath, the D.s combining with acidic groups in the fibre. They also have an affinity for impure cellulosic fibres such as jute and hemp, but not for pure cellulose (e.g. cotton). A mordant (q.v.) is then required, the most common being tannic acid fixed with tartar emetic.

2. **Acid D.s.**—These contain an acidic group and have a natural affinity for protein fibres and nylon, which contain basic groups with which the D.s combine. Applied from an acidic solution, the D.s are sub-divided into groups according to the degree of acidity required. Those which are applied from the weakest acid solution have the strongest affinity and have the best fastness to washing and similar treatments. They are known as acid milling D.s. The others, which are applied from stronger acid solutions, are known as levelling D.s, since their poorer fastness permits level dyeings to be readily obtained.

3. **Direct cotton D.s.**—These are D.s containing an acidic group and which also have a direct affinity for cellulosic fibres. They do not require the use of a mordant. Their introduction in 1884 was thus of considerable importance. The first member of the group, Congo red, is a disazo D. derived from benzidine, and the majority of direct D.s follow this pattern. In application, the addition of a simple salt (common or Glauber's salt) is needed to promote affinity and the D.s may be sub-divided according to the proportion of salt required. The affinity is also affected by the temp. of the D.-bath, and this property is also used to regulate the course of dyeing. Fastness, particularly to washing, is not good, but it may be improved by suitable after-treatments, e.g. with copper or chromium salts, diazotisation and coupling, etc.

4. **Mordant D.s.**—This is a class of D.s which are applied with the aid of a second substance (known as the mordant) which is not a D. but which combines with the D. to form a more complex and less soluble molecule, often known as a lake. Mordants are usually metal-containing salts (e.g. chromium, copper, aluminium, iron, etc.) and these form lakes with essentially acidic D.s. For basic D.s complex acids (e.g. tannic) are used as mordants, but basic D.s are not normally classified as mordant D.s. The majority of the natural colouring matters belong to this group. They may be regarded as true mordant D.s, since they have no

affinity unless the mordant is first present on the fibre. This distinguishes them from the modern synthetic mordant D.s which also behave as normal acid D.s, the purpose of the mordant (usually a salt of chromium) being principally to improve the fastness properties. Among important natural mordant D.s is alizarin (q.v.), obtained from the root of the madder plant but now manufactured synthetically. Its most important application was on an aluminium mordant to produce the famous Turkey red. On other metal mordants differently coloured dyeings are obtained (e.g. tin—pink, iron—violet, chromium—puce). Logwood, obtained from campeachy wood, is the only natural mordant D. still used commercially (see HAEMATOKSYLIN). Applied on a suitable mordant, e.g. iron or copper, it produces dense black shades. An interesting modern example is its use for dyeing nylon. Synthetic mordant D.s (chrome colours) are used for the production of fast dyeings on wool. The mordant (usually a dichromate or chromate) may be applied before, together with, or after the D., which is itself applied in much the same way as an acid D.

5. **Metal-containing D.s.**—These D.s are a modern innovation and are becoming used increasingly widely. They represent a logical development from the mordant D.s, the D.-metal complex (usually with chromium or copper) being formed during the manufacturing process rather than on the fibre during dyeing. D.s of this type are now available both as direct D.s for cellulosic fibres or as neutral dyeing acid D.s for wool and other basic fibres. They have good fastness properties.

6. **Ingrain D.s.**—The term 'ingrain' is very old and has been used to denote insoluble D.s formed by chemical reaction, on the fibre, of reagents applied either from a mixed bath or from a succession of baths. The modern technical description places them more specifically into 2 groups: (a) Insoluble azo D.s.—These are also known as azoic D.s and as ice colours. Conventionally, 2 components of the D. are applied separately to the fibre. The first is an aromatic hydroxy compound, known as naphthol, and often a phenol or naphthol, which is applied uniformly in alkaline solution. On subsequently passing the prepared material through a solution of a diazotised amine (a diazo compound), coupling occurs and results in the precipitation of a coloured, insoluble azo compound inside the fibres. In a refinement of this technique, particularly useful for textile printing, the diazo compound is converted into a stable, non-coupling form which may safely be mixed with a naphthol without the D. being formed. The two are then applied together. On treating the material with mild acid the diazo compound is regenerated and coupling again takes place. Since the final D. is insoluble, the fastness to washing, etc., is good. Many members are also resistant to attack during normal processing. Insoluble azo D.s are used mainly for colouring cellulosic fibres and

also, by modified techniques, the newer synthetic fibres. (b) Oxidation colours.—These are black or brown D.s produced by the oxidation of suitable aromatic amines on the fibre to be dyed. By far the most important is aniline black, obtained from aniline (q.v.). Aniline, together with either hydrochloric or sulphuric acid and an oxidising agent, is first applied to the cloth, which is then heated in a moist atmosphere and subsequently treated with a dichromate and acid. The aniline is oxidised in a number of stages, resulting finally in the formation of a dense black precipitate within the fibre. Aniline black is applied mainly to cotton, especially by printing, and also gives dense blacks on nylon. Other amines, when oxidised in a similar way, give brown shades, and are used for the dyeing of fur and of hair.

7. Vat D.s.—This class includes 2 natural D.s of great antiquity, indigo (q.v.) and Tyrian purple, but all the rest are synthetic. Their name derives from the ancient practice of fermenting indigo in a vat to render it fit for use. As with the ingrain D.s, these D.s are also insoluble in water. For application, the insoluble vat D. is first treated with a reducing agent in alkaline solution (usually sodium hydro-sulphite in caustic soda). This is the process of vatting and replaces the older fermentation method. It converts the vat D. into its so-called leuco compound, which is soluble in the alkaline solution. The material is then dyed with this solution. On exposing the dyed material to the atmosphere, oxidation of the leuco compound occurs and the insoluble vat D. is re-formed, now within the fibre. Finally, washing and soaping treatments, which remove surplus D. and usually brighten the shade of fixed D., complete the process. This method is normally used mainly for cellulosic materials, since the conditions are detrimental to many other fibres. Modified methods of application are often used. Thus, in textile printing, formaldehyde-sulphoxylate is used as the reducing agent. This delays the formation of the leuco compound until the prints are steamed, this process being an essential one in printing. A different kind of modification is in the preparation, by the manufacturer, of stable, soluble derivatives of the leuco compounds. These require no chemical treatment by the dyer before use, and may be applied to cellulosic fibres in the same way as direct D.s of low substantivity or to basic fibres as acid D.s. They are reconverted, on the fibre, to the insoluble vat D. by treating the dyed goods with an acidic oxidising agent, most commonly sodium nitrite in sulphuric acid, but more complex systems are used for printing.

The vat D.s as a class show good all-round fastness properties. The yellow and orange D.s, however, may bring about degradation of the material on which they are dyed if this is exposed for long periods to sunlight.

8. Sulphur (or Sulphide) D.s.—These are so called because they all contain

sulphur in the molecule and are mostly applied from baths containing sodium sulphide. Like the vat D.s they are insoluble and are converted into alkali soluble leuco compounds for application, in this case generally by the use of sodium sulphide and sodium carbonate. The insoluble D. is regenerated on the fibre by oxidation, usually by the atmosphere. Sulphur D.s do not, as a class, give very bright colours, but mostly represent the cheapest form of intense fast colour available for dyeing cotton goods in dark utility shades, black, navy, khaki, etc.

9. Disperse D.s.—In this class the D.s are also insoluble. Instead of being chemically converted into a water-soluble derivative, the D.s are very finely ground and used in an aqueous dispersion with the assistance of a dispersing agent. They were originally introduced for application to cellulose acetate, which cannot be dyed with the normal water-soluble D.s. More recently they have acquired further importance in dyeing the newer synthetic fibres such as nylon, Terylene, Orlon, etc.

10. Reactive D.s.—These have been introduced very recently (1956). Intended primarily for cellulosic fibres, they contain reactive groups which allow the D.s to combine chemically with cellulose and thus become an integral part of the fibre molecule.

11. Mass coloration of manufactured fibres.—This consists of the inclusion of suitable colouring matters in the fibre solution or molten fibre-substance before extrusion. The colouring matters are usually insoluble pigments (often azoic, anthraquinonoid or phthalocyanine, but in some cases inorganic) compounded with a dispersing agent. The fibres which result are uniformly coloured, and with carefully chosen pigments the fastness properties also are good.

Classification by Chemical Structure.

1. Azo D.s.—This is by far the largest chemical class, and is characterised by the presence of the azo group $-N=N-$ joined to 2 benzene or naphthalene residues. Mono-, di-, tri-, and tetra-azo D.s, i.e. those containing 1, 2, 3, or 4 azo groups in the molecule, are in use. In addition to the azo group they also contain either a hydroxy ($-OH$) or amino ($-NH_2$) group. They may be insoluble (see above) or soluble in water. The latter contain additional ionic groups, mostly sodium sulphonate ($-SO_3Na$), which impart this solubility. Soluble azo D.s behave as acid D.s, those

derived from the diamine benzidine also behaving as direct D.s (see above), for which they are chiefly used. An example of a simple acid azo D. is Orange II. In

addition to their use as azoic colours (see above) the insoluble azo D.s may also be used as dispersed D.s and as pigments.

2. Di- and triphenyl methane D.s.—The majority of the basic D.s come in this group and were amongst the earliest synthetic D.s. They are derivatives of di- and triphenyl methane containing usually 2 or 3 basic amino groups and are presented as their salts, usually with hydrochloric acid. The ionised basic group in this way confers both water solubility and affinity for acidic fibres such as wool and silk. An example of a triphenyl methane D. is malachite green. Many of these D.s,

MALACHITE GREEN

when sulphonated, may be used as acid D.s. Closely related to the di- and triphenyl methane D.s are the xanthene (e.g. rhodamine *S*), acridine (e.g. acriflavine) and phthalein (e.g. rhodamine B) groups, which are also used as basic D.s.

3. Anthraquinone D.s.—These are more or less complex derivatives of anthraquinone (q.v.). By far the most important members of this class are vat D.s. These range from relatively simple derivatives of anthraquinone such as benzoylamino anthraquinone, which is a yellow D., to far more complex compounds such as the dibenzanthrone D. caledon jade green, the first successful green vat D.

The first synthetic anthraquinonoid vat D. was indanthrone, a blue D. of exceptional fastness properties. Many derivatives of indanthrone are now used as well as derivatives of pyranthrone and other complex structures. All these D.s are

insoluble in water, but are capable of being reduced to the alkali soluble leuco forms (see INDIGO). Hydroxy anthraquinones may be employed, not as vat

INDANTHRONE

D.s but as mordant D.s. Indeed, some of the most important natural mordant D.s belong to this class. Thus alizarin, traditionally extracted from madder root, is 1:2-dihydroxyanthraquinone, and purpurine, which accompanies it in madder, is 1:2:4-trihydroxyanthraquinone. Alizarin was first synthesised in 1868 by Gräbe and Liebermann and since then many other synthetic anthraquinone mordant D.s have been prepared. In

ALIZARIN

addition, some amino anthraquinones are used as dispersed D.s and as pigments and also, when sulphonated, as acid D.s.

4. Indigo and derivatives.—Indigo, which is the oldest known vat D., was traditionally obtained from the plant *Indigofera tinctora*. Following many years of research it was first synthesised in 1880 by von Baeyer and manufactured in 1897. It is now almost exclusively produced synthetically. It is insoluble in water and for use it is reduced to its leuco compound indigo white, which is soluble in alkali. Other vat D.s give so-called leuco compounds in a similar way, although not all are white. Many

INDIGO

derivatives of indigo are now synthesised, particularly the halogenated compounds. It is interesting to note that the valuable anet D. Tyrian purple, traditionally

obtained from the mollusc *Murex brandaris*, is 6:6'-dibromoindigo. This D. is not now manufactured commercially.

INDIGO WHITE

Thioindigo, in which the $\backslash \text{NH} /$ groups of indigo are replaced by $\backslash \text{S} /$, was synthesised by Friedlander in 1906. It, and many of its derivatives, are in use as important vat D.s.

5. Phthalocyanines.—The first phthalocyanine was discovered in 1927 and commercial production commenced during the following few years. They are the most recent chemical class of D. The parent compound, phthalocyanine itself, is a blue pigment. Its chemical structure closely resembles the porphyrin structure, which is in turn the parent of many biologically important natural pigments (e.g. haemoglobin, chlorophyll). Like the

PHTHALOCYANINE

natural porphyrins, the phthalocyanines contain a combined metal, replacing the 2 central hydrogen atoms, the most important metal being copper. The first phthalocyanines were pigments, but water soluble D.s are now available. They show very good fastness properties and chemical stability.

6. Sulphur D.s.—The first D. of this class, 'Cachou de Laval,' was prepared in 1873 by fusing sawdust, bran, etc., with sodium sulphide. Later members are made in a more refined manner by fusing aromatic amines, nitro-amines and phenols with sodium sulphide or sulphur. Even so, these D.s do not fall into a well-defined chemical class and in many cases their structure is not known. They all contain combined sulphur, but only a part of this is contained in the essential chromophoric (i.e. colour conferring) system of the molecule.

See also BLEACHING.

See C. M. Whitaker and C. C. Wilcock, *Dyeing with Coal-Tar Dyestuffs*, 1949;

K. Venkataraman, *The Chemistry of Synthetic Dyes*, 1952; T. Vickerstaff, *The Physical Chemistry of Dyeing*, 1954; H. A. Lubs, *The Chemistry of Synthetic Dyes and Pigments*, 1955.

Dye Trade. The hist. of the T. in dyestuffs goes back to the middle of last century, when Sir W. H. Perkin (then a lad of 18) discovered the aniline D., 'mauve' or 'mauveine.' Eng. people were slow to see the importance of the discovery, and as a result of farsighted action on the part of the Germans there was developed in Germany an immense D.-making industry, enabling the Ger. firms to obtain practically a monopoly of the D. T. of the world. When the First World War broke out the Germans had ready to hand factories fully equipped for the production of high explosives of all kinds in great quantities. On the other hand Great Britain and her allies were put in a position of the gravest possible embarrassment and danger owing to the absence of such factories. After the armistice of 1918 the Brit. Gov., as the result of a series of resolutions passed by the Allies in Paris, took steps to prohibit the import of dyestuffs under the Customs Act, 1876. It was decided in the courts that the prohibition was illegal, and accordingly the Import Regulation of 1920 was passed, setting up a committee for the issue of licences for the importation of dyestuffs. Unfortunately there was an interval of nearly a year between the decision of the courts and the operation of the act, and the Germans availed themselves of that opportunity to pour into Great Britain enormous quantities of D.s of all kinds. The result was that for over 2 years after the act became effective the D.-makers of this country were struggling against an overwhelming burden of foreign competition. Since then, however, they have made very remarkable strides indeed—so remarkable that an unsuccessful effort was made by the Labour Gov. in 1930 to put an end to the act of 1920 (generally known as the Dyestuffs Act), the assumption being that the Brit. D.-makers had done so extraordinarily well that they were in no further need of protection. The Brit. D.-makers claimed that this act must be continued for a time unless the country was prepared to run the risk of seeing a great deal of the work which had been done thrown away and the development of the industry suddenly arrested, and this view prevailed in the House of Lords, where the gov. was defeated. To-day, of the dyestuffs used in Great Britain 93 per cent are produced in the country and all the intermediates are home-made. All that is left to the foreign producer is 7 per cent, consisting very largely of comparatively small quantities of D.s of a novel or particularly complex type, because Brit. D.-makers have wisely concentrated on the production of D.s for which there is the greatest demand. Before the First World War the production of D.s in Great Britain was about 9,000,000 lb. avoirdupois; by 1938 it had become 45,500,000 lb., and exports, which were 4,000,000 lb.

before the First World War, were 8,900,000 lb. When the act came into operation at the end of 1920 the price of dyestuffs was 4s. 4d. per lb.; the pre-war price was 1s. per lb. To-day the average price of Brit. D.s is 1s. 5d. per lb. Both in Germany and the U.S.A. the substantial D.-making industries have been sheltered by high protective tariffs, securing for the D.-makers a monopoly of their own market. This has been very effective in the U.S.A., where the tariff act of 1930 levies a duty of 7 cents per lb. plus 40 per cent *ad valorem* on Amer. selling price of similar competitive articles. Before the First World War, the production of D.s in Great Britain was about 9,000,000 lb.; by 1935 it was well over 40,000,000 lb.; while exports had risen from 4,000,000 lb. to 16,000,000 lb. The most recent figures reported for the U.S.A. are a total production of 143,000,000 lb., valued at \$160,000,000. Recent figures for U.K. production are not available, but in 1954 exports were 14,664 metric tons, valued at \$31.9 million. See also DYE.

Dyeline Process, see COPYING.

Dyer, Sir Edward (c. 1545-1607), poet and courtier, b. Sharpham Park, Somerset. After studying at Oxford he travelled for a time, and then entered the court of Elizabeth, who employed him on sev. embassies. He, Sir Philip Sidney, and Fulke Greville were intimate friends from boyhood, Sidney himself writing of their having 'one mind in bodies three.' D. and Greville were chief pall-bearers at Sir Philip's funeral. Spenser speaks highly of D. as a poet, but only one of his songs is now generally remembered, 'My mind to me a kingdom is.' His verse and prose writings were collected by A. B. Grosart (1872). See R. M. Sargent, *At the Court of Queen Elizabeth: the Life and Lyrics of Sir Edward Dyer*, 1935.

Dyer, George (1755-1841), author, b. London. He was educ. at Christ's Hospital and Emmanuel College, Cambridge. Besides writing a *History of Cambridge University* and other works, he assisted in the preparation of Valpy's ed. of the Gk and Lat. classics (141 vols.), ruining his eyesight in the work. His friend Charles Lamb speaks of him very tenderly in his essays 'Oxford in the Vacation' and 'Amicus Redivivus.'

Dyer, John (1699-1757), poet, painter, and clergyman, b. Llanfynydd, Carmarthenshire. Educ. at Westminster and Cambridge, he studied art in Italy from 1724 to 1725 and for some years travelled in Wales as an itinerant painter. In 1741 he took orders and became vicar of Calthorpe, Leicestershire. He has a definite, if modest, place in literature as the author of 3 poems, *Grongar Hill*, 1727, *The Ruins of Rome*, 1740, and *The Fleece*, 1757. The first of these is the best, and contains much true natural description of S. Wales scenery. Wordsworth had a high opinion of D. as a poet, and addressed a sonnet to him. He is included in Dr Johnson's *Lives of the Poets*.

Dyer, Reginald Edward Harry (1864-1927), soldier, b. Simla, India; son of

Edward D., a brewer. Educ. at Middleton College, co. Cork. Commissioned in the Queen's Regiment, 1885, and transferred later to 25th Punjab of the Indian Army. He served in the Burma campaign of 1886-7, and the Zakka Khel expedition of 1908. In the First World War he commanded the 45th Infantry brigade on the E. Persia border. Brigade-commander at Jalandhar, 1919, he was sent by the viceroy in April of that year to Amritsar, where rebellion was strongest. Here he pursued a policy of repression (see AMRITSAR) of which particulars became known only gradually; D. was appointed in May to command on frontier. An inquiry at Lahore, Nov. 1919, at which D. gave evidence, resulted in his being directed to resign. He was inventor of a range-finder. He wrote *The Raiders of the Sarkhad*, 1921. See life by I. Colvin, 1929.

Dyer, Thomas Henry (1804-88), historian and antiquary, b. London. His chief historical works are *Life of Calvin*, 1850, *History of Modern Europe*, 1861-4, and sev. vols. on Rom. hist. which were severely handled by critics. His antiquarian books on Pompeii and Athens met with greater approval.

Dyer, Sir William Turner Thiselton (1843-1928), botanist, b. Westminster. Prof. of natural hist. at R.A.C., Cirencester, 1868; prof. of botany, Royal College of Science, Ireland, 1870; assistant director at Kew Gardens, 1875; and director, 1885-1905. He ed. the Eng. ed. of Sachs's *Text-book of Botany*, 1875; also *Flora Capensis*, and *Flora of South Africa*. K.C.M.G., 1899.

Dyer's Rocket, see WEED.

Dyersburg, city of NW. Tennessee, U.S.A., co. seat of Dyer co. It manufs. staves, textiles, cotton-seed oil, and canned goods, and is a trade and processing centre for a timber and agric. area. Pop. 10,885.

Dyestuff, see PIGMENTS.

Dyfrig (Dubricius, Devereux) (c. 450-546), Celtic saint, founder of monasticism in Wales. His foundations extended from his first settlement in Gwent, on the Wye, to Caldey Is., and his rule over them as abbot-bishop gave him quasi archiepiscopal status. His disciples included Sts David, Tello, Iltyd, Cadoc, Cenydd, and Samson (qq.v.). He d. on Bardsey Is. on 14 Nov. His foundation of Llandaff is only legendary but his body was trans. there in 1120. See S. Baring-Gould and J. Fisher, *Lives of the British Saints*, 1908.

Dyke, a linear earthwork, a line of bank and ditch, which may be double or occasionally treble, designed to serve as a boundary or frontier. There is a possibility that certain Eng. D.s were made at the end of the Early Iron Age, but most are derived in inspiration from the well-known Rom. frontier works of Hadrian's Wall and the Antonine Wall, and are products of the Dark Ages. The best known in Britain is Offa's D. (q.v.), but the Devil's D. on Newmarket Heath is exceptionally well preserved, and Bokerley D., Wansdyke, and the Cambs D.s are

all worthy of notice. A few D.s, viz. Car D., in Cambs, the Foss D. between the Witham at Lincoln and the Trent at Torksey, and the D. between Peterborough and Lincoln, are thought to be Rom. canals, but only the Car D. has been proved by archaeological excavation, to be so. See Sir Cyril Fox, *Antiquity*, III, 1929, for a general account. See also EARTHWORKS.

Dyke Acland, Sir Henry Wentworth, see ACLAND.

Dykes, John Bacchus (1823-76), church composer; graduated at Cambridge, and became minor canon and precentor of Durham in 1849, Doctor of Music in 1861, and vicar of St Oswalds, Durham, 1862. As joint-editor of *Hymns Ancient and Modern* he wrote for that compilation some of its best-known tunes, e.g. 'Jesus, lover of my soul'; sev. of his anthems and services also attained great popularity.

Dykes are wall-like masses of igneous rock which fill up more or less vertical fissures in the earth's crust, and are so called from the Scottish word for wall.

DYKE

- a. Igneous rock forcing its way in overlying stratified rocks. When this solidifies in the cracks igneous dykes are formed.
- b. A dome of lava solidified before coming to surface—a laccolith

The 2 main characteristics of D. are: (1) they are bounded by more or less parallel surfaces and are of nearly constant width; (2) they are generally vertical at the time of intrusion. Some D. were injected in 'swarms' up parallel fissures formed by regional tensions in the crust of the earth. Others are related to volcanic centres, and the manner of their formation can be observed in the active volcanoes such as Vesuvius and Etna. Volcanic cones are fissured either by the hydrostatic pressure of the column of lava in the pipe, or by explosions due to the pressure of dissolved vapours and gases acting on the walls and roof of the funnel. Into the rents and fissures so formed the lava rises, forming D., veins, and horizontal sheets or sills. If the lava is extremely fluid, it ascends rapidly in the cracks and fissures and, cooling quickly on the outside but more slowly in the centre, forms D. with a vitreous edge and a crystalline interior. Since D. originate below the surface, they are only exposed to observation as the result of erosion. If the sedimentary strata, into which they have been injected, are more easily weathered than the igneous

material of the D., the latter stand up as vast walls, while where the igneous rock is more easily denuded the course of the D. is represented by a trench. As a general rule, D. run in straight lines, but may occasionally be zigzag. They vary in thickness from a few in. to 20 or 30 yds, and may be any length from a few ft up to 100 m. The Cleveland D. of the N. of England is 60 m. in length, and some of the Scottish D. are even longer. As well as forming a network in fissure eruption regions, as in Scotland, Iceland, and the Faroe Is., D. occur in the neighbourhood of large plutonic intrusions, such as granite bosses. These D. are finer grained than the granite from which they come, and may merge into mica porphyries, granophyres, and quartz-felsites. Where D. are intruded in the sedimentary strata, whether through fissures or along joint planes, the adjacent rocks are to some extent affected by the extremely high temp. of the igneous material. The rocks may occasionally be recrystallised, sandstones being altered to semi-crystalline quartzites, and limestones converted into crystalline marbles; more often, however, they are only baked or indurated, as when soft clays are metamorphosed to flinty shales, lydian-stone, or porcelanite (see METAMORPHISM). Regarded petrographically, D. belong to the phase 'Minor Intrusions' (sometimes called the dyke-phase). See IGNEOUS ROCKS; VOLCANOES, etc.

Dykh-Tau, 3rd highest mt in the Caucasus, in the main Caucasian range, 17,190 ft.

Dymoke, Eng. family holding the right of hereditary championship to the crown. Their representative formerly had to appear at the coronation banquet and challenge all comers to dispute the king's title. This office is held by tenure of 'grand serjeanty' in connection with the manor of Scrivelsby, Lincs, which passed to Sir John D. (14th cent.) by his marriage with the heiress of the Marmions.

Dynamic Frame, see CINEMATOGRAPH (THE SCREEN).

Dynamic Isomerism, see TAUTOMERISM.

Dynamical Units, see PHYSICAL UNITS.

Dynamics (Gk *dynamis*, strength, force), the science of motion, a branch of mechanics devoted to all problems of motion, as opposed to *Statics* that deals with problems of bodies in equilibrium or at rest. D. depends on 3 laws, called Newton's laws of motion. These state: (1) every body continues in a state or rest, or of uniform motion in a straight line, except in so far as it may be compelled by impressed force to change that state; (2) change of momentum is directly proportional to the impressed force, and takes place in the direction in which the force acts; (3) to every action there is always an equal and opposite reaction, viz. if a body A exerts a force on a body B, then simultaneously the body B exerts an equal and opposite force on the body A. On these 3 laws depends all our knowledge of motion of terrestrial and heavenly bodies. Einstein's theory of relativity has shown that in certain very special

problems the system of mechanics based on Newton's laws fails to account for the quantitative results obtained. The science of D. was begun by Galileo at the end of the 16th cent., when he studied the motion of falling bodies and disproved the Aristotelian idea that the speed of a falling body depended on its weight. Galileo, Huyghens, and especially Newton laid the foundations of the subject, which was further developed by continental mathematicians in the 18th cent., and subsequently by numerous other mathematicians and scientists. See S. Loney, *Elements of Statics and Dynamics*, Part 2, 1906; 1953; H. Lamb, *Dynamics*, 1926; E. T. Whittaker, *A Treatise on the Analytical Dynamics of Particles and Rigid Bodies*, 1937; S. Goldstein (ed.), *Modern Developments in Fluid Dynamics*, 1938; M. Davidson, *Introduction to Dynamics*, 1948. See also MECHANICS, KINETICS, and separate articles on individuals.

Dynamite, explosive consisting of some absorbent material impregnated with nitro-glycerine. Nitro-glycerine, which was discovered by Sobrero in 1846, although a powerful explosive, was early recognised as too sensitive and dangerous to be used as such, and in 1863 Alfred Nobel commenced experiments with absorbent substances with a view to arriving at a solid or plastic explosive with nitro-glycerine as its active constituent, which would be safer to handle. He was only moderately successful until he applied the method of causing explosion by detonation with mercury fulminate. He finally fixed on a siliceous earth known as kieselguhr (q.v.) as the absorbent best suited for the purpose. Kieselguhr, or guhr, is composed of the fossilised remains of diatoms, and consists of silica to the extent of about 95 per cent. It is found in Austria, Germany, Norway, Scotland, and Australia. It has the advantages of being itself inert and non-combustible, and of being capable of absorbing 3 times its weight of nitro-glycerine. The kieselguhr is prepared by calcination at low red heat in which moisture and organic substances are removed. The guhr is usually pink at this stage, owing to the presence of iron; if not, red ochre is added. Magnesium carbonate or calcium carbonate up to 2 per cent is then ground in. (These carbonates serve to neutralise any acid subsequently formed if the nitro-glycerine decomposes during the lapse of time before the D. is used.) The well-ground mixture is then sifted through a 30-mesh sieve. The guhr is weighed out into lined rubber bags, 3 parts of nitro-glycerine are added for every part of guhr, and the mixture is thoroughly completed by hand, after which the product is compressed into cartridge form; all precautions are taken to avoid friction. The D. is then wrapped in waterproof paper. D. is a greasy plastic solid of sp. gr. 1.59 to 1.65. It burns quietly when ignited, but may be exploded by a fairly vigorous percussion. It explodes with great rapidity, requires very little tamping, and has great shattering power if simply laid upon the ground. This has given rise to the saying

that 'dynamite explodes downwards,' as a hole is torn in the ground even when it is unconfined in other directions. It loses only one-sixth of its power under water, so is well adapted for subaqueous operations. It freezes at 40° F., and when frozen is difficult to explode. The operation of thawing D. is attended with some danger, and should only be performed when the rise of temp. can be carefully regulated. D. is used chiefly for blasting (q.v.). Its shattering power is too great for quarry work generally, but is effective for breaking up huge boulders and roots of trees, and for destroying obstacles to navigation under water. The rapidity of explosion renders its use as a propellant impossible. There are many modifications of the D. made with kieselguhr. One of these is blasting gelatine, where the nitro-glycerine is incorporated with collodion cotton, forming a gelatinous plastic material which is unaffected by damp. In order to prevent D. from freezing, the addition of such compounds as monochlorodinitrolycerin or glycerin dinitrate has been suggested. See EXPLOSIVES; and A. Marshall, *Explosives*, 1917-32; J. Keilly, *Explosives, Matches, and Fireworks*, 1938.

Dynamo, a d.c. generator, see ELECTRIC MACHINES.

Dynamometer, an instrument used for the measurement of force or power developed in machinery. A brake or absorption D. absorbs energy in frictional resistance. The instrument measures this absorption and so affords a method of obtaining the rate at which the machine is doing work on the brake. A transmission D. transmits the power measured without any absorption of energy.

Dyne, unit of force in the centimetre-gramme-second (C.G.S.) system. It is defined as the force required to produce an acceleration of 1 centimetre per sec. per sec. in a mass of 1 gramme. Such a force acting for 1 sec. on a mass of 1 gramme would therefore produce a change of velocity of 1 centimetre per sec. in the direction of the force. See METROLOGY.

Dyrrhachium, see DURAZZO.

Dysart, see KIRKCALDY.

Dysentery (Gk *dus*, bad; *enteron*, intestine), a group of infectious inflammatory diseases of the large intestine, characterised by the formation of ulcers and the consequent evacuation of blood and shreds of tissue. The disease is largely tropical but is more common in temperate climates than is generally supposed. It was a serious disease in the First and Second World Wars. There are 2 main types: *amoebic D.*, caused by the presence of a protozoan, *Amoeba dysenteriae*, and *bacillary D.* The bacilli associated with bacillary D. are the *Bacillus dysenteriae Shiga*, the *B. paradyenteriae Flemer*, and the *B. dysenteriae Sonne*. The latter often produces a simple diarrhoea rather than a true dysenteric condition.

The onset of bacillary D. is accompanied by general illness and diarrhoea. The desire to evacuate is particularly distressing and the discharge is often

scanty in amount. The evacuations are at first slimy, then blood-streaked, and if the disease is not checked ultimately consist almost wholly of blood and shreds from the lining of the large intestine. The ulceration gradually spreads until the greater part of the organ is affected. Occasionally the ulcers perforate the intestine, and death is likely to result from haemorrhage or peritonitis. Febrile symptoms become intensified, it is difficult to satisfy thirst, and the patient becomes greatly exhausted. Gangrenous matter may appear in the evacuation. Convalescence is protracted, and the disease may persist in a chronic form for years, as the injury to the tissues of the colon is usually extensive. Infection in bacillary D. results from swallowing the causative organism. Contaminated food is more often responsible than contaminated water, and the source is usually an acute case and not a carrier. Infection may be conveyed by flies. Protection of food, good sanitation, and anti-fly campaigns are important in the prevention of the disease. In treatment copious fluids are essential. Fortunately the sulphonamide compounds have a specific action on the D. bacillus, and sulphaguanidine is the one most used. The effect of sulphonamide treatment is dramatic and with good fortune the patient may be well in a few days. In cases in which specific treatment has not been started early, the powerful toxin secreted by the Shiga bacillus may produce symptoms of severe toxæmia. It can be countered by the administration of concentrated antitoxin.

In contrast to bacillary D., amoebic D. is essentially a subacute or chronic disease with an insidious onset. In certain circumstances, and in the presence of complications, it may, however, become acute. The primary cause is the protozoan *Entamoeba histolytica*. It is world wide in distribution and yet the disease is common only in tropical or subtropical countries. The parasite, which is found in man and a few other mammals, is transmitted from one host to another in the form of resistant cysts which are passed in the stools. The amoeba takes up its abode in the large intestine, more often near the caecal end. It causes small, flask-shaped ulcers which increase in size until they may be an inch in diameter, and in depth until they may perforate the bowel. Abdominal discomfort, a grumbling pain, and flatulence with a moderate degree of diarrhoea are the usual symptoms of amoebic D. The stools are semi-solid and offensive. Amoeba from an ulcer may penetrate a vein and be conveyed to the liver, setting up an amoebic hepatitis (q.v.). This may develop into an amoebic abscess. Emetine, a derivative of ipecacuanha, is the main specific treatment for amoebic D. Lately various antibiotics, notably bacitracin, aureomycin and terramycin, have been used with some success. See article by J. S. K. Boyd, *British Medical Journal*, 1951, 1, 1440; Manson's *Tropical Diseases* (14th ed.), 1954.

Dysmenorrhoea, see MENSTRUATION.

Dysodyle, yellow, greyish, or greenish mineral substance found in Sicily. It is bituminous, and burns vividly, with a disagreeable smell. It is laminated in structure, and often contains fossil fishes and plants.

Dyson, Sir Frank Watson (1868-1939), astronomer royal, Greenwich Observatory, from 1910 to 1933; b. Ashby-de-la-Zouch. He was educ. at Bradford Grammar School and at Trinity College, Cambridge—where he was Second Wrangler and Smith's Prizeman, also winning the Isaac Newton studentship. He was chief assistant at the Royal Observatory, Greenwich, 1894-1905, and secretary to the Royal Astronomical Society, 1899-1905; in the latter year he was appointed astronomer royal for Scotland. He became F.R.S. in 1901, and contributed many papers to the society's *Transactions*. Under his direction radio-time signals were first broadcast from Rugby, and in 1924 the 6-pip signal of the B.B.C. was adopted. Besides official pubs. he wrote *Astronomy: a Handy Manual*, 1910, and (with R. Woolley) *Eclipses of the Sun and Moon*, 1937. Knighted 1915.

Dyspepsia (Gk *dys-*, badly; *peptin*, to digest), functional derangement of the digestive processes. The cause may be localised in the digestive organs, and may be either some temporary derangement of function or some organic disease. Alternatively D. may be a symptom of some systemic disease. The nervous system has an effect on digestion, and excitement, worry, or anxiety may interfere with the digestive processes.

Dysprosium, metal belonging to the 'rare earths' (q.v.). It was discovered in 1886 by Lecoq de Boisbaudran. Its symbol is Dy, its atomic number 66, and its atomic weight 161.2 ($H = 1$) or 162.5 ($O = 16$). D. oxide is a white solid. D. occurs naturally in the minerals euxenite, fergusonite, xenotime, polycrase and gadolinite, etc. Chemically, it is related to erbium, holmium and thulium.

Dytiscidae, or true water-beetles, are coleopterous insects with bare 11-segmented antennae, and hind legs capable of swimming only. The perfect insect is purely aquatic, though it can fly from one pond to another; the larva is also aquatic, but before changing into a pupa it comes to earth and buries itself; and the pupa is wholly terrestrial. The beetle can live for sev. min. in a submerged state, but it is obliged to come to the surface for air; this it does up in air-tubes under its elytra, or wingcases, which fit tightly to its body. It is an active creature, carnivorous of habit; it grasps the prey with its legs and then feeds by its toothed jaws, or mandibles. The larva has hollow, curved mandibles which are used for piercing the prey and sucking the juices from it swiftly and fiercely. The males are frequently found in the mating position attached to the females by suckers on their fore-feet. There are nearly 2000 species of this family already known inhabiting water of cooler parts of the world, and among the chief genera are *Dytiscus*,

Cyblister, *Actinus*, and *Hydroporus*. Related families are the Gyrinidae (whirligig beetles) and the Hydrophilidae.

Dzaisang, see ZAYSAN.

Dzauzhikau, see ORDZHONIKIDZE.

Dzerzhinsk (before 1917 Chernorech'ye, then until 1929 Rastyapino), tn in Gor'kiy oblast, of central Russia, on R. Oka 20 m. W. of Gor'kiy. It is one of the main chemical industry centres in Russia (synthetic ammoniac, fertilisers, explosives). Originally a holiday resort, it has been a tn since 1929; industrial development started before 1917, and was particularly rapid during the 1930's. Pop. (1956) 147,000 (1926, 10,000; 1939, 103,000).

Dzerzhinskiy (Polish *Dzierzynski*), **Feliks Edmundovich** (1877-1926), Russian Communist, by birth and upbringing belonging to the Polish gentry. In 1895 he joined the Social Democratic party of Poland and Lithuania, which later developed Bolshevik leanings. He was sev. times imprisoned and banished to Siberia. Released from prison by the Feb. revolution in 1917, he became a central committee member of the Bolshevik party. D. played an active part in the seizure of power and immediately afterwards set up the Cheka (q.v.). He remained chairman of the Cheka and later the G.P.U. (q.v.) until his death. At the same time he was Commissar (Minister) of Transport from 1921 and chairman of the Supreme Council of National Economy from 1924; in the latter year he became candidate member of the Politburo (q.v.). In the inner-party struggle after Lenin's death he supported Stalin.

Dzhalal-Abad, oblast (prov.) of the Kirgiz S.S.R., Soviet Central Asia, in the Tien-Shan mts. Pop. 225,000.

Dzhambul: 1. Oblast (prov.) of Kazakh S.S.R. of Soviet Union. Important area for cultivation of sugar beet, cotton, wheat, rice, and tobacco. Pop. 540,000.

2. Tn. cap. of oblast, formerly Auliye-Ata, one of the oldest tns in Kazakhstan. It is the centre of a sugar-beet and orchard area; it manufs. phosphate fertiliser and has sugar refining, fruit canning, metalworking, and distilling industries. Pop. (1939) 62,723.

Dzhezkazgan, tn and copper mining and refining centre in Karaganda oblast (prov.) of the Kazakh S.S.R. of the Soviet Union. Pop. 40,000.

Dzhugashvili, see STALIN.

Dzierzynski, see DZERZHINSKIY.

Dzungaria, or **Zungaria**, **Basin**, the largest oasis of Sinkiang, China, bordering on Russian Turkestan, and lying between the Tien-Shan on the S., the Greater Altai on the N., and the Mongolian Gobi on the E. The surface is mainly a desert and slightly hollowed plateau, but there are large tracts of forest, and the plains and valleys afford good pasturage, while cereals are grown in parts. There are numerous mt streams, but the only important rivs. are the Black Irtysh and the Ili. The minerals include gold, copper, iron, and salt. Oil was discovered in 1954, and large-scale production began in 1956. The country was conquered by the Chinese emperor in the 18th cent. The inhab. include the Kalmuck Dzungars and Turgots, and also Khalkas and Dungans, Chinese, and Kirghiz.

E

E: 1. Fifth letter of the Eng. alphabet, was originally (i.e. in the Semitic alphabet) a consonant, having the phonetic value of *h*, and was called *he*. When the Greeks took over the Semitic alphabet, *he* became *epsilon*; in some varieties of the Gk alphabet it was adopted to represent the short *e*, while the Semitic *heth* was adopted to denote the long *e* or *ēta*. (In other Gk alphabets, *epsilon* was adopted both for the long and the short *e*.) The Etruscan and the Lat. alphabets used the letter *E* for the sound *e* as in 'men' or 'prey' and made no distinction between long and short vowel. *E* is the most frequently used of all the Eng. letters. Its phonetic value, however, varies: the long *e* (as in 'me') agrees with the continental *i*; the short *e* (as in 'men') and the open and long *e* (as in 'prey') agree with the continental *e*; whereas as a final letter it is usually silent (as in 'table').

In the calendar *E* is the 5th of the Dominical letters. See ALPHABET.

2. In music, the 3rd note in the scale of *C* major. Its own major key has 4 sharps, its minor key 1 sharp.

Ea, a prin. deity in the leading Assyro-Babylonian triad (with Anu and Enlil, qq.v.). He was god of the deep ocean and underworld waters. Particularly favourable to man, he warns him of the coming Deluge and instructs him in the wisdom of the gods. In the later role he is the Oannes of Berossus (3rd cent. bc) and the god of exorcism. *E*. was the father of Marduk (q.v.), the champion of mankind and of Babylon. His main shrine was at Eridu (q.v.) (modern Abu Shahrain) by the Persian Gulf.

Edgar the Peaceable, see EDGAR.

Edmer (or **Edmer**) of **Canterbury** (c. 1064-1124), historian and monk, friend and chaplain of St Anselm. He was elected bishop of St Andrews in 1120, but as there was controversy between Canterbury and York about jurisdiction over the see, while the Scottish king maintained his independence of either, *E*. was never consecrated. His chief works were: *Historia Novorum*, 1060-1122 (first printed 1623), and *Vita Anselmi* (pub. 1551), both in the Benedictine ed. of Anselm's *Works*, 1721. *M*. Rule's ed. in the *Rolls* series appeared in 1884.

Eads, James Buchanan (1820-87), Amer. engineer and inventor, granted a gov. contract (1861) for constructing a fleet of ironclads for use on the Mississippi. With these the capture of Fort Henry was effected during the Civil war. *E*. constructed the steel arch bridge at St Louis (1867-74), and undertook to deepen the Mississippi's channel by means of jetties. He also planned a ship-railway across Tehuantepec isthmus, but his project was not carried out. See F. D. How, *J. B. Eads*, 1900.

Eagle: 1. Military standard of the Roms. and earlier nations. The Persians, in the time of Cyrus the Younger (5th cent. bc), carried an *E*. on a spear as their standard. The Rom. *E*. was of silver, bronze, or gold, with wings extended. It was carried on the top of a spear, with a cross-bar supporting it. Some held thunderbolts in their talons. Napoleon's armies had a similar standard (1804). A number of Brit. regiments which captured Fr. *E*s during the Napoleonic wars incorporate these in their badges. As an armorial bearing the Imperial *E*. was adopted by the Holy Rom. empire, and at various periods in their history by Austria, France, Germany, Russia, U.S.A., and Poland.

Arthur Brook

GOLDEN EAGLE AND YOUNG

2. Term employed in speaking of many species of Accipitridae in the sub-family Aquilinae. They occur in all parts of the world, usually building eyries in forests or on mts, and all are fierce and powerful birds of prey. The species described in mythology and art belonged to the genus *Aquila*, but it is not known from actual specimens. *A. chrysaetos*, the golden *E*., is a large and fiercely predaceous bird rarely found in Britain, though it has been known to breed in remote parts of Scotland. Its nest or eyrie is usually built on cliffs or mts. *A. naevia*, the spotted or screaming *E*., occurs in N. Europe. The sea-*E*s are represented by the genera *Haliaetus* and *Thalassaeetus*; the hawk-*E*s by *Spizaeetus* and *Limnaetus*; the fishing *E*s by *Pandion*; the harrier-*E*s by *Circus*. The erne or white-tailed sea-*E*. *Haliaetus albicilla* ceased to breed in Britain only in comparatively recent years. The *E*. has been adopted by various nations as a symbol of power,

e.g. by Germany (for a time), or, again, as exemplified in the Bible (Ezek. xvii.), or as an emblem of nobility and generosity; while in Christian art it typifies contemplation and is the symbol of St John the evangelist. In the Bible, the Heb. term *nesher* equivalent to Gk *etos*, like the Arabic *niser*, denotes sev. birds of prey. Probably the griffon vulture is most often intended. It has no true feathers on head and neck, hence the phrase 'enlarge thy baldness as the E.' (Mic. i. 16). This bird abounds in Palestine, making its nests in the high cliffs overlooking the valleys (Jer. xlix. 16). The E. is noted for the telescopic range of its vision, and espies its prey from immense distances, while its flight seems to be watched by many other birds that follow to feast upon the carrion (Matt. xxiv. 28). There is an allusion in Ps. ciii to the anct belief that the E. was able to renew its youth. In the Middle Ages it was believed that every 10 years the E. beat its way upward high into the sun, whence, plunging into the sea, its old plumage was shed for new, and its youth was restored. See *under* separate headings for descriptions of species.

Eagle-hawk, see HAWK-EAGLE.

Eagle-owl, or *Bubo*, genus of the family Strigidae, which is represented in all parts of the world but Australia.

Eagle Pass, tn of SW. Texas, U.S.A., on the Rio Grande, in an agric. and coal-producing dist. Pop. 7300.

Eagle-wood, see ALOES-WOOD.

Eaglehawk, municipal bor. of Bendigo co., Victoria, Australia. 4 m. from Bendigo, and 105 m. from Melbourne; noted for fine gold mines. Pop. 5000.

Eagre, see BORE.

Eakins, Thomas (1844-1916), Amer. painter, b. Philadelphia, Pennsylvania. He studied art in Paris under J. L. Gérôme at the École des Beaux-Arts, and under Léon Bonnat. He also worked in the studio of Dumont, the sculptor. In America he was prof. of and lecturer on anatomy and painting in various schools of art, and assisted his pupil, Samuel Murray, to model the colossal figures of the Prophets on the Witherspoon Building at Philadelphia; he modelled 2 reliefs on the Trenton battle monument, also the horses ridden by Grant and Lincoln on the Soldiers' and Sailors' Monument at Brooklyn. He painted the Crucifixion in Overbrook Seminary, and a portrait of Cardinal Martinelli. A realistic painter, he has been called 'the American Courbet'.

Ealdhelm, see ALDHELM.

Ealdred, see ALDRED.

Ealing, municipal bor. of Middx, England, 7 m. W. of Charing Cross. It was created in 1901, the first of the modern bors. of the co., and includes Northolt (q.v.). Hanwell, Greenford, Perivale, and the residential part of West Twyford. It is nearly certain that E. was settled by Saxons as early as the mid-6th cent., and it remained a vil. until the early 19th cent., but is now the centre of a populous London suburb and industrial dist. At Hanwell the Brunel Viaduct forms a well-known landmark. Perivale has the smallest church in the co., mainly a 13th-

cent. building with a 16th-cent. weather-boarded tower; Greenford, once an area of open fields, is now largely industrial. The industries of E. include the manuf. of glass bottles, infant foods, pharmaceutical products, electrical goods, oil heaters, and vacuum cleaners; here also were the E. Film Studios. Pop. 185,000.

E. A. M. (Ellinikon Apelevtherotikon Metopon), a Gk resistance movement or 'National Liberation Front' in Second World War. See GREECE.

Eames, Emma (1865-1952), Amer. prima donna, b. Shanghai, China; studied at Boston, Massachusetts, and Paris. Made her début in Paris in 1889, and first sang in London, at Covent Garden, in 1891.

Ear. The E., the organ of hearing, is divisible into 3 parts: (a) the external; (b) the middle; (c) the internal. The most important portion is the internal E. or *labyrinth*; the other 2 can be considered merely as accessories to this, their function being the collection and transmission of the sound waves so that the sentient portion of the organ may be affected. The parts will be described from the exterior inwards. The external E. consists of 2 parts, the *pinna* and the *meatus*. The former is a broad, peculiarly shaped, and for the most part cartilaginous plate, concave on the whole, but thrown into various elevations and hollows to which distinct names have been given, the largest and deepest hollow being the *concha*, which surrounds the entrance to the meatus. The variety of contour is to ensure that the sound waves collected within the rim of the pinna are reflected into the external auditory canal, somewhat similar to the action of the Whispering Gallery of St Paul's. The pinna is also used to ascertain the direction from which the sound is coming. The meatus, about 1½ in. in length, has an outer cartilaginous portion with many fine hairs and a large number of sebaceous glands which secrete *cerumen* or E. wax. The innermost half of the tube enters the temporal bone which encloses the middle and internal E. The meatus is first directed upwards and then, narrowing in diameter, surmounts a convexity in the floor of the osseous part to dip downwards and widen again to its termination at the obliquely placed *membrana tympani* or *drum*.

The middle E., or *tympanum*, is a narrow, irregular cavity varying in width from ½ in. to ⅓ in. between the tympanic membrane and the outer bony wall of the labyrinth. Its enclosed air is in direct communication with the pharynx (throat) by means of the Eustachian tube. This arrangement ensures that the cavity is kept supplied with renewed air at the same pressure as that of the external E. so that the drum is able to vibrate freely. It contains a chain of small bones which convey the vibrations across the cavity to the middle E. The *membrana tympani* is an ellipsoidal disc about 0.37 in. by 0.33 in., and about ⅛ in. thick. To its inner surface is attached the handle of the 1st bone (the *malleus*, or hammer), the

rounded head of which fits into a corresponding hollow in the 2nd bone (*incus*, or anvil), and this in its turn articulates with the *stapes*, or stirrup, which fits into the *fenestra ovalis* of the internal E. The *fenestra rotunda* separates the *scala tympani* from the middle E. The complicated ligament and muscle attachments of the chain of bones ensure an exact reproduction at the *fenestra ovalis* of the highly complex movement of the tympanic membrane.

The internal E. is contained in the petrous portion of the temporal bone and consists of a complex cavity, the *osseous*

auditory epithelium, which contains distributed filaments of the auditory nerve. The *cochlea* (Lat. a small shell, from its spiral shape) appears in the form of a blunt cone about $\frac{1}{2}$ in. in height and the same in breadth at the base. It consists of a gradually tapering spiral tube of $2\frac{1}{2}$ turns and some $1\frac{1}{2}$ in. in length, the inner wall of which is formed by a central column, or *modiolus*, from which projects a spiral lamina along the whole extent of the cochlea. The membranous labyrinth consists of structures lined throughout by epithelium, and at certain parts receives branches of the auditory nerve. In the vestibule and canals the structures have a general resemblance in form to the complicated cavity in which they are contained. They do not, however, lie loose within the osseous labyrinth, but along the convex border of the canals, and at the places of entrance of the nerves into the vestibule and ampullae they are fixed to its walls. In the cochlea the membranous structures complete the septum and enclose an intermediate cavity. In the osseous vestibule there are 2 membranous sacs: (a) the *utricle* (Lat. *utriculus*, a small bladder), connected with the canals, and (b) the *sacculus*, connected with the cochlea; these sacs are only in indirect communication with one another. Both contain small masses of calcareous particles (*otoliths*) which are set in movement by vibrations, and they also contain patches of auditory epithelium with nerve filaments. The cavity of the osseous cochlea is divided into 3 distinct parts, *scala vestibuli*, *scala tympani*, and *canalis cochleae*, by means of 2 membranes: (a) the *basilar*, and (b) the more delicate *membrane of Reissner*, the oblique dissection of which latter causes the smallest portion, the cochlear canal, to have a triangular section; this is in communication with the sacculus and contains endolymph, whereas the other 2 scalae contain perilymph. The cochlear canal is highly complicated, and only a brief description is possible here. The most important structure of the floor of the cochlear canal, that is, on the basilar membrane, is the so-called organ of Corti, which consists of the rods of Corti. There is an inner row and an outer row all along the spiral, each row containing sev. thousand rods. Flanking the rods are rows of cells (sev. thousands in each row), each cell bearing short hairs on its free surface, and the auditory nerves passing through the lamina spiralis reach the cochlear tube along the whole length of the spiral and end in filaments which are lost in the organ of Corti, but are probably connected with the hair cells. It is thought that the cochlea distinguishes pitch and timbre in notes. What takes place in hearing may be summarised thus: The vibrations set up by a sounding body are conducted by the accessory apparatus to the perilymph through the membranous sac, thence to the endolymph. The vibrations in time reach those particular places containing auditory epithelium, and set the auditory hairs or the otoliths in movement, and so excite the delicate filaments below, which

PARTS OF THE EAR

A, pinna; B, meatus; C, eustachian tube; D, cochlea and semi-circular canals; E, section of cochlea.

labyrinth (auditory capsule), hollowed out of the bone and containing the *membranous labyrinth*. The former is incompletely divided into 3 parts, viz. the *vestibule*, the *semicircular canals*, and the *cochlea*; the membranous labyrinth is smaller, and the space between the two is occupied by *perilymph*, while *endolymph* is contained in the inner labyrinth. The vestibule forms the central chamber of the labyrinth and communicates in front, by means of a large opening, with the cochlea, and behind, by means of 5 smaller openings, with the semicircular canals; its outer wall is penetrated by the *fenestra ovalis* mentioned above. The semicircular canals are 3 tubes differing from one another in direction, length, and position with regard to the vestibule; they are arranged in 3 planes mutually at right angles, and they are of the greatest importance in the guidance of co-ordinated movement so that bodily equilibrium may be maintained. Each canal is about $\frac{3}{8}$ in. wide, but each is dilated at one end forming an *ampulla* about $\frac{1}{4}$ in. in diameter, and on each ampulla is a crest or ridge (*crista acustica*) projecting into the cavity of the canal and consisting of

causes impulses to pass along the auditory nerve to the brain.

Deafness and diseases of the ear.—The most common affection of the E. is deafness, which is of various types. An impacted plug of wax will cause it, and should be removed by syringing, which however must be carried out with care. It is best to drop a few drops of hydrogen peroxide or liquid paraffin into the E. for 2 or 3 nights before syringing, in order to soften the wax. A *furuncle* or boil in the meatus may also cause deafness, but the chief symptom is severe throbbing pain. By far the greater number of cases of deafness, however, are caused by affections such as catarrh of the middle E. or Eustachian tube, which, if not properly treated at an early stage, may proceed to chronic catarrh. *Adenoids* (q.v.) are a common cause of deafness among children. *Otosclerosis* also brings middle-E. deafness, and is due to obscure changes in the bony labyrinth, but unhappily neither its cause nor cure is known. *Nerve-deafness* is due to an affection of the cochlea or the acoustic nerve. Other diseases include *otitis media*, or inflammation of the middle E.; this may be associated with one of the infectious diseases, particularly measles (q.v.) and scarlet fever (q.v.), or with tonsillitis, the bacterial infection spreading up the Eustachian tube. *Otitis media* commonly leads to abscess formation, unless checked in its early stages by antibiotic treatment, and the abscess is drained by an incision through the tympanic membrane. This operation is known as myringotomy. Otorrhoea, or chronic suppurative infection of the middle E., may follow acute *otitis media*. It causes a chronic offensive discharge and the condition is difficult to cure. Infection of the mastoid air cells, or *mastoiditis*, may follow acute *otitis media*. Abscess formation must be treated by surgical drainage. *Vertigo* is a distressing symptom in which the patient feels or sees movement when, in fact, no movement has occurred. It is accompanied by a disturbance of balance which causes the sufferer to clutch a support and, in severe cases, may throw him to the ground. It may even occur at rest. Vague disturbances of balance without any sensation of movement are not true vertigo. In most cases vertigo is due to a loss of function of the vestibular system of the inner E., either in the labyrinth or the 8th cranial, or auditory, nerve. The symptoms of vertigo are most severe when loss of function is sudden and affects one side only. In cases of gradual onset the nervous system develops alternative means of maintaining balance, and loss of function is not so noticeable. Acute cases may be accompanied by collapse and vomiting. The loss of vestibular function may be temporary, as in the overstimulation of the end-organs in the labyrinth in motion sickness, or may be due to permanent damage from injury or disease. Damage to the vestibular nerve connections may occur from a cerebral haemorrhage or a tumour or disease of the nervous system. Or the lesion may be in the

labyrinth itself. When the lesion is in the labyrinth the condition is known as Ménière's disease. Labyrinthine lesions may occur from head injury, such as a fractured skull; from infections secondary to *otitis media* or meningitis (q.v.); and from the effects of toxins. One of the antibiotics, streptomycin, has a selective toxic action on the labyrinth in some people. An obstructive distension of the endolymph of unknown cause is responsible for labyrinthine vertigo in other cases. Treatment consists in treating the cause where possible. Sedative drugs help in the acute attack.

Ear-ring, strictly a ring worn as an ornament suspended from the lobe of the ear, which is pierced for the purpose. The custom of wearing E.s has existed among the Orientals from the earliest times. It was common to both sexes among the Asiatic races (Persians, Babylonians, and Carthaginians), but reserved for women only among the Greeks and Romans. In Elizabethan times in England E.s were still worn by men, and sailors sometimes continue the custom. This form of jewellery has for long been highly fashionable and popular among women all over the world. The 2 chief kinds are a jewelled stud fitting closely to the lobe, or a drop or pendant hanging from a gold loop. In costume jewellery many thousands of different patterns are produced.

Ear-shell, gastropod mollusc of genus *Helix* sometimes called ormer. The shell is ear-shaped.

Ear Stones, see OTOLITHS.

Ear-wax, see CERUMEN.

Earheart, Amelia (Mrs G. Palmer Putnam) (1898–1937), Amer. social services worker and air-woman, b. Atchison, Kansas. She was the first woman to fly the N. Atlantic, flying as a passenger from Newfoundland to Burry Port, Wales, in 1928. She served with the Red Cross during the First World War and subsequently directed a social service centre in Boston; flew from Newfoundland to Ireland in 13½ hrs, 1932; and made the first solo flight from Honolulu to Oakland, California, doing the journey in 18½ hrs, in 1935. In July 1937, when attempting a flight round the world, she was lost at sea with her navigator, Capt. Noonan, near Howland Is.

Earl, title of Brit. nobility, between a marquess and a viscount. It was during the Norman period that earldoms first became hereditary, and for some time E.s were called counts, and their wives at the present day are called countesses. The title of E. was the highest hereditary dignity until the reign of Edward III, who created his eldest son 'Duke' of Cornwall, 1337. The eldest son of an E. bears the title of 'viscount,' while the younger sons are styled 'honourable.' See also NOBILITY.

Earl Marshal of England. The king's M. (A.-S. *meath*, horse, *seale*, groom) early became one of the chief officers of state, and, under the Norman and Plantagenet kings, judge in the Courts of Chivalry. Since 1672 the office has been hereditary in the family of Howard

(dukes of Norfolk). The E. M. is now head of the Heralds' College through which he regulates all matters connected with armorial bearings, standards, etc., and controls the arrangements for state functions. In Scotland a similar dignity was hereditary in the family of Keith from the 14th cent. till 1716.

Earle, John: 1. (1601-65) Clergyman and essayist, b. York. Educ. at Oxford, where he was a Fellow of Merton, he took orders and became chaplain to Charles II. At the Restoration he was made dean of Westminster, in 1662 bishop of Worcester, and in 1663 bishop of Salisbury. Learned and eloquent, he was opposed to all forms of religious persecution, including the Conventicle and Five Mile Acts. As a writer, he is chiefly remembered for his *Microcosmographie*, or *A Piece of the World Discovered in Essays and Characters*, 1628, the best and most entertaining of all the once fashionable collections of 'characters.'

2. (1828 1903) Eng. philologist and clergyman, prof. of A.-S. at Oxford, 1849-54; re-elected, 1876. He became rector of Swanswick in 1857, prebendary of Wells (1871), and rural dean of Bath (1873-7). His works include: *Two of the Saxon Chronicles Parallel*, 1865; *A Book for the Beginner in Anglo-Saxon and The Philology of the English Tongue*, 1866; *Anglo-Saxon Literature*, 1884; *English Prose, its Elements, History, and Usage*, 1890; *The Psalter of 1539, 1894*; *A Simple Grammar of English now in Use*, 1898; *The Alfred Jewel*, 1901.

Earlestown, see NEWTON-LE-WILLOWS.

Earlom, Richard (1743-1822), mezzotint engraver, a pupil of Cipriani (q.v.). He was the first artist to make use of the point in mezzotint work. He engraved plates after Rembrandt, Van Dyck, Correggio, and others; the 6 after Hogarth's 'Marriage à la Mode' are well known. 'Fruit and Flowers,' after J. van Huysum, made his reputation, and 'Bathsheba leading Abishag to David' won much praise. His patron, Boydell, pub. the 'Liber Veritatis,' 1777, a series of mezzotints from the originals of Claude Lorraine.

Earls Barton, vil. of Northants, England, 4 m. SW. of Wellingborough. Its par. church has a noted Saxon tower dating from the late 10th cent. It is the centre of boot and shoe manufs. Pop. 3000.

Earl's Court, part of the bor. of Kensington, London, with a large hall used for exhibitions and entertainments.

Earlston, Erroldoune, or Erroldoune, par. and mkt tn of Berwickshire, Scotland, on Leader Water, 4 m. from Melrose. Ruins of an auct tower remain, the traditional abode of Thomas the Rhymer (13th cent.). Tweeds and other textiles are manufactured, and there are dye-works. Pop. 1700.

Early, Jubal Anderson (1816-94), Amer. confederate general, practised law from 1838 to 1861. He served in the Florida war (1837-8), and in Mexico (1847-8). In the Civil war he commanded a brigade at Bull Run (1862), and distinguished himself at Williamsburg, Antietam, Fred-

ericksburg, Chancellorsville, and Gettysburg, commanding part of Lee's army. After some successes in the Shenandoah Valley, he was defeated by Sheridan (1864), and by Custer at Waynesborough (1865). He wrote *A Memoir of the Last Year of the War for Independence in the Confederate States*, 1867. See G. Pond, *The Shenandoah Valley in 1864*, 1883. See also M. K. Rushong, *Old Jube*, 1955.

Early Closing. The movement for reducing the working hrs of shop assistants was inaugurated in 1842, since which year the compulsory weekly half-holiday, the introduction of 'summer time,' and other reforms have appreciably improved their conditions. The provisions of the Shops (Early Closing) Act, 1920-1, were permanently adopted in 1928. The act states that for only one day weekly may a shop remain open until 9 o'clock, and on the remaining evenings it must close no later than 8, although customers inside the doors before closing time or anyone requiring some article urgently in case of illness may be served. Exemptions are given in respect of exhibitions and seasons such as Christmas, while special provisions are made for holiday resorts and sea-fishing centres. The occupier of a shop breaking the law is liable to a maximum fine of £5 for a 1st offence, and £20 for any subsequent offence. A Shops Bill to amend the scale of working hrs went before Parliament in 1956, but its progress was suspended during 1957. See SHOPS ACTS.

Early English Text Society, founded in England by F. J. Furnivall (q.v.) in 1864 to bring unprinted early Eng. literature within the reach of students and lexicographers. During the last 90 years the Society has pub. more than 360 texts which range in date from the earliest A.-S. period to the 17th cent. These were drawn on heavily in the editing of the *Oxford English Dictionary*. Together these texts—among them being *Beowulf* (facsimile), *Piers Plowman*, Gower's *Confessio Amantis*, the Towneley and Chester cycles of mystery plays, 3 Tudor lives of Sir Thomas More, and many other works, religious and secular—form a collection invaluable for the scholar and the general reader.

Earn, loch of Perthshire, Scotland, about 6½ m. long by ½ m. broad, and about 300 ft deep. On the S. is Ben Vorlich, a mt. of 3224 ft, and Ardvorlich House is the 'Darnlinvarach' of Scott's *Legend of Montrose*. The riv. issues from the loch, flows E. through the well-wooded valley of Strathearn, past Comrie, Crieff, and Bridge of E. The E. finally joins the Tay near Abernethy, about 6 m. from Perth.

Earnest (Scottish *arles*), trifling sum of money or token given to 'bind the bargain' of a sale or agreement, marking the assent of both parties to a contract. A practice of great antiquity, it is still sometimes observed in England and Scotland. It is not quite the same as part payment, for in the case of E. proper, or 'dead E.', no allowance is made later for the value of the token given beforehand by the purchaser.

Earth (O.E. *eorthe*), the planet on which we live. The term is also used to denote the solid portion of the globe, in particular the uppermost layer, consisting of disintegrated rock and organic particles loosely bound together, otherwise known as soil. The early chemists recognised 4 elements, fire, air, water, and E., of which all other substances were thought to be mixtures or modifications. In modern chem. the term persists as applied to certain metallic oxides. The older chemists gave the name E. to non-metallic substances which were insoluble in water and were not affected by high temps. As many of them had an alkaline reaction they were known as alkaline E.s, but subsequent investigations have shown that each such E. is a compound of a metal and oxygen. The term alkaline E. is now restricted to lime, strontia, and baryta, these being oxides of calcium, strontium, and barium. There is another extensive group of oxides known as the rare E.s (q.v.).

The Earth as planet.—The E. is a member of a group of bodies distinguished from other bodies in the universe by their motion around one member of the group, the sun. The central body, or sun, is the only member of the group, as far as we know, which shines by its own light. The other bodies consist of planets which move in elliptical orbits about the sun, and satellites which revolve around certain of the planets. The planets, in order of nearness to the sun, are Mercury, Venus, the E. with its satellite the moon, Mars, with 2 satellites; then come a vast number of minor planets or asteroids, and outside of these the larger planets, Jupiter, Saturn, Uranus, and Neptune, with 12, 9, 5, and 2 satellites respectively, and Pluto. The path of the E.'s motion round the sun, that is of its *revolution*, is an ellipse of which the sun forms one focus. The mean distance of the E. from the sun is about 93,000,000 m., and the eccentricity of the orbit is about 0.0167272. The plane of the orbit is called the ecliptic, and it is inclined to the E.'s equatorial plane at an angle of about $23\frac{1}{2}$ degrees. The time which the E. takes to make a complete circuit is known as the solar year, and measures 365 days 5 hrs 48 min. 46 sec. (see CALENDAR; CHRONOLOGY). The E. has another movement, rotating about its own axis, thus causing points on the E.'s surface to have periods of sunlight alternating with the periods of darkness. Owing to the inclination of the E.'s axis to the plane of the ecliptic, some places are presented to the rays of the sun more directly than others; this causes the phenomena of the seasons (q.v.). Also places in high lats. are presented for longer periods to the sun's rays according to the position of the E. in its orbit; this accounts for the variations in the lengths of day and night in those lats. The E. is nearly spherical in shape. The ancients believed it to be a flat disk, and the belief persisted in the popular mind for many centuries. Pythagoras, however, asserted that the E. was spherical and his view was strongly supported by Aristotle, who employed many of the arguments current

to-day. The horizon becomes more extensive as the position of a spectator becomes more elevated. The E. always throws a circular shadow on the moon when it is in eclipse, and the lower part of a receding object is the first to disappear. The E. is, however, not a perfect sphere. In the 17th cent. Jean Richer observed that a clock which kept perfect time in Paris lost about $2\frac{1}{2}$ min. a day at Cayenne, and the pendulum had to be shortened in order to correct the error. Newton explained the occurrence by showing that the attraction due to gravity was less at the equator than in more northerly lats. owing to an increased distance from the E.'s centre of gravity, and, in addition, centrifugal force due to the E.'s rotation diminishes from equator to poles, thus increasing the E.'s gravitational pull. This conclusion received confirmation by experiments with delicate spring balances, which registered less weight for a given mass in equatorial than in regions of higher lat. It was also observed that the length of a degree of lat. is greater towards the poles than near the equator. The degree is readily indicated with great accuracy by astronomical methods, and its length being determined by careful E. measurement showed beyond doubt that the E. is flattened at the poles. The amount of the flattening is not great, the extent by which the polar diameter is less than the mean equatorial diameter being about 1 298th part of its length. The equatorial section of the E. is also slightly elliptical. The length adopted of the polar diameter is 7900.09 m., and of the equatorial diameter 7926.70 m., giving a difference of 27 m. approximately. The mass of the E. is given by the most recent researches as 5,885,000,000,000,000,000 tons. The mean density of the E. is computed at about 5.5, the density of pure water at 4° C. being taken as unit. The planet E. is a great magnet. If a magnetic needle is placed upon a pivot so as to oscillate freely it takes up a position which is approximately N. and S. The N. and S. poles of the E. considered as a magnet are some distance from the poles of the rotatory axis and undergo secular variation of position. (For measurement of the E., see also METEOROLOGY and PHYSICAL CONSTANTS.)

Origin and history of the Earth.—No theory of the origin of the E. has been generally satisfactory. The nebular hypothesis, which was once in favour, states that the solar system was at one time a great nebulous mass which had a rotation and slowly contracted under its own gravitational pull. As the contraction increased, its angular velocity also increased in accordance with the well-known law of the conservation of angular momentum. Matter was ejected by the centrifugal force prevailing over the gravitational attraction, this matter forming rings which afterwards became the planets. These latter repeated the process on a small scale, their rotation condensing matter which afterwards condensed to form satellites. There is certainly abundant evidence that the E.

was at one time at a much higher temp. than to-day. The gradual rise of temp. on descending towards the E.'s interior suggests that the innermost regions are still at an enormously high temp. The existence of volcanoes which pour out molten rock and hot gases is taken by some as sufficient evidence that the interior is still in a fluid condition, and that the crust is a solidified envelope of comparatively little depth. Physical facts are against the likelihood of a permanent gaseous or molten interior, and some scientists say that the amount of radium in the E., indicated by the discoveries fairly near the surface, is sufficient to account for almost any degree of temp. Attempts have been made to compute from geological, physical, and other data the length of the period during which the E. has been in a solid state. Lord Kelvin based his hypotheses on arguments derived from consideration of 3 kinds of data. By judging the rate of the loss of heat from this planet, he placed the limits of not less than 20,000,000 years and not more than 400,000,000 years as the length of time from the first superficial solidification of the E. to its present condition. From the amount of retardation of the E.'s rotation due to tidal friction he judged that the E. became consolidated not much more than 100,000,000 years ago. Thirdly, by calculating the probable age of the sun's heat, he brought down his estimate of the age of the E. to about 20,000,000 years. Geologists, however, were disinclined to accept any period less than 100,000,000 years as sufficient for the elaboration of the present structure of the E. It is indisputable that some hundreds of millions of years must have elapsed while the great sedimentary rocks were being deposited. With respect to the larger features of the E.'s surface, it is likely that 2 different kinds of movement are responsible. Where the contraction of the E. has caused a lessening of the support below the surface, there has been a subsidence of great areas. Where the rigid crust has been able to contract into a smaller space, great ridges and folds have been formed, showing marked continuity and parallelism. The subsidences which caused the ocean appear to have taken place at different ages. The Atlantic Ocean probably dates from middle Cretaceous times; the Indian Ocean may be older; and the Pacific, whether a subsidence of great antiquity or not, has certainly suffered great modifications in comparatively recent times. Akin to the general discussion of the age of the E. is speculation concerning its future. The constant operation of tidal friction will cause it to rotate more and more slowly, and the gradual cooling of the sun itself will inevitably diminish the amount of heat received by the E. A time will come, many thousands of millions of years distant, when the members of the solar system will no longer receive sufficient heat from the sun to make conditions favourable for any form of life.

Structure of the Earth.—The E. consists of an outer gaseous envelope, the *atmo-*

sphere; a middle layer of water, the *hydrosphere*, occupying the hollows in the surface of the globe; and a central core of solid material, the *lithosphere*. In the course of its solidification, the lithosphere developed ridges, which are represented by the great mt ranges, and subsidences, which are represented by the great oceans. The progressive cooling had its consequence in stresses in various parts of the surface of the lithosphere which took effect in various movements, sudden occasionally, but long sustained for the most part, and so the general shape of the E. was and is constantly changing; in places the land is gradually lifted above the sea, while other lands are gradually submerged, only to reappear in a later age. There are other agencies at work tending to change the form of the E. The disintegrating forces of frost and water action gradually wear down the older rocks, while the deposition of the débris, mixed with relics of organised life, builds up layers of sedimentary rock. The oldest rocks, those of the Pre-Cambrian (q.v.) period, are believed to have been formed about 3,500,000,000 years ago (see GEOLOGY, *The Geological Method*). The study of the crust of the E. is the aim of the science of *Geology*. In *Geography*, the surface of the E. is considered: its div. into continent and ocean, the features of the land masses, mts, rivs., plateaux, plains, etc., the distribution of life on the globe, the manner in which the various sections of the human race have grouped themselves, the nature of their govts., their industries, their cities and tns, roads of communication, commerce, and markets. *Astronomy* deals with the E. as a planet, its movements, and the methods of accurately measuring them. The measuring of the surface of the E. is the concern of *Geodesy*. The constitution of the various rocks is dealt with in *Mineralogy* and *Chemistry*. The study of earthquakes (q.v.), of the physical conditions in the E.'s interior, as far as its centre, its density, magnetism, etc., is dealt with in *Geophysics*. The constitution and phenomena of the atmosphere are the business of *Meteorology* (q.v.). The hydrosphere is studied under the name of *Oceanography*. See OCEAN AND OCEANOGRAPHY.

See J. H. Poynting, *The Earth*, 1922; G. A. Bailell, *Evolution of the Earth*, 1929; V. A. Heiskanen, *On the Figure and Structure of the Earth*, 1941; T. A. Ryder, *Mother Earth*, 1948; Harold Jeffreys, *The Earth*, 3rd ed. 1952.

Earth-closet, privy that has a movable receptacle for faecal matter, the contents of which are deodorised by being covered with earth, ashes, or other material. E.s may be installed in lieu of water-C.s where there is not a sufficient water supply for the serving of water-C.s and a sewer is not available. The definition of an E. in the Public Health Act, 1936, is so framed as to include certain types of chemical closet.

Earth Colours, see PIGMENTS.

Earth Current. If 2 metal plates are sunk in the earth at some distance from each other, and then connected by a wire,

E. C.s flow from one plate to the other, and may be detected by a delicate galvanometer placed in the circuit. The potential difference between the plates may be as much as 20 millivolts per kilometre distance between them. This potential difference varies daily, and may cause serious interference with the transmission of messages. The telegraph lines running from N.E. to S.W. in England are the prin. sufferers from E. C.s. These C.s were discovered by Walker and Barlow in England in 1847 from measurements on telegraph lines. Strictly speaking the C.s caused by the following phenomena are not included under the title of E. C.: C.s from chemical activity of ores, and from local temp. differences, and surges due to lightning discharges. E. C.s are essentially pulsating or alternating C.s of relatively long periods, and no steady direct C. has been found. They are associated with M. C. storms, magnetic storms, movements of charge in the ionosphere, and sunspot activity.

Earth-house, or Yird-house, see SOUTHERN RAINS.

Earth-nut, see GROUND-NUT.

Earth-pillar, pillar of earth or soft rock capped by a large boulder or some harder material, such as sandstone or limestone. These columns are formed by the action of rain on a mass of soft, stony clay, or by the washing away of softer substances beneath cracks formed in the cap of rock. They occur in the moraines of glaciers, boulder-clay, and similar formations, and are from 30 to 100 ft high. Examples are found in the 'bad lands' of W. North America, in the 'Garden of the Gods,' in Colorado, and at Bolzano (Tyrol). There are also specimens at Fochabers in Scotland, and elsewhere.

Earth-shine, light reflected from the earth's sunlit surface to the moon, causing the dark parts of her surface to become slightly luminous (with a reddish tinge) for a few days before and after new moon. The appearance, popularly described as 'the old moon in the new moon's arms' (the whole surface being visible in ashy-coloured light), is a result of the E.

Earthenware, name used in England to denote objects made out of clay and baked hard, but not to the point of vitrification. (For the latter, see STONEWARE and PORCELAIN.)

TECHNIQUE. Although nowadays potters only use clay from a few favoured dists. with particularly fine clay, earlier potters used the local clay. The greatest invention in the hist. of E. is that of the potter's wheel, a contrivance which consists essentially of a dish or table revolving horizontally. The clay is thrown on the centre of the wheel and fashioned by the hand of the potter, aided by a few simple tools, into a symmetrical shape about the axis of the wheel. The clay is then put aside to dry and be worked more accurately by steel tools in a lathe; spouts, handles, etc., are moulded and attached to the body. The objects are placed in coarse E. containers called *saggars* and piled up in the kiln to be baked, often in 2 or more stages. The

baked but unglazed first stage is known as biscuit (q.v.). Coloured decoration is now added and made permanent by another firing. A glaze, either lead or salt, is added and made hard and transparent by firing.

HISTORY.—Ancient Britain.—E. was one of the features of the Neolithic revolution which started somewhere in the E. Mediterranean. The earliest forms are very simple, often with lugs for carrying. Sev. varieties are known in the Bronze Age but all are local products. With the introduction of the hand turntable or the wheel in the Early Iron Age, E. became to a certain extent an industry in Britain.

Egypt, Mesopotamia, etc.—The art of E. proceeded on parallel lines. Bricks made of sun-dried clay and straw were common at an early period. In Assyria they were glazed and used for decoration on important buildings, e.g. the frieze from the Achaemenid Palace at Susa, c. 500 BC (now in the Louvre). Baked clay tablets and cylinders were used for inscriptions and writings. The finest Egyptian E. is the vitreous alkaline glazed vases, bowls, etc., especially the turquoise blue glazed ware of 12th–18th dynasties. In Ptolemaic times the glaze is less opaque.

Crete.—Valuable E. discoveries were made in the 20th cent. Early Minoan ware consisted largely of pots made from coarse grey clay, which was hand-polished and decorated with incised lines, like the E. of 2500 BC from the Antiparas Is. A ripple design is found on Neolithic ware from Crete dating from before 3000 BC. In the Bronze Age, during the early Minoan period at Knossos, coloured baked clay was used and painted a dull black, which later was ornamented with white patterns. In the middle Minoan period the potter's wheel was probably introduced from Egypt. Light-coloured patterns on a dark ground (polychromeware) or dark patterns on the plain baked clay (monochrome ware) were made. Later Minoan ware includes egg-shell vases and designs in relief, and the large storage jars similar to those in use to-day. A change away from polychrome towards monochrome marks the late period, during which was discovered a durable black varnish, which was not a glaze. The E. is often covered with a brown-black glaze on a buff clay slip and the designs are naturalistic. There followed a rapid decline in quality.

Greece.—E. developed largely without influence from Egypt or Assyria until a late period. The most typical form of Gk E. is the vase, with its innumerable variations of shape and many uses. The earliest decoration is incised patterns. The Greeks used no glaze but a black and red 'gloss,' obtained by painting the partly dried pot with a fine suspension of clay containing iron. The E. was then fired and if kept from contact with the reducing gases resulted in the red, and if exposed to them resulted in black, terra sigillata (see SAMIAN WARE). From the 4th cent. Gk E. tends to be over-decorated and the drawing becomes careless.

Rome.—There was simple E. used for domestic purposes and there was the bright red glazed E. known as samian ware (q.v.). The latter is usually decorated with stamped, moulded or applied ornament, though simple incised patterns occur.

Asia.—High quality E. was made in Korea, often of a celadon green colour, and it is claimed that the Japanese learnt to make E. from the Koreans. In China, the discovery of hard-paste porcelain (q.v.) by the 7th cent. AD tended to replace E., except for the poor-quality objects of common use. Early Islamic E. of the 9th and 10th cents. was of a high quality—often glazed polychrome ware. By the 13th cent. a fine stoneware tends to take the place of E. in Persia.

European Earthenware.—Dark Age E., following the fall of the Rom. empire, was very simple and of poor quality. By the 10th cent. improvements, such as the use of glaze, were made, and by the 13th cent. polychrome E. in W. Europe of high artistic standards and shapes had been evolved. The great advance in E. came with the introduction of a tin glaze from the Moslems in Spain (see HISPANO-MORESCUE). This technique, which provided a fine white ground for coloured decoration, spread to Italy where it was developed, creating the new class of E. called maiolica (q.v.), and later, in the 16th cent., to France where it is called faïence (q.v.). The great centres, Rouen, Moustiers, and Strasbourg, dominated the styles of the many other Fr. factories. At the same time, this technique was developed in an individual way in the Netherlands (see DELFTWARE) and in Germany, particularly at Nuremberg under a craftsman, Augustin Hirschvogel (1503-53). In 16th-cent. France, lead-glazed E. in a style completely independent of It. or other foreign influence was made by Bernard Palissy (q.v.), and at Saint-Porchaire, known as Henri-Deux ware. In the late 17th cent. E. in imitation of Delftware was made in Germany at Frankfurt-on-Main, Hanau, Berlin, etc., and by the 18th cent. was often adorned with beautiful paintings, sometimes signed, by the *Hausmaler* or 'outside the factory decorators.' In England, tin glaze E. was introduced from Holland about 1570 (see DELFTWARE) but the medieval tradition of lead-glazed E. remained unrivalled in Staffordshire and Derbyshire, where Slipware, Athbury and Whieldon wares (q.v.) were made in the 17th and 18th cents. Josiah Wedgwood (q.v.) not only industrialised the making of E. but created a 'Cream-Coloured Ware' (q.v.), which was imitated everywhere in Staffordshire, in Leeds, Swansea, etc., and soon had a secure world-wide market, being so much cheaper than porcelain but possessing many of its qualities. It remains a standard material for table use to-day. See also references under CERAMICS and POTTERY.

Earthing, in electrical engineering, connection of any metal part (not normally carrying current) of machinery or appara-

tus to a plate or framework buried in the earth and therefore assumed to be at zero potential. The object is to prevent shock to human beings (normally at zero potential) touching such parts, in case any charge has leaked through from 'live' conductors. In house installations water pipes are at earth potential. The Institution of Electrical Engineers' Regulations recommend the use of the all-insulated type for all portable equipment and give rules for E. of metal conduits and cable sheaths. Simultaneous contact with an earthed and a leakage-charged object is especially dangerous. Factory regulations require E. of machine frames and other exposed metal parts, and where efficient E. is not possible there must be earth-leakage protection by a circuit-breaker or fuse which opens the circuit as soon as the metal becomes charged to a certain potential. On farms E. is essential, and sometimes earth-leakage protection is advisable. The steel pylons of the Grid are earthed through the wire connecting the tops, which is taken to an earth-plate at each 3rd or 4th pylon. It is therefore not dangerous to touch the lower part of the pylon. Trolleybuses that run on rubber tyres are sometimes earthed by a trailing chain. In Great Britain the neutral point of transformers and machines (q.v.) is earthed through a low resistance. This makes elaborate protective measures against earth-leakage unnecessary. On the Continent and in Sweden the arc-suppression coil (q.v.) is much used; in Norway the neutral point is left isolated.

Earthquake, trembling or shaking of the earth, due to a sudden movement or failure in the crust as a result of slowly growing strain. This strain is imposed on the outer part of the earth as the result of movement of material in the deeper parts; the effect is cumulative and E.s provide periodical relief. The place within the earth where the movement occurs is termed the focus of the E. and the position on the surface immediately above the focus is the epicentre. An E. sets up shock waves within the earth which travel outwards from the focus, as ripples spread on a pond into which a stone has been thrown. One type of shock wave set up by E.s does in fact closely resemble such ripples, for it causes a vibration in a plane at right angles to the direction in which it is travelling. A second type of wave, however, sets up vibrations parallel to the direction of travel. Near the epicentre these vibrations may set up very destructive large surface waves which cause the greatest destruction, bringing down buildings, causing landslides, and starting tidal waves or 'tsunamis' at sea which may sweep in to inundate nearby coasts.

Within the area affected by an E. the intensity at any place may be gauged by the nature of the damage done, but seismographs, which are instruments designed to record E.s, can detect shocks at great distances, where no damage may

occur, and enable the energy released during an E. to be calculated. By comparing the times at which the shock waves reach sev. seismographic stations it is possible to establish the position of the epicentre and the depth of the focus. E.s are much more common in some parts of the earth than in others. Most E.s are shallow, originating at depths of less than 30 m. below the surface. Intermediate E.s, with a focus at between 30 and 150 m. depth, are less common, and deep E.s, occurring down to 430 m., the rarest of all. The deep E.s are, however, often very large and, as a group, account for the greater part of the energy dissipated by E.s or seismic activity.

E.s may be recorded anywhere, but originate in parts of the earth where volcanoes or earth movements are active. Most E.s occur in one of 2 well-defined belts; a belt running round the Pacific,

60,000 lives were lost; Aleppo (1822), 20,000 lives lost; Naples (1857), 12,000 lives lost; Peru (1868), 25,000 lives lost; Krakaton, where the E. was accompanied by a volcanic disturbance by which the is. was completely destroyed; Charleston (1886), where almost every building was damaged; India (1896), when Assam was devastated; Mont Pelée (1902), 20,000 lives lost; India (1905), where a disturbance spread from Kangra over an area of 1,500,000 sq. m., causing the loss of 20,000 lives; California (1906), when a large portion of San Francisco was destroyed; Valparaiso (1906), 2500 lives lost; Messina (1908), when Messina, Reggio, and many vils. were totally destroyed, with a loss of life estimated at 77,283. Japan suffered its worst disaster on 1 Sept. 1923, when an E., followed by a tidal wave and fire, destroyed the cap. city, Tokyo, one of the world's largest

SEISMOGRAPH RECORD OF THE MESSINA EARTHQUAKE (1908)

which includes the W. coast of the Americas, the Aleutians, the is. off E. Asia, and New Zealand, together with a loop running from Central America into the West Indies, or in a belt which follows the Mediterranean, crosses Asia Minor and the Himalayas and which passes through Indonesia to join the first belt.

Two-thirds of all E.s and virtually the whole of the deep E.s occur in the Pacific belt, whereas a fifth occur in the second or Mediterranean belt. The remaining E.s occur mostly along the mid-Atlantic ridge, in the Indian Ocean, near the Rift Valleys of E. Africa, and near major faults in otherwise stable parts of the crust. Minor shocks, for example, are felt in Britain near the Great Glen Fault which runs along the Caledonian Canal between Fort William and Inverness. These movements can usually only be detected by seismographs and any damage caused is generally trifling.

The strains which produce E.s result either from the movement of molten rock below the crust or are the result of stresses estab. during the uplift of rocks to form mts. The 2 seismic belts do in fact follow the general line of recent mt chains or run near to lines of active volcanoes.

Notable earthquakes.—Among E.s of particularly disastrous effects are the following: Lisbon (1755), when from 30,000 to 40,000 lives were lost; the greater part of the city was wrecked, fire broke out, and a tidal wave swept over the quays and destroyed the shipping; property was destroyed to the value of £20,000,000; Calabria (1783), when

cities, and Yokohama, the chief port. Casualties were 246,540, of whom 103,733 were injured, 99,331 killed, and 43,476 missing and probably all killed; 447,128 houses were destroyed by fire, and 128,266 by collapse. An area of 50,000 sq. m. was devastated by an E. in S. central Chile, Jan. 1939, and 30,000 persons killed, mostly in the cities of Concepción and Chillón. Turkey suffered a series of E.s in Anatolia in Dec. 1939, involving the death of over 30,000 persons, Erzincan being almost wholly demolished. Other disastrous E.s rocked Anatolia in July 1940 and Dec. 1942. 4000 people were killed near Karachi, India, in an E. (Nov. 1945) caused by a seismic sea wave. The Dominican Rep. (Aug.) and N. Peru (Andes mtn area, Nov.) suffered violent E.s in 1946. In the same year, S. Japan was devastated by a very severe E. in Dec. About 4000 persons lost their lives in Fukui, Japan, June 1948. Violent tremors in central Ecuador on 5 Aug. 1949 killed 7000 and left 100,000 homeless. During 1950 disastrous E.s occurred in Cuzco, Peru, on 21 May, in N.E. Colombia (Arboledas) on 8 July, and in N. Assam, India, in Aug., followed by floods, leaving about 5 million people homeless. El Salvador (Jucuapa) had its worst E. on 6 May 1951, the Ionian Is. in Aug. 1953. An E. in Orleansville, N. Algeria, 9–12 Sept. 1954, killed about 1600 people. S. Lebanon was heavily hit by shocks on 16 Mar. 1956. Kutch in India on 27 July, the Kalmard area in Afghanistan on 10 June, and S. Persia on 4 Nov. In July 1957 2000 persons were reported to have been killed in a disastrous E. in

N. Persia; Mexico City was severely rocked in the same month.

See C. Davison, *The Origin of Earthquakes*, 1912; *A Manual of Seismology*, 1921; *A History of British Earthquakes*, 1925; H. Jeffreys, *Great Earthquakes*, 1936; K. E. Bullen, *An Introduction to the Theory of Seismology*, 1947; *Seismology*, 1954; G. A. Elby, *Earthquakes*, 1957.

Earthwork, in a strict sense, is used of any bank or mound of earth with or without a defensive ditch, which is intended for use as a fortification. In an archaeological sense, in which the term is usually employed, an E. may be a burial mound, an earthen circle which is part of a stone circle monument, a 'camp,' which is best understood as a defended area for a community, a hill-fort or hill-tin, the site of an anct. vil. or primitive cultivation system, a hollow track-way, a linear dyke or boundary, a Norman castle mound, a medieval homestead moat, or a medieval enclosure bank. The term is thus a generic one of wide application. See also ARCHAEOLOGY; BARROWS; CATRNS; HILL-FORTS; IRON AGE; OFFA'S DYKE; ROMAN REMAINS IN BRITAIN; DYKES; SOUTERRAINS.

Earthworms belong to a div. of Annelids called Oligochaeta. They are found in all parts of the world, though naturally they do not thrive in arid tracts; and their effect upon the fertility and drainage of the soil can hardly be calculated. Burrowing into the ground, they cast up the earth they have swallowed, and so pursue a constant and thorough system of ploughing. Though eyeless, they evade the light and only come out of their burrows at dusk, often remaining, even then, with their tails in the holes and their bodies working round and round. The Brit. E. are confined to the Lumbricidae, and are usually about 6 in. long, with a pointed head, rounded body and slightly flattened tail. The *Allolobophora*, which are largely distributed over England and Ireland, are also found in the Arctic regions, and are the only E. capable of burrowing through snow and ice; *Lumbricus terrestris*, the common E., and *L. foetidus*, the dunghill worm, represent another genus; and *Alluris*, the remaining genus, are equally at home on earth or in water. Some tropical species of E. reach a gigantic size, those found in Central Africa, Australia, and Ceylon growing to a length of 3 to 6 ft.

Earwig, name given to certain species of Forficulidae. *Forficula auricularia*, the common E., is found all over Europe, and is regarded by horticulturists as a great pest, as it feeds on young shoots, the petals of flowers, and the flesh of soft, ripe fruit. The name arises from a popular but erroneous idea that this insect will crawl into the ear and remain. The E. is gregarious and nocturnal, and makes its home under stones, beneath the bark of trees, or in almost any dark hole or crevice. The larvae, when hatched, cluster round their mother, whom they closely resemble, except for the lack of wings.

Easements form one of the class of rights called incorporeal hereditaments (q.v.) (and see also GRANT). E. consist of those rights in the nature of privileges or conveniences without profit which one or more persons have in, or over, the land (q.v.) of another, as e.g. a right of way or a watercourse (see LAND LAWS). E. are usually annexed or appurtenant to the ownership of a particular piece of land (the dominant tenement), and are said to be affirmative if the owner of the servient tenement must allow the owner of the dominant tenement to do something, as e.g. to use a right of way across his land; negative if he must refrain from doing something, as blocking up the 'ancient lights' of the other. E. consist chiefly of rights of way, watercourse, and light (see LAND LAWS), but include any right over

the land of another not 'capricious,' e.g. a right to increased lateral support for land weighted with buildings, or a right to access of air for one's chimney or window, is an E. A right to light may be defeated by blocking access to light, unless the right arose by express grant or by prescriptive title or user of 20 years. E. arise either by (1) custom, e.g. where villagers have been accustomed for a number of years to use a pathway over a piece of land; (2) grant; (3) prescription, either at common law, i.e. where the right has been enjoyed from the time of legal memory (accession of Richard I); or under the Prescription Act, 1832, which makes an uninterrupted user for 20 years *prima facie* evidence (q.v.) of the right to a way or watercourse, while after 40 years an indefeasible title is estab.; and 20 years as uninterrupted user is conclusive of a right to light; (4) necessity, i.e. where absolutely necessary to the reasonable enjoyment of a tenement, e.g. if A sells B a piece of land entirely surrounded by other land of A's, a right of way in B is necessarily implied over the surrounding land. E. are lost by non-user for 20 years, by express release, or, of course, by reason of the dominant and servient tenements falling into the possession of the same person.

East, Sir Alfred (1849-1913), painter and etcher, b. Kettering, Northants; studied

art in the Glasgow School of Art, and later at the Ecole des Beaux-Arts in Paris, where he received lessons from Bouguereau. A.R.A., 1899. In 1906, the year when he pub. his *Landscape Painting in Oil Colour*, he was chosen president of the Royal Society of Brit. Artists. His pictures are widely distributed, and may be seen in the galleries of Birmingham, Chicago, and Venice. As a painter of landscape, he was noted for charming and well-balanced composition. 'The White Carnival' (Brussels), 'Autumn' (Manchester), and 'Passing Storm' (the Luxembourg) display this and other merits. He was knighted in 1910, and elected R.A. in 1913.

East, quarter of the horizon where the sun rises, when in the equinoctial. From very early times the E. has been clothed in a certain sacred mystery, and it was the custom of many of the pagans (as it is generally among Christians) to build their altars in the E. part of places of worship so that they could offer their sacrifices towards the rising sun. Hence arose the custom of turning towards the E. for prayer, also the practice of laying the dead with their feet toward the E.

East Africa, British, see BRITISH EAST AFRICA; KENYA COLONY; TANGANYIKA TERRITORY; UGANDA PROTECTORATE.

East Africa, German, see AFRICA. GERMAN EAST, CAMPAIGN IN, FIRST WORLD WAR; RUANDA URUNDI; and TANGANYIKA TERRITORY.

East Africa, Portuguese, see MOZAMBIQUE.

East African Railways and Harbours, formed on 1 May 1948 by the amalgamation of the Kenya & Uganda R.s & I.s and the Tanganyika R.s & Ports Services. The R.s are metre-gauge and some 1300 m. of line are open. The undertaking operates extensive road, lake, and river services and administers the ports of Mombasa, Tanga, Dar-es-Salaam, Lindi, and Mtwara.

East Anglia, see ANGLIA, EAST.

East Barnet, urb. dist. of Herts, England, lying about 1 m. SE. of B. (q.v.), includes New B., Monkton Hadley, and Brunswick Park. E. B. par. church, built 1100, is one of the oldest churches in the co. Pop. 40,414.

East Cape (Asia), see DEZHNEV, CAPE.

East Chicago, port city in Indiana, U.S.A., on Lake Michigan, with steel mills and foundries, oil and metal refineries, etc., and a canal connecting with the Illinois Waterway. Pop. 54,300.

East Cleveland, city of Ohio, U.S.A., suburb of C. and site of General Electric experimental laboratories. Pop. 40,000.

East Detroit, city in Macomb co., Michigan, U.S.A., a residential suburb of D. It has truck and poultry farming. Pop. 21,461.

East Flanders (Flem. Oost-Vlaanderen), prov. of Belgium, with Antwerp to the E., Brabant to the SE., and West F. to the SW. It includes the basin of the Scheldt, and under skilful cultivation yields excellent crops, sugar-beet, flax, and hops, especially in the Waas dist., which was once barren marsh. There is a

considerable trade in flowers and textile manufs. The chief tns are Ghent (the cap.), the 2nd port of Belgium, Sint-Niklaas, Alost, Eekloo, Dendermonde, and Oudenaarde. The area is 1147 sq. m. Pop. (1955) 1,249,435. See also FLANDERS.

East Friesland, see FRIESLAND.

East Ham, co. bor. of SW. Essex, England. It is one of the 3 co. bors. in Greater London. Pop. 120,000.

East India Company, C. founded for the purposes of trading with I. and the E. Indies. It received its original charter at the hands of Queen Elizabeth in 1600, and this charter, at first granted for 15 years, was subsequently granted for ever by James I. C.s for similar purposes had already been formed in the great maritime nations of Europe. It was in fact the monopoly of trade by Dutch E. I. C. which led to the foundation of the Eng. E. I. C. in the year already mentioned. The first governor of the C. was Sir Thomas Smythe, and the C. early estab. a trade, not only with the stations which it founded on the coasts of I., but with the Far East as well. The early ventures (usually private ones) of the C. were entirely successful, and huge profits were realised. The competition of the Eng. aroused the anger and jealousy of the Dutch and led to many quarrels between them. These culminated in the massacre of Ambogna, when the Dutch captured and ill-treated a number of Eng. traders. The indignity was never forgotten, but for the time the Eng. traders confined their attentions to the mainland of I., leaving the is. to the Dutch. The trade with I. led to the building of fine merchant vessels, and the palm of mercantile shipping must be given to the E. I. C. up to the 19th cent. During the 17th cent. the C. began to spread and to gain ter. It built fortresses, raised troops, and gained general recognition, but still in quite a small way. This monopoly was interrupted by the advent of a number of interlopers who felt that they had equal rights with the C. to the Indian trade.

The C. appealed against the interlopers, but it was held that except by special act of parliament all Brit. subjects had the right to trade with I. (1694). In 1698 one may say a new E. I. C. sprang into being, when by loan of £2,000,000 to the state the C. was reorganised and reinstated. Quarrels between the rival C.s continued down to the reign of Queen Anne, and the gov. only renewed privileges to the original C. after obtaining large grants of money. The C. still remained merely a trading concern, and its authority, as stated in the charter of Queen Elizabeth, still held good. But during the 18th cent. the rivalry of France and England extended to I., and gradually the C. rose, after the victories of Clive, to the position of a ruling power. The C. still held unchecked power over its servants and soldiers, until the Regulating Act, 1773, created a governor-general, appointed by the C. but approved of by the Crown. A council of 4 was also created together with a court of judicature. Pitt's India Bill (1784) created a board of control and gave the

political, financial, and military control into the hands of the gov. Indian policy was no longer a matter for the C. but for the gov. Gradually the monopolies of the C. were taken away, and the C. in this way ceased to be a trading C. and became merely an administrative body. Finally, after the disaster of the mutiny (1857), the entire administration of I. passed into the hands of the Crown (Aug. 1858). See Florence Bowman and Esther Roper, *Traders*, 1924; W. Foster, *East India House*, 1924; C. Grey, *Merchant Venturers of London*, 1932; C. G. Fawcett, *English Factories in India*, 1936; R. H. Mottram, *Trader's Dream*, 1939; C. Lestock Reid, *Commerce and Conquest*, 1948.

East Indies is opposed in the broadest sense to West I., the name given by early explorers to is. in the Atlantic which they believed to be off the coast of India. It thus includes India and many groups of is. in the Pacific. But the name is commonly used of the Malay Archipelago, and especially of Indonesia (q.v.). This archipelago is the largest cluster of is. in the world. It lies to the SE. of Asia, and to the N. and NW. of Australia, between 95° and 141° E. long., and 6° and 11° S. lat. Borneo—which is larger than the Brit. Is.—the Philippines, Java, Sumatra, and Bali must once have formed part of the Asiatic continent: the shallows about them—nowhere are the surrounding seas deeper than 250 ft—indicate that they are summits of submerged hills. The investigations of botanists and zoologists all go to prove that the more easterly is. are closely associated with Australia. It is a curious fact that of the 2 adjacent volcanic is. of Bali and Lombok, separated by a narrow but very deep channel, Bali is entirely Asiatic in fauna and flora, Lombok markedly Australasian. In other cases the Asiatic and Australasian characteristics merge in the central is. and only become marked in those near the continents. Tin, malachite, copper, petroleum, and precious stones are the chief source of mineral wealth. There are many volcanoes, and the soil, as might be expected, is very fertile, yielding sugar, coffee, rice, maize, tea, coconuts, plantains, and spices in plenty. The land is, however, covered, for the most part, in unexploited forest. Java, the most developed of the is., shows what riches could be produced were they all systematically cultivated. Their natural resources are immense. The is. formerly known as Dutch E. I. are now Indonesia. In 1898 the Philippines were ceded by Spain to the U.S.A. but gained their independence as a rep. in 1946; Portugal holds a part of Timor; North Borneo is a Brit. protectorate, as is Papua, the SE. part of New Guinea. The NE. part of that is. was formerly a Ger. possession, but now constitutes, with the Bismarck Archipelago, the Mandated Ter. of New Guinea. The native pop. includes Papuans or Melanesians and Malays.

East Kazakhstan, oblast (prov.) of the Kazakh S.S.R., Soviet Union.

East Kent Regiment, Royal, see BUFFS.

East Lancashire Regiment, The, formerly 30th and 59th R.s., linked in 1881 to form E. L. R. The 30th was raised in 1702 as marines, and served at the capture of Gibraltar, 1704; thence in West Indies, America, and in fleet against Fr. coast. In 1782 it was named 'The Cambridgeshire Regiment,' served under Abercromby in Egypt in 1801, and in the Peninsular war with Wellington. It was in the Crimean War, and later went to Canada. The 59th was raised in 1755, and served in the Amer. War of Independence. It afterwards took part in the Peninsular campaigns and the battle of Waterloo. It then served in the West Indies, China, and Afghanistan. The E. L. R. served in the Boer War and raised 17 battalions during the First World War, which served in France, Flanders, Macedonia, Gallipoli, Egypt, and Mesopotamia. In the Second World War the R. fought in NW. Europe. They were engaged in especially heavy fighting in the vicinity of Goch and other tns in the Rhineland. The regiment is to be amalgamated with the South Lancashire Regiment by 1959.

East Lansing, residential city in Ingham co., S. central Michigan, U.S.A., on Red Cedar R. It is the seat of Michigan State College of Agriculture and Applied Science, the oldest state agric. college in the U.S.A. (opened 1857). Pop. 20,325.

East Linton, small burgh of E. Lothian, Scotland, on the N. Tyne riv., 5 m. from Haddington. Nearby is Hailes Castle, once a residence of Mary Queen of Scots. Pop. 990.

East Liverpool, city of Ohio, U.S.A., on Ohio R. 36 m. S. of Youngstown. Clay products are its chief manufs. Pop. 24,200.

East London, seaport of SE. Cape Province, South Africa (see PORT ELIZABETH), at the mouth of the Buffalo R., 569 m. by sea from Cape Town, 253 m. from Durban, 644 m. from Johannesburg, terminus of the Cape Eastern Railway System. (Cap. cost of the harbour was £4,140,000; to-day it handles substantial exports of wool, also citrus fruits, pineapples, chilled meat, and dairy produce. Bulk petrol and fuel-oil tanks are situated near the harbour. A large fishing industry is based on E. L. The beautiful scenery and excellent bathing make it a

popular seaside resort. The site of E. L. was discovered in 1836 by John Baillie, an Eng. settler, who reached South Africa in 1820; and the first steps to founding a settlement there were taken about 1847 by Capt. Wm Baker, who gave the name of Fort Glamorgan to the place. Pop.: Whites, 45,096; Bantu, 41,432; Coloureds, 6,219; Asiatics, 1689.

East Lothian (formerly **Haddingtonshire**), SE. maritime co. of Scotland, bounded by the Firth of Forth and the North Sea on the N., and the cos. of Berwick (on the E.) and Midlothian (on the W.). There are sev. anct castles, including Tantallon on the N. coast, and the co. is associated with John Knox and

with manufs. of farm equipment. Pop. 13,900.

East Orange, city of Essex co., New Jersey, U.S.A., adjoining Newark, 12 m. from New York, of which it forms a suburb. It has wide, well-shaded streets and many attractive houses. There are electrical works and manufs. of pharmaceutical supplies, paints, and insecticides. Upsala College and Panzer College of Physical Education are here. Pop. 79,340. See Whittimore, *The Founders and Builders of the Oranges*, 1896.

East Point, suburb of Atlanta, Georgia, U.S.A. It manufs. yarn, fertiliser, metal products, batteries, and furniture. Pop. 21,080.

EAST LONDON: A LINER LEAVING THE HARBOUR

Wm Dunbar the poet. Its surface is generally hilly in the S., with the Lammermuirs (1500 ft), and flat in the N. The only important riv. is the Tyne (28 m.). Coal and iron are mined and limestone quarried in various dists., but the chief occupation is agriculture, and the co. is noted for the richness of its grain and green crops. Fishing is also carried on. The chief tns are the royal burghs of Haddington (the co. tn), Dunbar, and North Berwick. Berwickshire and E. L. together return 1 member to Parliament. Area 267 sq. m.; pop. 52,500.

East Main, former name of the portion of Labrador peninsula (Hudson Bay Ters.) bounded N. by Hudson Strait, W. by Hudson Bay, S. by Quebec. It is now the Ungava dist. of the dominion of Canada, with a scanty Indian pop.

East and West Malling, 2 adjoining pars. in Kent, England, in the Medway div. E. M. is 4 m. W. of Maidstone, and W. M. 5½ m. WNW. The latter has the remains of a Benedictine nunnery founded in 1090. Pop. of rural dist. 38,300.

East Moline, city in Illinois, U.S.A., on the Mississippi R. adjoining Moline,

East Providence, tn of P. co., Rhode Is., U.S.A., separated from P. by the Seekonk and Providence rivs. It manufs. building materials, chemicals, petroleum products, wire and steel products, insulating board, paper, feed, flour, and roofing; there are also dairy products. Other activities include textile dyeing and ship-building. Pop. 35,871.

East Prussia (Ger. *Ostpreussen*), the former easternmost prov. of Prussia (q.v.). In 1919 the creation of the Polish Corridor (q.v.) separated it from the rest of Germany. In 1945 the prov. was divided between Russia (as part of the R.S.F.S.R.), which took the N. third including the cap. Königsberg (Kalinigrad), and Poland, which obtained the S. portion (see MASURIA). E. P. lay between the Vistula and the Neman rivs. (qq.v.); a large part of the ter. is forest, moor, and bog, and the soil in general is poor. The coast, on the Baltic, is flat and sandy and has 2 large indentations, the Frisches Haff and the Kurisches Haff (qq.v.). Oats, rye, potatoes, and flax are grown, horses and cattle are bred, there is much fishing, and some amber is found.

Apart from Königsberg, tns of importance are Tilsit (Sovetsk), Insterburg (Chernyakhovsk), Elbing (Elblag), Braunsberg (Braniewo), Allenstein (Olsztyn), Gumbinnen (Gusev), and Marienburg (Malbork). Area 14,280 sq. m.; pop. (1939) 2,280,000.

Unprejudiced examination does not bear out the tradition that E. P. was the home of 'Prussianism' or the *fons et origo* of Ger. militarism. It was a typical E. Ger. prov., with great estates rather less predominant than elsewhere, and like all Germany E. of the Elbe it was colonial land or land reconquered in the last 600 years from the Slavs. But unlike the 'march' lands won back by secular princes, E. P. was the relic of a crusading order, the Teutonic knights (q.v.), who, in the early 15th cent., were finally defeated by the Poles at the great battle of Tannenberg (q.v.), and their ter. reduced to the land round their 2 great crusading castles Marienburg and Königsberg, or roughly the modern ter. of E. P. It is sometimes thought that the crusading militarism of the Teutonic knights was the source of Ger. ruthlessness in war, but the theory has no warrant in hist. In the 17th cent. the landowners of E. P., far from manifesting a habit of militant servility, pursued a constitutional struggle with the Elector of Brandenburg. In the 19th cent., far from aiding the Prussian militarists to dominate Germany, E. P. took the lead against them, and the Liberals of the Prussian parliament who resisted Bismarck's (q.v.) unconstitutional system were largely representatives of E. Prussian rural constituencies. In fact the Ger. farmers and traders from E. P. showed the rough independence and courage which not seldom characterise a colonial people. Later the Junker landowners (see JUNKERS) and liberal farmers composed their differences and united in an agrarian organisation known as the Landbund. In the 19th cent. E. P. was not notably or aggressively nationalistic in the conflict with the Poles, and in fact produced the few Ger. radicals who wanted to co-operate with the Poles in a common war of liberation against Russian Tsardom. After 1919 when W. Prussia and Posenania were incorporated in Poland, E. P. became the isolated advance post of Ger. nationality in E. Europe for the first time since the awakening of national consciousness, and its frontier nationalism tended to be magnified as a symbol of the national struggle, mainly by the propagandist immigrants rather than by the E. Prussians themselves. No doubt some of the Prussian military families came from E. P., but they are scattered all over Germany E. of the Elbe and few have an exclusively E. Prussian origin. Depriving Germany of E. P., or even of a great part of it, spares her the strategic problem of defending an isolated prov. besides reversing a Ger. advance at Slav expense sev. centuries ago, but it involves also the difficulty of shifting a great number of Germans to other parts of the country.

In the First World War the Russians advanced into E. P. in 1914 as far as

Alenstein, when Hindenburg routed them in the region of the Masurian Lakes at the second great battle of Tannenberg (26-30 Aug. 1914). By the treaty of Versailles (q.v.) a part of E. P. was ceded to Poland. In the Second World War the Russian armies invaded E. P. in Jan. 1945, Marshal Rokossovsky (q.v.) advancing northward against the prov. while simultaneously Gen. Tcherniakovsky attacked from the E. By 21 Jan. Tilsit, Insterburg, Allenstein, and Tannenberg had been taken and a few days later Rokossovsky's forces had advanced to the Gulf of Danzig. On 9 April the Russians took Königsberg. (See EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.) After the defeat of Germany the Potsdam Agreement (q.v.) provided, on the proposal of the U.S.S.R., that, pending the final determination of ter. questions at the peace settlement, the section of the W. frontier of Russia which is adjacent to the Baltic should pass from a point on the E. shore of the Bay of Danzig to the E. N. of Braunsberg-Goldap, to the meeting-point of the frontiers of Lithuania, Poland, and E. P. It was also agreed that ultimately the city of Königsberg and the area adjacent to it as described above should be transferred to Russia. The transferred portion includes the Kurisches Haff, Gumbinnen, Tilsit, and Insterburg, but excludes Elbing, Braunsberg, Allenstein, Osterode, and Marienburg, all of which were included in that part of E. P. which was assigned to Poland.

See T. A. R. Marriott and Sir C. G. Robertson, *The Evolution of Prussia*, 1915; C. von Lörck, *Herrenhauser Ostpreussens*, 1933; W. Franz, *Geschichte der Stadt Königsberg*, 1934; S. Srokowski, *East Prussia*, 1934; J. A. Wilder, *The Economic Decline of East Prussia*, 1937.

East River, strait connecting New York Harbour with Long Is. Sound. E. of New York City, U.S.A. It is 15 m. long, 600-4000 ft wide. By its N. arm (Harlem R.) and Spuyten Duyvil Creek it is connected with the Hudson R. It separates the bors. of Manhattan and the Bronx (W. and N.) from those of Brooklyn and Queens (E. and S.). Among its is. are Blackwells, Randalls, Wards, and Rikers. The channel at Hell Gate (between Wards and Long Is.) has been made navigable by blasting the rock. Brooklyn, Manhattan, Williamsburg, Queensboro, Triborough, Bronx-Whitestone, and Hell Gate bridges span E. R.

East St Louis, city in Illinois, U.S.A., on Mississippi R., opposite S. L. and connected with it by bridges. It is a railway centre with alumina and oil refineries, meat-packing plants, steel works, and grain mills, and manufs. chemicals, paint, glass, and prefabricated houses. There is a livestock market. Parks College of Aeronautical Technology (S. L. Univ.) is here. Cahokia Mounds State Park is nearby. Pop. 82,300.

East Surrey Regiment, The, formerly the 31st and 70th R.s. The 31st was raised in 1702 as marines. It became a foot R. in 1715 and fought at Dettingen,

where it gained its nickname of 'Young Buffs.' It served in the Amer. War of Independence, and later under Wellington in the Peninsula, then had a distinguished career in India. The 70th was raised in 1758 in Glasgow. It served in the West Indies and Canada, in 1863-6 in the Maori wars, and in the Second Afghan War, 1878-9. In 1881 the 2 R.s were linked to form the present R., which served in Egypt and the Boer War (1899-1902). During the First World War it raised 18 battalions, which served in France, Flanders, Italy, Macedonia, Egypt, Aden, Mesopotamia, and N. Russia. In the Second World War the R. fought in France in 1940, and in Africa, Sicily, and Italy. A battalion served throughout the Malayan campaign with the 6th Indian Infantry Brigade. The E. S. R. is to be amalgamated with the Queens by 1962.

East Yorkshire Regiment. The (The Duke of York's Own), Brit. R., formerly the 15th Foot, was raised in 1685. It gained great distinction under Marlborough at Blenheim, etc., and under Wolfe at Quebec. The R. saw much service in the West Indies and participated in the capture of Martinique, Havannah, St Lucia, and Guadeloupe. It went through the Second Afghan War with Lord Roberts. The title E. Y. R., added in 1782, was amended to The E. Y. R. in 1881. During the First World War it raised 21 battalions and served in France, Flanders, Macedonia, Gallipoli, and Egypt. The R. saw much service in the Second World War in Norway and at the battle of Normandy and the subsequent advance to the Rhine. Other units fought in Burma. The E. Y. R. is to be amalgamated with the West Yorkshire Regiment by 1959.

Eastbourne, municipal and co. bor. and popular seaside resort of Sussex, England, 64 m. SSE. of London. Formerly the site of the present tn was occupied by the 3 hamlets of East-borne, South-borne, and Sea-Houses, the antiquity of which is attested by the mention of Borne in the Domesday Book. The interesting par. church of East-borne belongs to the transitional Norman period, and dates back to the 12th cent. The modern tn, with its m. of terraced promenades, its spacious tree-lined streets, pavilioned pier, theatres, Winter Garden, golf links, and handsome public structures, owes much to the 7th duke of Devonshire whose family seat is at Compton Place, E., and whose name is commemorated in Devonshire Park, a fine public pleasure-ground. The boundaries of the bor. were extended in 1911, 1927, and 1938, and in 1929 the E. Council completed the purchase of some 4000 ac. of downland, extending from Beachy Head to Folkington. The summit of Beachy Head is 575 ft above sea-level and during the Second World War was the site of a radio location station. Civilian casualties through enemy air raids were: killed, 174; injured, 932; 475 houses were destroyed and no fewer than 11,000 were damaged. This damage was caused by 747 high-explosive bombs,

4000 incendiary and oil bombs, and 15 flying bombs. Pop. 57,200 (1952).

Easter, the greatest of all Christian feasts, in commemoration of the resurrection of Christ, about the time of the vernal equinox. The Gk. and hence the Lat. Vulgate, name for this feast is the *Pasch*, i.e. Passover, the Jewish feast with which the death and resurrection of Christ coincided and whose prophetic meaning they fulfilled. E. is thus the Paschal feast, the Christian Passover. The Eng. name E. and the Ger. *Ostern* are said to be derived from the name of the feast of the Teutonic goddess Ostera, celebrated by the anc. Saxons early in the spring. Some definite way of fixing a date for E., upon which many other festivals of the Church depend, became necessary very early. There was much difference of opinion; the Oriental Church commemorated our Lord's death on the 14th day of the moon after the spring equinox, and kept E. 2 days later; while the Lat. Church kept E. on the Sunday following the 14th day of the moon. The sect known as Quartodecimans in provincial Asia kept E. on the same day as that of the Jewish Passover, the 14th Nisan, claiming the authority of St John the Apostle for so doing; but Rome rejected it, saying that Christ's resurrection took place on the 1st day of the week after the Passover, and ought in that case to be kept on a Sunday. In AD 325 the Council of Nicaea settled that E. should be held on the 1st Sunday after the 14th day of the moon that occurred next after the vernal equinox, and that should the 14th day of the moon fall on the day of the equinox, the following Sunday was to be E. Sunday. Also it was decided that, in finding E., the vernal equinox should be considered to fall every year on 21 Mar. It was later directed that this calculation should be made according to the tables of Victorius of Aquitaine, which he introduced in AD 457. As Britain was now no longer a part of the Rom. empire, this 6th-cent. order regulating E. had no effect at first on the Brit. Church, which continued its calculation on the old method. After more than a century of controversy the matter was ultimately settled at the synod of Whitby in 664; and after this date the Brit. clergy conformed to the general practice of the W. Church.

As at present ordained, E. falls on one of 35 days (22 Mar.-25 April). Because of the social and commercial importance of the E. holiday, there is growing support for the adoption of a fixed E. In the rite of E. Eve, now once more performed at midnight, the Lat. Church, amid many beautiful ceremonies, kindles new fire, and lights a Paschal Candle representing the new Light of Christ. This may be derived from the renewal at Rome of the sacred fire in the temple of Vesta every year on the 1st of Mar., the beginning of the Rom. year. Bonfires are still lit by the priest on E. Eve in many parts of Europe, especially Germany. The E. fire of Germany corresponds to the Beltane fire of Celtic Europe, which had the same ceremonies and beliefs, namely, that

wherever the light of the fire reached, the fields would be fruitful and the inhab. safe from sickness and danger. Festivities were also held to celebrate E., such as dramatic performances, dances, songs, etc., and special cakes were made, of which the present-day 'hot-cross buns' (bearing a representation of the cross) and 'simnel cakes' are relics. The custom of the giving of E. eggs, as symbols of resurrection, life, and fruitfulness, is very ant. and widespread, especially in Europe. See J. Tyrer, *Historical Survey of Holy Week*, 1932; Sir H. Grierson (ed.), *And the Third Day: a Record of Hope and Fulfilment*, 1948.

Easter Island (Rapanui, Fr. île de Pâques, Sp. Isla de Pascua), isolated volcanic is. in E. Pacific, 27° 10' S. and 109° 20' W. The most easterly land settled by Polynesians. Since 1888 a dependency of Chile. Discovered by Adm. Roggeveen on Easter Day in 1722. He estimated the pop. as between 1000 and 3000. Owing to deportation by Peruvian slavers between 1858 and 1870, and the introduction of European epidemics, numbers dwindled to 100, but are now increasing again: in 1954 there were 760 natives gathered in a vil. on the W. side called Hanga Roa (Cook's Bay). The rest of the is. is given over to cattle and 35,000 sheep. Maize, sweet potatoes, figs, and bananas are grown. The is. is famous for the colossal statues, from 12 to 33 ft in height and carved from volcanic rock, which were found ranged along great terraces of stone. The origin of these statues, and of a form of script described as resembling Egyptian glyphs, remains an unsolved mystery to archaeologists.

Easter Sepulchre, a temporary wooden erection, or a richly decorated stone structure, placed in the chancel of a medieval church. It was associated with the religious ceremonies commemorating the burial and resurrection of Christ; in medieval times a crucifix or figure would be placed within the structure to remain there from Good Friday to Easter Day. Literary authorities trace the origin of Eng. drama to these ceremonies, which were accompanied by words and later by actions, and performed by the clergy. See also MIRACLE PLAY.

Easterlings, Esterlings, see STERLING.

Eastern Empire, see BYZANTINE EMPIRE.

Eastern Front, or Russo-German Campaign in the Second World War. (For Far Eastern Front, see PACIFIC CAMPAIGNS.) The German invasion of Russia began on 22 June 1941. The goals in the main lines of advance were Leningrad, Moscow, and Kiev. The invasion was made by 3 main armies, the N., and weakest, under von Leeb, the Central, and strongest, under von Bock, and the S. under von Rundstedt. Gen. von Leeb's primary task was to clear the Baltic states of Russian forces and bottle up the remaining Russian forces in the N. of Leningrad; and then, having taken Leningrad, he was to converge, with the Central Army, towards Moscow. These 2 armies were to move rapidly in the wake of the spear-head thrusts of the

armoured panzer divs. under Guderian, Germany's leading tank general. In the S. Lwów and the very strong natural line of defence along the Grodek chain of lakes left only one chance of a frontal breakthrough, in the direction Vladimir-Volynski-Lutsk-Novograd-Volynsk. The 'Stalin Line,' with Kiev as a strong base behind it, stretched along the Dniester and through very easily defensible country in the direction of Zhitomir and Korosten. Von Rundstedt was compelled to wheel round to the SE. right under the guns of Kiev and of the Stalin Line at Korosten, and to effect a daring operation in order to annihilate a large part of Budyonny's army W. of the Dnieper. But by the 10th week of the campaign, von Rundstedt dominated the Dnieper and could co-operate strategically and tactically with von Bock's army.

The Central and N. armies' first objective was the gap between the upper Dvina and upper Dnieper. This gave opportunities for breaks through parallel to the N. edge of the Pripet Marshes, from Grodno towards Baranoviche and Minsk, and from Vilna towards Minsk and Polotsk. Conditions favoured the invaders, whose new frontiers in Poland enabled them to attack from Vilna at once, while the fact that bridges over the Bug remained intact allowed Guderian to rush his panzer forces in a little over a fortnight through the Pripet Marshes and the Stalin Line towards Vyazma, W. of Moscow, destroying or capturing a number of Russian armies on the way—one of the greatest battles in the hist. of warfare. Von Leeb carried out a daring advance, capturing Kaunas and Daugavpils, breaking through the Stalin Line, repelling counter-attacks from Veliki Luki, the Valdai Hills, and Novgorod, and hemming in the remains of the Russian armies on the coast of Estonia and in Leningrad. These tactical and strategical successes of the N. and Central armies were partly due to the fact that the Russians elected to make their stand in the ters. recently acquired by the 1939 treaty with Hitler. Events showed that they ought to have adopted 'scorched earth' tactics from the beginning and destroyed all communications W. of the line Dvina-Lake Narocz-Minsk-Pripet.

The Germans, pursuing their familiar blitz tactics, had hoped for much speedier triumphs in the opening 2 or 3 weeks' fighting. But they made impressive advances, reaching the so-called 'Stalin Line,' which ran from the Gulf of Finland through Lake Peipus, along the frontiers of Latvia, Poland, and Rumania to the Black Sea, with a depth at Minsk and other vital places of between 50 and 100 m. By 2 July the Germans had captured Riga, the Latvian cap., 300 m. from Leningrad. The Finnish threat to Murmansk and Karelia was becoming serious and strong reinforcements of the Soviet Army and Air Force were rushed up from Leningrad to the N. front; while the threat to Leningrad through the Baltic States was checked by massing troops on the fortified lines running along the old

Russian border W. and SW. of the city against a threatened attack from Tallinn.

The Russian military leaders early reached the conclusion that it was impossible to hold up indefinitely, massed forces of tanks with fortified lines, and they therefore began to work out the plans for an 'elastic defence,' the basic principle of this new strategy consisting of the separation of the Ger. panzer arm from its supporting infantry, coupled with harassing guerrilla tactics. All depended on the magnitude and quality of the Russian equipment. Technically the Russian war-machine of 1941 was very different from that of 1914. The modern Russian soldier and army technician were almost entirely the product of the 'New Civilisation.' Quality was always a weak link in the Soviet economy; but, since 1930, real progress in the field of industrial production had been achieved, though wastage was enormous and much remained to be done in general economic organisation. In military organisation and liaison Germany had the upper hand. Yet the very precision of the Ger. war-machine hinged on its ability to keep to its time schedule. If this could be upset by the Russians the contending forces would, so far as technical performance was concerned, be more evenly matched. The losses on both sides were very great; but in this respect the advantage lay with Russia, whose mobilisation was as yet far from completed. Hence delaying actions were fought all along the front to give as much time as possible for mobilisation and the despatch of reinforcements.

The Germans approach the Stalin Line.—By this time the opposed 'lines' ran through Riga—Daugavpils—Borisov—Volynsk—Tarnopol—Cernauti—Bielski. But along most of the front the position was very confused. The Russians were still fighting for the most part on soil annexed by them within the previous 2 years, and the next stage of their resistance was based on the original defences begun on a large scale 10 years previously along the former frontiers from Latvia to the Black Sea, and in July this 'line' had been pierced at only one point—from Minsk towards Smolensk. The determination of the Russians to resist the invader by all and any means was illustrated by the promptitude with which they carried out Stalin's 'scorched earth' order—the order to destroy everything in the wake of their retreat. For battles over a front of such extent, involving such great numbers of men and elaborate equipment, there were no parallels. By the end of the first 16 days of the invasion, the Germans had reached a depth of no less than 300 m., giving an average of about 20 m. a day over the whole period—slightly faster than their advance on the W. Front to Sedan. Both sides were now preparing for a tremendous Ger. offensive against the Stalin Line, or chain of strong positions within the U.S.S.R. proper. So far the Germans had captured practically the whole of the fringe of ter. annexed by the Soviet Union since 1939, except Estonia. Though progress had been made in the

Baltic States, the vital sector in the campaign was in the neighbourhood of Minsk, where the Germans were now making 2 distinct thrusts on either side of the railway, the N. through Lepel and the S. through Bobruisk. Repeated Ger. attempts to cross the Dnieper were repelled and powerful counter-attacks were launched here and elsewhere by the Russians. W. of Kiev, in the Novograd-Volynsk sector, the Germans attacked with large tank forces. In the ensuing days a savage battle raged round Ostrov, near the junction of the Latvian, Estonian, and Soviet frontiers on the main Berlin-Warsaw-Leningrad railway. The closer the threat to Leningrad, the stiffer became the defence.

The end of the 3rd week found the Germans halted on a line running, roughly, from the Gulf of Riga across Latvia and White Russia to the R. Berezina and then down, through the border regions of the Russian Ukraine, to the Upper Dniester, the Pruth, and the Black Sea. At this time, after 3 weeks' furious fighting, the Germans were still 140 m. from Leningrad, 400 m. from Moscow, 150 m. from Kiev, and 130 m. from Odessa, and at only 2 points were they in Russia proper—between the Ostrov and Minsk sectors and near Novograd-Volynsk, in the Ukraine. Against this, the Germans had sustained great losses in men, tanks, and planes, and, moreover, the Ger. High Command found itself unable to concentrate the entire strength of the Luftwaffe on the Russian front on account of the growing Brit. air raids in the W. of Europe. The fighting spirit of the Russians remained unbroken, and the often wholesale slaughter of innocent civilians by the Germans in ter. they occupied only served to unite all surviving Russians against them. At the opening of the campaign errors were made which led to large bodies of men being cut through and encircled; but soon afterwards in defence and counter-attack the Russians showed not only coolness and great courage but marked ingenuity. Much had been learned from the mistakes of the Finnish War, particularly in the organisation of small units within the infantry to be trained for independent action, and in mobility generally.

The second German drive.—In this drive, which began approximately on 15 July, the Russians hurled some of their newest 150-ton tanks into the conflict around Kiev. In the N. the Ger. thrust at Leningrad made some progress in Estonia, and Tallinn, the cap., by Stalin's order, was set on fire. In White Russia, though Smolensk still held out, the fighting by 18 July had moved farther E. as the result of the Ger. thrust between the Dvina and the Dnieper. But now (20 July) so menacing was the Ger. drive that Stalin, by assuming the post of Commissar of Defence, put himself at the head of the Russian armies. By a variety of tactics the Russians bewildered, delayed, and wore down the Ger. columns. The Ger. High Command was forced to declare that the only real military advantage they

could achieve consisted of encircling and destroying the Russian forces and that further territorial gains were of dubious worth because of their cost.

The next centres of severe fighting were in the sectors of Petrozavodsk, on the Murmansk railway, N.E. of Lake Ladoga, and of Zhitomir, in the Ukraine, E. of Novograd-Volynsk, on the road to Kiev. There was also a renewal of the intensive Ger. drives towards Leningrad and Moscow, where the Russians still held out stoutly in the Smolensk sector. On 21 July Moscow had its first of a series of Ger. air-raids. The Ger. intention was much simpler than its result. It was to strike in 2 thrusts towards Moscow, one N. of the Smolensk-Moscow road through the gap between the Dvina and Dnieper rivs., and S. of the road eastwards from Bobruisk. When they had got so far the 2 columns would meet, compressing and annihilating the Russian forces between them. The Germans knew that in the critical battle for Smolensk everything depended on whether reinforcements would arrive in time. It was the part of the Russian defenders, boldly staying in their positions after they had been penetrated by the tanks, to see that reinforcements did not arrive. Again, at the N. end of the front the invaders were making but little headway. The destruction, too, of war material on both sides was immense, and the losses were cancelling each other out. There was, moreover, only negligible trace of that political disaffection upon which the Germans had counted, and little sign of disintegration in the Red Army. Subsequent reports showed that in the first days of the invasion, some areas outside Russia proper had welcomed the Germans, only to be disillusioned by the treatment they received.

There was now (Aug.) a comparative lull in operations against Leningrad like that on the more S. front, the pause being due to the Germans concentrating on the improvement of their communications. A serious threat to the Soviet defences was, however, developing in the S. Ukraine, where the forces of von Rundstedt were making strenuous efforts to destroy those of Budyonny. Budyonny skilfully extricated his forces from von Rundstedt's trap and reconsolidated his front along the E. bank of the R. Bug. Fighting was still severe in Estonia, Finland, and around Smolensk, but the Ger. main effort was concentrated in the Ukraine, because success there might well give them the industrial area of the Donetz basin and, ultimately, the Caucasus. On 13 Aug. the Russians evacuated Smolensk. Leningrad, Moscow, Kiev, and Odessa, however, still remained in Russian hands. The position in the centre, where the armies of von Bock faced those of Marshal Timoshenko, was static. But in the S. the position of the Russians had become critical. Budyonny had given up the valuable Krivoi Rog industrial area, and was exerting all his efforts to withdraw his armies to the E. bank of the Dnieper so as to protect

Odessa and as much of the E. Ukraine as might be practicable.

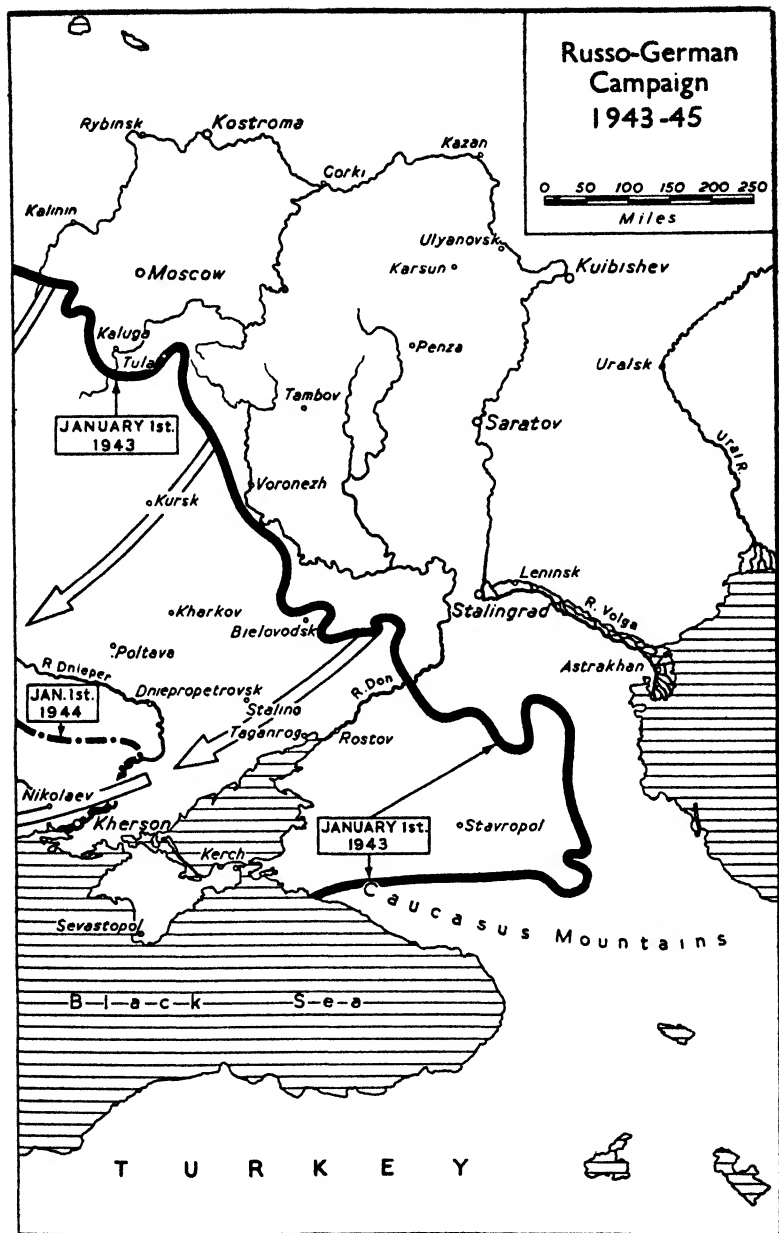

Novgorod evacuated—Battle for Leningrad.—After stubborn resistance the Soviet forces evacuated Kingisepp, 90 m. by road SW. of Leningrad. In the centre the immediate Ger. objective was Gomel, an important railway junction halfway between Smolensk and Kiev. Stubbornly as the Soviet troops fought for their land, the Ger. advance continued, slowly but remorselessly, involving ever more sacrifices by the Russians in conformity with the 'scorched earth' policy of Stalin. By 21 Aug. the Russians had to evacuate Gomel. The tremendous pressure of the Ger. thrust on Leningrad met strong resistance from Marshal Voroshilov's army. The month of Aug. was ending and the 50-m.-deep defences of the city showed no sign of collapse or of weakening. The Russo-Ger. campaign was now over 2 months old and in that period each side had probably lost about 1 million in killed and wounded.

President Roosevelt and Churchill had chosen Moscow as the place where proposals for aid to Russia would be discussed. This was significant, since their decision implied that they were confident that Moscow could withstand all dangers for a long time. Nevertheless, the Germans continued to advance regardless of losses. Novgorod, S. of Leningrad, was evacuated by the Russians on 25 Aug. after tenacious fighting. In the S., Budyonny's forces were retiring towards the crossings of the Dnieper, and Dniepropetrovsk, famous for its colossal dam, a peak of Soviet achievement, was now threatened. The Russians, however, destroyed the dam and so paralysed the vast industrial undertakings of the E. Ukraine. Dniepropetrovsk itself was abandoned.

The battle for Leningrad was reaching an acute stage. Ger. 'Stuka' dive bombers were launching numerous attacks on Leningrad's outer defences, yet without dominating the air, and the casualties inflicted by the Russian anti-aircraft guns and fighter-planes ran into hundreds (20 Aug.—3 Sept.). The operations against Leningrad both in scale and intensity overshadowed those elsewhere on the front (1-4 Sept.). Yet Voroshilov continued to hold the Germans back.

Russian victory at Pelnja.—On 4 Sept. the Ger. forces halted 50 m. from Leningrad and bitter fighting raged along a line which had now become more or less stabilised. Voroshilov held an advantage in the possession of supply bases close to the rear, as Leningrad's military industry was extensive and highly developed. The fighting in the centre of the front showed no sign of abating (7 Sept.). After some 26 days of fighting the Russians succeeded in re-taking the tn of Yelnya, 45 m. ESE. of Smolensk, 8 Ger. divs. being routed, their remnants retreating westwards (8 Sept.). But the battle for Leningrad continued with unabated fury and the Germans captured the important tn of Schlüsselburg, E. of the city near Lake Ladoga. Timoshenko's army, continuing

to counter-attack in the Yelnya sector, had now driven back the Germans 15 m. beyond that town and was still advancing. This victory at Yelnya was the first major success against the Germans that the Russians were able to claim. It virtually assured the safety of Moscow for the rest of the year, while a successful Ger. drive across the Dnieper was rendered improbable. The urgency, in view of the impaired Ger. morale at home, of the Nazi need to capture Leningrad was revealed by an order of the day (10 Sept.) issued by von Leeb, declaring that the city must be taken within the next few days regardless of cost. It was, further, essential that troops and equipment should be set free in order that the entire strength of the Ger. military machine might be hurled into the central sector, towards Moscow; this was necessary, not only because the colder weather heralded winter's approach, but also because, if Timoshenko and Budyonny were able to concentrate enough men and equipment, they would stand a good chance of inflicting such a serious major defeat that the Germans could not recover from it, at least during 1941; while the effect on the spirit of the Ger. home front might well be disastrous. This explained why the Ger. air-raids on Leningrad were the fiercest of the whole war and why, regardless of the sacrifice of life, Ger. ground troops were driven relentlessly into the deadly fire of the Russian fortresses, although Voroshilov's barrage still prevented the invader from making any substantial advance. R.A.F. fighters were now providing escorts for the Russian bombers from Leningrad.

Russians evacuate Kiev.—Kiev was now in danger from a double thrust—to the N. across the riv. and a drive by von Bock S.E. from Gomel. On 21 Sept. the Russians evacuated Kiev, but a fierce and confused battle continued to the E. of the city, both sides suffering great losses. In the extreme S., von Rundstedt's drive to the Sea of Azov had isolated the Crimea by land, but behind the powerful fortifications of the peninsula the Russians still offered a stubborn resistance.

Germans drive on Moscow—Soviet Government moved to Kuibishev.—The ensuing month saw bitter fighting along the whole front. This soon became concentrated in tremendous drives towards and around Moscow and against the Crimea. The drive on Moscow took the familiar form of 2 converging thrusts—one from the SW. and the other from the NW. Simultaneously the Germans launched a powerful drive in the Ukraine towards Kharkov and attacked the Crimean roads and railways from the air. Ger. attacks were especially furious in the region of Briansk and Vyasma, SW., and around Orel due S., of Moscow. Orel was evacuated on 8 Oct., Briansk 4 days later, and Vyasma on the 13th. The Ger. pincers were remorselessly closing in a ring round Moscow. The Soviet Gov. moved from Moscow to Kuibishev, though Stalin himself remained in the cap. Meanwhile, Odessa was evacuated by 16 Oct. after

furious street fighting. By 18 Oct. Ger. efforts to encircle Moscow had brought their forces in a ring marked by Kalinin, Rzhev, Mozhaisk, Kaluga, and Tula. But the pace of the Ger. advance had become slower and the Russians were making strong counter-attacks, notably at Kalinin, which often changed hands. Mozhaisk, Maloyaroslavets, and near Orel.

After a lull of some days, the Germans resumed the offensive in the S., mixed Axis forces of Rumanians, Italians, Hungarians, and other satellites advancing towards Taganrog and the industrial centres of the Donetz basin. The main advance was chiefly along the coast towards Rostov and the Don. At about this time the Russian armies were regrouped into a N. group under Marshal Zhukov, former chief of the general staff, who included Moscow in his command, and a S. group under Timoshenko. Zhukov was to prove the finest Russian general of the war.

Over 100 Ger. divs. were now operating between the Orel and Kalinin regions, and half of these, including 4000 tanks, were in the central sector trying to smash a path to Moscow through Mozhaisk and Maloyaroslavets, suffering heavy losses all the time. Towards the end of Oct. the Russians were compelled to evacuate Stalino, an important armament centre in the Donetz basin. Other important towns lost were Kharkov and the railway junction of Bielgorod. The loss of the industrial centres of the Donetz Basin, such as Stalino, was serious.

The position in early Nov., following the setting in of snowy conditions alternating with heavy rain, so that tanks and motorised columns were bogged, was that the Russians had been compelled to make a considerable withdrawal in the Crimea, while holding the attackers on the Moscow front. But at least they denied the Germans much advantage from their conquests. The advancing enemy hordes, instead of finding cities of plenty, with warm accommodation for their troops during the winter campaign, came always upon a scene of utter desolation. On 3 Nov., however, the Germans began their 5th attack on Moscow, using strong tank forces and large numbers of dive-bombers. But they were soon forced to abandon their characteristic tactics of going all out for a breach with a large armoured force backed by motorised infantry and to launch attacks in the old manner, with a small tank detachment followed closely by infantry advancing on foot. The inference was that they did not hope to break through and that their armoured divs. were below strength. Their main blows were at Kalinin and Tula; but they made no headway and attributed their failure to weather conditions. This offensive was the Gers.' first major military error, and possibly marks the real turning-point of the whole E. F. campaign. In the S. von Rundstedt captured Feodosia, a Black Sea port near Kerch Strait, and broke through the ill-fortified Perekop Isthmus.

For a brief space winter brought to a standstill all major operations except those in the Crimea, where in the course of Nov. the Germans overran most of the peninsula, taking the cap., Simferopol, and the naval base of Kerch, and threatening Sevastopol.

Russian counter-offensive.—The Ger. plan, in their 2nd general offensive against Moscow, which had begun in mid-Nov., was to break through the Russian lines and encircle the city with a wide outflanking movement by almost all their armoured and mobile strength, combined with pressure on the front or centre. The desperate Ger. onslaught had, by 26-27 Nov., made some progress W. and N.W. of the city. On 6 Dec. Zhukov launched a counter-offensive against the Ger. forces on both flanks. Both Ger. formations were routed in 5 days' fighting and retreated rapidly. Equally dramatic was the change on the S. front where, early on 29 Nov., the Soviet Fifty-seventh Army of Remizov attacked across the Don SW. of Rostov and launched an assault which carried the Russians back into the city itself. The following night the Soviet Ninth Army under Kharitonov, crossing the Don near Novocheboksak, broke through the Ger. lines and entered Rostov from the NW., thereby almost encircling the Germans. After savage street fighting the remnants of the Ger. forces under von Kleist retreated in disorder towards Taganrog, pursued by the Russians and harried by guerrillas. This was Germany's first serious defeat on the E. F., and was a remarkable vindication of Stalin's judgment in placing Marshal Timoshenko in direct command on the S. sector.

This major Russian victory helped the army of Belov, in co-operation with the forces of Konev, to make further progress in the all-important Tula section at a moment (2-3 Dec.) when Ger. tank thrusts round Mozhaisk were forcing the Russians to retire to new positions. But some few days later the Ger. armies, beaten to a standstill on the whole E. F. by intense cold and deep snow and, above all, by the almost miraculous tenacity and courage of the Russian soldiers, halted their Russian campaign for the winter. Brit. and Amer. aid in tanks, guns, planes, and other equipment contributed to this result: as also indeed did the constant bombing of objectives in Germany and the occupied countries of W. Europe by Brit. airmen, and Gen. Auchinleck's offensive in Libya; for these assaults involved the transfer to W. Europe and N. Africa of increasing numbers of Ger. fighter planes and pilots from the E. F. The Ger. official announcement of their intention to abstain from any major strategic moves during the winter was a momentous one, for their abstinence was forced upon them by the miserable condition of the majority of the Ger. soldiers, who were quailing before the first Russian frosts for which they were ill-prepared in clothing and equipment. From this time the Russian generals took the initiative and throughout the bitterly cold winter months steadily pressed the invaders

back. The Ger. front as at 6 Dec., the farthest point of their advance, ran approximately through Schlisselburg—Novgorod—Kalinin—Rogachev—Moska—Narotorminsk—Serpukhov—Tula—Stalinogorsk—Elets—Byelgorod—Kupiansk—Rostov—Kerch. By the end of Feb. much Ger. had been recovered, the Ger. line being forced back to Kholm, Veliki Luki, Rzhev, Yelnya, Orel, Kursk, Kharkov, Lozovoe and to within a few m. of Mariupol. Kalinin, an important tn on the Moscow-Leningrad railway about 100 m. NW. of the cap., fell on 15 Dec. On 29-30 Dec. Russian troops made a landing in the Crimea and occupied the tn and fortress of Kerch and Feodosia.

The New Year opened well for the Russians, Kaluga, 110 m. SW. of Moscow, being recaptured, while no fewer than 16 Ger. divs. under the Ger. panzer leader, Guderian, were routed. The Russians were also pursuing the Germans from Kerch. On the central Moscow front, Maloyaroslavets, 80 m. SW. of Moscow, fell on 2 Jan. and, 3 days later, the Russians retook Borovsk, and on 19 Jan. Mozhaisk. In the Crimea the Germans retook Feodosia, though Russian pressure was maintained E. and W. of Taganrog. In the centre, following a break through in the Valdai Hills between Smolensk and Lake Ilmen, Veliki Luki, the railway junction and base for von Leeb's forces investing Leningrad, was threatened. Considerable progress was also made in the Ukraine by the armies of Timoshenko, who had begun a new general offensive on 18 Jan. At the same time especially fierce Russian assaults were being delivered on the Leningrad front.

Spring was now at hand. The Germans were striving to maintain a series of large-scale centres of resistance or buttresses, behind which they might keep communications open and, for a time, provision by air-borne supplies. The Russians were penetrating between these strong places, which, in fact, represented a modern or informal version of the ring-fences of the last century. But as yet Vyasma, Orel, Kursk, Kharkov and others still blocked the way, preventing them from using communications essential to the continuance of their offensive and leaving in Ger. hands springboards for the much-heralded spring counter-offensive.

By 1942 allied war supplies were pouring into Russia in ever-increasing quantities via Bandar Shahpur on the Persian Gulf and the Trans-Iranian railway. Brit. and Amer. war equipment was also reaching Russia's Arctic ports in convoys after hazardous passages around the North Cape.

The Battle of Kharkov—Fall of Sevastopol—German Offensive in the Don Region.—The Russians anticipated the Ger. spring offensive by launching (13 May) an offensive, on a 50-m. front, in the Kharkov region. This offensive by Timoshenko was a counter-move to the formidable Ger. drive in the Kerch peninsula, where the Russians were driven back by combined Ger. and Rumanian forces to the coast of the Sea

of Azov. Timoshenko's attack, which, by 17 May, extended along a 100-m. front between Byelgorod and Smilyev (40 m. NE. and 20 m. SE. of Kharkov), aimed at enveloping Kharkov from the N. and S. On 19 May von Bock delivered a heavy counter-attack in the Donetz region around Izyum, 70 m. SE. of Kharkov, and at Barvenkovo, 20 m. S. of Izyum; but massed Russian artillery and anti-tank guns successfully held these formidable thrusts. The Germans made great efforts

Sevastopol fell early in July. A few days later the Germans delivered an attack of great violence from the Kursk-Byelgorod area, due N. of Kharkov—their immediate objectives being the important railways running from Voronezh to Moscow in the N. and to Rostov in the S., and the Don R. They made rapid progress all along the Don from Voronezh to Svobodn, Boguchar and Millerovo, and by mid-July the main battle extended from the junction of the R. Boguchar with the

to force the Donetz crossings and threatened to cut off large Russian forces in the Izyum-Barvenkovo area, but these forces were relieved by a force of tanks and infantry even larger than that of the enemy. The next great battle was for Sevastopol, which began early in June with air raids on the beleaguered city and the mass concentration of great quantities of siege guns and other artillery. By the last days of June the city area of Sevastopol had been practically destroyed by bombing and shell fire, though the garrison, with forlorn courage, continued to repel waves of enemy infantry and tanks. Elsewhere the position, from the Russian standpoint, was no better, for on the Kharkov front von Bock's offensive was still heavier than in the Izyum-Barvenkovo battle, and the Russians were forced to evacuate Kupiansk, an important rail junction, some 60 m. SE. of Kharkov; but at least Timoshenko's armies still remained intact.

Don to the Sea of Azov, including the Donetz basin, the Russians retiring to their main prepared line, 200 m. long, along the lower Don. Apart from severe fighting round Rzhev and near Orel, the fiercest struggles in the next ensuing weeks were the battles for Rostov and Voronezh. The Ger. advance was most methodically planned and powerfully supported, and the Ger. commander no longer repeated the error of sending tank columns far afield without heavy infantry and artillery support. Notwithstanding losses, the Ger. armies continued to advance and the Russians to fall back. By the early days of Aug. 2 great battles were being fought in the S.—the battles for the Volga and for the Caucasus. Stalingrad, the great riv. port, manufacturing and business centre, was now von Bock's immediate objective. In the N. Caucasus the Ger. forces under von Kleist were threatening the oilfields of Malko and the city of Krasnodar. But grave

and far-reaching as were the Ger. successes in N. Caucasus, it was realised that the battle for Stalingrad was far more momentous. Timoshenko had elected to direct all his limited resources towards the defence of Stalingrad and the Lower Volga.

The battle for Stalingrad and the invasion of the Caucasus.—In the autumn the chief objectives of the Ger. invaders were Stalingrad—a narrow city on high ground stretching for 20 m. along the W. bank of

wore on, the name of the city assumed almost a symbolic significance throughout the free world. The Russians fought on remorselessly, contesting every yd of advance. A new Ger. offensive, however, began from the SW. of the city on 31 Aug. after a brief lull following the almost complete destruction of von Kleist's 14th Panzer Div. at Kotelnikovo. For hrs the defence stood firm and the Ger. attacks broke against the Russian heavy guns and mortars. NW. of the city von Bock

RED ARMY MEN ATTACKING IN A RUINED FACTORY IN STALINGRAD

the Volga—the Grozny oilfields, and the Black Sea port, Novorossiisk. The Germans were not able to attack all along the E. F., as they had done in 1941; instead, they adopted the plan of concentrating their maximum strength in the S. on very narrow fronts and elsewhere acting on the defensive, notably at Voronezh and at Rzhev. The main object of the Ger. offensive of 1942 was, however, not the occupation of the oilfields, but to outflank Moscow from the E., to cut off Moscow from the Urals, and then to strike at the city itself. In connection with the thwarting of this plan the importance of the Russian attack at Voronezh cannot be overrated. In the vicinity of Rzhev Zhukov delivered an effective counter-offensive in the triangle formed by Gzhatsk and Vyazma with Rzhev. Further N. there was occasional activity in the region of Lake Ilmen. But it was the battle for Stalingrad which dominated everything, and gradually, as the months

delivered an equally determined attack, but met with still stiffer resistance. In the general result, however, this double threat to Stalingrad had become gravely accentuated by 3 Sept. Von Bock had received orders from Berlin to take the city at all costs and destroy the Russian forces there and in the whole of the Caucasus. Satellite troops, composed of Rumanians, Italians, and Hungarians, were sacrificed remorselessly. By the end of the 4th week of this titanic struggle more than 20 Ger. divs. were opposed by a rather smaller force of Russians. Day after day von Bock used shock tactics in the hope of taking the city after only a short struggle; but he was gradually forced to begin siege warfare. Bitter street fighting followed a Ger. breakthrough into the NW. (17 Sept.). But the Russians were determined to resist to the end and the road of retreat was barred to the defenders by the will of the whole Russian people. Every pile of

rubble, every crater in the broad streets, every window in the battered houses was a Russian point of resistance. Furious air fights went on all day. The city, which had been the especial pride of the Russians, was now a smoking cauldron in which 2 armies were locked in a frenzied struggle for the mastery. The position inside Stalingrad was at its most critical point on 26 Sept., when the garrison found itself being overwhelmed. But at this juncture the 13th Div. of the Guards, under Rodimtsev, reached the E. bank of the Volga opposite the city after a series of forced marches. Some regiments arrived in the N. and some in the S., as the Germans had broken through to the riv. and controlled part of the bank in the centre. This was the period during which the Germans plausibly claimed to have cut the city in two. Both halves of the Guards Div. then attacked and cleared the enemy from the Volga bank, joining up to form the first Soviet line inside the city. From the moment of their dramatic intervention the Russian resistance in Stalingrad stiffened.

A lull only came on the 51st day of the battle. Hist. may well ask how Stalingrad withstood protracted attack by such a preponderance of tanks and infantry, supported always by a greatly superior air force. Guns were the real mainstay of the Russian defence. Their mobility and the open nature of the country allowed them to concentrate in masses on narrow sectors. Thence their fire, often from 3 or 4 regiments at once, converged on the great Ger. tank columns as they streamed across the steppe. As winter approached the Germans' chances of taking the city dwindled. Meanwhile Timoshenko's relief force was slowly advancing from the NW.

In Aug. Gens. Zhukov and Konev had succeeded in cutting the single line between the Rzhev region and the main Ger. armies there and to the SW. But while Zhukov was making headway here in the centre of the E. F., Timoshenko's forces in the S. were forced to withdraw to new positions covering Stalingrad. Meanwhile heavy fighting was also in progress still further S., and late in Nov. the Germans took Nalchik and advanced to Ordzhonikidze and the all-important Georgian military road, which leads directly to Tiflis. But here they were pulled up by a brilliant counter-offensive at Ordzhonikidze and routed in such decisive manner as to end the danger to the Grozny oilfields, at least for the winter. But a still more dramatic change came over the S. Russian front from 19 Nov., when the Russian troops at the approaches of Stalingrad passed over to the offensive both from the NW. and from the S. of the beleaguered city. In a few days they had broken the Ger. line in the NW. on a 20-m. front and on a 15-m. stretch in the S., advancing from 40 to 50 m. On the 5th day of the offensive, Stalingrad's battle-worn defenders were at last relieved, when a Russian army broke through to link up with them from the N. and they themselves then joined

in Timoshenko's great offensive. The result was that the Axis forces were now facing an increasingly precarious position with Russian armies closing in behind them across the Don to the W.

Russian Counter-offensive.—Destruction of German Sixth Army.—Fall of Rostov.—Following orthodox strategy the Germans, in the early summer of 1942, had concentrated their strength for the blow at their main target, Stalingrad, on a 200-m. front from Izyum to Kursk. They drove E. and SE., following the 2 main railways to Voronezh and Rostov respectively, their right fanning out, as it passed the industrial tns of the Donetz, in order to try to encircle the Russians retreating on Rostov. But the Germans were held at Voronezh, and the Ger. main concentration was switched southward to follow the railways to Stalingrad. Thus Rostov was taken and the Germans rushed forward up the Salsk-Stalingrad railway, and it was then that the Ger. High Command boldly broadened their whole plan, abandoning orthodoxy and over-reaching themselves. For they now aimed, not only at taking Stalingrad, but at cutting off Russia from her oil and from her Brit. and Amer. supplies, separating the Central European part of the Soviet Union from the Volga and the Ural area and surrounding and taking Moscow, and so putting the Russian armies out of the war. But the Russian High Command had observed that the Ger. troops were really insufficient for the 900-m. front N. of Kursk and, behind these lines, the Russians were left in comparative peace to withdraw and train and move reserves as they chose. In sharp contrast to the Ger. was the Russian strategy, which aimed at surrounding and routing the Ger. forces on the approaches to Stalingrad. This plan was effected in Nov.-Dec. 1942 in 3 stages. The 1st was the Russian offensive NW. and SW. of the city, which has been described. The 2nd stage was the Russian offensive in the area of the middle Don (16-30 Dec.). The Russian troops here were assigned the task of penetrating to the rear of the Ger. troops in the Don bend and preventing those Ger. troops which were surrounded on the approaches to Stalingrad from escaping or being relieved. The 3rd stage was the Russian offensive S. of Stalingrad. With the aim of relieving their Stalingrad army, the Germans concentrated a considerable force N. of Kotelnikovo, and on 12 Dec. launched an offensive. The Soviet troops, however, routed this new concentration, rolled the Germans S., and so deprived them of the last chance of breaking through to the encircled Sixth Army. By the end of Jan. 1943 the Russians had completed the destruction of the Ger. Sixth Army, commanded by von Paulus. Famine, disease, and Russian bombs and gun-fire had, by mid-Jan., reduced an army of over 300,000 to between 70,000 and 80,000 men. Those that remained rejected a Russian ultimatum to surrender and the Russians then launched a new and final attack of annihilation. On 31 Jan., the Russians captured von Paulus and the remnant of

the Sixth Army. Catastrophic losses in equipment and prestige, apart from the loss of men, were incurred by the utter collapse of the Ger. Stalingrad expedition. On this same day the Ger. position in the Caucasus was rendered still more precarious by the loss of the junction of Tikhoretsk and the clearing of the Malkop oilfields. A confident Ger. army, flushed with victory, experienced a transition from a wholly offensive to a wholly defensive force. Certainly winter conditions were partly responsible for the change in mind, but the chief factor was just as certainly the Russian method of offensive warfare, which the Germans had not previously experienced.

Gens. Vatutin and Golikov were now attacking westward and driving the Ger. forces out of the Don bend; while, soon afterwards, Eremenko (commander of the SW. front in the Stalingrad battle) and other generals attacked again from the Kotelnikovo region towards Salsk and Rostov, and before even this attack had reached its height, another army on the Voronezh sector forced the Germans and Hungarians to retreat rapidly and yield essential railways. And at the same time the Russians were prosecuting operations on the middle front so that the Germans were unable even temporarily to weaken that front by sending reinforcements S. In one of these central front attacks the Russians captured Veliki Luki, a most important stronghold, and in another they reduced Schlüsselburg, the fortress in eastward of Leningrad, and so reopened a land-corridor to the long-besieged garrison and inhab. (see further Leningrad). Altogether less dependent on railways than the Germans, the Russians, accustomed to large-scale operations across their native winter countryside, were now demonstrating that their soldiers were not only better officered for such warfare but were more than a match for Ger. soldiers on the open steppes. The next places to fall were Izyum in the Kupiansk region (9 Feb.), Stary Oskol, 50 m. W. of Voronezh, the port of Azov, 10 m. SW. of Rostov, and, in the first fortnight of Feb., the important tus of Kursk and Byelgorod, the capture of the last-mentioned place increasing the threat to Kharkov from the N., Kupiansk, Lozovaya (increasing the threat to Kharkov from the S.), Bataisk, and Novocherkassk, which brought the Russians to the gates of Rostov, and Krasnodar, a large in which gave them control over the Kuban river country. Thus, by this time the Russians were threatening the entire Donetz basin and the whole of the W. Caucasus, having recaptured in 3 months of winter all the ter. that the Germans had taken in 5 months in 1942. The fall of Kursk and Kramatorskaya removed 2 vital pins on the extreme end of a 220-m. front and, as a result, the Russians now enjoyed a wider freedom of manoeuvre. Flying columns of tanks, motorised infantry, and ski troops all played their part in the complicated moves by which forces, simultaneously attacking from various directions, first encircled and then cap-

tured these strongholds. On 14 Feb. Rostov was taken and on the same day the fall of Voroshilovgrad, 70 m. NW. of

Soviet Weekly

TROOPS OF THE RODIMTSEV
DIVISION ON RECONNAISSANCE
IN STALINGRAD, WINTER, 1942

Rostov, gave the Russians a key point on the railway to Kharkov. The entire Ger. position in the Donetz basin was now

threatened and Russian forces were closing in rapidly on Kharkov, their successes placing them in an unbroken arc around the city. This great city, the third in importance in Russia, fell to the Russians under Gollkov on 16 Feb.

A new offensive under Timoshenko was launched late in Feb. between Leningrad and Moscow, the Germans being driven out of an area of 900 sq. m. in a few days. The following day Timoshenko captured the stronghold of Rzhev; and the next day, continuing their advance W. of Rzhev, the Russians cleared the whole length of the railway between Moscow and Veliki Luki. The mild winter and thaw, however, stopped further advances by the Russians in the Ukraine. Early in Mar. they were faced with a concentration of 23 Ger. divs.—many brought up from the W. of Europe—on a narrow sector in the Donetz basin and were forced to retreat towards the N. bank of the Donetz. W. of Moscow, however, they made further advances, particularly towards Vyasina, which they entered on 12 Mar., though Ger. resistance around Orel was now stiffening. S. and W. of Kharkov the Russians were being very hard pressed, and by 15 Mar. the Germans had recaptured most of the city. The powerful Ger. recoil of Feb.—Mar. eliminated the threat of envelopment to their armies between the Donetz and the sea and cut off, with considerable loss, some of the advanced Russian columns. But although the Germans had, by the end of Mar., re-established their position along the line of the Donetz to N. of Taganrog, they were not appreciably better off in ter. than when they set out for the Volga and the Caucasus the previous year, and, in their existing situation, this was equivalent to a heavy strategic defeat on the result of the whole period.

The Kursk-Orel battles.—The capture of Kharkov was the high-water mark of the Russian offensive in the Donetz region. At one time, for a fortnight, they held the entire course of the Donetz R. But at this point the unusually early end of a remarkably mild Russian winter left the Russians at a great disadvantage, and their mobility was abruptly checked by ground softened by melting snow. The Germans gained time to regroup and reinforce. Von Manstein, instead of commanding a defensive retreat-force, now drove offensively towards the Donetz and Kharkov, with a strong force brought by rail from the Dnieper bend with ample armour and air support. The Russian positions on the lower Donetz and down the Mius to the Azov Sea remained firm and Voroshilovgrad was still in Russian hands. Between that time and early July there was a lull on the whole front. The only marked activity was in the Kuban region. Here the forces of Gen. Maslennikov were pounding Novorossisk. Then came the spectacular Ger. Kursk-Orel offensive, which began on 4 July.

The ideal aim of this long-prepared offensive, like its predecessors, the offensives of 1941 and 1942, was to smash the

Russian armies rather than merely to eliminate the Kursk salient, and to do so before the Allies might launch their 'second front' offensive in Europe. Judging by the troops and planes engaged and by the armour thrown in, this was the biggest battle of the war up to that time. The progress of the battle was essentially determined by the contest between the Ger. tanks and the Russian artillery and other anti-tank weapons. Air losses were heavy on both sides. But the outstanding feature of the Byelgorod-Orel battle was the tremendous Ger. losses in tanks and the insignificant operational gains. This Ger. offensive differed from those of 1941 and 1942 in that almost from its beginning the Russians, after giving some ground, notably in the Byelgorod region, were soon counter-attacking with great vigour. The first week of this great Orel-Byelgorod battle ended without any climax being reached, though the Ger. right arm made some progress between Byelgorod and Kursk. It was, however, significant that already the Germans were forced to resort to artillery bombardment after their costly armoured thrusts, and that they were even now regrouping their mauled forces. Decisively beaten N. of the Kursk salient, von Kluge now tried to widen the Ger. wedge driven towards Kursk from the direction of Byelgorod; then the Russians, far from being exhausted, suddenly took the offensive in 2 directions, from the N. and E. of Orel. The Russians soon recovered all the ground gained by the Germans on the N. side of the Kursk salient and nearly all their gains in the Byelgorod region. On 4 Aug. the Russians stormed and captured Orel, which restored to them a valuable railway junction and promised the restoration of through rail traffic on the main line from Moscow to Kursk. On the same day Byelgorod was also successfully stormed by the Russians.

The fall of Orel and Byelgorod soon had its effect on the co-ordinated Russian operations further S. in the Kharkov region. The Germans fought for Kharkov with great tenacity, recognising it as the hub of their entire position on the E. F., and, about 10 Aug., they began a series of heavy counter-attacks. But the Russians soon fought the whole of the counter-attacking armies to a standstill, and as their corridor of retreat was now narrowed to only 20 m. the Germans evacuated the city. Meanwhile in the Donetz basin, S. of Izum and SW. of Voroshilovgrad and in the N. near Briansk, the Russians continued to develop their offensives.

The Donetz Basin overrun.—The Germans evacuated Taganrog on 30 Aug. The withdrawal was a preliminary to their gradual evacuation of the entire Donbas; for Taganrog was one of the corner-stones of their defences in that area and its abandonment made a withdrawal also from the Kuban and the Crimea a matter for urgent consideration. The Russians made their next big advance in the Sevska area, taking the important positions of Rylysk and Glukov and penetrating into

the N. Ukraine. They also took Yelnya, a most important fortress in the Smolensk area. This double offensive on the central front was the most extensive the Russians had undertaken since Stalingrad and their largest-scale enterprise in any summer season. With the capture of Sumy the whole of the Kursk region was freed. One large city only, Stalino, now remained to the Germans in the Donbas, their reserves being no longer sufficient to enable them to mount such a counter-attack as that which had retaken Kharkov earlier in the year. Most of their available reserves were now concentrated for the defence of their positions in the region of Poltava and Krasnograd—vitaly important to stem a possible Russian attempt to break through to the Dnieper. Stalino was, however, taken on 8 Sept. The capture of Konotop and Bakhmach N.W. of Kharkov involved a break-through which cut the Germans' main lateral railway and took the Russians appreciably nearer Kiev.

Late in Sept. the Russians had taken Briansk and were advancing on Smolensk. The capture of Chernigov by Rokossovsky gave the Russians complete control of the Desna R. throughout its length, and when, soon afterwards, Poltava fell, the Russians were well advanced towards the Dnieper bend. Smolensk, so long Hitler's H.Q. on the E. F., was taken by storm by Sokolovsky on 25 Sept., a triumph which had a profound psychological effect on the Russian people. Following the fierce 3-day battle which resulted in the capture of Poltava, the Russian forces took Kremenchug, the important rail junction on the E. bank of the Dnieper (30 Sept.), and thus now stood on the E. bank of that great natural defensive barrier, facing Zaporozhe and Kiev. Still further S. they captured Novorossisk, the Black Sea port, after a 5-day battle in which 4 Ger. divs. were routed, and so increased the threat to the Germans in the Crimea.

Dnieper 'Bend' battles.—Early in Oct. the Russians broke through the Ger. defences W. of Veliki Luki and took Nevel, an important rail junction 30 m. SW. of that place. But their main effort was much further S., where their reinforcements were now streaming across the Dnieper and enlarging a number of bridgeheads N. of Kiev. The breaking of the Dnieper Line was the result of a lightning operation that took the Germans completely off their guard. Meanwhile the Germans were driven from their last foothold on the Caucasian mainland. Land and sea operations, together with a terrible pounding from 'Stormovik' planes, finally cleared the Taman peninsula. There was bitter fighting for Kiev, but the main battles of the whole front were those which were developing at ever greater pressure in the Dnieper Bend between Kremenchug and Melitopol. Zaporozhe, the important junction of railways and waterways on the lower reaches of the riv., was captured on 14 Oct. The final storming, on 23 Oct., of Melitopol, the gateway to the Crimea,

after 11 days of street fighting, opened the way across the Nogaia steppes and threatened 1,000,000 Germans still fighting in the Dnieper Bend to the N. and in the Crimea further W. The Russian wedge across the Dnieper had now broadened and deepened into a huge triangle 80 m. wide at its base and nearly as deep, covering hundreds of sq. m. of the W. Ukraine. From its left flank the drive on Dniepropetrovsk had now been launched with strong artillery and tank support along the narrow triangle between the Dnieper and the railway to Krivoi Rog. By 25 Oct. the great industrial centres of Dniepropetrovsk and Dneprodzerzhinsk on the riv. had been taken. On 31 Oct.—1 Nov. the Russian troops cut the land retreat for Ger. forces in the Crimea by delivering a swift blow on the Perekop isthmus, which carried them through the Ger. defences to Armiensk.

Fall of Kiev.—The Russians now held the initiative all along the line, for their blows fell now at one point and now at another, while the Germans, denied the use of strategic railways which were cut at vital centres, were unable to rush reserves to threatened places. It was in these circumstances that Kiev fell in the early days of Nov., and Jitomir (10 m. W. of Kiev) a week later, thereby cutting N. and S. rail communications and carrying the victorious armies of Vatutin within 60 m. of the pre-war Polish frontier; while at the same time heavy Russian blows were being struck at Krivoi Rog in the S. and in the Nevel region farther N.

General Vatutin's advance to Poland. Relief of Leningrad—German Eighth Army destroyed—Fall of Nikopol and Krivoi Rog.—The Russians were now on 2 fronts—Kiev and the Dnieper Bend; secondary fronts were Gomel and Vitebsk further N. Their method was to ring the changes upon these sectors, switching fresh power to one as the strength of the defence increased at another. Thus the Kiev offensive was begun after Ger. reserves had been concentrated at Krivoi Rog; while the Gomel offensive was intensified when the Germans struck at Jitomir (18 Nov.), and at the same time the offensive was renewed in the Dnieper Bend. The Russians had just taken Korosten, the rail junction N. of Jitomir, and Rezhitsa, a centre of communications 20 m. W. of Gomel, when the Germans great counter-thrust to drive the Russians off the Kiev-Jitomir road was launched. The Russians fell back stubbornly, but, as indicated above, other Russian forces were soon creating a diversion, and, having reached the Beresina, were threatening Gomel (23 Nov.). Two Russian Ukrainian armies were also active in the 'Bend' in especially fierce fighting S. of Kremenchug. The industrial centre and rail junction of Gomel was seized by Rokossovsky's armies (26-7 Nov.) in a bold by-passing manoeuvre. The next appreciable Russian success was the capture of Znamenska in the 'Bend' by Konev; while in the direction of Kirovograd, a most important position on the lower Dnieper about 20 m. W. of Zna-

men, the Russians were exerting heavy pressure (10-11 Dec.). This fighting in the Bend was well timed, for in the Kiev salient the battles had reached a pitch of great violence in view of the Ger. objective, which was to regain Kiev and restore their fortunes in S. Russia. Meanwhile the Russians had begun a new offensive near Nevel in the N. and in a few days had broken through the Ger. fortified line on a front of 50 m. long and penetrated to a depth of 20 m. The Ger. offensive in the Kiev salient collapsed towards the end of

switch reserves between the points at which major action developed.

But the Ger. resistance in the 'Bend' remained as tenacious as ever despite Vatutin's success further N., for the Germans wished at all costs to keep the Russians out of the Balkans. By a brilliant attack in the 'Bend' Konev seized Kirovograd, before the Germans had time to destroy the tn's installations. Further N. Vatutin's First Ukrainian Army had pushed on into Poland and was advancing on Rovno (12 Jan.).

British-Soviet Society

RUSSIAN ANTI-TANK RIFLE CREW

Dec. and Vatutin struck back, advancing (27 Dec.) on a 50-m.-wide front. Korosten was recaptured on 29 Dec. by Vatutin in his spectacular westward sweep, thereby giving him a junction of 5 railways. Vatutin's counter-offensive had in less than a week recovered every important point won in 7 weeks' bitter fighting by von Manstein's counter-attacks, with one exception, Jitomir, and that place fell on 31 Dec. By 2 Jan. Bagranyan's troops were at the walls of Vitebsk. With gathering impetus Vatutin's offensive was now sweeping forward on almost all sectors, von Manstein being out-maneuvred and suffering, not so much from lack of men, as from lack of mobility through the loss of strategic railways. Practically all the Ger. successes in Russia from the beginning of the war were achieved by seizing and exploiting the better lines of communication, but by now the Germans were left with few of the excellent lateral railways by which they were previously so often enabled to

Southward of this front, the Russians were driving on Vinnitsa and the junction of Zhmerinka, on the main railway from Odessa to Warsaw. A well-planned out-flanking move gave Rokossovsky possession of Mozyr and Kalinkovichi, the twin Ger. bases in the Pripiet basin in White Russia (13 Jan.). These constituted the main enemy base on this front after the fall of Gomel and Rozhitsa.

Meanwhile, the Russian High Command had been preparing a powerful blow much farther N., around Leningrad. Here they were aiming at the railway between the great city and Moscow, and now advanced to wipe out the salient which for so long had outflanked Leningrad. The new offensive, under Gens. Govorov and Meretskov, was begun in the area of Oranienbaum and in the Volkhov region N. of Novgorod. This anet tn was taken by storm on 20 Jan. SW. of Leningrad the Russian advance overwhelmed the Ger. beachhead along the S. shore of the Gulf of Finland—a stretch of 50 m.—

enabling ships of the Baltic fleet to sail once more and land supplies.

In the whole course of the Ger. withdrawal since the opening of the summer campaign of 1943 no large body of Ger. troops had ever been cut off, and it seemed well within the capacity of the Ger. generals, skilled in defence, to continue the movement without disaster until they could take up their positions on the 'Ostwall' or fortified zone behind the Bug, which they regarded as impregnable. But the renewal of the Russian offensive S. of the Kiev salient and towards Kirovograd in Jan. increased the threat to some 10 Ger. divs. constituting the Eighth Army, based on Kanev, S. of Kiev, the last Ger. foothold on the middle Dnieper. When the Germans were thrust back on either side of Kanev, these 10 divs. were left in a 'pocket,' the 50-m. mouth of which was gradually sealed by convergent Russian movements from E. and W. This salient at Kanev became a fatal trap owing to Hitler's orders to hold out even at the price of annihilation.

Meanwhile in the N., on 26 Jan., Goyorov captured Krasnogvardeisk, the railway junction S. of Leningrad. By the taking of Lyuban and other stations, the whole trunk line between Moscow and Leningrad was cleared of the enemy, except at Chudovo, where, however, the Ger. garrison was surrounded (28 Jan.). Chudovo soon fell to the Russians who were now advancing irresistibly on the great Ger. base of Luga, some 50 m. W. of Novgorod. On 5 Feb. the Russians reached the mouth of the Narva R. and the shores of Lake Peipus.

The position of the Ger. Eighth Army in the Dnieper Bend had changed sharply for the worse by 8 Feb., for all the good airfields were now in Russian hands, and air-borne supplies to the trapped divs. had become meagre. Seven Soviet spearheads of attack were thrusting at the doomed army which was now compressed within an area of less than 250 sq. m. and with 90 m. of front to defend. An ultimatum was sent by Konev calling on the Germans to surrender but, acting on Hitler's order to stand and die, they rejected the ultimatum. Some 52,000 Germans were killed in the Kanev trap or pocket and 11,000 were taken prisoner. The sequel to this victory was the capture on 22 Feb. of Krivoy Rog after heavy house-to-house fighting.

The destruction of the Dnieper bend 'pocket' at Korsun removed a handicap to the development of the Russian plans, which were necessarily directed to cutting the Odessa-Lwów railway, and released a large force for an advance towards the Bug. It was at this time that the victorious Vatutin fell ill (he d. in April), and his place was taken by Zhukov. Zhukov's dramatic intervention soon brought material results in a great break-through between Shepotovka and Tarnopol on a 100-m. front. Zhukov's offensive threatened to force von Manstein back against the Carpathians and the Rumanian frontier. Meanwhile, further N. the Russians captured Staraya Russa, S.

of Lake Ilmen (18 Feb.), and, with the seizure of Rogachev, Dno, and Vitebsk on the route to Pskov a week later, were threatening the Ger. lines of retreat n. White Russia.

The Germans were, however, allowed no respite, for the armies under Konev (Second Ukrainian Front) in their turn resumed the offensive further S. and also broke through on a 100-m. front, crossing the Bug and taking Uman and Kristinovka, and heavily defeating 14 Ger. divs. (5-10 Mar.). Then, soon afterwards, forces of the Third Ukrainian Army under Malinovsky, having forced the Dnieper, stormed Kherson (13 Mar.), which constituted a powerful base of resistance at the mouth of the riv. Konev, having broken through on the Bug front, was now pressing without pause towards the Dniester valley and Bessarabia. By 20 Mar. his troops were across the Dniester, having forced the riv. on a stretch of 30 m. and captured the Moldavian tn. of Soroka. The rapidity of his advance is shown by the fact that, on reaching Ryshkanovka (Rascani), he had advanced 200 m. from the positions on the Dnieper where only 7 weeks previously his guns were firing on the Ger. positions at Kanev. The fall of Zhmerinka and the isolation of the great hedgehog stronghold of Vinnitsa removed the danger of a Ger. counter-thrust against Russian units advancing on Mogilev-Podolski. Both the latter and Vinnitsa fell to the Russians soon afterwards.

Meanwhile, for the past fortnight von Manstein had been making strenuous counter-attacks in the Tarnopol-Proskurov region, hoping at least to retain the railway between the 2 tns. Then suddenly Zhukov struck again on a wide front on sov. sectors at once, broke through the Ger. defences in the Tarnopol-Proskurov region and swept forward from 40 to 60 m., forcing the R. Pruth and closing in on Kamenets-Podolsk and Proskurov.

Ploesti was the prize for which the Russians were driving across the rivs. of the Ukraine and Bessarabia. Before the end of Mar. Konev's troops, having crossed the Dniester on a front of 110 m., reached the Pruth for 50 m. of its course. Kamenets-Podolsk, centre of Ger. resistance N. of the Dniester, was stormed by Zhukov's tanks and infantry, thus cutting the only railway left for the retreat of the Germans in the Proskurov area. At the same time Malinovsky's forces captured Nikolaiev, the Black Sea port on the mouth of the lower Bug—the last tn. held by the Germans on the l. b. of the riv. The Russians soon forced the Pruth, and on the last day of Mar. Zhukov took Kolomea, 45 m. NW. of Cernauti. Cernauti fell the next day. Zhukov's and Konev's forces had now joined hands, and all 3 Ukrainian armies were moving simultaneously. Ochakov fell in a sea and land attack to Malinovsky on 31 Mar. In close co-ordination the armies of Zhukov and Konev drove the enemy from Bukovina and took up positions on a 180-m. front from the Yablonica Pass in

the Carpathians to a point on the Sereth 50 m. NW. of Jassy. Thus the Russians had now reached the borders of Czechoslovakia, and among their forces was a strong Czechoslovak brigade under Gen. Svoboda. On 10 April Odessa fell to Malinovsky. On the same day Tolbukhin's Fourth Ukrainian Army launched a new offensive against the Crimea from the isthmus of Perekop while Eremenko's Independent Maritime Army was advancing eastward from the Kerch peninsula. The feature of this campaign for the retaking of the Crimea was the rapidity with which the Russians overran the peninsula. On 13 April Eremenko captured Feodosia on the Black Sea while Tolbukhin took Eupatoria, and then Simferopol, cap. of the Crimea and main base of Ger. resistance covering the ways to the harbours on the S. shores of the Crimea. Tolbukhin then struck straight through the mountains S. of Simferopol to the coast, and soon both his and Eremenko's forces were closing on Sevastopol. But the main object of this whirlwind Russian campaign was not so much the recapture of ter. as the destruction of the enemy divs. rashly left behind by von Manstein for the defence of the Crimea.

Eremenko captured the port of Yalta, 30 m. from Sevastopol, on 16 April, and the battle was now restricted to a struggle for Sevastopol and the Khersones headland. Meanwhile the lower Dniester was forced at many points in the direction of Kishinev. Bombers of the Red Air Force made a heavy attack on the railway junction of Galatz (17 April). Allied bombers, based on It. airfields, were also attacking places in Rumania and Bulgaria. But it was essential to get Sevastopol and so free the armies of Tolbukhin and Eremenko. By 19 April the Russians, breaking through precipitous rocks, reached the aqueduct S. of the city, thus completing the arc round its landward sides and bringing the whole city and port under their artillery fire.

Fall of Sevastopol—German débâcle in the Crimea.—In 29 days the whole Crimean campaign was at an end and the Germans and Rumanians driven out of the peninsula. Sevastopol, which earlier in the war the Russians had defended for 250 days, fell to Tolbukhin's forces within a week from the moment when the Russians, on 6 May, began their attack on the Belbek line. The Russians took the tn by storm after breaching the defences on the Sapun Ildge. The loss of the Crimea and the destruction of a force of 200,000 men was a Ger. disaster almost as great as that of Stalingrad.

Russian offensives in Finland and White Russia—Fall of Minsk and Vilna.—While the Anglo-Amer. forces were invading Normandy in 1944 and advancing northwards in Italy, Stalin was preparing new and decisive blows against the Germans on the E. F. He began with an attack on the Karelian Isthmus, Finland, in mid-June, to remove the persistent menace to the N. flank of the Russian front. In a week the Mannerheim Line was broken. Govorov soon captured

Vilpuri, where the enemy's chief lateral line of railway met the coast.

A few days later the Soviet armies began a great enveloping movement against the Ger. divs. concentrated in the fortified zone of Vitebsk, and on 26 June, after forcing the W. Dvina, they carried by assault the tn of Vitebsk, an important regional centre. This proved to be the opening gambit of a Russian attack on a massive scale which was soon destined to have deep repercussions. Already the attack extended from N. of Vitebsk to Zhlobin, a front of 200 m. Along this impressive front from the Karelian Isthmus to the Pripet the order of battle was: Leningrad front (Govorov); 2nd Baltic front (Eremenko); 1st Baltic front (Bagranyan); 3rd White Russian front (Cherniakovsky); 2nd White Russian front (Zakharov); and 1st White Russian front (Rokossovsky)—in all 6 great army groups, not counting that of Meretkov. Bobruisk was captured on 29 June by Rokossovsky. Rokossovsky's blow was a decisive one, for it doomed the Ger. defence at the White Russian cap. of Minsk.

Minsk, the great bastion of the Ger. front N. of the Pripet, was captured by the forces of Cherniakovsky and Rokossovsky on 3 July; while farther N. still the Russians had fought their way into Polotsk, pivot of the Ger. positions defending the Baltic coast.

The swift Russian advance westward threatened the important railway junction of Vilna, the loss of which would disrupt the Ger. Baltic and central F.s and lay E. Prussia open to attack by the triumphant Soviet armies. On 13 July Vilna fell to the Red Army. On the next day the capture of Pinsk and of Volkovysk (2 outposts of the Ger. line covering Warsaw) increased the Red Army's threat to the strategic junctions of Bialystok and Brest Litovsk. Between Dvinsk and Vilna 2 Russian groups had now joined hands and 25 m. W. of Vilna were marching on Kaunas, which, with Grodno, formed the other great bastion defending the E. border of E. Prussia.

Marshal Konev's advance into Poland.—

Fall of Pskov.—In 3 days' fighting (16–18 July) troops of the 1st Ukrainian F. led by Konev—who had assumed command in place of Zhukov—broke through the Ger. defences E. of Lwów on a 120-m. front and advanced 30 m. Further, on 18 July Russian troops N. and S. of Alytus fought for the expansion of their bridgehead on the W. bank of the Niemen. Blows now fell thick and fast along the E. F. generally. On the 19th the forces of Eremenko and of Bagranyan broke through strong defences on a 43-m. front towards the Latvian border S. of Ostrov and, towards Dvinsk, penetrated 5 m. inside the border. Farther S. Konev's forces in the advance on Lwów completed the encirclement of a large enemy group W. of Brody. In yet another new offensive next day, from Kovel, they made a 90-m. breach in the Ger. defences, and in 2 days swept forward 30 m. to the W. Bug R. The Germans were now in precipitate retreat from

long cherished positions designed to protect the roads to the Baltic, to Warsaw, and to Germany itself. Pskov, the stubborn N. barrier to the Baltic reps., was taken on 23 July, 2 days after the fall of Ostrov. Its fall marked the liberation of the last city of the Russian Rep. from the Ger. invader. 22-3 July saw, indeed, the most remarkable advance of the war, a veritable Russian tidal wave on an immense frontage. All along its tn-strongholds of the first importance—Dvinsk, Kaunas, Bialystok, Brest Litovsk, and Lwów—were now in the utmost peril. In Estonia there was every chance of isolating the Ger. divs. under Lindemann. The Germans had been holding the line from Lake Peipus to Dvinsk with the greatest obstinacy, knowing that if they lost their hold on the lake their strongly-defended front to the N. of it would become useless. But now, with the loss of Pskov, it looked as though their link with Lake Peipus would soon be snapped, and, if that happened, the Russians could push on towards Riga.

Russians take Przemysl, Brest Litovsk, Bialystok, and Kaunas.—By taking Siauliai (Shavli), the key junction in Lithuania, the Russians cut the main link between the Ger. armies in Estonia and Latvia and East Prussia (27 July 1944). Dvinsk and Rezekne in Latvia and Lwów and Stanislawow in Poland were occupied. The next day 3 more of the remaining Ger. strongholds fell—Przemysl, Yaroslavl, and Brest Litovsk. In these days of a rapidly-changing front the Ger. High Command was outwitted by the unorthodoxy of Russian strategy. The Ger. generals, unable to be uniformly strong all along the line, especially with dwindling reserves, left those parts of the front more thinly guarded which might seem, from the Russian standpoint, to be unsuitable and costly for large-scale offensives; but it was precisely at these points that the Russians launched their main attacks—at Przemysl, Lublin and westward in a direct line for Warsaw. Impressive as were the victories at Dvinsk and Pskov at one end of the front and of Lwów at the other, nothing was so spectacular as the tremendous Russian surge into the middle of the Polish plains. In the Baltic States Bagramyan's advance into central Lithuania forced the Ger. plan to form a strong line on the Dvina and thereby keep open the road for Germany's Baltic armies into E. Prussia. Protecting Bagramyan's right flank was the army of Eremenko, who captured Jelgava (Mitau), the main communication centre between the Baltic area and E. Prussia. Farther N. other Russian forces crossed the Estonian border and advanced along the Pskov-Riga road and the Valka railway. Kaunas (Kovno) was stormed on 2 Aug. The Russians were now massing forces on the Vistula and Nemen for the invasion of E. Prussia and, possibly, of Cracow. Meanwhile Rokossovsky's troops were heading NW. to Warsaw. Very heavy fighting now threatened on the E. F. generally. For the prizes at stake were great: 2 trapped Ger. armies in the Baltic; the 'sacred soil'

of E. Prussia; Warsaw, Cracow, and Silesia; and the Carpathian passes.

The Battle for Warsaw—Armistice with Finland—Russian offensives in the Baltic States.—The stiffer Ger. resistance caused a check to the Russian attacks before Warsaw, against E. Prussia, and in the Baltic States. The situation in Warsaw itself was obscure. Relying, apparently, on the approach of the Russian forces, the patriots rose against the Germans and were soon in possession of many key-points. They were commanded by Gen. Thaddeus Bor-Komorowski, known as Gen. Bor. But at this juncture the Germans strongly reinforced their E. F. with a great accession of armour, and the attacking Russian forces received a severe set-back. Meanwhile, however, the plight of the Poles inside Warsaw was daily growing more desperate. Allied airmen dropped light weapons for their use, but the Russians refused the use of air-fields E. of Warsaw to facilitate and increase their supplies. The Russian Command contended that the rising in Warsaw was premature and contrary to their orders; but it is more probable that the political conflict between the Polish gov. in London and the Polish liberation committee formed in Russia had its influence on the position (see further POLAND).

An armistice was arranged between Finland and Russia on the morning of 4 Sept. The armistice was not actually signed until 19 Sept. when the Finnish delegation reached Moscow. Under its terms Finland lost both Karelia and the Petsamo area—which latter was still held by the Germans.

Near Warsaw, the Russians had captured part of Praga after some 6 weeks of violent battle. But Warsaw as yet was far from falling to the Russians, and on 3 Oct. the Polish underground army, starved and its supplies exhausted, gave up the struggle.

According to Gen. Bor's disclosures in 1948 the Soviet armies for 60 days passively watched the destruction of Warsaw and the massacre of its Polish defenders and inhab. The prin. difficulty which faced the Polish Home Army of Gen. Bor was that Russia had broken off diplomatic relations with Poland early in 1943, and efforts by Anthony Eden, as mediator, to re-establish relations in view of the Red Army's approach to the Polish frontier were unsuccessful because the Soviet gov. would only discuss renewal with a Polish gov. 'favourably disposed' towards the Soviet Union, and Molotov's reply to Eden was that neither the Polish gov. in London nor the Polish commander-in-chief, Gen. Sosnkowski, fulfilled that condition. On 1 Aug. the city rose against the Germans, not only the date but the precise hr for so doing having been given to the Russians by Mikolajczyk, the Polish premier, who was then in Moscow, and the Russian staff was officially notified by the Brit. staff. Within 3 days the greater part of the city had fallen into Bor's hands. Then suddenly the Soviet artillery became

silent and the Soviet Air Force disappeared from the skies. The Soviet radio, which had continually urged the Polish people to rise and free their cap., became suddenly mute. All Bor's efforts to establish liaison with the Soviet High Command, either directly or through London, were unsuccessful. After that the rising gradually collapsed and in. by in. the Germans recovered their lost ground. Capitulation followed inevitably, the Polish losses being more than 15,000 soldiers in addition to thousands of civilian losses.

On the so-called Leningrad F., in mid-Oct., the Soviet armies began a new offensive in the Baltic States, from 70 m. E. of Tallinn, the Estonian cap., to the outskirts of Riga, the Latvian cap., a distance of 200 m. Tallinn fell to Govorov on 23 Sept., the Germans thus losing an important naval base and port in the Baltic. All Estonia was now in Russian hands except for the is. of Dagö and Oesel. A powerful Russian attack in Lithuania NW. and SW. of Shavli broke through the strongly-fortified enemy defences, and in 4 days' fighting the Russians advanced in spectacular manner up to a distance of 62 m., widening the breach in the Ger. F. to 175 m.

New Russian attacks in Rumania—Armistice with Rumania.—First attack on East Prussia.—Russian invasion of Hungary.—Budapest encircled.—Russian troops under Malinovsky and Tolbukhin launched new offensives in Rumania late in Aug. with a view to the capture of the all-important Ploesti oil fields and the elimination of both Rumania and Bulgaria from the war. On 23 Aug. Rumania sought an armistice which, with the approval of Great Britain and the U.S.A., was granted by the Soviet Union. It now remained for the Russian gens. to expel the Germans and their satellite troops. Ploesti fell on 30 Aug. after a remarkably rapid advance by Malinovsky's troops, while a few hrs previously the port of Constanza was captured by Tolbukhin. On 31 Aug. the Russians entered Bucharest. Advancing up the Danube valley parallel with the Bulgarian frontier, the Russians reached that frontier between Giurgiu and the Black Sea. It was plain that Russia would tolerate no further Bulgarian aid to Germany. Bulgaria's attitude throughout had been treacherous and equivocal. She had long since declared war on Britain and the U.S.A. but had pretended to be neutral towards Russia while giving the Germans every kind of aid short of sending combatant troops against her. Meanwhile effective co-operation had been estab. between the Red Army's tanks advancing up the Danube and the partisan forces of the Yugoslav National Army of Liberation under Tito. S. of the Iron Gate Brit. and Amer. land, sea, and air forces, too, were co-operating with Tito's army to destroy Ger. escape routes. The other great wave of the Russian advance beating upon the barrier of the E. Carpathians had penetrated from the N. into Transylvania. Other columns crossed the Transylvanian Alps and closed in on Cluj the cap., which

had a mixed Ger.-Hungarian garrison controlling communications. From W. Rumania strong Russian forces under Malinovsky were now thrusting into Hungary itself and, by early Oct., were within 100 m. of Budapest. Thus the mt. ramparts guarding central Europe had been largely overcome and the Red Army had penetrated deep into the Hungarian plain. Russia's chief concern about Bulgaria was to cover the flank of the Red Army during its advance towards Yugoslavia and Hungary, and therefore war was declared on Bulgaria, which country promptly replied by vainly seeking an armistice. But the next day (9 Sept.) Russian troops crossed the Rumanian-Bulgarian frontier and occupied Rustchuk, Silistria, and the Black Sea port of Varna. Then at length Bulgaria declared war on Germany and accepted Tolbukhin's demands that Ger. soldiers in Bulgaria be handed over as prisoners together with all Ger. ships in Bulgarian ports. These developments left the Red Army forces free to continue their advance through N. Transylvania, for although Rumania was out of the war the Germans were by no means out of Rumania. There was now in progress a double Russian offensive in Yugoslavia, S. and N. of Petrovgrad, in co-ordination with Tito's operations, which augured well for the early liberation of Belgrade (5 Oct.). On the same day Brit. and other allied forces landed on the Gk mainland and captured Patras and, soon after, Corinth.

Late in Oct. 1944 Cherniakovsky broke through long-prepared defences into E. Prussia for some 20 m. on an 85-m. F., his offensive extending many m. N. and S. of the Kaunas-Insterburg-Königsberg railway. But thereafter the offensive was stopped by repeated Ger. counter-attacks, made regardless of heavy casualties. Meanwhile, at the end of Oct. 3 groups of Russian armies were advancing in the general direction of Budapest. Cluj, the cap. of Transylvania, was taken by Malinovsky on 11 Oct. Towards the last days of Nov. Tolbukhin's army crossed the Danube N. of the Drava and broke through on the W. bank of the Danube on a 90-m. F. to a depth of 25 m. After this followed a month of very obstinate resistance to the Russian invasion of Hungary, but, at the beginning of Dec., the Russians pierced the Ger. line in S. Hungary guarding the way to Lake Balaton and the road up the W. side of the Danube to Budapest. This drive by Tolbukhin from the S. was co-ordinated with the other drives on Budapest from the E. and NE. Tolbukhin was now advancing northward up the Danube valley. Meanwhile Malinovsky had gained control of the SE. shores of Lake Balaton. It was a considerable achievement to cross the Danube (which at this point is a m. wide) by means of pontoon bridges brought up under cover of darkness almost entirely by hand. By Christmas the main forces of the combined armies of the 2 Russian marshals were investing Budapest, their advanced elements entering the outskirts from the W.

and NW. But still the city did not fall.

German occupation of Greece ended.—*Civil War in Greece.*—In Greece rival resistance groups were fighting one another in the winter of 1943-4. The resistance groups were persuaded to cease fighting in Feb. 1944, and in Sept. all placed themselves under the orders of Ger. Scobie, who had been nominated G.O.C. in Greece. The Germans evicted Greece in Sept., their position being hopeless in face of the Russian advance in the Balkans; and when Brit. and Gk regular forces landed early in Oct. they encountered only rearguards. Fighting soon broke out again between pro-Communist and anti-Communist Gk resistance groups, in which Brit. troops became involved, being for a time hard-pressed. But as the days passed Brit. reinforcements arrived from the It. front. Street by street Athens was cleared of Communist rebels. (See further GREECE—History.)

Stalin launches his general offensive in South Poland, Upper Silesia, and East Prussia.—By mid-Jan. Stalin was satisfied that he could maintain the momentum of an offensive which should have as its immediate objectives the capture of industrial Silesia and the over-running of all W. Poland and E. Prussia, and also the invasion of Brandenburg and Pomerania, with remote objectives in Stettin and Berlin, and the destruction of the whole Wehrmacht. The defeat of von Rundstedt by Montgomery and Bradley in the W. prevented the 6th Armoured Div. from being turned E. for the defence of the E. F., while the diversion of the floating Ger. armoured reserves to Budapest and Latvia, instead of monacing the S. and N. flanks of the projected Russian offensive, merely resulted in a fatal dissipation of Ger. reserves and in the locking-up of their armies of E. Prussia and the Baltic, while effecting nothing in the attempted relief of Budapest. At the start of the Russian offensive, the Germans disposed about 150 divs., of which no fewer than 50 were in the Baltic States and on the Danube. The Russians in the first 2 or 3 weeks of their amazing attack advanced at twice the rate of their advance in the summer, or a total average distance of over 200 m., and in that short space of time they had overrun a large part of Upper Silesia, swept through the whole of W. Poland, and isolated E. Prussia. The great offensive was opened by Marshal Konev's 1st Ukrainian front from the Sandomierz-Baranov bridgehead on the Upper Vistula—a bridgehead he had held since Aug. The Ger. prepared positions were so completely overwhelmed that in 2 days the Russians broke through to a depth of 25 m. Before Konev's army now lay the open plain of S. Poland, terrain well-suited to the movement of armoured and mechanised forces. Beyond this plain lay the road to the Ger. border.

On 14 Jan. Zhukov's 1st White Russian army assumed the offensive on 2 fronts on the W. bank of the Vistula S. of Warsaw from the Pulawy-Warka

sector with massive artillery support, and soon broke through the enemy's powerful deeply-staggered defences. In 3 days the 2 fronts linked up and advanced 37 m., having extended the breach in the Ger. lines over a front of 74 m. while over-running the strongly-fortified Ger. defence points of Warka, Grojec, Solec, Zwolen, and Jedlinsk, and occupying more than 1300 other tns and vils. Soon afterwards Zhukov's troops carried by storm the important industrial and communication centre of Radom, 60 m. S. of Warsaw, and a strong bastion in the enemy's defence system. This immensely powerful blow was skilfully co-ordinated with Konev's attacks to the S., so that the 2 most formidable Russian army groups were now striking W. along a massive F. of 120 m. on the shortest road into Germany. Almost simultaneously with the opening of Zhukov's attack, Rokossovsky began an attack NW. of Warsaw, carrying by storm the bastion of Przasnysz and the in and fortress of Modlin.

Warsaw fell at this time to Zhukov, and the road to Lodz lay open to the Russians. Meanwhile Konev had taken Piotrkow, an important stronghold in the direction of Lodz. Two days later Konev, advancing W. of Czeszochowa, broke through strongly-fortified defences on the SE. border of Germany and advanced into Ger. Silesia on a 60-m. front, capturing Kreuzburg, Rosenberg, Guttenberg, Landsberg, and Pitschen—all powerful strong-points in the defences covering the roads to Breslau. At this date yet another offensive was in progress, this being the advance of the 3rd White Russian front under the Jewish gen. Cherniakovsky, who carried by assault Tilsit, the largest tn in the N. frontier zone of E. Prussia, and Gumbinnen, the important junction and stronghold in the enemy's defences in the Königsberg direction. Rokossovsky, co-operating with this army, had now crossed the E. Prussian border in the S., and captured Tannenberg.

By 20 Jan. Zhukov's group of armies, which included the greatest accumulation of armour ever seen on the E. F., had passed more than 100 m. from Warsaw and stood over half-way to Poznan, the last of the historic cities of Poland still held by the enemy. Powerful blows by tanks and infantry overwhelmed the garrisons on the way to Torun (Thorn) and Bydgoszcz (Bromberg), tns of Posen prov. Lodz fell at the same time, and so swift was Zhukov's advance that the city was taken intact with all its great textile factories. Cracow, too, which fell to Konev at this time (22-3 Jan.), also escaped Ger. demolition. Large gains of terr. were made on 22 Jan. by the Russians in their double advance into E. Prussia from the S. and E. By the capture of Allenstein (Olsztyn) Rokossovsky had reached the heart of the prov. while Cherniakovsky, advancing from the E., captured Insterburg. By the capture of Allenstein the Russians cut the main railway from Berlin to the Baltic States. At the same time the Russians also took Osterode, 22 m. SW. of Allenstein, and

Deutsch Eylau, powerful Ger. strongholds. Yet a 5th Russian army group, that under Gen. Petrov, was now advancing along the N. slopes of the Carpathians and Tatra Mts in Slovakia, with the intention of securing the Carpathian passes and reaching the E. approaches of the Moravian gap along the N. slopes of the Beskids.

Konev reached the Oder on 23 Jan. on a 40-m. front in the area of Breslau. On the same day Zhukov captured Bydgoszcz by a combined frontal and encircling move. Large Ger. forces had taken up positions to challenge the Russian advance SE. of Poznan, but Zhukov bypassed them, leaving them to be forced into the salient between his and Konev's fronts. Nothing could stay the Russian offensive. On the 24th Konev seized Oppeln, the cap. of Upper Silesia, and advanced to within 5 m. of Breslau on the SE. Simultaneously other forces of Konev cut the railway from Breslau to the N. by taking Rawicz and Trachenberg. Gradually it was being revealed that the Red Army's triumphs were due not so much to superiority in numbers or to the Ger. blunder in reducing their armour to a dangerously low level as to the advantage the Russians enjoyed in having a better equipped and swifter moving fighting force, commanded by gens. of greater ability than the Wehrmacht. On front after front the Germans were out-generalled, out-maneuvred, and out-fought.

Rokossovsky reaches the Gulf of Danzig. —Zhukov invades Pomerania and Brandenburg.—Fall of Budapest, Danzig, and Königsberg.—In a few sectors Ger. resistance stiffened, notably in the region S. of Elbing and to the E. of Königsberg; but the Ger. divs. were fighting separately without plan; while in some resistance was stubborn, in others submission was prompt. On 26 Jan. Rokossovsky's forces captured the E. Prussian tns of Marienburg and Mühlhausen and reached the Gulf of Danzig, thus cutting off the E. Prussian garrison from central Germany. At the same time the other invading army, under Cherniakovsky, seized Allenburg, Tapiau, Lötzen—strongholds in the Ger. defence zone constructed over a long period and covering the approaches to the central dists. of the prov. In the Breslau area on the same day the Red Army crossed the Oder at sev. places, while Zhukov's armoured forces were now only 100 m. from Berlin. This stupendous offensive had thus carried the Red Army in some places more than 250 m. from their starting points on 12 Jan. There was no hope of a planned withdrawal by the Germans; yet they had been well aware that the offensive was coming, and, for sev. months, they had strengthened the fortifications along the entire Vistula line and all over E. Prussia.

Zhukov's forces broke into Ger. Pomerania on 29 Jan., while Cherniakovsky advanced to within 2 m. of Königsberg. One consequence of the smashing of the stronghold of E. Prussia was the fall of Memel, the garrison of

which was being supplied along the Kurland Spit. The linking up of Rokossovsky's forces and those of Zhukov in the Bydgoszcz area led to an immediate improvement in their positions in relation to the Danzig-Berlin railway. Zhukov's troops on the banks of the Obra, in the prov. of Poznan, decisively cracked the Obra defence line, forced the riv. and then advanced rapidly along the Netze valley and across Brandenburg. They burst through the Netze-Draga lines on 31 Jan., carrying the Red Army across the Danzig-Berlin autobahn and the main railways connecting the 2 cities. Despite ferocious Ger. resistance in Pomerania, the main Russian forces bit deeply into the fortified zone extending from Schneidemühl along the R. Netze to Kreuz, frost aiding the offensive. Zhukov's central army group, striking along the shortest route to Berlin, was now about 30 m. deep into E. Brandenburg and 24 m. from the Oder, the last great water-barrier before the Reich cap. Torun on the Vistula and an important rail junction linking Berlin, Insterburg, Warsaw, and Danzig, which had been surrounded for some time, was taken by Rokossovsky on 1 Feb. On the same date Schneidemühl (90 m. E. of Stettin) was encircled. By establishing themselves at Heidekrug on the Frisches Haff the Russians had now completed the envelopment of Königsberg from the N.

Zhukov was now taking the risk of developing a straight break through the centre and on 1 Feb. he came down from Landsberg to within artillery range of Küstrin, the fortress city at the confluence of the Warta and the Oder, while a parallel column moving from Schwiebus made for Reppen, the last railway station before Frankfurt. On the same day the first big mass of Ger. reserves comprising also Volksturm (Home Guard) was hurled across the path of Zhukov; but the Germans were beaten out of the field in tank actions. Over the entire area E. of a line drawn S. of Stettin along the Oder bank Ger. supply channels were now in great confusion. They were crammed with refugees, columns of army transports, and masses of troops whose orders for battle were sometimes changed in a few hrs as new road and railway junctions fell. Meanwhile Berlin was preparing itself for grim defence and a system of trenches was being dug around the cap. and strong-points prepared in the outskirts. A rapid thaw at the beginning of Feb. impeded Zhukov's attempts to force the passage of the Oder, though by capturing Sonnenburg he was only 5 m. E. of Küstrin. But Konev crossed the Oder SE. of Breslau and in 3 days' fighting extended his bridge-head along a 50-m. front while advancing 12 m.

By the capture on 11 Feb. of Liegnitz, one of the largest tns in Silesia, Steinau, Lüben and other tns, the Russians cut the Breslau-Berlin railway, besides almost surrounding Breslau. This advance of nearly 40 m. carried Konev's armies across the Oder in great strength, besides widening their breach to 100 m. At the same time troops under Rokossovsky

captured Elbing, the second city of E. Prussia; while Cherniakovsky's forces took Preussisch Eylau besides breaking up the strong Ger. defence zone based on that tn and on Kreutzburg and Landsberg. Meanwhile on 12 Feb. Petrov, advancing over the broken and forest-covered country of the Carpathians, stormed the tn of Bielsko, an important bastion in the Ger. defences covering the approaches to Moravska-Ostrava, the N. entrance to the famous Morava Gap. Hunszlau on the Bober fell to Konev on the same date, thus taking his forces to within 75 m. of Dresden.

basin. The same day Zhukov's troops stormed the long-encircled tn and fortress of Schneidemühl, a powerful support-point in the Ger. defences in E. Pomerania.

Russian infantry was moving up in force to the fortified water barrier of the Neisse protecting Saxony and S. Brandenburg, while armoured units had reached the r. b. of the riv. The Germans launched strong counter-attacks between Landsberg and Stargard against Zhukov's armies in Pomerania, but suffered heavy losses. The purpose of these attacks was to try to halt the Red Army's converging movement towards Stettin and the Baltic.

RED ARMY CAVALRY CROSSING A RIVER IN HUNGARY

Soviet Weekly

Budapest fell at last on 13 Feb. after 6 weeks of the most bitter fighting. The fall of the great city was the culmination of a campaign of which the strategic value was obvious. The vast turning movement which brought the Red Army through Rumania and up the Danube valley created a situation in which the Russians were able to sweep across Poland with decisive superiority in armour; for there came inevitably a moment when Malinovsky seemed to be on the point of an advance through the Morava gap and it was then that the Germans felt compelled to transfer a tank army from S. Poland to Budapest. In fact the Red Army's strategists had given the Germans no option, and to describe the Ger. decision as mistaken is to withhold from the Russian strategists the credit due to their enterprise.

Having now shattered the Ger. line of defence on the Bober, Konev's forces on 14 Feb. captured sev. more Silesian tns, including Neusalz, 75 m. down the Oder from Berlin. Konev's armies now held 150 m. of the upper Silesian industrial

Cherniakovsky's troops were advancing along the Bydgoszcz road to Danzig. On the same day (18 Feb.), however, Cherniakovsky was killed. The outline of Zhukov's great salient in the centre of the E. F. remained more or less unchanged for some weeks. Meanwhile the main Russian effort was directed towards Stettin, Danzig, and the Baltic coast generally, in face of bitter Ger. resistance.

On 4 Mar. Russian forces, in a spectacular advance of over 60 m., reached the Baltic at 2 places in Pomerania. Zhukov's troops reached the area of Kolberg, while 30 m. to the NE. Rokossovsky's men reached the coast from Küslin, thereby cutting the Stettin-Danzig road and railway and threatening to isolate both Danzig and the Polish port of Gdynia from the rest of Germany. Next day the main weight of Zhukov's armies, having turned westwards towards the lower Oder, captured Stargard, together with Naugard and Polzin, all powerful strongholds and centres of communication in the direction of Stettin. After very stubborn fighting the strongly-defended tn of Küstrin on the

E. bank of the Oder fell to Zhukov. This was the prin. Ger. strongpoint cramping the Red Army's communications (11 Mar.). Russian forces advancing across the Polish corridor from Pomerania reached Danzig Bay and captured Tczew and Neustadt, outposts of Danzig. Fighting their way along the Frisches Haff to Heide-Waldburg the Russians, on 15 Mar., split the Ger. E. Prussian army group in two.

The main weight of the Russian offensive was now directed to the flanks of the E. F., the immediate objectives on the N. flank being the Baltic ports of Gdynia and Danzig and the city and fortress of Königsberg; on the S., Bratislava and Vienna. On the 27th Rokossovsky's troops occupied a dozen suburbs of Danzig and broke into the centre of the city, besides breaking into the tn of Gdynia. The latter was carried by assault on the next day, thus giving the Russians an important naval base and large port on the Baltic. At the end of the month the Russians completed the capture of Danzig.

Vassilievski's troops completed the capture of the heavily-fortified city and fortress of Königsberg on 9 April. Thus went the most important stronghold in the Ger. defences of E. Prussia. Its capture by the Russians meant that, with the exception of small Ger. groups, the Baltic shore was now entirely cleared, from the Ger. pocket in Courland to the mouth of the Oder opposite Stettin.

Capture of Bratislava and Vienna.—*The Battle for Berlin.*—*Capture of Stettin and Moravská Ostrava.*—In the S. the Germans had staged a tremendous effort to win back ground E. of Lake Balaton, in the vain hope of re-taking Budapest or, at least, safeguarding Vienna, with the view, possibly, of building up an 'impregnable' fortress in the S. of Europe from Munich to Hungary and southward to the It. Alps. But, on 18 Mar., the Russians had struck back in the direction of the Bratislava Gap and Vienna. In a week Tolbukhin's forces were only 30 m. from the Austrian border, as well as driving along the N. shores of Lake Balaton on the way to Slovenia. Tolbukhin crossed the Austrian frontier 50 m. S. of Vienna on 30 Mar., while Malinovsky forced the rivs. Hron and Nitra and took a number of strongholds in the defences in front of Bratislava. Wiener Neustadt, railway junction and engineering tn 22 m. S. of Vienna, was occupied by Tolbukhin on 3 April, together with Eisenstadt, cap. of Burgenland. Bratislava, cap. of Slovakia, was carried by assault by Malinovsky's troops on 4 April and its elimination left him free to advance on Vienna from the E. while Tolbukhin was coming up from the S.

By 5 April the Russians were at the gates of Vienna and had cut the Vienna-Linz highway. Very soon Vienna was almost encircled, for Malinovsky was swiftly advancing along the N. bank of the Danube. On the night of the 6th Tolbukhin's forces fought their way into Vienna after the city had been under shell-

fire for sev. hrs. Tolbukhin's troops, in co-operation with Malinovsky's, after stubborn fighting in a built-up area W. of the Danube, captured all Vienna. The Red Army's tactics saved most of Vienna's celebrated buildings from serious harm. But after the Russians had liberated the city Ger. thermite shells set many famous buildings ablaze. Exploiting their capture of Vienna, Tolbukhin's forces rapidly advanced up the Danube valley, while Malinovsky pushed on between the Morava and the Vienna-Brno highway, the Germans being hustled back across Lower Austria towards Moravia.

Ger. forces in E. Prussia were now (18 April) confined to a 6-m. peninsula enclosing the Frisches Haff and to small parts of the cape between Fischhausen and Königsberg, both areas being packed with men and equipment including what had been evacuated from Danzig and Gdynia.

The Battle for Berlin.—Zhukov began the battle for Berlin. The building up of the striking-force had been in preparation for 2 months; but it was not until Himmler's Pomeranian group of armies had been destroyed, and Danzig captured, that his plans reached their maturity. Reconnaissance activity between 15-17 April increased on the 18th to full-scale battle for the estab. of bridgeheads over the Oder and Neisse. Muskau and Weisswasser, 80 m. SE. of Berlin, were captured by Konev. By the 20th the Red Army was ranged in an arc about 25 m. from Berlin. Two days later Zhukov's and Konev's troops had captured many suburbs of Berlin in advances from sev. directions. From ENE. and N. the armies of Zhukov, and from the S. those of Konev, were inexorably closing all round the doomed Reich cap. During the 22nd over a dozen suburbs were taken. Zhukov had brought a huge force of armour, accompanied by veteran assault troops who had fought at Stalingrad. These were now moving on the E. and NE. periphery of Berlin and in the teeth of fanatically desperate resistance were challenging the Ger. artillery. 'Stormovik' dive-bombers, operating by day and night, were sweeping the Ger. lines from low altitudes and thwarting counter-attacks. The city's military defence was placed under the command of Lieut.-Gen. Heymann, though later it was asserted that Hitler was directing the defence in person. Zhukov's forces, after passing to the offensive from their bridgeheads on the W. bank of the Oder, broke through strongly fortified and deeply staggered Ger. defences covering Berlin from the E. and in less than a week had advanced from 40 to 62 m. During this time they captured the tns of Frankfurt, Wandlitz, Oranienburg, Birkenwerder, Pankow, Friedrichsfelde, Karlshorst, Köpenick, Genningsdorf—all at distances ranging from 15 to 4 m. from the centre. Konev had broken into the city from the S. also through deeply echeloned defences, on the Neisse, and had advanced from 50 to 95 m., occupying the important tn of Cottbus and also Lüben, Zossen, Luckenwalde, Teltow

and others. At the same time in the direction of Dresden other forces of Marshal Konev had reached the Elbe.

When, on 25 April, the armies of Zhukov and Konev joined hands, NW. of Potsdam, Berlin was surrounded and all roads leading westward from the cap. were cut. The Red Army was now striking relentlessly towards the centre of Berlin from N., E. and S. The fighting was bitter in the extreme, each side employing a great amount of artillery, probably greater than was ever gathered together in any battle for a city. The Germans were using all types of artillery for street fighting and the Luftwaffe was now chiefly in battles over the city in and around the huge column of smoke that was rising from its heart. On 27 April the Russians took the suburbs of Spandau, Potsdam, and Rathenau and, in the cap. itself, the industrial dist. of Neukölln, besides the vital airport of Tempelhof. Under the terrific concentration of fire what remained of Berlin after the allied air raids now suffered tremendous damage. Familiar architectural features were fast disappearing in piles of rubble through which the Russians cleared narrow lines for their infantry. At the end of the 8th day (29 April) of the battle in the streets of the cap. the Red Army had ringed the inner area and hacked its way through almost to the edge of the Tiergarten. On 30 April Zhukov's troops hoisted the banner of victory on the Reichstag building. Berlin had become a city of cellar- or cave-dwellers. In the centre fanatics continued their futile resistance—remnants of the Ninth Army, members of the Schutzstaffel, Hitler's personal guards—sev. divs. strong and lacking nothing in ammunition and weapons. On 1 May the Red Army, hoping to be able to celebrate the day with the full capture of Berlin, turned every gun and mortar they could muster on to the small area into which the Germans had now been compressed. The important dists. of Charlottenburg and Schoenberg were cleared the same day. In the midst of this conflict it was announced on the Ger. wireless that Hitler had fallen at his post in the Reich chancellery fighting to his last breath against Bolshevism (1 May) and also that Adm. Dönitz (q.v.) was his successor. It was at this very moment that Himmler (q.v.) had offered immediate unconditional surrender to America and Britain. Dönitz, however, said that he would continue the struggle 'to save the German people from destruction by the Bolsheviks'.

Meanwhile other Russian armies were continuing their rapid advance westward. NW. of Dresden Konev's forces crossed the Elbe on 25 April and, the same day, Vassilievski's troops at last captured Pillau, large port and naval base on the Baltic. Next day Rokossovsky, after new crossings of the Oder, captured Stettin, the Pomerian cap., together with many other smaller tns. Prenzlau, 30 m. SW. of Stettin, fell to Rokossovsky the following day.

It had for some time been obvious that

the W. and Russian Allies would soon meet in Germany. The actual joining hands took place on 27 April on the Elbe in the area of Torgau, NE. of Leipzig, and the significance of the junction was that Germany had now been cut in two. In the 4 months since the opening in Jan. of the final Russian offensive the Germans lost on the E. F. more than 800,000 officers and men prisoners and about 1,000,000 killed.

Berlin Surrendered.—Fall of Pilsen and Surrender of Breslau and Dresden.—German Capitulation on the Eastern Front.—Liberation of Prague.—The garrison of Berlin surrendered on 2 May. Over 100,000 prisoners were taken on that and the next day. Destruction of the encircled Ger. groups SE. of the city was completed the same day. Hitler, it was stated by the Germans, had fallen among the defenders, though later evidence suggested that he had committed suicide. The battles for Berlin had lasted for 14 days and the capture of the city, synchronising with the vast surrenders to Field-Marshal Alexander and Montgomery (see ITALIAN FRONT; WESTERN FRONT), heralded the virtual end of the war in Europe.

But there still remained a number of pockets of resistance, including the Bohemian fortress. Gen. Eremenko, advancing along the E. approaches, took the strong bastion of Teschen on 3 May. As late as 6 May the Germans were still putting up stiff resistance in Moravia to the Russian forces of Gen. Eremenko and Marshal Malinovsky. The general advance towards the important tn and bastion of Olomouc, however, was in full swing. In the N., Rokossovsky took the is. of Rügen. Elsewhere on the E. F. the operations were marked by the Ger. Army's desperate attempts to disengage in their eagerness to surrender to the Brit. and Amer. forces. Allied divs. were fast approaching Prague. Gen. Patton approaching from the SW. near Pilsen and the Russians from the E., but over a hundred miles away. Patton's tanks entered Pilsen on 6 May. There was a citizens' revolt in Prague, and the Czech National Committee issued broadcast appeals for speedy allied help against some 300 tanks which the Germans were believed to have at their command. Breslau surrendered to Konev on 7 May. The city had sustained a siege of 82 days. Dresden fell on the following day, being the last tn of any major importance then still held by Ger. forces. On the same day Eremenko captured Olomouc on the Morava. But apart from fighting in a few isolated little pockets, notably in Czechoslovakia, where Patton's forces were marching to join up with the Russians, the end had come on the E. as on the W. Front. The end of Ger. resistance came on 9 May with the final act of surrender to the Allies. (See WESTERN FRONT IN SECOND WORLD WAR.) This was a repetition of Gen. Jodi's surrender at Rheims to Gen. Eisenhower on 7 May, but was now made to all the Allies, including Russia. This act of

surrender was signed in Berlin by Field-Marshal Kettel, Adm. Friedeburg, and Air Col. Gen. Stumpf, and it was an unconditional surrender of all Ger. armed forces on land, at sea, and in the air to the Supreme Commander, Allied Expeditionary Force, represented by Air Chief Marshal Tedder, Deputy Supreme Commander of that force, and simultaneously to the Supreme High Command of the Red Army, represented by Marshal Zhukov, Gen. Spaatz of the U.S. Air Forces and Gen. de Lattre de Tassigny of the Fr. First Army signed as witnesses.

Russian tanks under Gens. Izybalko and Lelushenko turned from Berlin in a swift rush southward on 3 May. They crossed the Dresden-Leipzig highway W. of the Elbe, and broke into Bohemia in an operation of great audacity, the tanks entering Prague from the NW. in less than 6 days from their start, a distance of 150 m. Konev arrived in the city on 11 May. Patton was prevented from entering Prague in order to allow the Russians the credit for liberation. But he could have entered 3 days before the Russians, and saved many Czech lives, apart from retaining Czechoslovakia within the W. sphere of influence.

In fighting on the scale of that which took place on the E. F., 1941-5, casualties on both sides were bound to be enormous. Accurate casualty figures have never been agreed, but the military dead alone on each side ran into sev. million. The campaign was remarkable for the immense destruction wreaked upon the civilian pop. Some authorities have estimated that between 7 and 10 million Russian civilians d. during the campaign, and the material destruction was also vast. The Ger. occupation of Russian ter. occasioned some of the worst atrocities of the war; but it is also true that Russian troops committed excesses when they occupied not merely Germany but even areas basically friendly to them. Ten years after the war ended the Russians were still holding sev. thousand Ger. prisoners, though repatriation of some 9000 Germans, allegedly held for war crimes, was begun after Adenauer's visit to Moscow in 1955.

The final and overwhelming Russian victory was fundamentally determined by numerical superiority in both men and equipment. To this must be added the strategical skill of Russian generals such as Zhukov, Konev, and Cherniakovsky, the enthusiasm and self-sacrifice of the masses, both behind the front line and behind the enemy lines, and the co-operation of Russia's allies, both in sending direct material help, and in diverting a vital part of Germany's military strength away from the E. F. by their own offensives in the W.

The destruction of the Ger. armies on the E. F. was total: the retreat of autumn 1944 had become a rout by 1945. But the earlier stages of the campaign had been marked by some brilliant Ger. strategical successes, and until the end of 1944 the Germans fought with determination and bravery. Sev. of their worst

defeats prior to 1945 were the result of the military command being overridden by orders from Hitler based on purely propaganda considerations.

After the war it was obvious that Russia had used her military occupation of E. Europe, undertaken initially to bring about the total Ger. defeat, to establish Communist or near-Communist regimes in the countries concerned. Britain had wished the W. forces to anticipate the Russian occupation of much of this ter.—but in this she was overruled by the United States.

Eastern Orthodox Church, sometimes inaccurately called the Gk Church, as identified with the Gk-speaking half of the Rom. empire, embraces far more non-Greeks than Greeks, and worships not only in Greek but also in Slavonic and many other languages, the liturgy being often used in the vernacular. Among refugees of mixed origin, a combination of languages is even used at times. Historically the E. O. C. is the anct Church of the E. separated from the Lat. W. in 1054 (see CHURCH HISTORY; CERULARIUS; FILIOQUE). There had been schisms before (see PHOTIUS), but this was embittered and hardened by the Crusades (q.v.) and especially by the sack of Constantinople, 1204. Doctrinal agreement was for a while reached at the Council of Ferrara-Florence, 1438-41, but the resentment of the E. laity nullified it. Since then doctrinal and papal developments in the W. have widened the gap, as also the secession of the small group of Uniate (q.v.) Churches from Constantinople to Rome.

The constitution of the Eastern Orthodox Church, like that of the Anglican Communion (see ANGLICANISM), is a federation of self-governing (autocephalous) Churches, the principle being that each nation should have its own Church, with its own customs and complete freedom and equality within the Orthodox family, self-administering and using in worship the language of its choice. The Ecumenical Patriarch of Constantinople has a primacy of honour but no right to interfere with the autocephalous Churches except at their invitation. Each Church is divided into dioceses, and these into the

equivalent of deaneries and pars. The laity are prominent in the life and gov. of the Church. Teaching and preaching are permitted to laymen, and there have always been great lay theologians in the E. O. C. Parochial councils, diocesan conferences, and national synods are active in the Church, and have often been suppressed by despotic govts. as dangerously democratic, e.g. in Russia, 1681-1917. There are 9 great patriarchates, of which Constantinople, Alexandria, Antioch, and Jerusalem are the ant and original 4; to these have been added Moscow, Georgia, Serbia, Rumania, and Bulgaria. Apart from these there are the autocephalous Churches of Greece (under the Archbishop of Athens), Cyprus, Albania, Poland, and Czechoslovakia, with the autonomous monastery of Sinai. After the Russian revolution, refugees carried the E. O. C. to all parts of the world, and these branches are run by bishops and exarchs under the Patriarch of Moscow or Constantinople. Most pars. have married priests, or archpriests (rectors). A priest must marry before ordination, or remain celibate as a monk-priest (*hieromonach*). A priest whose wife dies may not marry again. Bishops are chosen from the celibate or widower priests.

The spiritual life of the Eastern Orthodox Church, while centred on the Liturgy, is intensely mystical. Monasteries are numerous (as are convents) and ruled by *hegumenoi* (priors) or archimandrites (abbots). The rule is always based on that of St Basil (see THEODORE OF THE STUDIUM). Many monks become hermits at a certain stage of spiritual progress. Bible-reading, meditation, and devotional reading (especially of St John Chrysostom, and of the *Philokalia*, an anthology of the E. Fathers on the mystical life) are common among the laity. Many live under the spiritual direction of a priest or layman known for his experience in prayer, and called in Russia a *Staretz*. Pilgrimage, especially to Palestine, is greatly prized, and pilgrims have an honoured status. Among methods of mental prayer, the Jesus prayer is most famous, viz. the inward repetition of the prayer, 'Lord Jesus Christ, Son of the living God, have mercy on me a sinner,' combined with rhythmic breathing, until it becomes a continuous activity as counselled by St Paul ('prayer without ceasing'). The *Kombolion*, a chaplet of beads or knots, from which the W. and the Moslem rosary (q.v.) are derived, is used by monks only. It is not subdivided into decades, a petition like the Jesus prayer, accompanied by deep reverences, being repeated continuously with it.

The doctrine, liturgy, and ceremonies of the Eastern Orthodox Church differ markedly from those of the W. The only creed recognised is the Nicene Creed, without the addition of the Filioque (q.v.). The decisions of the 7 great Ecumenical Councils (q.v.) are accepted, but only because of their subsequent approval by the Holy Spirit, shown in the unanimous consent of the Orthodox

Church. The E. O. C. entirely rejects the W.'s attempt to localise authority in the Bible or in this or that eccl. institution. For her the one authority is that of the Holy Spirit, working through the whole body of believers. The way of safety and sure truth is to preserve organic unity with the saints of the past, who lived, and still live, in the unity of the Spirit. The Apostolic Succession of the Hierarchy enables the faithful to attain this end. The invocation of saints and the veneration of their icons (q.v.) is an expression of the same idea. Statues, or carvings in the round, are not permitted in the E. (see ICONOCLASTS). Chief among the saints is the Blessed Virgin Mary (q.v.), the God-bearer, and spiritual mother of all the brethren of Christ. She is believed to have been without personal sin and, after dying naturally, not to have seen corruption, but to have been raised to heaven in her glorified body. The Orthodox do not believe, however, that she was exempt from original sin by an immaculate conception (q.v.). In the threefold ministry of bishops, priests and deacons, the latter is a permanent office of great liturgical importance. The name of Sacrament is not limited to the great 7. Baptism (q.v.) is administered, even to infants, by threefold total immersion, followed immediately by Confirmation (by a priest, with oil blessed by a bishop), and by Holy Communion. Holy Communion (see EUCHARIST) is always in 2 kinds, commingled in the chalice and given by a spoon to the laity. Infants and young children always communicate, being innocent, adults seldom more than 4 times a year, and in Lent instead of at Easter, when the length of the Liturgy and the crowded churches make it impracticable. The bread of the Eucharist is always leavened (see AZYMITES), specially baked in small loaves, imprinted with a particular design. Fasting before Communion is the rule, which the faithful however freely modify as their circumstances demand. The same is true of the Lenten fast, which strictly is of extreme rigour. The Holy Sacrament is reserved on the altar for the sick, but there is no genuflexion before it, nor any extra-liturgical cultus. Confession is not frequent, and made standing beside the priest, who gives a comprecatory absolution ('May God . . . through me, a sinner, pardon thee . . .'), except among the Russians, who in the 17th cent., under Lat. influence, introduced a declaratory form ('I . . . absolve thee'). A penance is not necessary and is seldom given, unless as a spiritual help. The penitent, before going to confession, usually visits relatives and friends to ask their pardon formally. Marriage, called the 'Crowning' as the couple are crowned in the rite, ideally may not be repeated even after the death of a spouse, much less after divorce. Nevertheless, the E. O. C. does bless second marriages in both cases, though with a penitential note in the form used. Unction is given not only in *extremis*, as in the Rom. Catholic Church, but for spiritual and bodily infirmities, even where the

sufferer is not bed-ridden or in danger of death. Holy orders are imparted by the laying on of hands by bishops, but great stress is laid also on the unanimous consent of the assembled congregation. At worship, except for the sick or old, the Orthodox stand, according to the ancient custom prescribed at Nicaea and preserved in the ancient Rom. basilicas. Individuals, however, kneel when their devotion leads them so to do. The Liturgy (q.v.) is always solemnly and chorally celebrated (without instrumental music) and is long (from 1 to 2 hrs.). One of 3 forms of rite is used, according to the day or season; the Liturgy of St Chrysostom generally throughout the year, that of St Basil on certain feasts, and that of the Presanctified in Lent. A 4th (of St James) is occasionally used. Prayers and requiems are offered for the dead, but the E. O. C. does not believe in a Purgatory of pain as the Rom. Catholic Church does. It believes that the departed share in some degree the glory of the saints, and reach a higher perfection by God's grace with the assistance of prayer on earth. Prayers are also offered for the increase of the saints in glory, and, like them, the departed may be asked for their prayers. The old Julian Kalendar is followed, and as this is now some 13 days behind the Gregorian, the Orthodox Christmas (q.v.) now almost coincides with the W.'s Epiphany. Easter (q.v.) is the principal feast. The Liturgy is celebrated at midnight, after which the kiss of peace is exchanged with the greeting 'Christ is risen,' and the reply 'He is risen indeed.' The Liturgy is never celebrated more than once a day on any one altar. The Orthodox Breviary contains the same series of Offices as that of the W. (see also CANONISATION).

Missions.—The E. O. C. has often been accused of lack of missionary zeal and enterprise. The truth is that after the 8th cent. Muslim domination prevented any such activity (even within Orthodox ter.), except for the Church of Russia, and she did immense work among the 20 million non-Christians of Siberia, Turkestan, and the Caucasus, and further in Japan, China, Korea, and Alaska. This, however, passed unnoticed in the W. Since the revolution, the Russian Church has borne the brunt of the struggle with atheistic Communism. For religion under the Soviet regime, see RUSSIA. Among emigrants and refugees the E. O. C. does a great pastoral work, but it has never been her practice to proselytise among other Christians, though (like the Rom. Catholic Church) she claims to be uniquely and exclusively the one true Church of Christ, and does not recognise other Christian bodies as belonging to it. Yet, in spite of this exclusive claim, she has responded to the approaches of other Christians anxious for Christian unity. Her relations with the Anglican Church have long been intimate and friendly, and she has shared fully in the Ecumenical Movement (q.v.).

While W. Christendom suffered some disintegration at the Reformation, this

made little impact on the E. O. C., in spite of the efforts of Melancthon and others (see LUCARIS), until the 19th cent. when the Baptists made many converts in Russia. However, the E. O. C. has suffered much from schisms in the past, the most important of the dissident oriental Churches being the Monophysite, Armenian, Coptic (Egyptian), Jacobite (Syrian), and Abyssinian (Ethiopian) Churches, and the Nestorian Churches (see MONOPHYTISM; ARMENIAN CHURCH; COPTS; JACOBITES; ABYSSINIAN (ETHIOPIAN) CHURCH; NESTORIAN CHURCHES; also UNIAE; MARONITE; MELCHITE). For the Old Believers, see RASKOLNIKI; see also HESYCHASTS; VESTMENTS, ORIENTAL ECCLESIASTICAL. See E. L. Langford-James, *Dictionary of the Eastern Orthodox Church* 1923; B. J. Kidd, *The Churches of Eastern Christendom*, 1927; M. Constantinides, *The Greek Orthodox Church*, 1931; S. Bulgakov, *The Orthodox Church*, 1935; F. Gavin, *Some Aspects of Greek Orthodox Thought*, 1936; R. M. French, *The Way of a Pilgrim*, 1941, *The Eastern Orthodox Church*, 1951; N. Zernov, *The Church of the Eastern Christians*, 1942; S. Khomiakov, *The Church is One*, trans. N. Zernov, 1948; *Proceedings of the Conference of Heads of the Autocephalous Orthodox Churches, Moscow, 1948*, trans. O. F. Clarke, Paris, 1951.

Eastern Question. The, an expression which derived its origin from the problems connected with the existence of a portion of the Ottoman Empire in Europe. The main aspects of the problem were the struggles of the Christian populations in Turkey to regain their lands and rights and the efforts of Russia to obtain free entry into the Mediterranean Sea through Turkish ter. Connected with the latter aspect was the attitude of other European Powers, who had no desire to see Russia gain a strategic advantage which might in the event of war be turned against the countries bordering the Mediterranean Sea. There was also a strong desire in Greece to regain Constantinople, which had been captured by the Turks in 1453. The question became one of first-class importance to European statesmen in 1807, but the Congress of Vienna failed to make Turkey comply with its terms; from which circumstance Russia gained considerable prestige in view of the fact that she had contended that the question was a purely local one, and this failure appeared to confirm that view. In 1850 France raised the question with Turkey regarding the right to protect Catholics in Turkey and the guardianship of the holy places in Palestine. France considered that she still had these rights, but the matter was contested by Russia, who made a similar claim. No agreement was reached, and the Crimean War (q.v.) resulted. The Serbs had for cents. endured much from the Turks, but in 1862 they drove them from Belgrade, a success which, however, only

served to intensify the difficulties among the Christians of Herzegovina. Bulgaria also revolted against Turkey in 1875, but this was quelled by wholesale massacre. In 1877 Russia, Serbia, and Rumania declared war on Turkey, the battles round Plevna being the most notable of this campaign. The allies swept on to Adrianople, and by Feb. 1878 were in sight of Constantinople, when the Brit. Gov., alarmed at their success and apprehensive of its consequences, sent a fleet to defend Constantinople. The war was brought to a close by the Treaty of Berlin, under which Turkey lost much ter. The E. Q. became acute again in 1895, when Turkey embarked on a career of massacre of the Armenians in spite of strong representations from Great Britain and France.

Just before the First World War the Balkan Wars (q.v.) of 1912-13 brought about certain territorial adjustments which irritated most countries concerned and were one of the contributory causes of the First World War. The E. Q. as such, however, lost its significance after Turkey had lost most of its European ter. Since 1920, however, a new E. Q. has in fact arisen: firstly, before and during the First World War, when Germany's campaigns in N. Africa and activities in Persia threatened Middle E. stability; and, secondly, since the Second World War, when the growth of Arab nationalism, exacerbated by the creation of Israel (q.v.), and encouraged by Soviet Russia, has made the Middle E. the most politically inflammable area in the world. See also TURKEY. See J. A. R. Marriott, *The Eastern Question*, 1917.

Eastern Rumelia, see RUMELIA.

Eastlake, Sir Charles Lock (1793-1865), painter, was for some time a pupil of Haydon, a fellow Devonian. He once saw Napoleon, a captive on the *Bellerophon*, in the harbour of his native Plymouth, and later executed a fine life-sized portrait of the emperor largely from sketches made on that occasion. From 1817 to 1830 he lived chiefly in Rome, and became R.A. in 1830. In 1850 he was president of the Royal Academy, and, having been appointed director of the National Gallery in 1855, he exerted his influence towards improving the It. schools. In his best work, such as 'Christ lamenting over Jerusalem,' 1843, 'Pilgrims arriving in sight of Rome,' 1828, and 'Byron's Dream,' 1834, it is grace and finish which impress. His *Materials for the History of Oil Painting*, 1847-69, still has value.

Eastland, city of Texas, U.S.A., co. seat of E. Co. Centre of oil-producing region. Pop. 3600.

Eastleigh, bor. and tn of Hants, England, 5 m. N. of Southampton and 7 m. S. of Winchester. The carriage and locomotive works of the S. Region of Brit. Railways are here, and cables and confectionery are manufactured. Southampton (E.) Airport is in the bor. Pop. 31,000 (1954).

Easton, John Murray (1889-), architect, b. Aberdeen. Started practice in London, 1919, in partnership with H. M. Robertson (q.v.). From 1929 to 1940

they were associated with E. S. Hall. Buildings by the firm include the Brit. Pavilion at the Paris Exhibition, 1925; the Royal Horticulture Society's new hall in London, 1926; exhibition pavilions at Johannesburg, Brussels, and New York, 1936-9; numerous important scientific, administrative, and collegiate buildings at Cambridge Univ., 1932 onwards; new buildings for Reading Univ., 1949; Hatfield Technical College, 1948; printing works for Bank of England, 1950; blocks of residential flats in Marylebone and St John's Wood; sev. large hospitals; Watling House, London, 1954; South Bank Development Scheme, 1953; univ. of Malaya, 1953. E. was awarded the R.I.B.A. Royal Gold Medal for Architecture, 1955.

Easton, cap. of Northampton Co., Pennsylvania, U.S.A., on Delaware R., above the rapids, at the confluence of Lehigh R., about 60 m. from Philadelphia. It is on various railways, and connected with New Jersey and South E. by bridges. The fine public buildings include Lafayette College (Presbyterian, 1826). There are important manufs., including steel, cement, slate, electrical devices, textiles, paper, leather, clothing, chemicals, and machinery. The bell rung to summon the people to hear the Declaration of Independence still hangs in the court house. Pop. 35,630.

Eastport, city and port of entry of Washington Co., Maine, U.S.A., on Moose Is. in Passamaquoddy Bay. It is on the U.S.A. E. frontier, and is the site of old Fort Sullivan. Fishing and lumber trade are the chief industries, and it has sardine canning estab. The first sardine cannery in the U.S.A. was built here in 1875. Pop. 3123.

Eastwood, par. and urb. dist. of Notts, England, about 8½ m. from Nottingham, with coal mines. E. is the bp. of D. H. Lawrence (q.v.), the novelist. Pop. 10,100 (1954).

Eaton, Arthur Wentworth Hamilton (1849-1937), Canadian writer, b. Kentville, Nova Scotia, son of a schoolmaster. He graduated from Harvard in 1880, entered the episcopal ministry, and was rector of St Andrew's Church, Chestnut Hill, Massachusetts, 1885-7. He was the author of: *The Heart of the Creeds and Historical Religion in the Light of Modern Thought*, 1888, *Acadian Legends and Lyrics*, 1889, *The Lotus of the Nile and other Poems*, 1907, *The History of King's County, Nova Scotia*, 1910, *The Famous Mather Byles*, 1914, *The Eaton Family of Nova Scotia*, 1929, and *Acadian Ballads and Lyrics in Many Moods*, 1930.

Eaton, Herbert F. see CHEYLESMORE.

Eaton, Margaret O'Neill (1796-1879), 'Peggy O'Neill'; daughter of Wm O'Neill who kept a tavern in Washington, D.C. About 1823 she married John B. Timberlake, purser in the navy, who committed suicide in 1828 in the Mediterranean. In Jan. 1829 she married John Henry E. —appointed secretary of war that year. It was reported that she had had relations with E. while Timberlake lived. Wives of cabinet ministers refused to

recognise her. President Jackson on this account reconstructed his cabinet, favouring Van Buren who was friendly towards Mrs E. She was popular in Madrid society when her husband was ambas. in Spain, 1836-40. Her husband dying in 1856, she next year married Antonio Buchignani, an Italian aged about 20, whom she soon divorced.

Eaton, Theophilus (c. 1590-1658), colonial governor, son of an Eng. clergyman. Educ. in Coventry, where he formed an enduring friendship with John Davenport, the Puritan divine, through whom, later, he was influenced to settle in New England. Prior to migrating he had a successful mercantile career under the East Land Company who made him their 'deputy governor' or representative in N. Europe. Following the religious persecutions in England, he accompanied Davenport to Holland and thence went to America and interested himself in settlement. He became governor of New Haven, and was active in procuring the charter for Massachusetts in 1629. His administration was, however, embittered by the disputes between Eng. and Dutch colonists.

Eaton, Long, see LONG EATON.

Eaton Socon, vil. of NE. Beds, England, on the R. Ouse, 2 m. SE. of St Neots, Hunts. It is noted for its 14th-cent. par. church of St Mary the Virgin, which was almost totally destroyed by fire in 1930, but restored to its original form by vil. craftsmen in 1932. Pop. 3032.

Eau Claire, city, co. seat of E. C. Co., Wisconsin, U.S.A., on Chippewa R. 75 m. E. of St Paul, Minnesota, in dairying and livestock area. It manufs. automobile parts, rubber and leather goods, and paper, and is the site of a state teachers' college and of a state fish hatchery. Pop. 36,100.

Eau de Cologne, celebrated perfume, probably invented by Johann Maria Farina (1685-1766), who came from N. Italy and settled in Cologne (1709). Sev. firms at Cologne bearing the name of Farina claim to possess the original recipe for its manuf. The main ingredients are pure distilled alcohol and various essential aromatic oils (neroli, orange, rosemary, citron, bergamot), so blended as to yield a refreshing odour. It relieves headaches, and is very occasionally taken as a stimulant.

Eau de Javelle, one of the earliest bleaching solutions obtained, so called because first made at Javelle, near Paris. It is a solution of hypochlorite of potash, and was used as an antiseptic and to remove stains from muslin, linen, and white marble.

Eaux-Bonnes, Fr. spa in the dept of Basses-Pyrénées, on the Valentin. It is a summer resort, and a centre for winter sports. Pop. 500.

Eaux-Chaudes, or **Aigues-Chaudes**, Fr. spa in the dept of Basses-Pyrénées, in the wooded gorge of the Ossau. Pop. 200.

Eavesdrip, or **Eavesdropping**, literally the dripping of water from the eaves of a building. The term is chiefly used in connection with the A.-S. custom preventing

anyone from erecting a house at the extremity of his estate, lest the eavesdrip should injure his neighbour's land. This custom corresponded to the *stillicidium* or urb. servitude of the Romans. The right to permit rain-water to fall from one's roof upon a neighbour's ground is in the nature of an easement (q.v.). In a derivative sense, eavesdropping means loitering about to overhear private matter with intent to repeat it.

Ebbfleet, hamlet on the Is. of Thanet, Kent, England, on the borders of Ramsgate. *Ebbs Fleet* is said to have been the landing-place of invading armies under Hengist and Horsa in AD 449, commemorated in 1949 by the voyage under sail and oar from Denmark of a modern replica of a Viking ship, the *Hugin*, now at Cliffsend off the Sandwich-Ramsgate road. St Augustine landed here in AD 597.

Ebbw Vale, urb. dist. in the co. of Monmouth, England, with steel and tinplate works, and collieries. Pop. 29,205.

Exchester, see CONSETT.

Ebeling, Christoph Daniel (1741-1817), Ger. man of letters, was prof. of hist. and German at the gymnasium of Hamburg and chief librarian in that city for over 20 years. He lavished his best years on a voluminous *Geography and History of the United States of North America*, 1796-1816, a work which earned for him the public thanks of Congress.

Ebenaceae, a family of tropical Dicotyledons, consisting of about 320 trees and shrubs. The inflorescence is solitary or cymose, and the flowers are usually dioecious. *Diospyros*, *Euclea*, *Maba*, and *Royena* are genera.

Ebenezer ('stone of help'), the monument which Samuel raised to God after the victory of the Israelites over the Philistines (see 1 Sam. vii. 12). The site is not exactly known, but is thought to be near modern Deir Aban.

Eberhard I im Bart ('the bearded') (1445-96), Duke of Württemberg, succeeded his elder brother Louis II, duke of W.-Urach, in 1457. In 1482, by the treaty of Münsingen, he brought about the reunion of Stuttgart and Urach, and granted to W. its first constitution in 1492. He was raised to the rank of duke by Maximilian I in 1495. He founded the univ. of Tübingen (1476), and was a patron of scholars.

Eberhard, Christian August Gottlob (1769-1845), Ger. writer, who is now only remembered by his *Hannchen und die Küchlein*, 1822, a long narrative poem, and *Der Erste Mensch und die Erde*, 1828, an epic poem on the Creation written in hexameters.

Eberhard, Johann Augustus (1739-1809), Ger. philosophical and theological writer, b. Halberstadt. His first work, *Neue Apologie des Sokrates*, 1772, advocated a broader theological outlook towards those who have not accepted the tenets of Christianity. His prin. works are: *Amyntor, eine Geschichte in Briefen*, 1782; *Versuch einer allgemeinen Deutschen Synonymik*, 1795-1802; and *Handbuch der Aesthetik*, 1803-5.

Ebers, Georg Moritz (1837-98), Ger. Egyptologist and novelist, b. Berlin. He became lecturer in Egyptian at Jena (1865), and prof. at Leipzig (1870). The famous medical Papyrus Ebers, which he acquired from Edwin Smith at Luxor, was pub. in 1874. He also wrote *Aegypten in Wort und Bild*, a descriptive work, 1878. In 1876 he resigned his professorship through ill-health, and began a series of instructive historical novels with the object of popularising Egyptian lore. The chief of these are: *Uarda*, 1877; *Der Kaiser*, 1881; *Serapis*, 1885; and *Kleopatra*, 1894. Many of his tales have been trans. into Eng. His *Gesammelte Werke* were pub. in 25 vols., 1893-5. See his *Die Geschichte meines Lebens*, 1893; and a study by R. Gosche, 1887.

Ebersbach, Ger. tn in the dist. of Dresden, 38 m. E. by S. of Dresden (q.v.). It is in the Spree valley, is a frontier station on the Czechoslovak border, and has textile and piano manufs. Pop. 12,000.

Eberswalde, Ger. tn in the dist. of Frankfurt an der Oder, on the Finow canal, 48 m. NW. of Frankfurt (q.v.). It has a 14th-cent. church, and has a forestry school, and iron, steel, and timber industries. In 1913 one of the largest finds of prehistoric gold objects (11th-6th cents. BC) in Germany was made here. Pop. 36,000.

Ebert, Friedrich (1871-1925), Ger. statesman; b. Heidenberg; son of a poor Catholic tailor. He was apprenticed to a saddler in his native city at the age of 14. He became a travelling journeyman saddler, and helped to found a saddlers' union. In 1894 he became editor of the Bremen *Bürgerzeitung*, a socialist paper which he gave up to become secretary of the Bremen branch of the party. Later he entered the Reichstag and by 1916 was the Socialist leader there. In 1918 he succeeded Prince Max of Baden as chancellor, and in Feb. 1919 was confirmed in his office as first president of the Ger. rep. He retained the presidency till his death, his tact, patriotism, and moderation gaining him support from his countrymen generally.

Ebert, John Arnold (1723-95), Ger. poet; b. Hamburg; a friend of Klopstock and Lessing. As a translator he was eminently successful, but in his own poetry his deficiency in original force is at once apparent. His compositions include drinking songs, lyrics, epistles, and some much-admired epigrams. He trans. Young's *Night Thoughts*, 1751, and pub. *Übersetzungen einiger poetischen und prosaischen Arbeiten der besten englischen Schriftsteller* (2 vols.), 1754-6.

Ebingen, Ger. tn in the Land of Baden-Württemberg (q.v.), 40 m. S. by W. of Stuttgart (q.v.). It has an anct church and tower, has textile manufs., and is a health and mt sports resort. Pop. 18,000.

Eblonites (Heb. *ebion*, poor man), name probably applied at first to all Christians, later used particularly of an ultra-Jewish party who, though Christians, remained outside the Catholic Church. Their gospel was a form of that known as the Gospel according to the Hebrews: they

strictly adhered to all the customs and ordinances of Mosaic law, thus regarding St Paul as an apostate whose epistles they rejected; and some of them did not believe in the miraculous birth of Jesus Christ. The chief authorities as to their early hist. are Irenaeus, Hippolytus, Origen, and Justin. Those who lived E. of the Jordan held Essene doctrines, which gave rise to the 'Clementine' literature.

Eblis, or **Iblis**, of Muslim demonology, a fallen angel (Azazil) who attained the characteristics of the devil, and became chief of the Jinn.

Eboli, or **Evoli**, It. tn in Campania (q.v.), 15 m. ESE. of Salerno (q.v.). It has an anct castle and fine churches; considerable damage was done during the Allied landings at Salerno in 1943. S. of the tn, near the R. Sele, are the ruins of the anct Eburi. Pop. 20,000.

Ebonite, see RUBBER.

Ebony (Gk *ebenos*), an extremely hard wood of various species of the genus *Diospyros* (family Ebenaceae). The best quality is deep black in colour, consists of heart wood only, is very durable, and is yielded by *D. ebenus*, a tree that flourishes in S. India and Ceylon. Various kinds of E. are procured from *D. tomentosa* in Bengal, *Brya ebenus* in the West Indies, *D. dendo* in Angola, and *Dalbergia melanocylon* in Senegal. See BAUHINIA.

Ebony Heart, tree of Queensland, Australia. The *Elocarpus bancroftii*, family Tiliaceae, gives a hard enduring wood, somewhat like lignum vitae and used for much the same purposes. Yields a fruit resembling a plum, which is used for food.

Ebora, see EVORA.

Eboracum, see YORK.

Ebridae, see HEBRIDES.

Ebro (Lat. *Hiberus* or *Iberus*, whence *Iberia*), Sp. riv., in the NE. of the peninsula. It rises in the S. of the prov. of Santander (q.v.) and flows SE. past Logroño and Zaragoza (qq.v.) to the Mediterranean SE. of Tortosa (q.v.). Its chief tribs. are the Ega, Aragón, Gallego, and Segre on the l. b., and the Jalón, Martín, Guadalupe, and Matarraña on the r. b. It is navigable for small vessels from Logroño, but navigation is difficult because of shallows and rapids. The delta has been canalised, and another canal exists between Zaragoza and Tudela (see IMPERIAL CANAL OF ARAGÓN).

Ebsambul, see ABU-SIMBEL.

Eburi, see EBOLI.

Ebusos, see IBIZA.

Eca de Queirós, Jose Maria, see QUEIRÓS.

Ecbatana, or **Agbatana** (Heb. *Achmetha*), cap. of anct Media, is first mentioned in Assyrian inscriptions of Tiglath-pileser I (c. 1100 BC). It was captured by Cyrus (549 BC), and became the seat of gov. and the favourite summer residence of Persian and Parthian kings. It was surrounded by 7 walls, within which lay the royal castle, built of cedar and cypress wood, covered with gold and silver. The city was plundered by Alexander the Great and Seleucus I. The modern Hamadan is built on its site.

Eccce Homo (Lat. 'Behold the Man'), the title given to pictures representing Christ crowned with thorns. One, by Correggio, hangs in the National Gallery, London, and one of the best known of such pictures is a Titian of 1543, belonging to the former Imperial Gallery at Vienna.

Eccentric, a special form of crank, consisting of a disk placed eccentrically on a revolving shaft. A rod connected to a point on the E. and, at the other end, to a crosshead (q.v.), or hinged to another rod running through a sleeve, transforms the rotation of the E. into a rectilinear to-and-fro motion.

Eccentricity, see GEOMETRY, *Higher Pure G.*

in retirement at Kingston-on-Thames, devoted to fishing. He wrote a dozen operatic pieces and masques and a vast amount of incidental music for plays; in 1710 he pub. nearly 100 songs, many of them taken from his theatre music. His younger brother Henry (c. 1670-1742) was a violinist and minor composer.

Eccles, municipal bor. of Lancs, England, and a suburb of Manchester. It was incorporated in 1892. There are engineering works, cotton mills, and manufs. of ginghams and fustian goods. E. cakes take their name from the neighbourhood, where they are largely made. Pop. 43,780 (1954).

Ecclesfield civil and eccles. par. and

THE EBRO AT LOGROÑO

Echymosis, a spotted discoloration of the surface of the skin, caused by an effusion of blood below. It occurs as a result of a blow of some kind, but sometimes it is met with in diseases of the blood and blood-vessels. A fresh E. has the appearance of a group of pin-pricks. See BRUISE.

Ecclefechan, vil. of Dumfriesshire, Scotland, 5 in. N. of Annan. Thomas Carlyle, who was born and buried here, introduces it into *Sartor Resartus* under the name 'Entepfuhl.' Pop. 610.

Eccles, Sir David McAdam (1904-), politician, educ. at Winchester and New College, Oxford. Since 1943 he has been Conservative M.P. for Chippenham. He was minister of production, 1942-3; and, in the post-war Conservative Govs., minister of works, 1951-4 (his term of office covering the coronation of Queen Elizabeth II); and minister of education, 1954-7. In 1957 he was appointed president of the board of trade. He was knighted in 1953.

Eccles, John (1668-1735), composer, grandson of the Quaker Solomon Eccles (or Eagles), from whom he learnt music. He became a theatre composer and in 1700 was appointed Master of the King's Band. The same year he gained the 2nd prize for a competitive setting of Congreve's *Judgment of Paris*. For the last quarter of a century or so of his life he lived

vil. of Yorks (W. Riding), England, forming part of Wortley (q.v.) rural dist. The par. church of E. is in the Perpendicular style, incorporating parts of 2 earlier buildings, and erected between 1377 and 1546. Sev. coal seams are found here, and there are iron and steel works. Pop. (civil par.) 30,000; (eccles. par.) 7500.

Ecclesia, the general assembly of all freemen of the state in Athens. After the reforms of Cleisthenes, it was known as the E. when it met for political purposes, and 'Heliaea' when it had judicial business in hand. It is not thought that the E. had any definite form before the time of Solon, though some such institution was doubtless in existence. The reforms of Solon are not known exactly, but there is no doubt as to their general effect, which was to give the Thetes, the lowest class, a voice in the E., and the power of criticising and exercising some check over the actions of the Eupatrids, the governing class. All citizens of Athens over 18 years of age were eligible to appear in the E., save those who had for any reason suffered loss of civil rights. The meetings were of 3 kinds, ordinary, extraordinary, and those convened by special messengers; the last were held only when the attendance of the country members was desired. The proceedings were opened by various religious formalities, and if the omens were unpropitious, or the weather was bad, no

meeting was held. The voting was as a rule by show of hands, or on special occasions, by ballot. The practice of payment for attendance was instituted some time in the 4th cent. BC. The E. was the sovereign power in Athens throughout the time of her greatness, though being an untrained body it could not initiate laws; this was done by a committee of the Boule (q.v.). In 308 BC Demetrius of Phalerum curtailed the power of the E. by instituting Guardians, who could prevent it from voting on an illegal motion. As a governing body the E. perished when Athens became a *civitas libera* of Rome. See Aristotle's *Athenian Constitution*.

Ecclesiastes (Heb. *Kohleth*, 'the Preacher'). The Gk title, from which the Eng. is derived, means 'a member of assembly'; the Heb. word is found only in this book, and seems to mean the 'herald' who summons an assembly. Luther's trans. *der Prediger* ('the Preacher'), followed in the Eng. version, is fairly satisfactory; the purpose of the book is hortatory, and the form of the word implies an assembly.

Contents.—It is generally accepted by critics that the work is composite, an original pessimistic and even agnostic writing glossed by a wise man in praise of Wisdom and by a pious Jew who gave unorthodox and devout corrective to the cynicism of the original. The irregularity of the writing and jerkiness of the treatment are manifest. But a unity can be discerned if it is read as the observations on life of a man passionately sure of God's moral gov. of the Universe, yet disillusioned completely as to the old Jewish theory that virtue is always rewarded and sin punished in this life. As yet the doctrine of the future life was unrevealed. E. is left therefore with an unresolved conflict between his faith in God and the vanity of human life and virtue, if limited to this world.

Language.—The Hebrew of E. is unlike that of any other portion of the O.T. No other book has so large a proportion of words, phrases, and senses of words peculiar to itself. In its vocabulary and many of its constructions it is related to the 'Mishna,' which reached its present form c. AD 230 but contains much older material: most of the linguistic peculiarities have analogues in classic Hebrew.

Date and Authorship.—The ascription to Solomon is a literary device to add weight to the author's message. Solomon was the typical wise man, and experienced the vanity of earthly prosperity to the full. But the conditions revealed in the book do not fit those of Solomon's day. The author is therefore unknown: the date, it is generally agreed, is post exilic, earlier than Ecclesiasticus (190 BC) which shows knowledge of it, but later than Job and Proverbs, since it abandons the belief in earthly rewards and retribution. C. 220 BC would fit it.

Canonicity.—The disciples of Hillel and Shammai disputed its inspiration, but it was accepted at Jamnia (see BIBLE). None of the Christian Fathers questioned it.

Commentaries.—McNeile, 1902; Williams, 1922; Odéberg, 1929; Beal, 1950.

Ecclesiastical Commissioners, see CHURCH COMMISSIONERS.

Ecclesiastical Courts, C. in which the canon law (q.v.) is administered and E. causes are determined. Shorn of their former wide civil and criminal jurisdiction over laity and clergy alike in such matters as divorce, wills, and blasphemy (q.v.), they are now concerned only with questions of doctrine and Church discipline. The prin. E. C. are: (1) The Bishops' Consistory Court, presided over by the bishop's chancellor (q.v.), which can try clergy for uncleanness and wickedness of life, but not for doctrinal offences. Some authorities believe it can still try laymen guilty of heresy or incest. Since the passing of the Incest Act, 1908, made the offence of incest a crime cognisable by the ordinary courts, it may be assumed that jurisdiction of the consistory court over laymen is obsolete, although theoretically it can punish laymen by refusing them the Sacrament and prohibiting them from entering a church for such offences as the above, and for brawling. In exercising quasi-criminal jurisdiction the chancellor is assisted by 5 assessors who act as judges of fact. (See also CLERGY DISCIPLINE ACT, 1892.) The bishop can veto the prosecution of a clergyman for uncleanness and wickedness of life; the civil jurisdiction of the court relates principally to the grant of faculties for alterations in churches, questions of repairs to church fabric, and to disputed rights to pews. (2) The Court of Arches, presided over by the Dean of Arches. This court hears E. appeals from the consistory courts of the bishops of the prov. of Canterbury, and has jurisdiction over the 13 peculiar parishes in the diocese of London. It also has the transferred jurisdiction of the old Provincial Court of the Archbishop of Canterbury. The court tries also doctrinal offences and practices under the Public Worship Regulation Act, 1874. (3) The Provincial Court of the prov. of York, which hears appeals from the consistory C. in the diocese. (4) The Court of the Archbishop, presided over by the archbishop or his vicar-general, which has jurisdiction to try bishops for E. offences. The Court of the Bishop sitting in person, the Provincial Court of the Archbishop of Canterbury, and the Court of the Archdeacon are obsolete. The judicial committee of the privy council is the supreme court of appeal in all E. matters. In 1954 a commission appointed by the archbishops recommended a simplified system of E. C. and the estab. of a Court of E. Causes Reserved to determine doctrinal and ceremonial questions.

Ecclesiastical Dilapidations, in Eng. law, comes under the heading of waste. In England the incumbent of a benefice is compelled to keep his residence and its outhouses in a proper state of repair, i.e. free from dilapidations. If he be rector he is further obliged to take charge of the fabric of the chancel, though not to supply the ornaments or painting thereof.

One who fails to fulfil these obligations is liable to an action for dilapidations by his successor. On entering a benefice, the new incumbent must carry out all necessary repairs under the instruction of the bishop, after complaint by the archdeacon, rural dean, or patron. Each diocese has a surveyor of dilapidations, who reports on the condition of church property. In Scotland the heritors have to repair all except 'free manses.'

Ecclesiastical Law, in England, is the L. of the Church of England administered by the secular courts (q.v.), the sources of which are derived mainly from canon L. and civil L. (q.v.). It has never acquired that importance in the general L. which it once enjoyed in those countries where the state was subordinated to the Holy See. E. L. has, however, influenced principles applied in probate, divorce, and matrimonial matters which are now dealt with by the High Court. See also ECCLESIASTICAL COURTS.

Ecclesiastical Titles Act, Act passed in 1851 to prohibit the assumption by any unauthorised person of a title from any place in the U.K., whether or not such place were the seat of an archbishopric, bishopric, or deanery, and declaring null and void all acts done by them, or gifts made to them, under such titles. The Act was the legislative expression of the hatred of Catholicism. The immediate cause of the A. was the Oxford Movement led by the Rev. J. H. (afterwards Cardinal) Newman, whose followers, the so-called Tractarians, endeavoured to prove that the doctrines of the Church of England were essentially similar to those prevalent in the primitive Catholic Church. The authorities took this revival of religious energy to be no more than a desire for reconciliation with Rome, and the prevalent excitement consequent on the secessions from the Estab. Church to the Church of Rome led to Lord John Russell securing the passing of the E. T. A., which, however, through the weakness of its provisions, remained nugatory. It was replaced in 1871 by another E. T. A. which mitigated the heavy penalties imposed by the earlier Act. In this connection we may note that the Statute Book still contains an Act passed in 1829 which prohibits the assumption by any persons, other than the person authorised by law, of the name, style, or title of an archbishop, bishop, or dean of the Church of England. This is the Roman Catholic Relief Act.

Ecclesiasticus, the 'church book,' an apocryphal or deutero-canonical work in the Bible. The Gk name is 'the wisdom of Jesus, Son of Sirach,' or, more briefly, 'wisdom of Sirach.' The original name is said to have been 'Proverbs' in Hebrew, though it was known to the Rabbis as 'Book of Ben Sira.' The original Hebrew, lost after the Jamnia Rabbis excluded the Book (see BIBLE), was discovered among the discarded MSS. in the Cairo Geniza in 1896. It has been proved that before 132 BC a second and slightly expanded version of the Heb. text was produced, which underlies those

of the Vulgate and A.V. Its prologue tells us the Gk trans. was made by the author's grandson, perhaps from an autograph copy.

Authorship.—The Prologue fixes the date approximately as c. 180 BC. Josephus mentions it; Lev. i. ff. refers familiarly to Simon the High Priest (219–196 BC) as known to the author but dead when he wrote.

Contents.—The Book of Ben Sira is similar to Psalms, Proverbs, and Ecclesiastes, and contains hymns, prayers, rules of conduct, and speculations on a variety of practical subjects. The prologue explains the author's purpose in writing. He has a thorough knowledge of the O.T. books, and quotes freely from them; and although he omits the names of Daniel, Ezra, and Esther from his list of Heb. heroes, some of his phrases seem to be taken from the Book of Daniel. He makes no reference to Chronicles.

Ecclesiology, the science and study of church archaeology, architecture, and decoration. It also comprises church hist., as revealed by these.

Eccremocarpus, a genus of Bignoniaceae, contains 3 species of handsome Peruvian plants. *E. scaber* is climbing and half-shrubby in habit; it grows in thickets and hedges of its native country, and will live in the open air in the milder parts of England.

Echegaray y Elizaguirre, José (1832–1916), Sp. scientist, politician, and dramatist, b. Madrid. In 1858 he became a prof. of mathematics and pub. sev. valuable scientific works. It was not till he was 40 that he turned his attention to the writing of dramas and comedies. His works, which were issued under the *nom de plume* of Jorge Hayaseca, satirise the vices of society, and were very popular. Among his works may be mentioned: *La Esposa del vengador*, 1874; *En el pilar y en la cruz*, 1878; *Muerte en los labros*, 1880; and especially *El gran Galeoto*, 1881. He was granted the Nobel prize in 1904. See H. de Curzon, *Le théâtre de J. Echegaray*, 1912; J. R. Young, *J. Echegaray*, 1938.

Echelon (Fr., rung of a ladder), military term used of a regiment, the formation of whose troops resembles a ladder; that is, the divs. march in parallel lines, not exactly behind each other, but each to the right or left of the preceding one.

Echeveria, a genus of Amer. succulent perennials, family Crassulaceae, about 150 species, with ornamental leaves, always in rosette formation, and bell-shaped flowers.

Echidna, or **Spiny Ant-eater**, name given to 2 species of mammals in the order Monotremata; these are *Echidna aculeata*, or common E., and *Proechidna bruijnii*, or 3-toed E. The former, which has 5 toes on each foot, all clawed, inhabits Australia, Tasmania, and New Guinea, while the latter is found only in NW. New Guinea. Both are fossorial and mainly nocturnal animals, frequenting rocky dists. and subsisting chiefly on ants. The upper surface of the head and body is covered with a mixture of stiff hairs and short thick spines. It has a long, slender, beaklike

snout, with the elongated, cylindrical tongue common to all ant-eaters. The *E.*, and the Duck-billed Platypus (*Ornithorhynchus*), which together constitute the Monotremata, are unique amongst mammals in their mode of reproduction, by laying eggs. The female is provided with a pouch in which she places the single egg and in which the young suckles after birth.

Echinocactus, family Cactaceae, a genus of 9 species, all N. Amer., of large, roundish, ribbed plants, with densely woolly crowns, very spiny areoles, and flowers, usually yellow, at the top of the plants. *E. grusonii*, *E. grandis*, *E. ingens*, and *E. palmeri* are Mexican.

Echinococcus, name given to certain Cestoda in the cystic or bladderworm stage. *E. polymorphus*, or *E. veterinorum*, is found in sheep, in domestic animals, and occasionally in man; in its mature or tapeworm stage it infests dogs. The bladder, which is known as a hydatid cyst, occurs in the liver, brain, and other places; it may reach the size of a football and calls for surgical intervention. See CESTODA; TAPEWORM; HYDATID DISEASE; and BLADDERWORM.

Echinococcus Disease, see HYDATID DISEASE.

Echinodermata (Gk *echinos*, hedgehog, and *derma*, skin), name given to the great branch of invertebrate animals which includes Holothuroidea, the sea-cucumbers; Echinoidea, the sea-urchins; and Asteroidea, the star-fishes, etc. They are exclusively marine, and feed chiefly on small animals; their main characteristic is the water-vascular system, which is connected with the tube feet, and provides the means of progression and respiration. Many of the *E.* have the power of casting off and regenerating different parts of their bodies. The Echinoidea are predominantly globular, but a few are discoid. The body is enclosed in a shell of polygonal plates, accurately arranged in double rows, and covered with knobs or spines, and small stalked outgrowths, pedicellariae, some provided with 2, others with 3, blades, between which they seize any foreign particles or small animals and remove them, so keeping the shell clean. There is a complicated masticating apparatus, formed by the 5 teeth and 15 other pieces, and known as Aristotle's lantern. The animals move generally with the mouth directed towards the ground. There are 2 orders: (1) Palaeoechoinoidea, comprised solely of extinct and fossil forms, the oldest members being found in the Upper Cambrian; (2) Euechinoidea, including all living and some extinct species. The Asteroidea is typified by *Asterias rubens*, the common 5-rayed starfish, whose native haunt is the floor of the ocean at some depth, but which is often seen in shore pools at low tide. Allied to this class are the Ophiuroidea, or brittle-stars, whose arms, however, branch out more abruptly from the central part. Like the Echinoidea, the Asteroidea have outgrowths of spines and pedicellariae. At the end of each arm there is a bright red spot, the 'eye,' which is sensitive to light. Starfishes feed on bivalves, flat-

tening the tube feet on the 2 halves of the shell and then widening the arms of the star so that a steady pull on the muscles is exerted. The water-vascular system communicates with the exterior by a short canal, the stone canal, and an opening, the madreporite, which in Echinoidea and Asteroidea is represented by a porous plate. The Holothurians differ at first sight from other *E.*, as they have a plump, cylindrical body and a soft, leathery skin, in which is embedded a series of calcareous plates. Holothurians are generally sedentary. They live on the sea floor, and can crawl by means of their tube feet. These are not developed in species which burrow in the mud. The Crinoidea, feather-stars or sea-lilies, grow together in great masses, and are mostly fixed to the sea-bottom, or rock surface, by a joined stalk; they are also very common as fossils. The

ECHINODERMATA

Left, Asteroid. Right, Holothurian.

feather-star swims by movements of its 'arms' and alights by means of small leg-like outgrowths on them. Most *E.* lay small eggs in the sea, and these develop into larvae of various types. *E.* in the colder seas retain the eggs in the body-cavity, or swallow them and keep them in the stomach until they develop. In a few cases, after their release, the young are protected by the mother, and lie in depressions or among the spines on her body. The Blastoida and Cystidea, extinct classes of *E.*, are found in the Lower and Upper Silurian, and some Cystidea in the Cambrian rocks.

Echinoidea, see SEA-URCHINS.

Echinolampas, generic name of certain species of echinoderms in the family Cassidulidae. They are heart-urchins, with the anus on the under-surface.

Echinophora, genus of umbelliferous plants, is to be found in the Mediterranean. *E. spinosa*, the sea-parsnip, is an inhab. of sandy sea-shores, and has pinnate spinose leaves.

Echinorhynchus, name given to a genus of parasitic worms belonging to the Nematoda, and grouped under a special class, Acanthocephala.

Echinus, see SEA-URCHINS.

Echites, family Apocynaceae. Genus of tropical Amer. twining shrubs; *E. stellaris* and *E. sulphurea*, with spectacular flowers, may be grown in green-houses.

Echium, see VIPER'S BUGLOSS.

Echmiadzin, famous Armenian monastery 10 m. W. of Yerevan, since 1441 the seat of the Armenian Patriarch ('Catholicos') and the religious centre of the Armenian Church. The main cathedral

was founded in 303 by St Gregor, the illuminator of the Armenians.

Echo: 1. Gk nymph who repelled Pan; he, in revenge, made shepherds tear her to pieces till only her voice remained. But Ovid says E. was a nymph whom Zeus employed to talk to Hera to distract her from discovering his amours. Hera, discovering this, made E. unable to say anything but the last words of somebody else's speech. E. then fell in love with Narcissus, and pined away in despair till only her voice remained.

2. Sound produced by the waves of sound reflected from something denser than air. Since the velocity of sound in air is about 1100 ft per sec., an observer situated at a distance of about 550 ft from a reflecting surface would hear the E. of his voice after 1 sec., and would hear as many words as would last for that space of time. Various natural peculiarities of configuration have made the E.s in different parts of the world famous.

The modern 'echo sounder' is a machine which records ultrasonic waves reflected from the sea-bed, and allows the depth of water to be determined, and also detects submarines.

Echternach, tn of the Grand Duchy of Luxembourg. It stands on the R. Sure, about 20 m. NE. of the city of Luxembourg. The inhab. are chiefly engaged in manuf. of damask, linen, and porcelain. It is famous for the ann. procession on Whit-Tuesday, in gratitude for the ending of the penitential dance mania which raged in this neighbourhood in the 8th cent. There is a famous abbey here, founded by the A.-S. Willibrord, bishop of Utrecht, and a 13th-cent. par. church. E. was the S. point of von Rundstedt's desperate counter-offensive in the Ardennes (Dec. 1944-Jan. 1945), the N. point being near Malmédy. By the time the Ger. drive was halted the enemy had breached a 45-m. gap in the Amer. lines from E. to Monschau. (See also WESTERN FRONT IN SECOND WORLD WAR.) Pop. 3500.

Echuca, tn of Victoria, Australia, situated on the Campaspe and Murray rivs., 156 m. N. of Melbourne. A bridge 1905 ft long connects E. with Moama on the New South Wales side of the Murray. It trades in wool, wine, red-gum, timber, etc. Pop. 4000.

Ecija (anc't Astigi; Moorish Estija), Sp. tn in the prov. of Sevilla, the centre of the fertile valley of the Genil, a trib. of the Guadalquivir (q.v.). It has sev. fine churches and mansions, and has Rom. and Moorish remains. Its great summer heat has earned it the name of 'the frying-pan of Andalucía.' It has long been famous for its shoes, and also manufs. textiles. The dist. produces corn, fruit, wine, and olive-oil. Pop. 38,000.

Eck, or **Egg**, **Johann Maier von** (1486-1543), Ger. scholar and theologian, b. at Egg, in Swabia. He excelled in controversy, attacking Luther's thesis on indulgences, and defending the Catholic doctrines in the celebrated congress of Leipzig in 1519. Thenceforward he was one of the bitterest opponents of the Reformation; in 1525 his exposition of

Catholic dogma appeared in answer to *Lieux théologiques* of Melancthon, and was very successful. He took a prominent part in the congresses at Baden and Augsburg, and in 1530 sent a refutation of the Protestant confession to Charles V. In 1537 he pub. a Ger. N.T., and took part in the meetings at Worms in 1540, and at Ratisbon in 1541.

Eckart, or **Eckehart**, **Johannes**, see **ECKHART**.

Eckermann, **Johann Peter** (1792-1854), Ger. writer, b. Winsen an der Luhe. He became the friend and unpaid assistant of Goethe, and is principally known for his *Gespräche mit Goethe*, 1837, compiled from the notes Goethe had allowed him to take. The *Conversations* were trans. into Eng. by Margaret Fuller in 1889.

Eckernförde, Ger. tn in the *Land* of Schleswig-Holstein (q.v.), 16 m. NW. of Kiel (q.v.). It lies on a fford on the Baltic coast. It was for long a naval port, but is now a fishing port and holiday resort. Pop. 21,000.

Eckersberg, **Carl Kristoffer Vilhelm** (1783-1853), Dan. historical, marine, and portrait painter, b. Varnäs, Sleswig. He became a pupil of Abildgaard and afterwards of David, and also Thorwaldsen. It has been stated by his native admirers and critics that he first 'created a Danish colour.' His landscape scenes are clear and definite and the outlines natural, while his figures are conventional.

Eckhart, **Eckart**, or **Eckehart**, **Johannes**, very generally styled **Meister** (1260-1327), Ger. mystic, and one of the first speculative thinkers, b. Hochheim bei Gotha. Very little is known concerning his life. He entered the Dominican order, and studied and taught in Paris. After being made prior at Erfurt, he was vicar of his order in Thuringia. He was made vicar-general of Bohemia in 1307, and a few years later he preached at Frankfurt, Cologne, and Strasburg. His reputation for learning was very high, and he assisted in a controversy between Pope Boniface VIII and Philip of France. In 1327 his enemies caused him to be summoned before the archbishop at Cologne on a charge of heresy, when he partly recanted. Two years later he was again accused, and extracts from his works condemned, but he d. before the Bull against him was pub. His sermons and tractates written in German and Lat. are all that remains of his works, of which there is as yet no satisfactory ed.

Eckhel, **Joseph Hilary** (1737-98), an Austrian numismatist, b. Euzersfeld, Lower Austria, who in 1773 was made prof. of antiquities and numismatics at Vienna Univ. His chief work is *Doctrina Nummorum Veterum*, 1792-8. He is justly regarded as the founder of modern numismatics.

Eckington, par. and tn of Derbyshire, England, 7 m. SE. of Sheffield. There are saw-mills, iron works, canning factories, and manufs. of agric. implements. Pop. 17,000.

Eckmühl, Ger. vil. in Bavaria (q.v.), on the Laber, 15 m. S. of Regensburg (q.v.). It was the scene of the defeat of the

Archduke Charles of Austria (see CHARLES LOUIS) by Napoleon I (q.v.) in 1809.

Eclampsia, see PREGNANCY.

Eclecicism (Gk *eklegein*, to select), in philosophy, is the principle of selecting and adopting views from various systems and uniting them into one composite system of thought. Among the earliest eclectics must be numbered Cicero, the Peripatetics, and the Neoplatonists. E. has won great popularity in France, owing to the teaching of Victor Cousin, Adolphe Garnier, and others. Cousin asserted that 'Each system is not false, but incomplete, and in reuniting all incomplete systems we should have a complete philosophy, adequate to the totality of consciousness.' See Adolphe Franck, *Moralistes et Philosophes*, 1872; P. F. Dubois, *Cousin*, Jouffroy, Damiron, 1902.

Eclipses of the Sun and Moon. During the revolution of the earth round the S. and of the M. round the earth (see EARTH; MOON) there are certain positions of these bodies in which the M. comes between the earth and the S. and also when the earth comes between the M. and the S. In the first case an E. of the S. may take place and in the second case an E. of the M. may occur. The diagrams show the reasons for these phenomena. The first one shows the M. *M* in a line with the S. *S*, and the earth which is on the extreme right, only a small portion of its surface appearing. A cone of darkness to the right of *M* which intercepts the S.'s light is seen intersected by a small portion of the earth's surface; on any part of this the S. will appear totally eclipsed. Outside it some of the light from the top or bottom of the S. will not be intercepted by *M* and in these regions the S. will appear only partly eclipsed. If tangents are drawn from the top of *S* to the bottom of *M* and from the bottom of *S* to the top of *M*, they will intersect the earth's surface at points outside which the S. is completely visible, but inside which a portion will be hidden from view. Hence the distinction between a *total* and a *partial* E. of the S.

The lower diagram shows the earth interposing between the S. and the M., the result of which is a shadow cast on the M. As the M. does not

shine by its own light like the S. and other stars, it would not be visible were it not for the fact that some of the light refracted by the earth's atmosphere falls on the M.'s surface and is reflected back to the earth. Red predominates in this light, most of the shorter waves being absorbed as the light passes through the earth's atmosphere.

E. of the M. have not the same value as those of the S., and astronomers will go to any part of the earth where total E. of the S. are visible, setting up their instruments and making arrangements months beforehand, on some convenient site as close as possible to the centre of the belt of totality. This varies in width from a few m. up to 130 m., and the E. shadow sweeps over the narrow belt from W. to E. at a speed of about 35 m. a min. The belt from which a partial E. can be seen is much wider than this, but, compared with a total E., a partial E. has very little scientific value. The next total E. that can be seen in the Brit. Isles is on 11 Aug. 1999, and will be visible in Cornwall; in other parts it will be seen only as a partial E. The computations regarding the circumstances of E. are carried out at certain observatories by professional computers, though some amateur astronomers who are also mathematicians can make the computations. Certain abstruse problems arise, as, for instance, the speed of the M.'s shadow, which, we have seen, is about 35 m. a min., but this does not take into consideration the rotational speed of the earth, which varies according to the lat. and is more than 17 m. a min. in equatorial regions; hence if the shadow were moving W. at the equator its speed with reference to the earth's surface would be $35 - 17 = 18$ m. a min. The actual form of the shadow on the earth's surface, though as an approximation it can be regarded as an ellipse, is nevertheless not really an ellipse, and its projection on the nearly spherical surface of the earth does not conform to any well-known figure.

Those who wish to study the mathematical problems associated with E.s are recommended to read *The Mathematical Theory of Eclipses*, 1904, by Roberdeau Buchanan. Details of 8000 solar E.s between AD 1207 and 2161, and 5200 lunar E.s between AD 1206 and 2163, are given in Oppolzer's *Canon der Finsternisse*.

Ecliptic, The path which the sun takes in its apparent yearly journey from W. to E. among the fixed stars. This path lies through the middle of the constellations known as the Signs of the Zodiac (q.v.). Of course the E. is only the apparent path of the sun, for the earth revolves around the sun. If it were possible to view the earth from the sun, it would be found that the earth's orbit lay along the E. The E. is inclined to the equator at an angle of $23^{\circ} 27'$, and intersects it at 2 points 180° apart, called the equinoxes. The sun is at these points, known as the vernal and autumnal equinoxes, about 21 Mar. and 23 Sept.

Eclogite, or **Eklogite**, rock formation, crystalline in character, and composed of a green pyroxene, smaragdite, and red garnet. Occasionally feldspar, quartz, iron ores, etc., form a part of this exceedingly beautiful rock. It is not found in any great abundance, but it is seen among the Alpine mts., the Fichtelgebirge, at Baden, etc. The garnets in E. are frequently surrounded by a covering of bright green hornblende.

Eclogue (Gk *eklegein*, to select), a short poem, especially a pastoral dialogue. The term was first applied to the bucolics of Virgil and the idylls of Theocritus and hence came to be confined to poems of the same type. Spenser in his *Shepherd's Calendar* gives a false derivation of the word from *aix*, a goat, and *logos*, speech, the term E. being regarded as complementary to Pastoral, the former referring to form and the latter to content. In the 18th cent., when the E. was popular, its range was extended beyond country life, and to E.s were produced. John Davidson's *Fleet Street Eclogues*, 1893, were a similar departure. See PASTORAL POETRY.

Ecology (Gk *oikos*, house or abode, *logos*, discourse) is the study of the organism as a whole in relation to its environment. Since land plants are stationary, the study of plant E. is much easier, and consequently much more advanced, than that of animal E. On the other hand, plants and animals are so closely interdependent that investigation of the E. of one group involves that of the other. There are 2 main subdivisions of E. (1) Autecology, concerned with the separate environment factors and their effect on individuals. (2) Synecology, dealing with the combined effects of these factors on plant and animal communities. The chief environmental factors governing the distribution of plants and animals are temp., humidity, climate, soil, the intensity of light, the nature of the food, and interaction with other plants and animals. The individual effect of each separate factor is studied in the laboratory; the combined effects are seen out of doors, in woods, fields, swamps, lakes, seas, and other habitats. Generally speaking, animal communities are determined by plant communities—that is, by plants growing together and forming groups with a certain individuality. Any particular type of community is described as an association, and the general appearance of a plant association is determined by dominant species, e.g. the pine tree is the dominant species of a pine-wood association; in a mixed wood, oak and beech may be co-dominants. Associations having only one dominant species are called consociations. Plant associations show stratification; in a wood, trees constitute the uppermost strata, bushy undergrowth the next, herbs the 3rd, and mosses and liverworts the 4th. Beneath these are soil algae, fungi, and various bacteria, and protozoa, which by effecting changes in the soil affect the plants growing in it. Further change is effected by the constant addition of humus to the soil, and as a result of such changes

the character of the plant community gradually alters, other organisms better adapted to the changed soil gradually replacing the earlier ones. This process is termed ecological succession, and is concomitant with an ecological succession of animals. By studying the changing conditions as the level of Lake Michigan falls, Shelford has been able to predict, with regard to beetles of the genus *Cicindella*, the succession that will be determined by further fall in level. Since within limits animals can choose their habitat, behaviour is an additional factor of animal E. Animals form strata in a different manner from plants. The bottom stratum may be regarded as composed of animals forming food for those of the next stratum, and so on, until at the top are animals which have no enemies or are able to defeat them by virtue of size or skill. Thus spiders eat flies; small birds eat spiders; larger birds eat smaller birds. In this way animals form food chains, those forming the 1st link being far more numerous than those of the last. The 1st link consists obviously of herbivores capable of reproducing in enormous numbers, while the animals of the last link have limited means of reproduction and reduce competition between themselves by sharing out food areas. Other important factors in animal E. are the size of food and the status of the animal in the community, and interesting problems are presented by the phenomena of symbiosis and the specialisations of parasites. The extensive field of E. provides interesting material for the amateur who makes careful observations and keeps accurate records, but with drastic changes produced in natural communities by modern agric. practices, professional ecologists play an essential role in this industry. Their opinions are also sought when crops are to be introduced into newly claimed land. See also APPLIED BIOLOGY; SOIL SCIENCE. See A. Tansley, *The British Isles and their Vegetation*, 1939; W. C. Allee and others, *Principles of Animal Ecology*, 1949; C. Elton, *The Ecology of Animals*, 1950; also articles in *The Journal of Ecology* and *The Journal of Animal Ecology*.

Economic Blockade, see BLOCKADE; DECLARATION OF LONDON; ECONOMIC WARFARE, MINISTRY OF.

Economic Thought, History of. The H. of E. T. begins with the ancients, who confided everything to the power of the State, which resulted in the subordination of the individual to the State, and consequently in the subordination of economics to ethics and politics. The Gk philosophers condemned interest-taking and were prejudiced against trade and commerce. The Romans followed the Gks' ideas, and also made important studies of particular economic problems, but failed to establish a dominant system of E. T. Christianity strengthened in general the prevalent Aristotelian system of economic philosophy, its condemnation of usury and the pursuit of wealth in trade, its assertion of the superiority of agriculture, and its support of status. Christianity thus strengthened the subjection

of economics to ethics, but weakened the subjection of economics to politics. The early fathers, in their condemnation of avarice and their exaltation of fraternal love, sometimes used expressions which, taken by themselves, imply an utter condemnation of private property and an advocacy of Communism among the faithful; but this was only an ideal, and private property was early recognised as a necessity resulting from the fall of man. The effect of this ideal, however, appears in the accepted doctrine that the maintenance of the poor was not a matter of philanthropy, but an obligation. The scriptural attitude towards wealth led to an emphatic statement of the moral superiority of agriculture and handiwork over trade and commerce as a means of earning a livelihood, and the early writers seemed almost unanimous in the belief that what the seller made by trade the buyer necessarily lost.

With the increasing temporal power of the Church and the great development of commerce which marked the 11th cent. came the necessity of harmonising the doctrines of the Church with the obvious requirements of commerce, and many concessions were made by the later canonists. Thomas Aquinas (1226-74) concedes that it is lawful to trade for a simple livelihood, or in order to supply a country with the necessary articles which it does not produce, or when the profits of the trade are devoted to some honourable purpose, such as the assistance of the poor; but that, save in exceptional circumstances, a seller is bound to reveal a fault in an article, and that it is not permissible to sell an article for more than its worth. The fundamental axiom, in accordance with which all these conclusions are reached, is that every commodity has a fixed and objective value, which can readily be ascertained, and which determines its just price. The distinctively ethical standpoint of the canonists is shown in the prohibition of usury, which was based upon scriptural injunctions against it and upon Aristotle's argument that money being barren it would be extortion to charge for its use. As the growing commerce of the Middle Ages made the need of borrowing capital more and more imperative, the canonical theory had to be stretched so as to accommodate many ingenious forms of contract for what was practically, though not nominally, usury. In the latter half of the 15th cent. the Franciscans themselves instituted the *Monts-de-piété*, or charitable banks, for lending money to the poor at a small rate of interest to defray expenses of management.

Ethical considerations dominated medieval economic theory; political necessities that of the early modern period. The new national govts. had to secure greater revenue and in a liquid form. Ready money was necessary for the upkeep of armies and navies; and to meet the other requirements of a national power. It was imperative to find or create some better sources of revenue than the backward agriculture of the time. These necessities

led to the development of a mercantile system whose restrictive regulations, discriminating laws, and State interference Adam Smith and his immediate successors described and criticised. (See CLASSICAL ECONOMISTS.)

Mercantilism was the most important phenomenon of E. T. in the 16th and 17th cents., but it constituted no more than a part of a widespread and eager investigation of concrete economic facts. These studies became materials for Adam Smith's work. Money, banking, the rise of prices, pop., poor relief, etc., were extensively discussed in brochures and monographs. The maintenance of the poor was a constant subject of pamphlet and tract; Sir Thomas More, in his communistic *Utopia*, gives striking evidence that the problem of poverty occupied the attention of the best thinkers of the time. True, economic study had been separated from ethics and theology, but men like Bodin, Grotius, Pufendorf, Hobbes, and Locke developed economics into an essential part of a general political philosophy.

After mercantilism with its undue preference for commerce and industry and for a favourable balance of foreign trade there was bound to be a reaction in favour of agriculture. Mercantilism was the economic expression of nationalism: agriculture was now to find favour with the broad principles of natural law and liberty expounded in the works of Grotius, Pufendorf and Locke.

The preference for agriculture and industrial liberty found expression in the doctrines of the so-called physiocrats, the originator of which may be considered to be François Quesnay (1694-1774). The fundamental creed of the physiocrats was the subjection of economic and political phenomena to 'natural law,' which, as interpreted by them, gave rise to the familiar political doctrine of radical individualism, and a certain materialistic conception of wealth which somehow explains their peculiar economic theories. Adam Smith found that the physiocrats treated not only of political economy, 'but of every other branch of the system of civil government,' and that their political and economic theories were indissolubly fused in their general doctrine of a beneficent law of industrial freedom, according to which the largest production and most just distribution of wealth would be best secured by permitting each individual to 'pursue his own interest in his own way,' so long as he did not infringe on the liberty of others. This theory has been perpetuated and popularised by Adam Smith, and has influenced subsequent thinkers more than any other economic doctrine ever formulated. The physiocrats exposed the mercantilist error of confusing wealth with the precious metals, but they themselves fell into the error of confusing wealth with material objects, by identifying the production of wealth with the production of raw materials, whereby they concluded that manufs. and commerce, which merely change the position or form of raw materials, are

barren and unproductive, though useful and desirable when strictly subordinated to agriculture; that the value added to raw materials in the process of trade and industry is equivalent merely to the cost of production, while agriculture yields a net surplus over and above the cost of production. Quesnay considers the large agric. employer to be the real producer of wealth, not the agric. labourer. Agriculture being thus the sole source of national revenue, simplicity, economy, and justice demand that the state revenue be obtained by a single direct tax levied upon rent. Accordingly the physiocrats were the first who stated the epoch-making theory of surplus value, and the theory also that the product of industry contains a certain value, due to the co-operation of natural factors, which is in excess of the minimum remuneration required to elicit the toil and sacrifice of industry, and which constitutes, on this account, a satisfactory source of taxation.

Adam Smith (1723-90), whose *Wealth of Nations* appeared in 1776, is considered the greatest of economists and the father of economics. His influence hastened free trade, and popularised and dignified the systematic study of wealth; but his most important service was in divorcing political economy from ethics, and partly from politics. Such appears clearly in the delineation of his lectures, divided into 4 parts: I. Natural Theology; II. Ethics (included in his *Theory of Moral Sentiments*, 1759); III. Justice and Jurisprudence; IV. Political Economy. He has been accused of treating man as merely a wealth-producing animal, in whom altruistic motives are wholly absent; but in his *Theory of Moral Sentiments* the motives of duty and sympathy are fully recognised, and the desire for wealth is treated as only one of the worthier objects of ambition. Further, in *The Wealth of Nations* he opposes piece-work as calculated to excite the labourer to over-exertion, and voices the necessity for rest, diversion, and even 'dissipation.' His whole attitude is essentially this: 'Assuming that the object of the study is to increase the national wealth, this object will be most effectively secured by perfect industrial liberty.' On the other hand he did not succeed in separating politics from economics, because his ultimate purpose was to prove the supreme efficacy of the doctrine of *laissez-faire*. Before being able to lay down maxims for the increase of wealth, he had to inquire how wealth was actually produced and distributed. It was his dispassionate analysis of production, value, and distribution which had the greatest effect upon the economists who followed him, and led to the attempt to formulate a non-partisan science of political economy, which should pass no ethical or political judgments.

Malthus and Ricardo stand out among early followers of Smith and, with Bentham and other writers of the early part of the 19th cent., including McCulloch and James Mill, have been variously designated as the Classical, Orthodox, Ricardian, or Eng. school. Their general

system of thought is harmonious, but they differ upon points of economic doctrine. They are deductive in method, utilitarian and materialistic in assumptions, and cosmopolitan in the sense that their ultimate scientific ideal is the discovery of universal economic laws applicable at all times and to all nations. In France, J. B. Say may be placed in this group. He taught that supply creates its own demand (*Loi des Débouchés*) and his *Traité d'Economie Politique*, 1803, was a major means of spreading the Smithian views. The ethical framework of classical economy is due to Jeremy Bentham (1748-1832) through his formulation and continuous propagation of utilitarian philosophy. Bentham put it that 'To obtain the greatest portion of happiness for himself is the object of every rational being.'

Malthus's famous *Essay on the Principle of Population*, 1798, in which he propounded the theory that pop. tends to increase faster than food, exerted much influence in its day; but the gloomy inferences were falsified by the great advances in technology and science during the 19th cent., which multiplied production much faster than Malthus had expected, and by the use of birth control, which limited the growth in pop.

David Ricardo (1772-1823), in his theory of distribution, made the most important use of the Malthusian proposition. He held that as a country grew and pop. increased, society would be forced to resort to poorer and poorer soils to obtain its supply of food, the law of diminishing returns would operate, and as the margin of cultivation was forced down an increasing share of the product of industry would go to the landlord in the shape of economic rent—the difference between the natural productivity of the better land and the worst land in cultivation. Excluding rent, the div. of the remainder of the product between the labourer and the capitalist was determined by a corollary of the Malthusian principle—the 'iron law of wages.' This theory of distribution is fully developed as an integral part of his famous cost-of-production theory of value. When Ricardo said at times that all the expenses of production could be resolved into the toil and sacrifice of labour, he supplied the Communists with their celebrated labour theory of value, according to which labour is the sole cause of value, and consequently is entitled to the whole produce of industry, and Henry George (1839-97) with his doctrine that progress means poverty as long as private ownership of land is legal.

The most influential of Eng. economists between Ricardo and the younger, and greater, Mill was N. W. Senior (1790-1864). He propounded the abstinence theory of interest; and formulated the famous doctrine of the wages fund 'that the average rate of wages is the quotient secured by dividing the number of workmen into the fund of capital set aside by the capitalists for the employment of labour.'

John Stuart Mill (1806-73) was a thorough reformer, and typifies the transition in England from the classical to the modern school of E. T. He was first entirely under the influence of Ricardo, but in later years he followed Auguste Comte and the socialistic tendencies of his time. Fettered by the Ricardian economics, but moved by the warm desire conceived in his maturer years to find some means to improve the condition of the masses, his mind struggled hard to find a compromise between the 2 systems. The outcome of this mental battle appeared in 1848 under the title *Principles of Political Economy, with Some of their Applications to Social Philosophy*. This book was brilliantly written and became widely popular. It exercised an enormous influence upon the subsequent development of Eng. E. T. He preserved the old doctrine of rent and profits, and advocated *laissez-faire* as a general principle of political expediency, but made so many exceptions that at times they seem more important than the rule.

After 1850 Eng. E. T. was deeply affected by a reaction against the classical system. The logical successors of Ricardo and Senior were Cairnes, Bagehot, Fawcett, and, perhaps, Alfred Marshall. All of them have been defenders of the orthodox school, though they have recognised and expounded its limitations as a theoretical science. Thorold Rogers, Cliffe Leslie, Arnold Toynbee, Ashley, and Cunningham were historical economists who more or less endorsed the general views of the historical school (see below). A psychological school of political economy was founded by Jevons. He, Edgeworth, and others made important contributions in every branch of the science, particularly in statistics. Eng. economists now use all schools or methods, deductive, historical, psychological, statistical, and mathematical.

Karl Marx gave Communism a positive theory deriving from Ricardo's theory of value and distribution. The claim is that, as labour is the sole cause of value, the labourer is entitled to the whole produce of industry. Capitalism, it is asserted, is a temporary stage in industrial evolution, and must inevitably give way to collective production. Marx's theory of value has met with little favour; his doctrine, that the underlying causes of social currents, such as religion, literature, and art, are economic in character (the 'materialistic conception of history'), has influenced political scientists rather than economists.

Auguste Comte (1798-1857) is the father of modern sociology. His influence was immense. He was the first to protest against the Ricardians' aim at an abstract science of rigid precision and universal in application. Comte was the precursor of the Ger. historical school, which undertook the most influential reaction against classical economy. The historical school taught that economics is a social or political science which can be profitably pursued only in connection with the other sciences of political or social life, particu-

larly administration, law, and hist. Thus they replaced a universal political economy by an historical national economy. The nationalistic spirit of the school was first expressed in Friedrich List's economic pubs., 1789-1846.

The theory of marginal utility was most thoroughly developed and most widely applied by a group of Austrian economists, of which Menger, Wieser, and Boehm-Bawerk were the leaders. The theory itself was propounded almost simultaneously in 1871 by Jevons in England, Menger in Austria, and Walras in France. The disciples of this school held that the utility, or power of satisfying want, possessed by a commodity decreases per unit as the amount consumed increases, and the value itself expresses the utility of the last or marginal increment. The former unit of real value—i.e. the pain and sacrifice of labour—has made way for a unit of utility; the cost-of-production theory of exchange has been replaced by a wider conception which holds that value determines the expenses of production, rather than the expenses of production the value, that capital receives its value from the finished product, and not *vice versa*. The tendency of this theory has been to shift the centre of gravity in economics from the capitalist to the consumer. The theory of marginal utility still generally holds the field in the middle of the 20th cent.

Since the 1920's there has been a counter-reaction against the historical school and in favour of the main tenets of classical economics. The main leaders of the resuscitation of liberal economics have been Ludwig von Mises of Austria, Wilhelm Röpke of Germany, F. A. Hayek, first of Austria and then of England and America, Lionel Robbins and Sir Arnold Plant of England, W. H. Hutt of England and later of South Africa, and Henry Simons of America. They showed that the classical economists had often been misrepresented by historians and political theorists, and that their system of economic liberty was in many respects superior to that of central direction and planning. See CLASSICAL ECONOMISTS; ECONOMICS; ECONOMICS OF EMPLOYMENT; FREE EXCHANGE; GOLD STANDARD; MULTILATERALISM. See also the original works of the leading economists: Adam Smith, *The Wealth of Nations*, 1776; T. Malthus, *Essay on the Principle of Population*, 1798; D. Ricardo, *Principles of Political Economy*, 1817; J. S. Mill, *Principles of Political Economy*, 1844; Karl Marx, *Das Kapital*, 1867; H. Sidgwick, *Principles of Political Economy*, 1883; A. Marshall, *Principles of Economics*, 1890; Edwin Cannan, *Wealth*, 1914; A. C. Pigou, *Economics of Welfare*, 1932; L. C. Robbins, *The Nature and Significance of Economic Science*, 1932; L. von Mises, *Theory of Money and Credit*, 1934, and *Socialism*, 1938; J. A. Schumpeter, *Capitalism, Socialism, and Democracy*, 1943; T. W. Hutchinson, *A Review of Economic Doctrines, 1870-1929*, 1953; M. St John Packe, *Life of John Stuart Mill*, 1954. Robert L. Heilbroner and

Paul Streeten, *The Great Economists*, 1955, is a good readable introduction.

Economic Warfare, Ministry of, formed on the outbreak of the Second World War, to prevent vital war materials from reaching Germany. Its counterpart in the First World War was the ministry of blockade, but its functions were wider. Control bases were set up at Weymouth, the Downs, Kirkwall, Gibraltar, Aden, and Haifa, at which all shipping bound for the enemy or for neutral ports having access to enemy ter. had to submit to contraband control. The Fr. Gov. used the term 'blockade' for their analogous ministry, which co-operated closely with the M. of E. W. Shipping companies, in order to avoid delay, were encouraged to send advance copies of their vessels' manifests, giving details of all cargo carried, and names of shippers and consignees. One of the chief difficulties of the M. of E. W. was to prevent contraband goods consigned to neutral countries being resold to Germany, since it was no part of Brit. policy to ruin neutral trade with Germany, but only to prevent the entry of essential war materials, such as lead, nickel, copper, fats, etc., and in carrying out this task the M. of E. W. received information from its agents abroad, who reported upon the ultimate destination of contraband shipped to neutrals. While the M. of E. W. was responsible for answering inquiries about ships and cargoes detained by the contraband control authorities, the procurator-general became responsible as soon as the cargo had been seized and applications for release were made to that authority. Applications to bid for prize goods at auction were made to the Admiralty Marshal. Altogether the staff of the M. of E. W. numbered at most about 600.

Economics, term (*oikonomia*) by which the anc. Greeks used to signify the art of prudent and systematic household management, with particular reference to income and expenditure, and to the labour and satisfaction of the wants of the members of the household. Political economy, now generally described as E., later came to signify the art of directing the production and consumption, the incomes and expenditures of the State and its subjects. It was not commonly conceived as a neutral science till the 19th cent., when it became the science of wealth and exchangeable values. In the theoretical treatment of the matter some economists proposed to limit the term E. to the narrow science of wealth; but in about the middle of the 19th cent. the historical school (Roscher and others) maintained that the subject of the study was not wealth, but man's relation to wealth; that it was part of general social science, and could not be detached from ethics and politics. Following Adam Smith, and popular interpretations of the term, E. has been defined as the ordered knowledge of the social phenomena arising out of man's activity in the acquisition and use of wealth. A modern definition, which in many respects is

intellectually more satisfying, is that of Prof. Lionel C. Robbins, who has conceived of E. as the science that studies the principles governing the application of scarce means with alternative uses to a multiplicity of ends. This approach makes situations of scarcity rather than material wealth the subject-matter of E. Above all, it is proper to bear in mind the dictum of the late Lord Keynes that 'The theory of economics does not furnish a body of settled conclusions immediately applicable to policy. It is a method rather than a doctrine, an apparatus of the mind, a technique of thinking, which helps its possessor to draw correct conclusions.' See also ECONOMIC THOUGHT; HISTORY OF; CLASSICAL ECONOMISTS; ECONOMICS OF EMPLOYMENT; GOLD STANDARD; FREE EXCHANGE; MULTILATERALISM; RESALE PRICE MAINTENANCE; KEYNES; and entries for other economists. See L. C. Robbins, *The Nature and Significance of Economic Science*, 1932; F. C. Benham, *Economics*, 1955; R. F. Harrod, 'Economics, 1900-1950' in *The New Outline of Modern Knowledge*, 1956.

Economics and Political Science, The London School of, founded 1895, provides courses leading to degrees of the univ. of London in the faculties of arts, economics and political science (including commerce and industry), and law; also for the post-graduate academic diplomas of the univ. in colonial studies, law, public administration, and psychology; and for the school's certificates in international studies, social science and administration, mental health, applied social studies, and personnel management. There are also special courses in business administration, child care, and trade union studies. The majority of the 3500 students registered at the school are full-time, but part-time and evening students are also accepted. Over 500 graduate students are registered for higher degrees or for research. The Brit. Library of Political and Economic Science, which is housed in the school, is probably the largest in the world devoted exclusively to the social sciences.

Economics of Employment. In 1914, before the First World War, the outstanding problem was unemployment. Linked with this was the hotly-debated question of free trade versus protection. The gold standard was largely taken for granted. After 2 world wars the unemployment problem has been solved in principle; free trade has become multilateralism, and the subject of important international agreements under the auspices of the U.N.; while the gold standard had been twice abandoned, substitute arrangements being likewise brought within the scope of U.N. agreements.

In 1914 men went in fear of the 'Trade Cycle' and recurrent slumps. When the First World War broke out they had already come to regard unemployment as a more or less unavoidable economic scourge and they were the more impressed at its disappearance during the war. They were further impressed by the freedom with which money flowed in wartime; and

by the apparently bottomless state purse where war requirements were concerned. Fears or hopes that the First World War would 'stop within six months' because of financial exhaustion proved groundless. There were shortages of this material and that; but no shortage of money. As soon as the war was over the urgent cry of economy was heard and people felt it strange that while we could afford anything and everything to wage a war, reasonable requests for highly desirable amenities and improvements in well-being were met with the blunt statement that there was no money available. While it was reasonable to suppose that a devastating war would scarcely increase well-being, people nevertheless could not but be impressed with the 'money for war; no money for peace' contrast.

People had heard stories about banks making money—creating money—in the war, and they were ready to believe that such powers should be used in peace-time to create money to be spent on the good things of life. And when, after the war, unemployment arose once more and reached unprecedented levels the 'short of money' argument seemed to run contrary to commonsense. It was contrary. Whilst, given full employment with full efficiency and no increase of saving, every additional pound created must be inflationary, with unemployment in excess of minimum levels there is clearly not enough spending and we must either spend faster the money we have or create money to spend. This seems obvious enough now; but after the First World War there were still elementary misconceptions about the role of money.

Since barter made way for monetary transactions money had been of first, if not fully realised, importance in the economic field. A barter transaction was a complete exchange of goods for goods (or services). But a sale of goods for money is only a 'half' transaction which leaves the seller free to postpone indefinitely the exchange of his money for his ultimate satisfaction in the shape of goods. The vital effects of postponed spending, of saving, were not understood. In particular the effect of underspending on the national income—our aggregate income—was not recognised. It was not appreciated that the national income can rise only if someone spends more and fall only if someone spends less. There was a confused identification of the separate acts of saving and investment (spending). In dispersing this confusion lay the clue to the unemployment problem.

Some unorthodox writers, notably A. H. Abbati in a book pub. in 1924, argued the need for more spending both to cure unemployment and to utilise 'the unclaimed wealth'—to banish 'poverty in the midst of plenty.' The Liberal party, under the influence of Keynes and other economists, took up the idea and fought the 1929 general election with the slogan 'We Can Conquer Unemployment.' Yet the official view, as stoutly maintained by the Treasury, was that little or no employment could be created by state borrowing

or expenditures. It was not until Keynes in 1933 pub. his great work, *The General Theory of Employment, Interest and Money*, that first the academic world and then official circles began to show serious interest in the practicability of governing aggregate spending and so sustaining employment and the general income. In his book Keynes paid tribute to Malthus, Gesell, Hobson, and others. He referred indeed to 'orthodoxy having no valid reply to much of (the) destructive criticism' of Maj. Douglas, of social credit fame. In 1944 the Brit. Gov. White Paper on employment policy officially accepted the obligation to ensure adequate spending. Moreover in the same year by the Bretton Woods Agreement (q.v.), a U.N. conference agreed that 'The purposes of the International Monetary Fund (include) the promotion and maintenance of high levels of employment and real income . . .' It may be objected that the International Monetary Fund pronouncement looked to 'the expansion and balanced growth of international trade' to contribute to this end rather than the reverse; but the Havana Charter for an International Trade Organisation (Mar. 1948) goes further. The Charter's first objective is 'To assure a large and steadily growing volume of real income and effective demand, to increase the production, consumption, and exchange of goods, and thus to contribute to a balanced and expanding world economy.' Further quotations emphasise that it is not a question merely of the expansion of international trade contributing to high employment and income in individual countries but that the argument is now firmly put the other way round:—

Article 2 states that 'The Members recognise that the avoidance of unemployment or underemployment, through the achievement and maintenance in each country of useful employment opportunities for those able and willing to work and of a large and steadily growing volume of production and effective demand for goods and services, is not of domestic concern alone, but is also a necessary condition for . . . the expansion of international trade, and thus for the well-being of all other countries' and that 'The members recognise that the avoidance of unemployment or underemployment must depend primarily on internal measures taken by individual countries . . .'; while Article 3 states: 'Each Member shall take action designed to achieve and maintain full and productive employment and large and steadily growing demand within its own territory . . .'

The discovery of the practicability of a country deliberately maintaining its total spending and income is the outstanding achievement of modern economics, and it is a matter for satisfaction that this great international trade document embodies the idea in such substantial fashion. The idea that each and every nation could, and should, 'assure' its income and effective demand—effective spending—could not have been included in an

international instrument at the end of the First World War. But it was the experience of the First World War and its aftermath of unparalleled unemployment that led the way to the solution of the problem of recurrent unemployment.

Robertson, *Banking Policy and the Price Level*, 1926; J. M. Keynes, *A Treatise on Money*, 1930, *The General Theory of Employment, Interest and Money*, 1933; W. H. Beveridge, *Full Employment in a Free Society*, 1944; D. J. Coppock, 'The Theory of Effective Demand in the 1920's,' *The Manchester School of Economic and Social Studies*, 1954.

Economiser, see **BOILERS**.

Economism, name given by its opponents to the less dogmatic trend in the Russian Social Democratic movement of the 1890's and 1900's. There were 2 different branches of E., one maintaining that the workers' task in Russia was to fight for economic gains while politically supporting the constitutional movement of the liberal bourgeoisie; the other maintaining the need for a Social Democratic party but emphasising that the latter's policy should be dictated by the workers. The 2nd group exercised considerable influence in the Menshevik faction. See also **ISKRA**; **MENSHEVIKS**; **RUSSIAN SOCIAL DEMOCRATIC LABOUR PARTY**.

'**Economist, The**,' London weekly jour. founded in 1843 'to discuss financial questions in their wider social and commercial aspect.' James Wilson was the founder and editor from its inception until 1877, when he was succeeded by Walter Bagehot. Under more recent editors such as Lord Layton and Mr Geoffrey Crowther, the field covered by *The E.* has widened to include every aspect of public affairs. The paper has always been a force in politics, perhaps because its consistent policy of putting every question to the 'test of the facts' has resulted in an independent outlook. All articles are anonymous.

Economus, or **Eonumus**, hilly cape on the S. coast of Sicily, situated between Agrigentum and Camarina. It was the site of a battle fought in 311 bc, when the Syracusan Agathocles suffered defeat at the hands of the Carthaginians.

Ecorse, city in Wayne Co., SE. Michigan, U.S.A., on Detroit R. It manufactures steel, chemical products, auto parts, tools, and luggage. Pop. 18,000.

Eorins, **Barre des**, or **Pointe des**, the termination of the Dauphine Alps (q.v.). Until 1862 it was regarded as belonging to Mont Pelvoux, but F. F. Tuckett in that year estab. its separate existence. It reaches a height of 12,450 ft.

Ecstasy (Gk *ekstasiánai*, to derange), a frequent but by no means invariable concomitant of mystical prayer. It occurs most often in the 'illuminative way,' seldom if ever in the much rarer 'unitive' stage (see **PRAYER**). The most characteristic phenomenon of E. is a suspension of

the faculties. This may be, and very often is, only partial: when total it is known as 'ligature.' E. is described with wonderful clarity and abundant detail in the writings of St Teresa and St John of the Cross (qq.v.). E. in the form and circumstances described above is not to be confused with trance (q.v.).

Ectropion, eversion or curving outwards of the eyelids, resulting from chronic, long-continued irritation. This produces an unsightly condition, which comes under the category of 'blear-eyed.'

Ecuador (so called because the equator crosses it), rep. of South America, bounded on the SE. and S. by Peru, on the N. and NE. by Colombia, and on the W. by the Pacific. The boundaries between E. and the neighbouring countries were definitely settled only in 1944, the question having been referred to arbitration. The country is triangular in shape, and may be divided into 3 sections, the narrow, low-lying coast-land, the mt region, and the vast plains to the E. These dists. may be called the Cis-Andine, Inter-Andine, and Trans-Andine respectively. The prin. peaks of the Andes (q.v.) which are situated in E. are Chimborazo, Cotopaxi, Cayambe, Antisana, Cotoacachi (qq.v.), and 6 others with an altitude of over 16,000 ft. The prin. port of the country is Guayaquil, the cap. Quito; and Cuenca, Ambato, and Iñabamba are important cities (qq.v.). The chief rvs. are the Esmeraldas, the numerous streams that combine to form the Guayaquil; these flow to the Pacific. Trans-Andine E. is watered by the upper waters of many tribs. of the Amazon. The fauna include deer, tapirs, peccaries, parrots, humming-birds, and numerous reptiles; the condor, which inhabits the slopes of the Andes, is the most remarkable bird. The climate of the country is hot and unhealthy, especially in the rainy season from Dec. to April, save in the valleys of the middle region, where it is cool and salubrious. Vast areas of the country are covered with virgin forest, rich in rubber, cinchona, dyewoods, and other valuable timbers. Most of this forest area lies in the Amazon basin, but the Pacific slopes of the Andes up to an altitude of 5000 ft. are also forest clad. In the coastal regions and lower riv. valleys tropical farming is carried on, and cocoa, coffee, cotton, tobacco, sugar, and rice are grown; among the foothills and mt valleys is land suitable for grazing and dairy-farming and the cultivation of potatoes, cereals, and temperate fruits and vegetables. The output of cocoa, E.'s staple produce, is declining owing to competition, but it is still the most important export. The *Witchbroom* disease, which appeared in 1921 in the cocoa plantations, has had a disastrous effect on E.'s agric. wealth. Coffee, ivory-nuts, wild rubber, rice, caoutchouc, cinchona bark and fruits are other vegetable exports. 'Panama' hats are another article of trade. E. is the world's chief supplier of balsa wood. Petroleum is the chief mineral; considerable quantities of gold are found, and silver, copper, lead, iron, and coal are known to exist; sulphur is another im-

portant mineral product. Quicksilver is also mined, and emeralds and rubies are occasionally found. A beginning has been made with petroleum exploitation on the Santa Elena peninsula, at Salinas and La Libertad. Communications are bad, roads being very poor; there is river-transport in some dists. and some 1100 m. of railroad. There is no state religion, and toleration prevails; education is fairly well provided for, though methods need improvement. There are univs. at Quito, Guayaquil, and Cuenca, and a law college at Loja, with univ. statutes. There are 3700 primary schools, with 332,000 registered pupils, and 182 secondary with 32,400. Two-fifths of the pop. remain illiterate.

The gov. is in the hands of a president, a council of state, a senate, and a chamber of deputies. There are 2 senators for each of the 18 provs., and a deputy for every 50,000 inhab. elected by universal suffrage; the president is elected for 4 years. No privileges of rank or race are recognised. There are a small army, navy, and air force. In 1954 exports were valued at £36,000,000 and imports at £28,800,000. The area of E. cannot be definitely given, but is probably in the region of 175,000 sq. m. The Galápagos Is. have an area of 2868 sq. m. The Incas of Peru conquered this area towards the end of the 15th cent., and were in their turn conquered by the Spaniards under Pizarro. For 200 years the country remained part of the Sp. state of Peru; then, in 1822, a revolutionary war gave it independence, it becoming a part of the rep. of Colombia. In 1830 there was a civil war in this newly-created rep., and the presidency of Quito became the rep. of Ecuador. Warfare arising out of the border question continued, however, between E. and Peru nearly 100 years; and in 1941 Peru invaded the prov. of El Oro. The dispute was settled by the arbitration of Argentina, Brazil, and the U.S.A., and agreement reached in 1944. The pop. of 3,600,000 is composed chiefly of aboriginal Indians, descendants of the Sp. conquerors and people of mixed blood. See L. Ternaix-Compans, *Histoire du royaume de Quito. Traduite de l'Espagnol* (Velasco, *Historia del reino de Quito*), 1840; C. Cevallos, *Compendio del resumen de la historia del Ecuador*, 1885, and *Resumen de la historia del Ecuador* (Guayaquil), 1886; W. Reiss and A. Stübli, *Hochgebirge der Republik Ecuador*, 1892-3; C. R. Knock, *Ecuador*, 1914; B. Niles, *Casual Wanderings in Ecuador*, 1923; V. W. von Hagen, *Ecuador the Unknown*, 1939; A. B. Franklin, *Ecuador: Portrait of a People*, 1943; Lilo Linke, *Ecuador*, 2nd ed. 1955.

Ecumenical, or **Oecumenical** (Gk *oikoumenikos*, universal, concerning the whole inhabited world), term applied to the decisions of the whole Christian Church as embodied in the definitions of ecumenical or general councils from that of Nicaea onwards (see **COUNCILS**). The Apostles' Creed, the Nicene Creed, and that commonly called the Creed of St Athanasius are spoken of as E. symbols,

being held throughout the whole Church. The Rom. Catholic Church considers a council E. if summoned by the Pope from the Churches in communion with Rome.

Ecumenical Movement, a M. among non-Rom.-Catholic Christians to promote unity between the Christian Churches, by mutual study of each other, and conference and co-operation between them. A conference of various Churches was held at Edinburgh in 1910, followed by the Life and Work Conference at Stockholm, 1927, in which the Eastern Orthodox Church took part, Rom. Catholics being forbidden to do so. After continuation meetings of these 2 conferences in England in 1938 their work was fused that same year at Utrecht under a new committee, the World Council of Churches (q.v.), with a general secretariat at Geneva. It publishes a quarterly, *Ecumenical Review*, and organised its 1st E. conference at Amsterdam in 1948, with a missionary conference at Bangkok in 1949. A 2nd E. conference took place at Evanston, U.S.A., in 1954. The Churches of the E. M. recognise (1) that Christ is the Divine Head of His Body the Church; (2) that the Church of Christ is One, though Christians are now outwardly divided; that Christians must work and pray for the manifestation of the Church in its oneness. At the same time, membership of the World Council does not commit each Church to accepting the other Churches as being such in the true and full sense of the word. See Y.M.C.A. Press, *Proceedings of the 1948 Conference of Autocephalous Churches at the Jubilee of the Russian Church*, Paris, 1952; J. M. Todd, *Catholicism and the Ecumenical Movement*, 1955.

Eczema, see **SKIN**—*Diseases*; (domestic animals, see **DOG** and **HORSE**).

Edam, historic little tn in the prov. of N. Holland, Netherlands; it is one of the so-called dead cities of the IJsselmeer (Zuider Zee), but still very much alive, with a large Gothic 14th-cent. church, a museum in a house in the likeness of a ship built by a 16th-cent. sea-captain, and a bell tower with a very musical chime. E. is noted for its cheese which is exported from the country round it. Pop. 13,400.

E.D.C., see **EUROPEAN DEFENCE COMMUNITY**.

Edda, name given to 2 widely different but vastly important works in Old Icelandic. The original meaning of the word is uncertain.

(1) *Elder* or *Poetic Edda*, a large collection of lays, some mythical, some heroic, one of the great treasures of Germanic tradition. They are composed in 3 different though kindred metres, mainly governed by the same principles as O.E. and other Germanic poetry, and based on alliteration: *fornyrðislag*, *máladráttir*, and, the most irregular of the 3, *ljóðadráttir*. The earliest lays probably date from the 9th cent., the latest from the 11th. All are anonymous. About 1640 Bishop Brynjólfur Sveinsson (q.v.) came into possession of the vellum MS. containing the bulk of these lays, which he ascribed

to Sæmundur Sigfússon (q.v.), but we do not know on what authority. Whether the ascription be accurate or not, the name *Sæmundar-Edda* is irremovably fixed in Iceland. The heroic lays concern events and people familiar to all Germanic races, some legendary, some historical, and give expression to common N. heroic ideals. They are vigorous and often powerfully dramatic in style. Typical examples are *Atlakviða* (Lay of Atli) and *Völundarkviða* (Lay of Volundr-Weland the Smith in Eng. tradition). In comparison the mythological eddic poems are probably more strictly Scandinavian in origin. Some are didactic in their treatment of pagan beliefs and customs, e.g. *Hávamál* (Words of the High One, Odin); others, like *Þrymskviða*, tell stories about the gods. The greatest mythological poem is the *Völuspá* (q.v.).

(2) *Younger or Prose Edda*, or, in Iceland, *Snorra-Edda*, the work of Snorri (q.v.) Sturluson. It consists of 3 main sections: (a) *Gylfaginning* (The Delusion of Gylfi), a concise and surprisingly comprehensive survey of N. mythology, told in the form of a tale which is one of the supreme examples of Icelandic narrative art. (b) *Skáldskaparmál*, or Poetic Diction and Vocabulary, of chiefly technical interest, in which 'kenning' and other stylistic terms are defined, with examples. (c) *Háttatal*, a poem composed in honour of King Hákon of Norway and Duke Skúli Bárðarson. This consists of 102 stanzas in 100 different metres, exemplifying Snorri's marvellous metrical skill, and demonstrating the principles of composition laid down by him in the preceding section. Without this book our knowledge of N. mythology would be pitifully small, and we would then understand little of the Skaldic poetry which has come down to us.

There are sev. Eng. translations of the *Elder Edda*, the most accessible being that of H. A. Bellows. Of the *Prose Edda* translations by A. G. Brodeur and Jean I. Young may be recommended. See also Bertha S. Philpotts, *Edda and Saga*, 1931, and the ed. of the *Eddas* by Gudni Jonsson, with a joint commentary on both, 1949.

Eddington, Sir Arthur Stanley (1882-1944), astronomer and physicist, b. Kendal, Westmorland, and educ. at Owen's College, Manchester, and Trinity College, Cambridge, where he was Senior Wrangler in 1904 and Smith's Prizeman in 1907. He was made a Fellow of his college in 1907, and after 7 years' work (1906-1913) as chief assistant at the Royal Observatory, Greenwich, he was elected Plumian Prof. of Astronomy at Cambridge, his tenure of the chair being combined with the directorship of the Univ. Observatory, and elected a Fellow of the Royal Society in 1914. E.'s main work was not that of an observational astronomer, his time at Greenwich being mainly taken up with statistical examinations of stellar motions, and his researches in this sphere led to the pub. of his *Stellar Movements and the Structure of the Universe*, which appeared in 1914. His

original fields of research were the investigation of the stellar system, the study of the internal constitution of the stars, the interpretation of the theory of relativity and the estab. of the relationship between atomic structure and cosmogony. In 1916 he took up the study of the radiative equilibrium of the stars and reached the conclusion that big stars were tenuous and small stars dense. One of his most striking discoveries was a correlation between the mass and luminosity of stars (1924): he showed that the absolute luminosity of a star increased with its mass and that the luminosity per unit mass also increased. This law enabled astronomers to calculate the masses of the thousands of stars whose luminosities could be correctly measured. He extended his work to cover the Cepheid variables. He confirmed Einstein's theory of relativity by means of the solar eclipse on 29 May 1919 and extended it mathematically. His especial contribution to relativity was a generalisation of Weyl's theory—by which electromagnetic phenomena are included with gravitation in the geometry of the world—giving a conceptual representation of physical phenomena which allowed a new understanding of them. The chief feature of his generalisation is the idea of a unit of interval at every point of space-time; what is called a metre at any place and in any direction is a constant fraction of the radius of curvature of space-time for that place and direction. The last 10 years of E.'s life were occupied with research for precise connections between the cosmological constants and those of atomic physics, and in 1933 he pub. his popular book *The Expanding Universe* in which he developed his views of phenomena that might be expected in a finite expanding spherical universe of the type suggested by Einstein. In 1943 he pub. a complete account of his researches in his lectures before the Dublin Institute for Advanced Studies, entitled *The Combination of Relativity Theory and Quantum Theory*. His great book on the *Relativity Theory of Protons and Electrons*, 1936, is controversial and its value cannot be assessed yet; but his adversaries cannot deny his capacity for advancing rather startling ideas and for the brilliant working out of their consequences. In addition to the above-mentioned great books E. was the author of many other works. One of these was *The Nature of the Physical World* which was based on the Gifford Lectures delivered at Edinburgh in 1927. E. was a brilliant expounder of physics and astronomy with the gift of being able to impart the most abstruse conceptions in the simplest and withal most fascinating language—as may be seen in his *Space, Time and Gravitation*, 1920, and *Stars and Atoms*, 1927; and he was an able interpreter to philosophers of the significance of the most recent scientific discoveries. He was elected a Fellow of the Royal Society in 1914, knighted in 1930, and decorated with the O.M. in 1938. See A. D. Ritchie, *The Philosophy of Sir Arthur Eddington*, 1948.

Eddoes, see COCCO.

Eddy, Mary Baker (1821-1910), the discoverer and founder of Christian Science and author of its text-book, *Science and Health, with Key to the Scriptures*, and other works on Christian Science. Mrs. E., whose maiden name was Mary Baker, was born to Congregational parents of Puritan ancestry at Bow, New Hampshire, U.S.A., 16 July. She was thrice married. After a frail youth and middle age, most of which time she devoted to study, writing, and experimenting in the various systems of therapeutics in order to discover if possible the cause and cure of disease, Mrs. E., who was a profound student of the Bible, as the result of the instantaneous healing of the effects of an accident considered fatal, discovered in 1866 what she declared to be the divine principle underlying Jesus's works. On this discovery she founded her healing system and named it Christian Science. In 1875 she pub. *Science and Health, with Key to the Scriptures*; founded the 1st Christian Science church, in Boston, Massachusetts, in 1879; estab. successively the Massachusetts Metaphysical College in 1881, *The Christian Science Journal* (monthly), *Sentinel* (weekly), *Herold* (monthly in German), and *Monitor* (daily). Other writings include *The Science of Man*, 1870, *The People's Idea of God and Christian Healing*, 1886, *Rudimental Divine Science*, 1891, *Church Manual*, 1895-1910, *The First Church of Christ, Scientist and Miscellany* (posthumously), 1913. The most thorough authorised biography of Mrs. E. is that by Sibyl Wilbur, *Life of Mary Baker Eddy*, 1913. In it the reader will find details of Mrs. E.'s early life; of her struggles to gain a hearing for her ideas and her book and to protect them and herself from persistent attacks made from various sources—pulpit, Press, and medical—which involved some misrepresentation of both; of her final triumph in which she saw her Church grow, prosper, and become a power. Mrs. E. left the bulk of her estate, valued at \$2,000,000, in trust for the extension and promotion of Christian Science as taught by her. Suits were brought against the executors of her will by a son and adopted son of Mrs. E., but these were finally withdrawn. See also CHRISTIAN SCIENCE.

Eddy, see WHIRLPOOL.

Eddy-currents, circulating currents generated in any solid piece of metal by a varying (moving or alternating) magnetic field. In armatures of machines and in cores of transformers, E. represent an appreciable loss through heating, partly alleviated by building these pieces of thin sheets, with a fine coat of varnish, bolted together. The varnish, being an insulator, obstructs the path of the E. in direction normal to the sheets. E. induced in a metal disc rotating in a magnetic field act as a brake, an action used in supply meters. See ELECTRIC METERS.

Eddystone Lighthouse, light in the Eng. Channel erected to mark a group of rocks

which lie in the fairway from the Start to the Lizard, and are visible only at ebb-tide. The lighthouse is situated about 9 m. from the Cornish coast, and 14 m. SSW. of Plymouth. The present structure is the 4th which has been erected. The 1st was in the form of a wooden polygon 100 ft in height with a stone base; it was built by Henry Winstanley in 1696 and carried away by the storm of

Topical Press

THE EDDYSTONE LIGHTHOUSE

1703. The 2nd was also of wood on a stone base; it was erected by Mr Rudyard in 1706, was 92 ft high, and was burned down in 1755. The 3rd edifice was rebuilt by John Smeaton and was built of blocks of Portland oolite encased in granite and dove-tailed together. It was 26½ ft at the base, 15 ft at the top, and 85 ft in height. The rock on which it was built was undermined, so the structure was taken down and re-erected on Plymouth Hoe; the 1st tower was left on its site. The present lighthouse was designed by Sir J. N. Douglass and completed in 1882; its lamp has a dioptric apparatus and gives a light equal to 358,000 candles. The light gives a double flash every half min. and can be seen for 17 m., being 133 ft above the water.

Ede, James Chuter (1882-), politician. b. Epsom, Surrey, son of a grocer there; educ. at local schools, Dorking High School, and at Christ's College, Cambridge, having won a scholarship from the Battersea Pupil Teachers' Centre. He subsequently became a schoolmaster. He first entered Parliament as a Labour M.P. in 1923. From 1945-51 he was home secretary, and for 6 months in 1951 was leader of the House of Commons.

Edelinck, Gérard (1649-1707), engraver, b. Antwerp, and worked in Paris. He was a pupil of Poilly. Louis XIV entrusted to him the execution of sev. important works. He used every device of the burin to give 'colour,' texture, and light and shade to his plates. Among his works, which number some 400, his 'Holy Family,' after Raphael, may be mentioned; but he is noted for engraved portraits, including those of Le Brun, Rigaud, Philippe de Champaigne, La Fontaine, Colbert, Dryden, and Descartes.

Edelweiss, or *Leontopodium alpinum*, well-known species of Compositae which occurs in its wild state in Switzerland, but can be cultivated in Britain. The dense involucre consists of outer female florets and inner male florets, which are surrounded by hairy bracts.

Eden, George and William, see AUCKLAND, EARL OF, and AUCKLAND, 1st BARON.

Eden, Sir (Robert) Anthony (1897-), Brit. statesman, son of Sir Wm E., of Bishop Auckland, educ. at Eton and Christ Church, Oxford, where he took a 1st in Oriental languages. He served with distinction in the First World War, being awarded the M.C. In 1923 he was elected Conservative M.P. for Warwick and Leamington, representing this constituency continuously until 1957.

Under the National Gov. he became under-secretary at the Foreign Office, 1931; lord privy seal, 1934; and minister without portfolio for League of Nations affairs, 1935. E.'s grasp of foreign affairs was shown by his skilful handling of diplomatic negotiations during 1935, and in Dec., when Hoare resigned on the pub. of the Hoare-Laval proposals on Abyssinia, he was made foreign secretary. E.'s views differed fundamentally from those of Chamberlain, Baldwin's successor as premier, and in Feb. 1938 he resigned as a result of a difference of opinion with Chamberlain over proposals for an Anglo-It. pact.

E. was recalled to office on the outbreak of the Second World War, becoming secretary of state for dominion affairs. He was made secretary for war in Churchill's cabinet (May 1940) but in the same year became once again foreign secretary, a post he held until 1945, doing much to consolidate Anglo-Russian friendship after 1941. From 1945 to 1951 his party was in opposition, but in 1951 E. returned to the Foreign Office. His tenure of office was marked by sev. conspicuous successes; in 1954 the Geneva Conference produced a settlement of the Indo-China problem, and in this E. played a conspicuous part. The London agreement (1954) which

solved the problems of co-ordinated W. European defence created by the Fr. Assembly's final rejection of E.D.C. was also due in great measure to E., and has been considered the greatest achievement of his entire political career.

E. succeeded Sir Winston Churchill as prime minister and Conservative leader in 1955. At the general election in May his party was returned with an increased majority. At first the administration seemed to run smoothly: the meeting of heads of govts. at Geneva in 1955 was

Karsh of Ottawa

SIR ANTHONY EDEN

followed in early 1956 by the visit of Bulganin and Krushchev to London, and the friendlier atmosphere of foreign affairs was matched by increasing prosperity at home. But throughout 1956 the situation deteriorated: rising prices, the 'credit squeeze,' and limited unemployment produced discontent at home, and, abroad, the nationalisation by Egypt of the Suez Canal in July was soon followed by an Israeli-Egyptian war in which E. sanctioned Franco-Brit. armed intervention. By the end of the year Brit. influence in the Middle East was at a low ebb; but there were signs that the Anglo-Amer. alliance, much shaken by the Suez events, was reviving. E.'s health, however, had broken down and on 9 Jan. 1957 he resigned the premiership. Subsequently, he announced his intention to resign his parl. seat. He was succeeded as premier by Harold Macmillan (q.v.). E. was created Knight of the Garter, 1954. His publications include: *Foreign Affairs*, 1939, and *Freedom and Order*:

Days for Decision (selected speeches), 1949. See *lives* by L. Broad, 1955; A. Campbell-Johnson, 1955; and W. Rees-Mogg, 1956.

Eden, riv. of England, which rises among the Pennines, on the borders of Westmorland and Yorks. It flows in a NW. direction, through Appleby, Eden-hall, and Carlisle. After a distance of 65 m. it forms a wide estuary at Rockcliffe, in the upper part of the Solway Firth.

Eden, Garden of (Heb. 'delight'), described in Genesis as the first home of man. The Greek for garden gives us our word paradise. There has been much discussion regarding the exact site of Eden, and many futile efforts have been made to reconcile the mythical geography of Genesis with modern knowledge. Recent discoveries, however, have shown that *Edin* was the Sumerian name for the plain of Babylon, and at the S. end of it was the city of Eridu, and near it a beautiful garden said to contain the Tree of Life. The accepted site to-day appears to be El Qurnah, in Iraq. The riv. with its 4 heads, spoken of in Genesis, must have been the Persian Gulf, which the Babylonians regarded as a riv. An idea similar to that of the Tree of Life appears also in the *Vedas*, in which the first man is represented as leading men to the garden of immortality where he dwelt in fellowship with the gods; but the idea of the primeval state of man, in the biblical account of Paradise, is more religious and ethical than any of the myths that may resemble it in other ways. See the commentaries on Genesis and F. Delitzsch, *Wo Lag das Paradies*, 1881, and *Im Lande des einstigen Paradieses*, 1903.

Edenbridge, mkt tn of Kent, England, 10 m. W. of Tunbridge Wells. Hever Castle, near by, was once owned by the Boleyn family, and here Anne Boleyn made her home. Built in the 15th cent., it is now restored as the country seat of Lord Astor of Hever. Pop. 3500.

Edenderry, mkt tn of co. Offaly, Rep. of Ireland, near the Offaly-Kildare border. Pop. 2600.

Edenhall, vil. and par. in Cumberland, England, on the R. Eden, 3½ m. NE. of Penrith. Here is the site of the family seat of the Musgraves, owners of the glass cup known as *The Luck of Eden Hall* (at present in the Victoria and Albert Museum, London), the subject of Uhland's ballad, trans. by Longfellow. Pop. 216.

Edentata, order of mammals characterised by the absence of teeth in the front of the jaws and by the simple structure of their cheek-teeth, which are composed solely of ivory and cement, without any trace of enamel. They are of a low degree of organisation, although many of them are specialised for particular modes of life. All Edentates are either arboreal or terrestrial. Sloths, anteaters, and armadillos are the main members of this order.

Edenton, city of N. Carolina, U.S.A., co. seat of Chowan Co., with many historic associations. On 24 Oct. 1774 51 ladies at the 'Edenton Tea Party' signed resolu-

tions that they would not use tea or anything manufactured in England until the tax on tea should be repealed. The royal governors lived here. During the 18th cent. the N. Carolina legislative assembly met here, and many important statesmen lived near E. It is a trade centre for an agric. area. Pop. 4468, of whom a large proportion are negroes.

Ederle, Gertrude (1908-), Amer. swimmer, the 1st woman to swim across the Eng. Channel, which she did from France to England in 1926 in 14 hrs 34 min.

Edessa: 1. See *URFA*.

2. Tn of Greece, cap. of the dept of Pella, on the railway from Salonica to Monastir. It is a centre of the textile industry. Pop. 15,000.

Edfu, or *Idfu*, tn of Upper Egypt, situated on the W. bank of the Nile, in lat. 24° 59' N. It is the anc. Apollinopolis Magna, and is noted for its remarkable sandstone temple of E., which is the most complete Egyptian temple existing. It was begun by Ptolemy XIII in 57 BC and took over 180 years to complete. It is approached by 2 large pylons of great antiquarian interest. The tn of E. stands 484 m. SSE. of Cairo, and has manufs. of earthenware.

Edgar, or *Eadgar* (d. 975), surnamed 'The Peaceable,' Eng. king, succeeded at the age of 17 to the kingdoms of Mercia and Northumbria, but on the death of his eldest brother, Edwy, became king of the rest of England (959). After his coronation in 973 he is said to have been sworn allegiance to by 6 (or, according to some sources, 8) other Brit. kings at Chester. His reign was remarkably peaceful and it is chiefly memorable for E.'s friendship with St Dunstan (q.v.). All royal assistance was given to St Dunstan in his reorganisation of the Eng. Church.

Edgar Atheling (d. c. 1125), Eng. prince, great-nephew of Edward the Confessor. He must have been little more than a child on Edward's death, and it is hardly surprising that his claim to the throne was passed over in favour of Harold of Wessex. When Harold was killed at Hastings, the surviving Eng. leaders turned to E. as the last male representative of the line of Cerdic. E., however, swore fealty to William at Berkhamsted, but in 1067 judged it prudent to take refuge in Scotland with his mother and sister. He later went to Flanders, but about 1074 returned to England and was reconciled to William. E. helped to get his nephew Edgar on the Scottish throne, 1097; went on the First Crusade, and fought for Robert against Henry I at Tinchebray. He was taken prisoner by Henry, but was subsequently released and the rest of his life was apparently uneventful.

Edgbaston, dist. of Birmingham, England, to the W. of the city centre, a charming and spacious suburb. Cardinal Newman lived and worked at the Oratory of St Philip Neri in Hagley Road. Here are the main buildings of Birmingham Univ., including the famous Barber Institute of Fine Arts, the new Queen Elizabeth Hospital, and the Botanical Gardens.

Edgehill, hilly ridge in Warwickshire, England, 7 m. from Banbury. It is noted as the scene of the first battle of the Civil war in 1642. The country below was called the 'Vale of the Red Horse' from the figure of a horse formerly cut in the red soil of the hillside.

Edgeworth, Henry Essex (1745-1807), Irish priest, known as 'Abbé Edgeworth', b. Edgeworthstown, Ireland, where his father was rector. In 1748 E. was converted to Catholicism and went to Toulouse. E. entered the priesthood, and when he was ordained took the surname of De Firmont. He was made confessor to the princess Elizabeth in 1791, and in 1793 to her brother, Louis XVI, whom he attended to the scaffold. In 1796 he went to England, and was made chaplain to Louis XVIII, who was in exile there. He d. at Milan of a fever caught whilst attending the Fr. prisoners.

Edgeworth, Maria (1767-1849), novelist, b. Black Bourton, near Oxford, daughter of Richard Lovell E. (q.v.). Much of her life was spent on her father's Irish estate at Edgeworthstown. Her father, who was himself a writer on education and mechanics, gave much attention to her training, and she assisted him in his writing, especially in *Practical Education*, 1798, and the *Essay on Irish Bulls*, 1802; she also wrote stories to amuse her father's large family by his 4 wives, with the last of whom she enjoyed a close friendship. She soon discovered that her talent lay in fiction, and from 1800, when her first novel, *Castle Rackrent*, appeared, until 1834, when her last, *Helen*, was pub., she continued to produce a series of tales marked by ingenuity of invention, humour, and acute delineation of character. Sir Walter Scott, whose friend she was, declared that it was her success in picturing Irish character that gave him the idea of doing the same services for Scotland. In addition to the novels mentioned above she wrote *Belinda*, 1801, *Leonora*, 1806, *Tales of Fashionable Life*, 2 series, 1809, 1812, *The Absentee*, 1809, *Ormond*, 1817, and completed her father's *Memoirs*, 1820. She also pub. sev. books for or about children, including *Moral Tales*, 1801, *Popular Tales*, 1804, *Frank*, 1822, and *Harry and Lucy*, 1825. See studies by H. Zimmer, 1883; E. Lawless, 1904; also A. J. C. Hare, *The Life and Letters of Maria Edgeworth*, 1894; A. Paterson, *The Edgeworths*, 1914; F. V. Barry, *Maria Edgeworth: Chosen Letters*, 1931; and S. H. Ronilly (ed.), *Romilly-Edgeworth Letters*, 1936.

Edgeworth, Richard Lovell (1744-1817), writer, b. Bath. Remarkable for his powers of mechanical invention, he was a member of the last Irish parliament before the Union. He educ. his children in the spirit of Rousseau's teaching, and wrote on *Practical Education*, 1798, in collaboration with his daughter, Maria E., the novelist (q.v.).

Edgeworthstown, tn of co. Longford, Rep. of Ireland, the home of the Edgeworth family. Pop. 550.

Edgren, Anna Carlotta (Cajanello, Duchess of) (1849-92), Swedish authoress,

b. Stockholm. Her first husband, Judge E., did not share her advanced views, and after her divorce she married Pasquale de l'ezzo, duke of Cajanello. She pub. her 1st vol. of stories in 1869, entitled *By Chance*; later she wrote plays, of which the chief are *The Struggle for Happiness*, 1887, and *How One Does Good*, 1895. Most of her problem plays and stories now seem dated.

Edgware, anct par. of Middx, England, now in the bor. of Hendon, 11 m. NW. of London. It lies on the E. side of the anct Watling Street, known between here and London as the E. Road.

Edict of Nantes, edict signed by Henry IV of France in April 1598. It allowed the Huguenots free exercise of their religion, gave them definite rights of public worship, threw open to them all the offices of state, and estab. a Protestant chamber in the *Parls parlement*, and joint chambers in the local govts. This measure did much at the time to promote the internal peace and prosperity of France, but gradually the Huguenots' rights were not maintained in practice, and in 1685 Louis XIV formally revoked the E. of N. As a result considerable numbers of one of the most intelligent and industrious sections of the community left the country. They settled down in Protestant countries, many in Holland, Prussia, and Great Britain, and were generally a great acquisition to whatever country they chose.

Edictal Citation, term of Scots law used to describe a citation where personal service of the summons is impossible, as in the case of a non-resident debtor. Originally a proclamation was made, and an edict or order of the court was posted up in a public place. Now, however, a copy of the summons with a schedule of the citation attached is sent to the keeper of E. C.s at the Edinburgh General Register House.

Edinburgh, Philip, Duke of, see PHILIP. **Edinburgh, Dukedom of**, was first conferred in 1726 by King George I on his eldest grandson, Frederick. The dukedom having merged in the Crown by the accession of Frederick's son as George III, an earldom of E. was subsequently held by 2 Hanoverian dukes of Gloucester, and the dukedom itself revived for Queen Victoria's 2nd son, Alfred, in 1866. It became extinct on his death in 1900, his only son having predeceased him, and he was succeeded as duke of Saxe-Coburg by his nephew, Leopold Charles, Duke of Albany. The title of duke of E. was again revived in 1947, being one of those conferred, together with the prefix 'His Royal Highness,' on Lieut. Philip Mountbatten, R.N. (formerly Prince Philip of Greece and Denmark, which title he relinquished on being naturalised in Feb. 1947), on his marriage (20 Nov. 1947) to Princess Elizabeth, the elder daughter of King George VI and Queen Elizabeth and then Heiress-Presumptive to the throne. The other titles conferred on him at the same time were baron Greenwich and earl of Merioneth, one of the new dignities, therefore, being derived from England, one

from Scotland, and one from Wales. The heir to the dukedom (and 1st in succession to the throne) is Prince Charles Philip Arthur George, b. 14 Nov. 1948. *See also* PHILIP.

Edinburgh, cap. of Scotland, and one of the most ancient and finest cities in the U.K.; situated on the S. shore of the Firth of Forth, 390 m. N. of London, and 105 m. from Aberdeen.

The origin of E. is involved in obscurity, like most towns whose hist. extends for a

yet. King Robert Bruce held a Parliament at Holyrood in 1327, and his last Parliament was held in E. in the following year, but the chief importance of the town was from a military point of view. E. was held by the Eng. for sev. years, but with the outbreak of war between England and France in 1338, the Scots regained their lost ground. A new era began for E. with the accession of James I. E. may be called the cap. of the Stuarts; it shared the vicissitudes of that dynasty, and sank into

C.O.I.: Crown copyright

PRINCES STREET, EDINBURGH, FROM THE EAST

On the left is the Castle, and in the centre the Scott Monument.

long way into the past. The most probable account of the origin of the name E. is that it was derived from the Northumbrian King Eadwine; it had obtained the name Eadwinesburg or Edwinesburg as early as the beginning of the 7th cent. After this time very little is known of the hist. of E. until the reign of Malcolm Canmore (the son of Duncan I), when Donald Bane besieged E. Castle after Malcolm's death. In the year 1128, E. is called by David I 'his burgh of Edinburgh'; David lived more at E. than his predecessors had done, and this custom was followed by his descendants. By the treaty of Falaise, in the reign of William the Lion, E. Castle and other Scottish garrisons were ceded to England, but were restored as part of Ermengarde de Beaumont's dowry when she married Wm. Though E. had been frequently used as a royal residence, it was by no means the cap. of the country

comparative unimportance when they deserted it. It was not a walled town until the middle of the 15th cent. The 1st printing press was erected in the beginning of the 16th cent.; in the succeeding cent. E. was recognised as the undisputed cap. of the country. At an early period of the Reformation E. was converted to the Protestant faith; and in succeeding ages the great majority of its inhab. adopted the Calvinistic creed and adhered rigidly to the Presbyterian form of worship. The Union of England and Scotland aroused great excitement in E., and attempts were made to intimidate the members of the Scottish Parliament who were favourable to the Act of Union, but the Act was eventually passed without bloodshed. An unsuccessful attempt was made by the Jacobites to surprise the castle in the rebellion of 1715. In 1745 the Jacobites were more successful, and

were masters of the tn from 15 Sept. to 31 Oct., but could not reduce the castle. The Porteous affair of 1736 was a remarkable occurrence; the populace lynched the captain of the guard, Porteous, who had fired on the crowd and killed 6 persons. The city was ordered to pay £2000 to the widow of Porteous; the ringleaders were never discovered. In 1779 a mob burnt one Catholic church and plundered another during the parliamentary discussions on the subject of Catholic claims. The societies which were formed in E. about the time of the Fr. Revolution in sympathy with the principles prevailing in France were put down with great severity. George IV visited E. in 1822, and won great popularity by wearing the Highland dress. He was the 1st sovereign to visit the city since 1650. Holyrood was granted as a residence to the exiled King of France, Charles X., in 1830, and in 1842 Queen Victoria and Prince Albert visited the city.

Three eminences which run from E. to W. form the site of the city, which is surrounded on all sides, save the N., by hills. The steep ridge descending from the castle rock to the Netherbow Port constituted the anc. city, and on it the High Street is built. To the N. of this ridge was formerly the North Loch. The New Town lies on the ground which rises beyond the valley of the North Loch, now occupied by Princes Street gardens and railway lines. As viewed from the Calton Hill, the following is a bird's-eye view of the city. On the right may be seen the New Town, with its wide streets and stately houses stretching down towards the shore. Princes Street, nearly a m. long, lies opposite; whilst the serried masses of houses forming the Old Town stretch on the left as far as the castle. There are still further streets on the S. towards the Braid Hills, and on the E. to Arthur's Seat; whilst the northward view from the Calton Hill includes Leith, the Firth of Forth, and the hills of Fifeshire. The valley which formerly was the North Loch separates the New Town from the Old Town. The former occupies a ridge which is broader and not so steep as that which forms the site of the Old Town. The slopes on both sides of the hollow are laid out as public gardens. This quarter of the city has many attractions, though it does not possess the historical character and interest of the older portion of the tn. The streets and squares are well planned, and the buildings, most of which are built of calciferous sandstone quarried in the vicinity, are magnificent. The extensive pleasure grounds in this quarter of the city are another attraction. The most noteworthy streets in the New Town are Princes Street, George Street, and Queen Street, which all run parallel to each other, eastward and westward. At the W. end of Princes Street are the Caledonian Railway Hotel and station, St Cuthbert's Church, and St John's Episcopal Church; at the E. end are Waverley station and hotel, the latter one of the largest in Britain, the General Post Office, and the Register House (1774),

Calton Hill forms the E. extremity of the street; this is a rocky eminence studded with monuments, including the Nelson Column and the unfinished National Monument. Salisbury Crags, a huge belt of precipitous rock nearly 580 ft in height, rises beyond the E. extremity of the city; whilst behind this is Arthur's Seat, a conical hill, roughly in the form of a lion couchant, 822 ft high, with a narrow rocky summit. On the slopes of the Calton Hill are situated the Royal High School (founded in c. 1518), the Burns Monument, and St Andrew's House, a modern building occupying the site of the tn and co. prison, the H.Q. in Scotland of the Scottish Office. George Street, which is bounded by St Andrew's Square and Charlotte Square, has many fine statues and houses with literary associations. Queen Street contains the National Portrait Gallery and Antiquarian Museum, presented by J. R. Findlay; charming views of Fife may be obtained from its cross streets. The Water of Leith at Canonmills and Stockbridge forms the boundary of the New Town; many famous buildings and places are situated in this neighbourhood, including the E. Academy (founded 1823), Fettes College (founded 1870), and Stewart's College (founded 1855). A feature of E. is the number of Georgian buildings in the New Town. This may be seen in the work of Robert Adam which includes a large part of the univ., the N. side of Charlotte Square (recently restored to its original state), the tomb of David Hume, and the Register House.

The prin. street in the Old Town is that built on the steep ridge which extends from the castle rock to Holyrood. This old street is more than a m. in length, and is called, at different points, Canongate, Netherbow, High Street, Lawnmarket, and Castle Hill, the whole being often termed 'the Royal Mile.' The aspect of this backbone of Old E. is quite in keeping with its traditions; the houses are all very lofty; amongst them are some very old buildings. The High Street opens into Parliament Close or Square on the right-hand side, going E.; the latter contains the old Parliament House, built between 1633 and 1640, and St Giles's Church, a large and anc. edifice in the later Gothic style of architecture, renovated in 1830. The anc. cross of E., which was removed in 1756, but in 1885 was restored at Gladstone's expense, now stands near the E. end of the church. The Parliament House, the building in which the Scottish Parliament met before the Union, is a magnificent hall, with a lofty roof, and contains various marble statues of celebrities. The Advocates' Library, founded in 1682 (since 1925 the National Library of Scotland), and the Signet Library are adjoining buildings to the Parliament House. John Knox's grave is situated in Parliament Close, to the rear of St Giles's, while a house in which he lived for a time adjoins the Netherbow port, one of the anc. gates of the city. Many other historic sites are situated in the High Street, including Burns's lodgings, Riddell's Close, Ramsay Lodge,

Flesh-market Close, Old Fishmarket Close, and World's End Close. Past the Netherbow is the Canongate, a burgh founded by David I's charter of 1123 to the Abbey of Holyrood. At one time many of the nobility of E. lived here, and the Moray House, the Huntly House, and Queensbury House still remain. The Old Canongate Tolbooth and the Canongate church may also be seen in the Canongate; the closes off this street are as historically interesting as those of the High Street. Though at the present time it is hard to realise its former splendour, many parts of the Royal Mile have been or are being restored or reconstructed. The closes are numerous narrow lanes which descend laterally in regular rows from the main street; they are not as a rule more than 6 ft. wide at the entrance, and those which admit of the passage of a carriage are called 'wynds.' The old street called the Cowgate runs to the S. of and parallel with the High Street, and opens at the W. end into the Grassmarket. At one time many aristocratic mansions stood there, but now it is a very poor street. George IV Bridge and South Bridge cross the Cowgate at a height of 2 or 3 stories; the univ. is the chief ornament of the latter, whilst the National Library of Scotland and the Carnegie Free Library stand on the former. The castle of E. is one of the most interesting of the public buildings. The oldest part is St Margaret's Chapel, built in the 11th cent., which stands on the highest point of the castle rock; nearby is the old piece of ordnance called 'Mons Meg,' forged in the 15th cent. The Great Hall, built at the beginning of the 16th cent., was restored in 1888-9; the room in which Queen Mary gave birth to James VI is situated at the E. end of the SE. side of the castle. Holyrood Palace, standing at the lower end of the street leading to the castle, was begun by James IV, whilst the greater portion of it was built in the time of Charles II. The apartments occupied by the hapless Queen Mary are in the NW. angle of the building. The ruins of the chapel belonging to the Abbey of Holyrood, founded by David I in 1128, adjoin the chapel of Holyrood Palace on the N. side.

Among the other noteworthy public buildings of E. are the Royal Scottish Academy, the National Gallery, the Surgeons' Hall, the General Post Office, the Royal Scottish Museum, the Tron Church, and the Bank of Scotland. The monument to Sir Walter Scott, situated on the S. side of Princes Street, and designed by G. M. Kemp, is the finest in the city. The seated figure of Scott is of marble and the monument is in the form of an elaborate Gothic cross 200 ft. in height. Other monuments in the city are to Burns, David Hume, Allan Ramsay, James Watt, Livingstone, Wm Pitt, Dugald Stewart, John Playfair. The Scottish National War Memorial was opened by the prince of Wales on 14 July 1927. The actual memorial, which reposes in a shrine in a noble structure on the apex of the castle rock on the site of the old barracks, consists of the rolls of

honour containing the names of over 100,000 Scots who fell in the First and Second World Wars. The E. Cenotaph or Stone of Remembrance in the High Street before the City Chambers was unveiled by Prince Henry the same year.

The advisory committee on city development, appointed by the E. Corporation in 1943 to report on the general considerations governing the development and redevelopment of E. as the cap. of Scotland and the preparation of planning schemes, made a number of important and far-reaching recommendations. In 1949 a civic survey and plan for E. prepared by town planning consultants appointed by the corporation confirmed these recommendations and indicated proposals by which they might be realised. The development plan, submitted to the secretary of state in 1953 in accordance with the town planning acts, was prepared after a further examination of the recommendations and includes proposals for those parts of the recommendations which can be considered as likely to be realised by 1973. Since 1943 a substantial amount of development which is in accordance with the recommendations of the advisory committee and subsequent reports has been completed in E. New housing areas have been planned as self-contained communities in the W., S., SE., and E. of the city; an industrial estate has been estab. at Sighthill; the R.A.F. airfield at Turnhouse has been and is being used by civil aircraft with an airport building for passengers; a plan for classifying the academic area of the city within a primarily cultural and educational zone S. of the High Street has been prepared and is being completed with new buildings; a central 'bus station has been temporarily provided off St Andrew's Square; and the reconstruction of the High Street and Canongate is being substantially completed. Particular consideration is being given to developments in Princes Street, having regard to the unique character of that thoroughfare. The corporation is undertaking the removal of unsatisfactory housing areas in the centre of the city and elsewhere, and the redevelopment of the sites for purposes which are in accordance with the proposals shown in the development plan submitted to the secretary of state.

The educational and cultural sides of E. are most important; in addition to the univ. (for which see separate article) it has many schools. Amongst them may be mentioned the former college for educating theological students of the United Free Church, now part of the Church of Scotland Theological College, the Royal High School, Edinburgh Academy (1824), Fettes College (an endowed high school), Loretto School, near E. (founded 1827), Merchiston Castle School, and the training colleges for teachers. The Heriot Trust and the Merchant Company are represented by such institutions as George Heriot's School (1659), the Heriot-Watt College (1885), George Watson's College (1738), Daniel Stewart's College, and the Queen Street and George Square

colleges for ladies. A notable ann. event in the cultural life of E., and indeed of Great Britain, is the E. International Festival, first held in 1947.

The most important industries of E. are brewing and distilling, for which it has been noted for more than 200 years, and printing and publishing with the connected industries of paper-making, book-binding, and map-making. Other manufs. are rubber, biscuits, hosiery, and knitted goods, paper-making machinery, and electrical appliances. Lesser manufs. include rope and sail cloth, glass and sealing wax. There is shipbuilding and ship-repairing at Leith, which was incorporated in the city of E. in 1920. Nearby is the E. airport at Turnhouse. Sev. magazines of a high standard have been, or are, pub. in E.; the *Edinburgh Review*, 1802, *Blackwood's Magazine*, 1819, and *Chambers's Journal*, 1832, were all started there.

The city returns 7 members to Parliament (including the member for Leith); it is governed by a tn council of 71 members. Area 34,781 ac.; pop. 467,000.

See O. Smeaton, *The Story of Edinburgh*, 1907; G. Home, *Edinburgh, 'Mine own Romantic Town'*, 1927; R. Chambers, *Traditions of Edinburgh*, 1929; E. Grierson, *Things seen in Edinburgh*, 1925; Rosaline Masson, *Edinburgh*, 1931; I. Lindsay, *Georgian Edinburgh*, 1948; Chiang Yee, *The Silent Traveller in Edinburgh*, 1948; S. Sitwell and F. Bamford, *Edinburgh*, 1948.

'*Edinburgh Review*.' The, or *Critical Journal*, Whig quarterly, founded in 1802 by Francis Jeffrey, Sydney Smith, F. Horner, and Henry (afterwards Lord) Brougham. It was the earliest of the great reviews, and has had a far-reaching influence on literature and politics. Sydney Smith was the 1st editor. Its early literary criticisms were amazingly savage, notably in the case of Wordsworth and Southey, and gave rise to Byron's satire, *English Bards and Scotch Reviewers*. It ceased pub. in 1929. See (for the hist. of the *Edinburgh Review* from 1802-15) J. Clive, *Scotch Reviewers*, 1957.

Edinburgh University, youngest Scottish univ., founded in 1583 as the College of Edinburgh (the Town's College) by the tn council of Edinburgh under powers, including the conferring of degrees, granted by a charter of King James VI in 1582. An Act of Confirmation in 1621 secured to it all the rights and privileges of other Scottish univs. It was still legally the Town's College until 1858 when, by the Universities (Scotland) Act, all the Scottish univs. received new and autonomous constitutions. Its constitution now depends on the Universities (Scotland) Act of 1889 with the ordinances of the commissioners under that Act and the univ. court ordinances subsequent to it. The chief constitutional officers are the chancellor, the vice-chancellor, who is also the principal, and the rector, who is elected by the matriculated students for a period of 3 years. Rectors who have held office since the 1858 Act include W. E. Gladstone (1859), Thomas Carlyle (1865), Winston Churchill (1929), and Sir Alexan-

der Fleming (1951). There are faculties of divinity, law, medicine, arts, science, and music. The Old College, begun in 1789 by Robert Adam, completed in 1828 by W. H. Playfair, now houses the administration offices, the library (640,000 vols.) with its beautiful library hall, the common rooms and a few arts depts. Other buildings include the New Buildings (School of Medicine), the Kings Buildings (science), the McKwan Hall (the graduation hall), the Univ. Union, the Dental College, the Veterinary College, and Adam House (examination halls and theatre). The number of students (1954-5) was 5,877.

Edinburghshire, see MIDLOTHIAN.

Edingen, see ENGHEN.

Edirne, formerly **Adrianople** (Gk. city of Hadrian), lt and tn of the same name in European Turkey, at the confluence of the Tunja and Maritza (anc. Hebrus). The Rom. emperor Hadrian embellished it and gave it his name; from 1361 to 1453 it was the residence of the Turkish sultans. It was occupied by Russians (under Gen. Diebitsch) in 1829, and again in 1878. The mosque of Sultan Selim II is a magnificent building, while the mosque of Sultan Mourad I and the bazaar of Ali Pacha are worthy of note. Its manufs. are silk, wool, cotton, perfumes, and it has some dye-works and tanneries. During the Balkan wars it was besieged and taken by the Bulgarians and Serbians, but in spite of the treaty of London it remained in the hands of the Turks. By a secret treaty between the Central Empires and Bulgaria, the latter, as the price of her entry into the First World War on the side of those empires, was promised, at the expense of Turkey, a strip of land along the Maritza, controlling both that riv. and E. Restored to Turkey after the war. Pop. (lt) 253,319; (tn) 30,000.

Edison, Thomas Alva (1847-1931), Amer. inventor, b. Milan, Ohio, was of Dutch origin on his father's and Scottish on his mother's side. Beginning work at the age of 12 as a newsboy on the Grand Trunk line running to Detroit, he owed all his distinction and advancement to his own faculties. After printing and circulating the *Grand Trunk Herald*, the 1st newspaper to be issued from a railway train, he eagerly assimilated the principles of telegraphy from a friendly station-master. From 1871 he was superintendent to the New York Gold and Stock Company, till in 1876 he set up his own works at Menlo Park, New Jersey. Here his extraordinary inventive genius had full scope. The following is a mere catalogue of some of the more important of his 1000 patents: the duplex, quadruplex, etc., system of telegraphic transmission, the printing telegraph for gold and stock quotations, a microtasmeter (for detection of small changes in temp.), the aeroplane, the megaphone, the phonograph, or gramophone, the incandescent light, the kinetoscope, and the carbon telephone transmitter. It was an observation made by E. in one of his experiments which led to the invention of the thermionic valve. E. also invented a system

of wireless telegraphy to and from moving railway trains. He is also credited with a part in the invention of motion pictures and the alkaline storage battery. During the First World War he designed and operated benzol plants and plants for carbolic acid. See W. K. L. and A. D. Dickson, *Life and Inventions of Edison*, 1894.

Edmer of Canterbury, see EADMER.

Edmonton: 1. Cap. of Alberta, Canada, on the N. Saskatchewan R. at an altitude of 2182 ft., an important railway centre with large railway car shops, served by 12 branch lines. E. is a market for Central and N. Alberta, N. Brit. Columbia, and N.W. Territories. E. has 6 radio

Edmund I (d. 946), Eng. king. He succeeded to the throne in 938, but had already played a prominent part in the battles of the previous reign. In 940 E. was forced to cede land approximating to the modern cos. of Lincs, Derby, Notts, and Leicester to Olaf Guthfrithson, but regained these 2 years later, recovered York, and in 945 ravaged Strathclyde. He was killed by a criminal, who had been previously banished from the court.

Edmund II (Ironside) (c. 1016), king of the Eng. On the death of Ethelred II, E.'s father, the citizens of London chose E., but a large and important gathering of nobles and clergy at Southampton elected Canute (q.v.) as their king. There

stations, including the only Fr.-language station in Alberta. Many large and important industries have estab. plants on the outskirts of the city, and most of the major oil companies have erected processing plants close by. Besides being an industrial centre, E. is the centre of one of the richest agric. areas in the prov. It is the gateway to the vast mineral wealth of the N. It is also the seat of the prov. univ. located on the banks of the N. Saskatchewan R. Pop. 245,600.

2. Suburb of London, on the E. border of Middx. It has attained some notoriety in literature owing to the largely fabulous actions of the Merry Devil of E. and John Gilpin. It was once noted for a fair that was closed c. 1870. Keats lived here when he was apprenticed to a local surgeon. The par. church, with a 15th-cent. tower, has interesting monuments. Charles and Mary Lamb are buried in the churchyard. E. returns 1 member to parliament. Pop. 100,300. (See also SOUTHGATE.)

Edmund, St (849-870), king of East Anglia. He succeeded to the throne when quite a boy. In 870 E. fought the Danes, but was beaten and killed. His shrine at Bury St Edmunds was famous in every part of England, and his saintly reputation extended all over Europe. His feast is on 20 Nov.

E.E. 4--X

was fierce warfare between the 2 rivals, culminating in the battle of Assandun (Ashingdon). E. was soundly defeated, and agreed to divide the kingdom with Canute, Canute taking the north and E. the south. E. d. soon after this.

Edmund (Rieh), St (1180-1242), Eng. ecclesiastic, b. Abingdon, near Oxford; he studied at Oxford Univ., and later in Paris. In 1233 he was elected archbishop of Canterbury at the suggestion of Gregory IX, and at once leapt into prominence by the outspoken way in which he rebuked Henry III for encouraging foreign favourites; the king appealed to Rome for a legate, who at once opposed and thwarted E. at every point. In 1240 he withdrew to Pontigny, and d. at Soissy in 1242. Canonised in 1246, his feast is on 16 Nov.

Edmundston, city in New Brunswick, Canada, at the confluence of the St John and St Francis rivs. It is the H.Q. of the Fraser Companies Ltd. which operate a large pulp mill. The wood pulp is transported by pipeline across the U.S.A. border, then manufactured into paper at a mill owned and operated by the same company in the state of Maine. Pop. 10,753.

Edom (Heb. 'red,' Gk *Idoumaia*), an expanse of country to the S. of Israel some 100 m. long by 30 m. wide, extending

southwards from the Dead Sea to the Gulf of Akabah. Its name is probably derived from the ruddy colour of the sandstone rocks, and has been discovered under an Assyrian form in a tablet of the 2nd cent. bc. It was originally inhabited by the cave-dwelling Horites, but it later came into the possession of Esau, who received the surname of Edom, the derivation of the name being made from the red pottage given him by Jacob (Gen. xxv. 29 ff.). The relations between the Israelites and Edomites were generally hostile, and the O.T. tradition dates the commencement of this hostility from the time when the Edomites refused the Hebrews a passage through their country to the land of Canaan (Num. xx. 14 ff.). Under David and Solomon the Hebrews brought their ancient foes into apparent submission, but there were frequent rebellions. They regained their freedom after the fall of Judah, and waged war without much success with Judas Maccabaeus. They were later completely subdued and converted to Judaism by John Hyrcanus at the end of the 2nd cent. bc. From about 300 bc the E. part had been in the hands of the Nabathaeans. After the Rom. conquest, E., Judea, Samaria, and Galilee were united as a procuratorship under Antipater the Idumean, founder of the Herodian dynasty.

Edoni, Thracian tribe noted for some skill in music, literature, and the working of gold and silver. They were also famous for their orgiastic worship.

Edred (d. 955), king of the Eng. The youngest son of Edward the Elder, he succeeded to the throne in 946. His reign was largely spent in battling for Northumbria, which, having sworn him allegiance in 947, transferred its loyalty to Eric of Norway (Bloodaxe). Eric was killed in battle in 954 and E. then acquired Northumbria.

Edrioasteroids, a small group of Palaeozoic pelmatozoan echinoderms with a flexible sessile skeleton made of numerous irregular plates, and bearing 5 curved food-grooves.

Edrisi, or **Idrisi**, Abu Abdallah Mohammed El- (1099-1170), Arabian geographer, who under the patronage of Roger II of Sicily wrote a description of the 'inhabited earth' from observations, and not merely from books. emissaries were sent into various countries to obtain information which E. inserted in the new geography, entitled *The Rogerian Treatise*. This contained a full description of the world as far as it was known at that time.

Education. The term E. in the widest sense may be held to include the whole process of development through which a human being passes from infancy to maturity, gradually adapting himself to his physical and social environment; but the more definite sense in which the term is ordinarily employed is restricted to those influences which are *designedly* brought to bear upon the younger by the adult portion of the community for the purpose of maintaining and, if possible, of raising the level of culture attained, and it is to this sense of 'schooling' that we

must confine ourselves in this article. In the earliest stage of development of mankind, the training given to the young was of a purely incidental character: manners and customs were at first acquired by a process of imitation rather than by any consciously designed instruction.

As the arts of life, in the civil and military sphere, became more complex, provision was made for them, and with the invention of letters, requiring a special training for the mastery of the symbols, and encouraging the accumulation of knowledge far wider than provided by the immediate environment, schools as formal institutions came into existence. In the *Republic* and *Laws* of Plato will be found a representation of the ideal of E. at Athens and of the importance given to dialectic and music, and to gymnastic exercises for the body. The moral influence of gymnastics, and especially of music, upon the character was a cardinal feature of Plato's educational theory. There was practically no state regulation of schools for boys until they reached the age of 17 years, when they entered the *ephebea*. The younger boys were sent by their parents in charge of slaves to professional teachers, who were of 3 kinds: the *grammatists* who taught reading, writing, and arithmetic; the *citharistes* who taught singing and playing on musical instruments; and the *paedotribes* who trained the boys in wrestling, boxing, running, jumping, etc. During the early period of the Rom. rep. E. was left entirely to the parents. The boy was taught to read, to reverence the gods, and honour the state, and was trained in hardihood of body. With the influence of Gr. culture schools began to spring up under professional teachers who were for the most part Greeks. In these the boy was instructed in the 3 Rs by a master known as *literator*. On attaining the age of 12 or 13 he was sent to another master, *literator*, under whom he studied grammar (including the form and content of literature), poetry, hist., philosophy, and Greek. Schools of rhetoric were also estab., restricting themselves to training in oratory, the value of which is insisted upon by Quintilian and Cicero. In Quintilian's *Institutio Oratoria* we are given a discussion of the whole of E. from the cradle upwards, from which it would appear that the E. given by the *literator* was much as in Eng. grammar schools up to the 18th cent.

With the rise of Christianity schools were instituted for instructing the young in the Christian faith. As Christianity grew the old pagan schools gradually disappeared and their place was taken by schools mainly connected with monasteries, which prepared young men for the monastic life. The chief monasteries generally had, however, external schools for pupils not proposing to enter the order, as well as the internal schools for novices. By degrees the curriculum was widened to include the 7 liberal arts, relics of the old Rom. E., known as the *Trivium*—grammar, logic, and rhetoric (including the study of law)—and the *Quadrivium*—geometry (which corresponded rather

more to physical geography than what is now understood by the term geometry), arithmetic, music, and astronomy. The development of city life and trade guilds led to apprenticeship in the arts of the counting house and the workshop. The desire for E. penetrated even to the lowest classes of the people, and elementary A.B.C. schools came into existence, generally presided over by the par. priest, to give instruction to the children of the poor in reading, writing, and easy arithmetic. The most famous univs. were at Paris—the chief centre for philosophy and theology, which formed the model for the univs. of Oxford and Cambridge; at Salerno, at which the study of medicine took 1st place; and at Bologna, famous for its study of civil and canon law. The need for acquiring a definite status induced most univs. to apply to the Pope or the emperor for recognition, though a few of the greater univs. did not find it necessary to do this. Charters were granted by Henry III to the 2 Eng. univs., Cambridge in 1231 and Oxford in 1248. The Ger. univs. were of later foundation, and were mostly estab. by civic authority: Prague was estab. in 1348, and Vienna in 1365, and obtained charters from the emperor later. Though univs. were intended mainly for more advanced E., the distinction between them and grammar schools was not everywhere clearly marked, and young boys frequently attended.

The Renaissance led to a free and unfettered study of all that appealed to the intellect of man. The movement originating in Italy, which consisted in going back to the ancients and reviving the free study of all classical writers, both Lat. and Greek, assimilating their reasoning, and making a philological study of their language, is termed the *Revival of Learning*. Such literature was styled *litterae humaniores* and those who advocated its study were called *Humanists*. Vittorino da Feltre (1378–1446) was perhaps the most famous of the early It. Humanist schoolmasters. His ideal was the patriotic and well-equipped citizen rather than the self-contained scholar. Classics naturally formed the foundation of the curriculum in the Humanist schools. In addition to their value in stimulating literary taste and culture, they provided a disciplinary training much more than at the present day. The later Humanist theories of E., which the schools continued to follow generally for 2 or 3 centuries, were taken mainly from Erasmus (1467–1536) and Melancthon (1497–1560). To Erasmus Humanism, which in the eyes of the Italians was an end in itself, was only the means to the propagation of truth. Melancthon was a great supporter of the claim of the classics to impart a culture not otherwise attainable, and was also the author of sev. school text-books. The Lat. *gymnasien*, founded at Strasburg by Melancthon's friend Sturm (1507–89), became the model which the grammar schools of Protestant Europe strove to copy. In this school practically the whole of the time was given to acquiring a mastery of the Lat. language. In Eng-

land Humanism did not spread so quickly until it was adopted by the univs., where it encountered less opposition than in Germany. St Paul's School, founded in 1512 by Dean Colet, provided for a distinctively Humanistic E. In Catholic countries the Church retained entire control of E., and the Society of Jesus, founded in 1540 by Ignatius Loyola, estab. many schools which were extremely successful. The curriculum in these Jesuit schools was purely Humanistic, and a particular feature was the attention paid to the individual character of each pupil.

While Lat. was accepted as the medium of learning, and so long as new branches of knowledge were not discovered, the schools remained in harmony with the culture of the day; but during the 17th cent. the difference between the needs of life and the E. furnished by the grammar and other classical schools grew gradually wider, and many schools, owing to the rapidly decreasing numbers in attendance, fell into decay. Indeed, in England many of the old grammar schools degenerated into elementary schools of a very poor and inefficient character, and at the beginning of the 18th cent. organised E. was at a very low level. But there was no lack of educational theorists and writers. Comenius (1592–1671), the author of *The Great Didactic: the whole Art of Teaching all Things to all Men*, 1657, and a number of text-books on original lines, takes 1st place amongst the realists, of whom J. H. Pestalozzi and F. W. A. Froebel were latter-day disciples. The realists maintain that things, not words, must provide the organon of E., and that the child must be brought into contact with the concrete before proceeding to the abstract. John Locke (1632–1704) on the other hand is to be classed among the naturalists who hold that the duty of the teacher is to treat the child as an individual who is being prepared for life by living. He does not, however, appear to concern himself with any but the children of the wealthy, for he declares roundly in favour of a home E., under a private tutor, as opposed to that given in public schools. During the 18th cent. E. became more and more to be looked upon as the property of the select few. In 1762 appeared Jean Jacques Rousseau's famous *Emile*, the underlying motif of which is an appeal for a return to nature. With all its violent paradoxes *Emile* exercised a wonderful influence on E. Rousseau also made a special plea for child-study. At this time Pestalozzi (1746–1827) was a young student at Zürich. Though by method a realist, he drew his inspiration from Rousseau, and this early influence is traceable in his ardent belief that an important factor in E. had hitherto been insufficiently considered—the child himself. Froebel (1782–1852) succeeded in constructing a complete and consistent system for Pestalozzi's scheme. 'The boy,' says Froebel in his *Education of Man* (trans. 1891), 'has not become a boy, nor has the youth become a youth, by reaching a certain age, but only by having lived through childhood, and further on,

through boyhood, true to the requirements of his mind, his feelings, and his body.' The duty of the teacher consists in clearing the way for nature to do her proper work: to stimulate and direct the child's self activity, without in any way interfering with it. To this end he devised his scheme of gifts and occupations. Froebel's ideas as regards young children, though his native land has never given him due recognition, have been largely accepted outside his own country.

Similar conclusions—that given the right conditions, children love work as much as play—were reached by Dottoressa Maria Montessori (q.v.). The child from its very first years is essentially a spontaneous 'absorber' of what he finds in his environment. In her view, consequently, the art of education consists in preparing for the child a special environment which shall contain what we wish him to absorb in forms found experimentally to hold his attention, and establishing a dynamic relationship between the child and this environment.

Many other influences have stimulated the growth of a child-centred E. at the primary stage, with an emphasis on freedom and activity. Among these were the Dalton plan initiated in the U.S.A., and the Decroly system introduced by the Belgian, Ovide Decroly (q.v.), which differs from the Montessori method in that it does not employ experimentally determined apparatus.

One of the great influences, too, in modern E. has been that of Johann Friedrich Herbart (1776–1841). Great importance was attached by Herbartians to what are called the 'five formal steps': the successive stages in every lesson given in what they consider the only right way: (1) preparation; (2) presentation; (3) association; (4) formulation; (5) application.

Another significant influence has been that of Rudolf Steiner, distinguished founder of Anthroposophy. His pioneer school at Stuttgart (founded 1919) has been the inspiration of similar experiments in many countries, including Great Britain. These schools have had particular success in dealing with mental defectives, along original lines in which the arts are therapeutically employed.

The relation between the state and the individual in E. has long been a favourite theme of discussion and controversy. It is now generally recognised that the state has the duty of providing E. for all its children. Even Adam Smith and John Stuart Mill, the apostles of 'natural liberty' and *laissez-faire*, admitted the exception of E. Adam Smith was in favour of state-controlled elementary E., though he hardly disguised his disapproval of state interference in higher E. Mill, on the other hand, advocated that the state should provide for both elementary and higher E., and that elementary E. should be made compulsory. England for long lagged behind most of the other great civilised nations in this respect, and it was not until 1880 that elementary E. was made compulsory, but secondary E. was

left practically untouched by the state until 1902.

The various stages of growth from infancy to maturity require, and have created in most modern civilised states, a graduated system of schools adapted to the needs of each particular period. But, as a brief reference to the educational systems of a number of countries will show, development has been on widely different lines as a result of diverse social, political, religious, and economic circumstances.

GERMANY.—In Germany state intervention in E. began at the time of the Reformation, and towards the end of the 16th cent. 2 states, Saxony and Württemberg, had organised fairly complete educational systems in connection with the Church. The Thirty Years War had a disastrous effect on E., but in the 18th cent. the state system was revived in the 2 states above mentioned, and their example was followed by Hanover and Prussia. As early as 1717 a law was in force in Prussia requiring all children to attend school wherever schools were accessible. In 1806, when Prussia lay at the feet of Napoleon, the control of E. was all that was left to that state by her conqueror, and in response to Fichte's appeal in his *Address to the German Nation*, a thorough system of national E. was founded by von Stein in 1807. In 1850 a law was passed making elementary E. free, and the teaching profession a branch of the civil service. The basis of Ger. elementary E. was the Prussian code of regulations of 1854, as modified by the Falk laws of 1872 and later laws. Attendance was compulsory on all children between the ages of 6 and 14. But until the unifying impact of Nazi policy in and after 1933 there was much diversity in the different states, and in 1945 the autonomy in E. of the states or *Länder* was restored in W. Germany. For a time the 9 *Länder* administered E. independently, with the result that differences in educational practice became so considerable that pupils moving from one *Land* to another were often handicapped. Since 1954, however, there have been specific arrangements for co-operation between the *Länder* and a tendency towards unification. The foundation of the Ger. system is the *Grundschule*, a primary school which by a law of 1920 all children between the ages of 6 and 10 are required to attend. After these first 4 years the pupils, according to their ability and interests, receive their E. either in the *Volksschule* or people's school (about 81 per cent), or the *Mittelschule* (about 4 per cent), or the *Gymnasium* (about 15 per cent). Of the last there are sev. types, including the *Real-Gymnasien* which specialise in mathematics, science, and modern languages, but also teach classics. Since 1919 compulsory part-time continuation schools have been an important feature of the Ger. system, providing courses in agric., industrial, commercial, and domestic subjects. Of the 25 univs. 6 were founded in the 15th and 3 in the 16th cent. A prin. feature of E. in E.

Germany is that all children attend a common school for 8 years. Some continue there for another 4 years to pursue academic studies, the majority leaving at the end of the 8 years to learn a trade and attend a part-time continuation school.

FRANCE.—In France elementary E. was practically non-existent before the revolution, when a strongly centralised system of E. was estab. The minister of national E. exercises effective control of all state schools, transmitting directives through regional administrations located in 17 univ. areas. E. first became compulsory in 1882, and since 1935 the compulsory age-range has been 6-14. Under a decree of 1908 a system of nursery schools (*écoles maternelles*) was introduced for children between 2 and 6, and they are well attended. Of the 84,000 primary schools over 73,000 are state schools, the remainder being private schools, most of which are Catholic. In the state primary schools E. is free, and the teachers are civil servants. After the primary stage there are sev. alternatives: a *lycée* or *collège* (grammar or secondary schools), a technical training course, a continuation course of studies, finishing classes, or pre-apprenticeship classes. In addition to the provision made by the state for the post-primary stage there is a large number of private secondary institutions, of which 90 per cent are religious foundations. There are 17 univs., and a number of specialist institutions (*grandes écoles*) that award diplomas recognised by the state. After the Second World War there was a strong demand for educational reconstruction, and the important Languevin-Wallon commission made some fundamental recommendations which, while they have influenced outlook and method, have yet to be implemented.

In Denmark, Norway, Sweden, Austria, Switzerland, Holland, and Belgium, elementary E. is free and compulsory. Switzerland has an admirably organised system, and the management of the schools is in the hands of each canton. Primary and secondary schools are provided in every dist., and there are also numerous technical schools and sev. univs.

UNITED STATES OF AMERICA.—E. in America is under popular control, and there is very great local freedom. Each state, and many of the large cities, has its own system, and provides its own schools and teachers. Compulsory attendance is in force in most states. The elementary school constitutes the 1st section of the broad highway of Amer. E., and is attended by over 90 per cent of the children. Normally the age of admission is 6: the age of transfer to the secondary stage varies. The tendency in many parts of the country is to make the transfer after about 6 years of elementary schooling, and to follow this with 6 years of secondary E., divided in some areas into 3 years at a junior high school and 3 at a senior high school. The typical Amer. high school is 'comprehensive,' attended by pupils of every grade of ability and offering a great variety of

courses, academic and vocational. E. is free both in the elementary and the high school. E. beyond the secondary stage is provided on a generous scale, its range being as diversified as its quality. Many states have their own tax-supported univs., free to the youth of the state, but the development of univ. E. in America owes much also to the munificence of individual benefactors. Of the many univs. the oldest are Harvard, founded in 1636, and Yale, founded in 1701. While the most popular of the various institutions for higher E. is the 4-year liberal arts college, there is a wide range of technical E. which is constantly expanding to meet the growing needs of industry and commerce.

ENGLAND AND WALES.—The state was slow to intervene in E. in England and Wales, mainly for 2 reasons. One was the predominance of the political philosophy of *laissez-faire*, it being widely held that E. should be left to individual and voluntary effort. The other reason was historical. Before the Reformation the undivided Church had been responsible for E. The Reformation, however, created a new situation, the question of the control of E., especially during and after the Civil war in the 17th cent., becoming a source of bitter sectarian conflict. Throughout the greater part of the 19th cent. the chief promoters of elementary E. were 2 rival voluntary societies, one representative of the estab. Church and the other representing other important Christian bodies. Although by the middle of that century it had become apparent that these societies, even with increasing gov. subsidies, were unequal to the task of providing sufficient schools for the rapidly growing child pop., agreement on a national system of E. was not practicable. There was no hope of active intervention by the state until (1) the *laissez-faire* attitude became less rigid, and (2) statesmen could find a compromise that would reconcile the conflicting religious interests and satisfy those who valued freedom of conscience. The Elementary Education Act of 1870 embodied such a compromise and, although restricted in scope because of the prevailing *laissez-faire* outlook, it provided the foundation on which our comprehensive national system has been gradually built. There have since been 3 major E. Acts—1902, 1918, and 1944—but the ingenious Victorian compromise, though modified and amplified, has survived as the basis of our E. system. Its essential characteristics are: (1) a dual system of voluntary and local authority schools, and (2) respect for the individual beliefs of parents, including the right to withdraw their children from religious observance and teaching.

The 1870 Act created school boards to serve as local authorities for E., but in 1888 there was a fundamental reform of the then chaotic system of local gov. Co. and co. bor. councils were estab. by the Local Government Act of that year, and gradually statesmen irrespective of party came to the conclusion that the new local

authorities ought to be entrusted with the administration of E. In 1889 they were empowered under the Technical Instruction Act of that date to promote technical E., and at last by the Education Act of 1902 the school boards were abolished, and the co. and co. bor. councils were made the local E. authorities for both higher and elementary E. To placate opposition to the abolition of school boards a concession was made to certain urb. areas, which were given autonomous powers in regard to elementary E. Three years earlier the Board of Education Act of 1899 had provided a unified central administration, and before long the progressive partnership between the central and local administrations, which has been such a beneficial feature of Eng. E. in the present century, was firmly estab.

The Education Act, 1918, for which H. A. L. Fisher, as president of the Board of Education, was mainly responsible, provided for a number of valuable reforms. It made the school-leaving age 14, abolishing the system of part-time exemptions, commonly known as 'half-time.' Local authorities were empowered to establish and aid nursery schools, while the most dramatic and controversial of its provisions was one which required the estab. of compulsory part-time day continuation schools for young people between the age of 14 and 18. Unfortunately the financial stringency of the 1920's, notably the policy of retrenchment associated with what was known as the Geddes axe, rendered many of the reforms embodied in the Act abortive, including regretably the day continuation school project. Fisher's prin. achievement, therefore, was not his Act but certain administrative reforms that he initiated. These were designed to foster the partnership between the central and local govs., and associate teachers with that partnership. He set up a committee consisting of 2 panels, one representative of local authorities and the other of the teaching profession, under the chairmanship of Lord Burnham and now known as the Burnham Committee, to serve as a permanent negotiating body in respect of teachers' salary scales. He also instituted the present system of state scholarships to enable talented students to maintain themselves at univ.; and he drastically reformed the arrangements for external examinations of secondary school pupils, setting up a representative secondary schools examinations council to supervise and secure an approximate equivalence of standards.

During the years between the wars advocates of educational reform tended to focus attention on the inadequacy and, indeed, injustice of the system of secondary E. Local E. authorities, encouraged by the Board of Education, had since 1902 been remarkably successful in providing new grammar schools: when they began their task there were not more than 30,000 pupils in grant-aided grammar schools and by 1939 the figure had risen to well over 400,000. But in spite of this achievement the percentage receiving secondary E. was as low as 14, and there

was a growing feeling also that such E. ought to include provision for pupils with a practical bent for whom the more bookish E. of the grammar school is unsuitable. Some authorities estab. central schools for such pupils, and sev. junior technical schools were set up, catering, however, for relatively few, about 3 per cent of the boys and 2 per cent of the girls. In 1926 the consultative committee of the Board of Education, under the chairmanship of Sir Henry Hadow, issued a report under the title *The Education of the Adolescent* (often called the Hadow report). It urged the div. of E. into primary and post-primary stages with 11 as the age of transfer, and had the effect of stimulating the provision of many senior elementary schools, forerunners of the secondary modern school of to-day. In 1938 the consultative committee, then under the chairmanship of Sir Will Spens, issued another constructive report on *Secondary Education with special reference to Grammar Schools and Technical High Schools*; and this Spens report was followed in 1943 by the report of the Norwood committee on *The Curriculum and Examinations in Secondary Schools*. As a result of these reports and of discussions that they prompted, there was a growing consensus of opinion that the primary stage should be followed by a system of universal secondary E. organised so as to cater for the different abilities and aptitudes of pupils. The Education Act of 1944 gave statutory expression to this view, abolished the elementary school, and required local E. authorities to make suitable provision for the secondary E. of all pupils. There has been much discussion and some controversy as to the best way of fulfilling this requirement, and as these figures of all grant-aided secondary schools in England and Wales in 1955 show, various solutions of the problem of organisation have been adopted: grammar 1180, technical 302, modern 3550, bi-lateral (modern-grammar) 57, bi-lateral (modern-technical) 20, bi-lateral (grammar-technical) 16, multilateral 3, comprehensive 16.

The Education Act of 1944 not only wrought a revolution in our educational and social structure by abolishing the elementary school and introducing universal secondary E., but because of its comprehensive character it also determined the pattern of the whole educational system, adjusting and adapting it to the needs of our time. The following is a brief description of its main characteristics:

The Central Authority.—Under the Education Act, 1902, the central authority was the board of education and its president was the political head. The function of the board was defined as 'the superintendence of matters relating to education in England and Wales.' The 1944 Act replaced the board by a ministry, and the minister was given wide powers of direction and control over the whole field of public E. except the univ., which are independent, receiving grants direct from the Treasury through a univ. grants

committee. Although the minister, subject to Parliament, has substantial powers, administration is decentralised; the minister neither appoints teachers nor does he build schools. Nor in matters affecting the curriculum and teaching method does he do more than issue 'suggestions,' and similarly the gov. inspectors, known as her majesty's inspectors or H.M.I.s, while they inspect schools and give advice, are careful not to encroach upon the freedom of the teacher

tions to divisional executives, and there is a substantial delegation by co. authorities to some of the larger non-co. bors. or urb. councils, their areas being constituted in the phraseology of the Act 'excepted districts.' The L.E.A., as the administrative mainstay of our decentralised system, is responsible for the administration of all stages of E., except that of the univ., throughout its area.

Voluntary Enterprise.—There is a long tradition of voluntary enterprise in E.,

in regard to curriculum and method. The ministry has a separate dept for Wales with a permanent secretary and chief inspector.

The Local Education Authority.—The authority for elementary E. only granted by the Act of 1902, referred to above, was abolished by the 1944 Act. The co. and co. bor. councils are, therefore, now the only local E. authorities. There are 146 L.E.A.s (to use the customary abbreviation) in England and Wales—62 cos., 83 co. bors., and 1 joint board for the combined area of a co. and a bor. (the soke of Peterborough and Peterborough). Each of these authorities is required to appoint an education committee, about two-thirds of its members are aldermen or councillors, the remainder being co-opted members chosen because of their experience in E. or special knowledge. Each L.E.A. has to appoint an E. officer, who is assisted by an appropriate staff. In cos. the L.E.A. delegates some func-

and although the state continues to enlarge its frontier the number of voluntary associations and agencies tends to increase. Such associations are particularly active in adult E., the youth service, and in the E. of handicapped children. Some receive gov. grants or are aided by the L.E.A., and there is as a rule close co-operation between local authorities and the voluntary associations engaged in educational work in their area.

Finance.—Except for certain services, such as school meals, subject to special grant arrangements, the grant payable to L.E.A.s by the ministry of education is based on a formula designed to relate the grant to the number of children in the authority's area and its capacity to contribute to the cost of their E. by means of local rates. Calculated as a percentage of the authority's net approved expenditure, the grant is paid under a system which fosters the sense of partnership. In 1955 the total expenditure on E. met from

taxes and rates was £376 million, of which £233 million came from taxation in the form of ministry of education grants. Expenditure on E. is on an increasing scale, the main reasons being the growth of the school pop., the erection and equipment of new schools and technical colleges, instalments of equal pay for women teachers, increases in Burnham salary scales, and the additional cost of goods and services generally. Some services administered by L.E.A.s are grant-aided by gov. depts other than the ministry of education: for example, L.E.A.s which administer the youth employment service do so under regulations of the ministry of labour, receiving grants from that ministry on a 75 per cent basis.

The School System.—E. is regarded as a continuous process, and is divided into 3 stages: *Primary* (up to 11–12 years). For this stage nursery schools (2–5) are provided where deemed necessary; infant schools for children between 5 and 7, the compulsory age beginning at 5; junior schools for pupils from 8 to 12. In less populous areas infants and juniors usually share one school. *Secondary* (11–12 to 18). Attendance is compulsory to the age of 15, but under the Act the compulsory age is eventually to be raised to 16. As indicated above, there are sev. types of secondary school, the aim being to provide pupils with an E. appropriate to their ability and aptitude. Problems of selection and allocation present great difficulty, and since 1914 have been under constant review. *Further Education.* This stage embraces all vocational and non-vocational E. provided for young people who have ceased to attend school full-time, and all forms of E. for adults, including technical E. in the widest sense. The 1944 Act requires the provision of co. colleges, which all young people not receiving full-time E. will attend part-time up to the age of 18, but this important reform has not yet been carried out. In 1955 there were 2,041,000 students in grant-aided establs. for further E., of whom 64,000 were full-time, 402,000 part-time day, and 1,575,000 evening. The increasing demands of industry for technologists and technicians have focussed attention on technical E., and policy is being directed to its expansion and improvement.

The Supply and Education of Teachers.—There are over 240,000 teachers engaged in maintained and assisted schools of all kinds. It is recognised that the worth of the entire educational system depends upon an adequate supply of appropriately qualified teachers. Post-war policy has been much influenced by what is generally known as the McNair report on the supply, recruitment, and training of teachers and youth leaders, issued in 1944. There are 176 institutions engaged in preparing teachers for their vocation—23 univ. or univ. college depts of E., 113 non-specialist training colleges, 14 training colleges for domestic subjects, 7 training colleges for physical E., 3 training colleges for teachers of

technical subjects, and 16 art colleges with depts for teacher E.

Universities.—Until the 2nd quarter of the 19th cent. England had only 2 univs., the famous medieval foundations at Oxford and Cambridge. To-day there are 15 univs. in England—Birmingham, Bristol, Cambridge, Durham, Exeter, Hull, Leeds, Liverpool, London, Manchester, Nottingham, Oxford, Reading, Sheffield, and Southampton—and 2 univ. colleges, Leicester and North Staffordshire. The univ. of Wales has its constituent colleges at Bangor, Cardiff, Aberystwyth, and Swansea. Since the last war there has been a substantial increase in the number of students, from 50,000 pre-war to over 80,000. The expansion is likely to continue. For by 1960 the higher birth-rate of the war and immediate post-war years, which has been the cause of so many strains and stresses in the staffing and accommodation of schools, will be making its impact on univs. and technical colleges and causing still further expansion. More and more univ. students receive assistance from public funds, the proportion of assisted students now being about 75 per cent. The univs., too, increasingly rely on grants from the gov. through the university grants committee, about two-thirds of their income being derived from public sources. Arts, broadly defined, is still the most popular group of studies, but there is a marked increase in the proportion of students pursuing scientific and technological studies.

Handicapped Children.—Although much had been done for handicapped children before the last war and there were many special schools, residential and day, for children requiring exceptional educational treatment, it is generally agreed that the 1944 Act has brought about a welcome change of outlook in this small but important field of E. Previously children suffering from disability of mind or body had been dealt with as a separate group; under the 1944 Act they come within the provisions relating to primary and secondary E., and are regarded like other children as requiring an E. appropriate to age, aptitude, and ability. There have been great advances in the treatment of educationally sub-normal children both in the ordinary school and in special schools; 142 schools for children of this category have been opened since the Second World War. Since the passing of the 1944 Act the number of special schools of all types has increased from 528 to 743, and the number of pupils specially provided for from 38,500 to 58,000. In 1955 there were, in addition to 120 hospital schools, special schools as follows: blind 22, partially sighted 27, blind and partially sighted 3, deaf 14, partially deaf 4, deaf and partially deaf 31, physically handicapped 73, delicate 101, delicate and physically handicapped 45, delicate and maladjusted 3, educationally sub-normal 256, epileptic 8, maladjusted 35, speech defect 1.

The Dual System.—There are over 28,000 primary and secondary schools in

England and Wales, of which in 1955 18,035 were co. (i.e. local authority) schools and 10,773 voluntary. Under the 1944 Act the voluntary schools are of 3 kinds: aided, special agreement, and controlled. In an aided school the representatives of the Church or trust concerned constitute a majority of the governors (or managers). The governors (or managers) appoint the teachers, decide the character of the religious teaching, and meet half the cost of structural improvements and external repairs. Special agreement schools are a small category of schools in respect of which local authorities made building grants as a consequence of an Education Act of 1936. For them the conditions of management are similar to those for aided schools. In a controlled school the local authority representatives are in a majority on the governing body, denominational teaching may be given on not more than 2 periods a week, and otherwise religious teaching must be in accordance with an 'agreed syllabus.' Subject to the reservation of certain rights to the managers or governors, the L.E.A. is responsible for the appointment of teachers, and the L.E.A. bears the whole cost of structural improvements and repairs. Of the 10,773 voluntary schools, in 1955 5472 were aided, 4628 controlled, 55 special agreement, and 618 had yet to have their status determined.

The 1944 Act stipulates that in all co. and voluntary schools, both primary and secondary, the day shall begin with a corporate act of worship and that religious teaching shall be given. Children whose parents desire their withdrawal from religious periods are excused attendance at them. In all co. schools and, as indicated above, partly in all voluntary controlled schools, religious teaching must be in accordance with an 'agreed syllabus.' This is a syllabus drawn up or adopted for each area by a conference convened by the L.E.A. and consisting of biblical scholars, teachers, and representatives of the authority.

Schools outside the state system.—The law does not require a parent to send his child to school; it imposes on him an obligation to see that his child, if within the compulsory age-range, is receiving an appropriate E. Rather less than 10 per cent of parents choose not to make use of the state system, and of these nearly all send their children to independent schools. There is a great variety of such schools, some providing E. of the highest quality, while at the other extreme are schools that hardly deserve the name. As regards the latter there has for long been a widespread opinion that parents and children should be afforded some protection. The 1944 Act, therefore, made provision for the inspection of independent schools and the maintenance of a register of all which satisfied requirements. It also forbids the keeping of an unregistered school. It took some time to have all these schools inspected, and the section of the Act relating to independent schools did not come into force until Sept. 1957.

A committee was set up under the

chairmanship of Lord Fleming to consider how the public schools, among which are some famous schools, can be associated with the general educational system. Its report was issued in 1944, and it made a number of recommendations designed to enable a gradually increasing proportion of children from primary schools to be admitted to these independent boarding schools without cost to their parents or at reduced fees. A number of L.E.A.s have subsequently assisted children along the lines suggested by the Fleming committee, but the proportion of children so admitted has not been substantial, nor does it show any tendency to increase. The Fleming committee also made recommendations in regard to a small group of grammar schools, generally known as direct grant schools. They include some endowed schools of ancient foundation and some well-known girls' schools founded in the last century as part of the movement for the higher E. of women. The Fleming proposals for associating these schools with the general system were in the main adopted. There were in 1956 164 of these schools, receiving grants not from the L.E.A. but direct from the ministry. Usually about half their pupils are fee-paying, and the other half attend free, the majority of them being paid for by local authorities.

IRELAND.—In Ireland state intervention in E. began with the foundation of schools by the Elizabethan gov. in pursuance of their anglicising policy. Until 1802 there was a great lack of local effort in E., but in that year the Catholic Society of the Christian Brothers was instituted, which continues its great educational efforts. In 1811 also was founded the Kildare Place Society, which attempted to provide schools upon a compromise between the Catholic and Protestant religions. Both societies received grants from the Treasury in aid of E. until 1833, when a national system of elementary schools was estab. under a board of commissioners, among whose powers were those of aiding in the erection of schools, appointing inspectors, and awarding grants to teachers, of providing a training college, and of issuing text-books. In 1861 special provision was made that the membership of the board should be equally divided amongst Catholics and Protestants. The schools are now almost entirely denominational, either Catholic or Protestant. In the Rep. of Ireland primary E. is directed by the state. Secondary E. is in private hands, and is for the most part conducted by religious orders. School attendance is compulsory for children from 6 to 14 years. State grants to Irish univ. institutions were transferred from the Treasury to the Irish state govts. (Free State and N. Irish) as from April 1922. There are 2 univs., Trinity College, Dublin, and the National Univ. with constituent colleges in Dublin, Galway, and Cork. Northern Ireland became a self-governing unit in 1920, and 3 years later its legislature passed its 1st E. Act. This made each co. and co. bor. council the

L.E.A. for its area, assigning to them duties and powers in respect of almost every educational service except that of the univ. In 1947 an Act was passed which, following the Eng. pattern, required the organisation of E. in 3 successive stages and imposed duties on the L.E.A.s similar to those prescribed in the Eng. Act of 1944. It also provided for a system of secondary intermediate schools so as to make possible secondary E. for all. Northern Ireland has 1 univ., the Queen's Univ. of Belfast, and there

property and control of the existing schools, burgh and par., were transferred to them. Compulsory attendance for all children from 5 to 13 was enforced. The Act also distinguished 3 types of school, the elementary school, the higher grade school, and the higher class school, all of which had primary depts. Powers were also given to school boards to provide meals and medical attendance, defray cost of conveyance in outlying parts, etc., and the Act enabled them to make bye-laws requiring attendance at continuation

is also the Magee Univ. College in Londonderry.

SCOTLAND.—E. has always received marked attention in Scotland. Even as early as 1494 freeholders were required by a statute of King James IV to send their heirs to school to acquire 'perfect Latin.' In 1560 the Church Assembly decreed, under the influence of John Knox, that every church in 'any town of repute' should have attached to it a Lat. school, and in every par. of country dists. there should be a teacher of 'first rudiments.' In large tns, moreover, there was to be a college for 'logic, rhetoric, and the tongues.' In 1696 par. schools in connection with the Estab. Church of Scotland were set up by parl. statute, and a tax was levied upon landowners for their support. The burgh schools or academies were also estab. in most tns, and came under the authorities. In 1872 the Scottish Education Act made the provision of school boards universal and the

classes up to 17 years of age. In 1885 the Scottish and Eng. E. Depts were separated, and the former has since had its own committee and secretary. In 1888 a state system of leaving certificates was introduced into the higher class schools, and was soon extended to all schools doing higher work. In 1901 the school leaving age was raised to 14 for all children. The Education (Scotland) Act, 1918, made some revolutionary changes. It replaced the school boards by 33 co. and burgh E. committees, and transferred the voluntary schools to these E. authorities, subject to conditions that preserve their denominational character. In 1929 the Local Government (Scotland) Act abolished these *ad hoc* E. committees, and entrusted the administration of E. to the co. councils and the tn councils of Aberdeen, Dundee, Glasgow, and Edinburgh. Although since the Act of Union in 1707 England and Scotland have shared one Parliament, Scotland's educational

tradition is separate and distinct, and the secretary of state for Scotland is responsible for the central administration of Scottish E. Unlike England, Scotland has no dual system, and since 1939 all its primary and secondary schools have been administered under one code. Its post-war statute, the Education (Scotland) Act of 1945, is, therefore, a much less complicated measure than its Eng. counterpart of 1944, and contains few innovations. The 4 Scottish univs. are all anct

the Amer. companies for nearly 100,000 schools. In 1949 the Brit. Broadcasting Corporation began experiments in teaching by television. Daily transmissions were begun by the B.B.C. in the autumn, and by I.T.A. in the summer, of 1951.

BROADCASTING TO SCHOOLS.—Among the specialised programme services provided by broadcasting, the most important are perhaps the broadcasts to schools. In Great Britain the value of educational broadcasting was estab. as early as 1927, when a year's experiment was conducted among the schools in Kent. Twenty years later over 12,000 schools were registered as listening regularly to the Brit. Broadcasting Corporation's schools broadcasts. In the U.S.A. E. by radio has also achieved a prominent position, educational broadcasts being provided by

Education, Agricultural. See AGRICULTURE.—*Organisation of Agricultural Education in Britain*; AGRICULTURAL RESEARCH.

Education, Ministry of, a term widely used for that dept of the central gov. in which is vested ultimate responsibility for implementing public laws on E. Its degree of authority varies from country to country. In some cases it exercises direct control of the whole system, in others responsibility is shared with regional or local authorities. The M. of E. in Britain was estab. by the Education Act, 1944, to take over the duties previously performed by the Board of Education (1899-1944). Under a minister appointed by the sovereign on the advice of the prime minister its duty is to assist him 'to promote the education of the people of England and Wales' by gathering information and advice as a basis of policy and then putting the policy into effect when the necessary legislation has been passed. This function is exercised in co-operation with local educational authorities who are, according to the act, to 'contribute towards the spiritual, moral, mental, and physical development of the community by securing that efficient education throughout' the primary, secondary, and further stages 'shall be available to meet the needs of the population of their area.' The minister, who is of cabinet rank and receives a salary appropriate to it, is assisted by a parl. secretary, a secretariat of permanent officials, and H.M. Inspectorate of Schools. Through them, and the payment of money grants, contact with and control of the local education authorities and schools are maintained. The role of the inspectors is advisory, but in addition 2 central advisory councils are appointed by the minister to advise him upon such 'matters connected with educational theory and practice as they think fit, and upon any questions referred to them by him.' The Education (Scotland) Act applied to Scotland the gov.'s policy on education. Within this framework it is administered by the Scottish Education Dept. The Education Act (Northern Ireland), 1947, lays down the statutory system under the M. of E. in Belfast.

In general the act increased the power of the central authority. The M. of E. prescribes standards of school buildings and local education authorities have to submit their plans to the ministry for approval. The M. of E. also has the duty of making adequate arrangements for the provision of teachers. Independent schools are subject to registration and inspection. It is also the duty of the minister to 'cause inspections to be made of every educational establishment at such intervals as appear to him to be appropriate.' See EDUCATION.

Education, Technical, see TECHNICAL EDUCATION.

Education, University, see UNIVERSITIES.
Edward I (1239-1307), king of England, eldest son of Henry III, b. Westminster. He was married in 1254 to Eleanor of Castile, and on the occasion of his mar-

riage was invested with the baronies of Gascony, Ireland, and Wales. During the baronial troubles of his father's reign, it seemed at first that E. might side with de Montfort (q.v.), but from 1259 his loyalty to the king was unswerving. He soon distinguished himself as a soldier, and took a prominent part in the Baronial Wars. He was blamed for the overthrow of the royalist forces at Lewes, since, by his wild charge which swept the Londoners from the field, he so weakened the royalist forces that on his return from the pursuit he found his father's forces had been defeated, and surrendered. He escaped from prison in 1265, and defeated Simon de Montfort at the battle of Evesham (1265). From c. 1260 E.'s influence over his father increased steadily. In 1270 he set out on a crusade, and, returning to Europe in 1272, learnt of his father's death. Conditions in England were so stable at the end of Henry's reign that E. had been recognised as his successor, although absent from the country, without question. He was crowned in 1274, having spent the 2 intervening years in settling affairs in France.

His reign is important in sev. ways. E. worked to unify the outlying parts of his kingdom. After the 2nd Welsh war, which ended in the overthrow and death of the last Llewellyn (1282), he was able to annex Wales. The Statute of Rhuddlan made Wales an Eng. possession. Between 1284 and 1290 much new legislation was initiated. E. was determined to be king not only in name but in reality, and all his legislation tended towards that end. His chief measures in this direction were: the abolition of the office of Justiciar, leading to the organisation of the 3 common law courts, the Assize of Winchester (a nation in arms at the disposal of the king), the Statute of Mortmain, and *Quia Emptores* (a means of preventing subfeudation). But E.'s greatest ambition was to bring Scotland under his control. In 1286 Alexander III had d., leaving as his heir the Maid of Norway, his granddaughter, who was only 6 years of age. In pursuance of his ideal of a Scotland united with England, E. planned a marriage between the Maid and his son, Edward of Caernarvon. The marriage was accepted in Scotland, but in 1290 the Maid d. and Scottish affairs became chaotic. E., as arbitrator, at Nottingham chose John Balliol as king of Scotland, out of a dozen claimants, the most prominent of whom was Robert Bruce. Balliol did homage to E. as his over-lord, but the Scottish people, resenting keenly the attitude of E., forced Balliol into open rebellion, and E. invaded Scotland. By the end of 1296 he had reduced Scotland, and at Brechin had forced Balliol to surrender the crown. He appointed his own regents for Scotland and departed southward, taking with him the famous Stone of Destiny. In 1297 Scotland, led by Wallace (q.v.), was again in rebellion. N. England was harried, and at Stirling Surrey and Cressingham were totally defeated. E. hurried back, and in 1298 overthrew Wallace at Falkirk.

Between 1298 and 1306 it seemed that E. was master of Scotland. In 1305 Wallace was captured and executed, but in the following year Bruce murdered Comyn, and seized the crown of Scotland. E. hurried northward, but he was falling fast in health, and in July 1307 he *d.* at Burgh-on-Sands. On his tomb is inscribed *Edwardus Primus Malleus Scotorum hic est*. He may be best described as a man of stern character, jealous of his honour and of what he conceived to be the honour of his kingdom, true to his word when it suited his end, and only then. When it was necessary E. did not hesitate to break his pledged oath, and his conduct towards the Welsh and Scots was marked by cunning, duplicity, and ruthlessness. When he *d.* the prestige of his kingdom was high and its boundaries much extended; but his wars led to heavy taxation and though his success in Wales was lasting his Scottish policy was, in the last resort, indecisive. His 'Model Parliament' of 1295 in which the 3 estates of the realm were represented is perhaps his most lasting claim to fame. His first wife *d.* 1290 and in 1299 E. married the sister of the king of France. See life by T. F. Tout, 1893.

Edward II (1284-1327), king of England, b. Caernarvon, the first of the Eng. crown princes to bear the title of Prince of Wales. He succeeded his father in July 1307, and disobeyed his last command to continue the war with Scotland. He married Isabella of France, 1308. Weak, effeminate and incapable, his reign is one long record of struggle with the barons. His favouritism towards Piers Gaveston was unpopular, and the honours showered upon the favourite were to cost Gaveston his life. The barons, forming a committee (1310), drew up the Ordinances which E. was forced to accept (1311). For some years E. was little more than a nominal ruler, his defeat at Bannockburn (see below) giving the Lancastrian party the opportunity to seize power more firmly; but after Lancaster's death (1322) E. regained control of affairs, ruling as incompetently and extravagantly as before. In 1326 Isabella, who had gone to France with her son (Edward), returned, landed at Orwell, and marched against the king. The Despencers, the favourites of the moment, were captured and executed, and the king was deposed. In 1327 he was brutally murdered in Berkeley Castle. Outside England, E. had shown his weakness in the total defeat of the Eng. Army at Bannockburn in 1314, a victory which was followed up by the capture of Berwick, and resulted in the practical independence of Scotland. See T. F. Tout, *The Place of the Reign of Edward II in English History*, 1914.

Edward III (1312-77), king of England, son of Edward II, crowned in 1327. In 1328 he married Philippa of Hainault. During the early years of his reign Isabella and Mortimer retained the real power, until in 1330 he banished his mother and executed Mortimer. He then made peace with France in order to turn his attention to Scotland, where in the

early years of his reign (1330-6) he fought 3 campaigns, in which he defeated the Scots (notably at Halidon Hill on 19 July 1333) and forced Edward Balliol to do homage to him. After each campaign, however, the Scots rallied, and E.'s attacks on Scotland were stopped by the outbreak of war with France. His formal claim to the throne of France in right of his mother was largely an excuse to start a war which E. and the nobility both wanted. It was in part a commercial war, fought by E. because he desired to retain the Flem. woollen trade, but probably his basic desires were to increase his territorial power and national and international prestige, and to gain personal glory. It was the zenith of the age of chivalry with all its elaborate ceremonial and formal courtesies, and after the ineffectuality of Edward II's reign both king and nobles fretted to display their personal powers in the field and to reap large spoils from the traditional enemy, France, whose weakness was an invitation for invasion. The war opened with the battle of Sluys (1340), a naval victory for England. In 1346 was fought the battle of Crécy (q.v.), which resulted in the overthrow of the Fr. Army, and the vindication of the tactics of the Eng. archers. In the following year Calais fell into the hands of the Eng., and in the previous year the battle of Neville's Cross had delivered David, king of Scotland, a prisoner to the Eng. queen. The Black Death in England in 1349 put an end to the war for some time, and resulted also in the changing of the labour market in England. The relationship between the lords of the manor and the inhab. changed, and although the Statute of Labourers purported to fix wages, its provisions were found to be unworkable. In 1355 war was renewed, and Edward the Black Prince won a great victory at Poitiers. The Fr. king, John, became a prisoner and was taken to England. In 1360 the treaty of Bretigny was signed, and E. gave up his pretensions to the Fr. throne and received Aquitaine, Poitou, and the tn of Calais as a sovereign prince. The Scottish king had been released in 1357 on the payment of ransom, and the Fr. king in 1360. The latter, however, finding it impossible to raise the ransom, returned to England, and *d.* there a prisoner in 1364. War again broke out in 1369, and dragged on unsuccessfully until 1377, when E. *d.* His son, the Black Prince, had predeceased him. The latter years of his reign had been years of decadence, and most of the troubles of Richard II (q.v.) have their origin in his grandfather's actions—or inaction. E. had fallen under the influence of Alice Perrers, his mistress, and power had passed largely into the hands of John, duke of Gloucester, and his brothers. But the earlier years of the reign had been distinguished by great commercial expansion; while the statute of *Præmunire* (1353) marked a further step forward in the efforts of the sovereign to establish the supreme jurisdiction of his courts (directed, on this occasion, against papal

interference). E.'s reign is important also in the hist. of constitutional progress. Although the enthusiasm aroused by the Fr. war sometimes enabled the king to levy illegal taxes, his parliament succeeded in placing important restrictions on the royal power, as, e.g., when the king declared in 1352 that the levy of tallage should cease, and again when the prerogative of purveyance (see *PRE-EMPTION*) was abolished in 1362 except for the personal needs of the king and queen. Parliament also asserted its control over customs such as tunnage and poundage by the statutes of 1362 and 1371, which enacted that neither merchants nor any other body should impose a subsidy or charge on wool without parl. consent. In judicial matters, 2 important privileges were successfully asserted: the Commons asserted their right to impeach the ministers of the crown (1376), and the Lords confirmed their right to trial by their peers alone. See also *HUNDRED YEARS WAR*. See lives by W. Longman, 1869; and J. Mackinnon, 1900; and H. Pirenne, *Histoire de l'Europe*, 1936; and A. H. Burne, *The Crécy War*, 1955.

Edward IV (1442-83), king of England, son of Richard, duke of York, and Cicely Neville, b. Rouen. He was in the Welsh Marches when he heard of his father's overthrow and death at Wakefield (1460). E. immediately took over his father's position as Yorkist leader, and, acting swiftly and decisively, marched on London. On the way he won the battle of Mortimer's Cross, and entered the cap. in Mar. 1461. He was proclaimed king, and immediately marched N. again. At Towton his decisive victory consolidated his hold on the crown. But he owed much of his success to his Neville relations and especially to Warwick (q.v.). From 1461 to 1464 Warwick was the real ruler of England. After E.'s marriage to Elizabeth Woodville, however, Warwick's influence declined. In 1469 Warwick and Clarence, E.'s brother, rebelled. Warwick joined forces with Margaret of Anjou, and E. had to flee to Burgundy, whose duke had married E.'s sister, Margaret (q.v.), in 1468. With Burgundian help E. returned to England, defeating Warwick at Barnet and Margaret at Tewkesbury (1471). Warwick was killed in battle; Henry VI was put to death shortly after Tewkesbury, and Clarence was imprisoned and murdered, 1478. Henry's son had been killed after Tewkesbury. The remainder of E.'s reign was fairly peaceful, with the exception of a short war with France (1475), and an only partially successful campaign against Scotland (1482).

In an emergency E. could act energetically and with resolution; but his very real abilities were increasingly hidden by his natural indolence, and his court became notorious for its wantonness and luxury. In many ways he was a typical Renaissance prince, opportunist, politically unscrupulous, capable of extreme ruthlessness and barbarity, but a cultured patron of learning (he was a patron of Caxton), and of the new discoveries. Strengthened by the wealth he had

obtained from confiscations, and by the fact that any potential remaining enemies among the nobility were temporarily too weakened by the recent struggles to be immediately dangerous, E. gave his kingdom a short period of stable gov. such as it had not had for sev. decades. He is sometimes regarded as a fore-runner of the Tudor autocrats. See life by C. L. Schofield, 1923.

Edward V (1470-83), king of England, elder son of Edward IV and Elizabeth Woodville. He succeeded his father in April 1483, his uncle, Richard of Gloucester, acting as regent. In a little over 3 months Richard had imprisoned E. and his younger brother in the Tower and had them declared illegitimate, and had seized the crown himself as Richard III (q.v.). When it was given out that the young princes had d., popular suspicion immediately fastened on Richard as having ordered their deaths. Their murder in 1483 has been fairly conclusively estab. but the instigator of the crime has never been proved. Richard remains the most probable suspect; he had an overwhelming interest in the disposal of his nephews, and the power to command it; he made no attempt to refute contemporary allegations. P. M. Kendall's *Life of Richard III*, 1956, suggests that Buckingham may have been responsible.

Edward VI (1537-53), king of England, only legitimate son of Henry VIII, and the only child of Henry by his 3rd wife, Jane Seymour, who d. shortly after his birth. He was delicate from birth, but appears to have been unusually intelligent and precocious. E. was never created prince of Wales, but bore the title duke of Cornwall from his birth. He succeeded his father when not quite 10 years of age, and the gov. was carried out in his name by regents, first the duke of Somerset, and second by the duke of Northumberland. E. was practically a nonentity during his short reign, the famous acts assigned to him being the work of the regents. From the time of his father's death he was brought up as a Protestant, and gave promise of becoming a fanatic. He left a will when he d. which was obviously the work of Northumberland. By it he set aside the will of his father and left the throne to Lady Jane Grey (q.v.) and her heirs male, Lady Jane having recently been married to the eldest son of Northumberland. E.'s reign marks a turning point in the religious hist. of England. During it prominent Eng. Protestant refugees were able to return to the country, and influential continental Protestants freely admitted to England. Protestant doctrines penetrated every strata of society; vandalism of Church property was widespread. Protestantism gained a popular hold strong enough to make Mary I's dream of a quick, complete and relatively bloodless return to Catholicism impossible of fulfillment. See life by Sir C. H. Markham, 1907, and J. C. Nichols (ed.), *The Literary Remains of King Edward VI* (including diary 1549-52), 1857. See also C. H. Smyth, *Cranmer and the Reformation under Edward VI*, 1926.

Edward VII (1841-1910). Albert Edward, king of Great Britain and Ireland and of the Brit. dominions beyond the seas, emperor of India, was the eldest son and 2nd child of Queen Victoria and Prince Albert, and was born at Buckingham Palace. In the Dec. following he was created earl of Chester and prince of Wales. He was educ. under private tutors, and in 1859 went to the univ. of Edinburgh. From here he went first to Christ Church, Oxford, and later to Trinity College, Cambridge. In 1858 he had been made a knight of the Garter, and a colonel in the army. In the following year he visited Italy and Spain, and in the following year travelled through Canada and the U.S.A. In 1862 he paid a visit to the Holy Land. He had already impressed the people whom he had met with his charm, but his early life was passed under many restrictions, which did not lessen in severity after the death of his father. In 1863 E. was admitted a member of the privy council and took his seat in the Lords as duke of Cornwall. On 10 Mar., in the same year, he married Princess Alexandra of Denmark. He was granted an income of £40,000 a year in addition to the revenue of the Duchy of Cornwall, and Sandringham was purchased for him, whilst Marlborough House became his residence. His eldest son, Prince Albert Victor (duke of Clarence), was born 1864, Prince George Frederick Ernest Albert (George V), 1865, Princess Louise Victoria, 1867, Princess Victoria, 1868, Princess Maud (queen of Norway), 1869.

After his marriage the prince of Wales played an important part in the social life of the nation. The death of the prince consort had been an overwhelming blow to the queen, and for many years following it she lived in practical retirement. Though she allowed her son to represent her at a number of lesser functions, it was not until near the end of her life that she allowed him to take a major part in state affairs: and this no doubt at least partially accounted for his excessive preoccupation with social events, such as horse-racing, the theatre, etc. The prince, however, was always ready to help forward charitable movements, and he played an important part in the linking together of the empire by his various foreign tours and visits. He had already visited France. Amongst his more important visits may be mentioned Egypt, 1869; Ireland, 1871; Russia, 1874; India, 1875; Ireland, 1885. In 1871 he was struck down with typhoid fever, and for a time his life was in danger, but he finally recovered completely. In 1892 his eldest son, Prince Albert Victor, on the eve of his marriage to the Princess May Victoria of Teck, *d.* after a very brief illness. In the following year his son, Prince George, married the same Princess May Victoria of Teck, to whom a son, Prince Edward of Wales, was *b.* in 1894. In 1897 the prince of Wales took a leading part in the arrangements and the actual events of the queen's diamond jubilee.

Early in 1901 his mother, Queen

Victoria, *d.*, and the prince succeeded with the title of Edward VII. In May 1902 the war in South Africa was brought to an end. The personal popularity of the king was seen from the very beginning of his reign, and he proved a more able ruler than many had expected, though his activities were increasingly curtailed by ill-health. He took an active part in the political and social life of his people. He was thoroughly constitutional, but did much by a revival of court pageantry to restore the personal glamour of the crown, which had tended to lapse during Victoria's long widowhood, and his influence on foreign policy, especially in Anglo-Fr. relations, did much to further the cause of peace. The early part of his reign was clouded by his illness just before his coronation, but he recovered and was crowned on 19 Aug. 1902. Early in 1910 the king was taken ill, but recovered, but again on 5 May he was reported to be suffering from bronchitis, and on the following day he *d.* of heart failure. In spite of his lack of political training, and some marked personal faults which he himself did not try to conceal, E. speedily won for himself the affections of his people. It is possible that his personal influence on affairs of state was exaggerated by his contemporaries; but to the mass of his subjects he was for many years remembered as Edward the Peacemaker. See lives by Sir Sidney Lee (the official life), 1925-7; E. F. Benson, 1934; A. Maurois, 1936; C. Gavin, 1941. See also Virginia Cowles, *Edward VII and His Circle*, 1956.

Edward VIII (Edward Albert Christian George Andrew Patrick David) (1894-), king of Great Britain, Ireland, etc., from 20 Jan. to 10 Dec. 1936, the eldest son of the duke and duchess of York (afterwards George V and Queen Mary), *b.* 23 June at White Lodge, Richmond Park. He was created prince of Wales on his 17th birthday, and before attaining his majority, in 1912, he had completed his naval education at Osborne and Dartmouth, being gazetted midshipman in 1911 on the *Hindustan*, where he earned a reputation for hard work. He went into residence as a commoner at Magdalen College, Oxford, in Oct. 1912. During the First World War E. was attached to the staff of Sir John French (later earl of Ypres) on the W. Front in 1914; he was appointed staff capt. with the Mediterranean Expeditionary Force in 1916, and became D.A.Q.M.G. in the same year. In 1917 he paid a visit to the It. front. After the war he made a series of tours abroad. He visited Canada and the U.S.A. in 1919, being enthusiastically welcomed in both countries. He visited Australia, 1920, India, 1921, Africa, 1925, and Canada again in 1923, and South America in 1925 and 1931. His charm, sympathy and informality made him very popular; and during the depression of the 1930's his sympathy with the problems of the unemployed increased his popularity. One of the main events of his short reign was a visit to the distressed areas of South Wales. He succeeded to the throne on

his father's death, but abdicated uncrowned, because of constitutional objections to his proposed marriage to Mrs. Ernest Simpson (*née* Bessie Wallis Warfield and now duchess of Windsor), an Amer. citizen whose 2 previous marriages had been dissolved. He left England immediately afterwards and married her at the Château de Condé, France, on 3 June 1937. After his abdication he was created duke of Windsor. During the Second World War he became governor of the Bahamas, retaining this post until 1947. Apart from a number of private visits to Britain, E. has visited the country to attend the funerals of his mother, Queen Mary, and brother, George VI, but now lives in France. Both he and his wife have pub. their memoirs which deal in detail with the events of the abdication. *See also* H. Bolitho, *King Edward VIII*, 1937; and F. Owen and R. J. Thomson, *His Was the Kingdom*, 1937.

Edward, the Black Prince, *see* BLACK PRINCE.

Edward, Lake (formerly Albert Edward Nyanza), lake partly in Belgian Congo and partly in Uganda. L. E. covers 830 sq. m.; mean depth 365 ft. Fish abound, and the lake is said to be free from crocodiles. L. E. is one of the Nile's W. reservoirs. It was discovered by Stanley in 1889, when he succeeded in tracing the Semliki—the one and only outlet of the lake—to its source; and by him was named Albert E. after the prince of Wales, who became E. VII.

Edward Medal, an award for acts of heroism performed by miners and quarrymen or to those who rescue them when in danger; estab. in 1907 by King Edward VII.

Edward the Confessor (c. 1004–66), king of the Eng., the 2nd son of Ethelred 'the Unready' and Emma of Normandy. His surname was given on account of his saintly reputation. The greater part of his early life was spent in exile, since, on the death of his father, the throne of England passed into the hands of a Dan. dynasty. His mother had married Canute (Cnut) after the death of Ethelred, and by him had a son, Hardicanute. In 1041 Hardicanute invited E. from the Norman to the Eng. court, an invitation which implied that Hardicanute considered E. his heir. In 1042 Hardicanute d., and E., not without some opposition, was elected king of England, and crowned at Winchester, 1043. His long exile in Normandy had made him more Norman than Saxon, and he offended many Saxons by his patronage of Norman clergy and knights. It is probable, however, that the Norman element at E.'s court has been exaggerated; the most prominent Eng. family, the Godwins, intrigued against him out of personal ambition rather than Saxon patriotism. In 1045 E. married Edith, Godwin's daughter, but felt strong enough to exile Godwin in 1051. He was forced to receive Godwin back in 1052; but not before William of Normandy, to whom E. is believed to have promised the Eng. crown on his death, had made a visit

to England. He d. 5 Jan. 1066, apparently agreeing that Harold, Godwin's son and successor, should succeed him on the throne. He was canonised, with the title of Confessor, in 1161 by Pope Alexander III. E. had a humility and asceticism rare in a ruler of his time, but, though he could on occasion act with ruthless energy, as when he banished Godwin, he was generally ineffectual, and after Godwin's restoration he appears to have lost what interest he had previously had in affairs of gov. and to have devoted himself increasingly to religion. He spent large sums on the building of an abbey at Westminster, but was too ill to attend its consecration in Dec. 1065, a week before his death.

Edward the Elder (d. 924), Eng. king. E. was the 2nd son of Alfred the Great; he succeeded his father in 899. Much of his reign was spent fighting the Danes; by his death he had conquered all the Danelaw (q.v.) S. of the Humber. In addition, E. was given the allegiance of sev. Welsh princes, and the A.-S. Chronicle records that in 920 E. received the submission of the kings of Scotland and Strathclyde.

Edward the Martyr (d. 978), Eng. king. He was crowned in 975. His short reign was marked by an anti-monastic reaction. His assassination at Corfe Castle in Dorset was probably arranged by the supporters of his half-brother, Ethelred. Shortly after his death he was popularly venerated as a saint and a martyr.

Edwardesabad, *see* BANNU.

Edwards, Amelia Ann Blandford (1831–92), novelist and Egyptologist, b. London. She pub. over 15 novels, the best of which are usually considered to be *My Brother's Wife*, 1855, *Debenham's Vow*, 1869, and *Lord Brackenbury*, 1880. Her lectures on Egypt appeared in print under the title of *Pharaohs, Fellahs, and Explorers*, 1891, but her most universally appreciated book was one of travel entitled *A Thousand Miles up the Nile*, 1877. In 1882 she founded, and was long an honorary secretary of, the Egyptian Exploration Fund.

Edwards, Henri Milne, *see* MILNE-EDWARDS, HENRI.

Edwards, John Passmore (1823–1911), newspaper proprietor, b. Cornwall. Coming to London in 1845, he became a journalist and was one of the promoters of the Early Closing Association. In 1862 he purchased the *Building News*, and in 1876 the *Echo*, the first halfpenny newspaper. It and the *Weekly Times* were the foundation of a great fortune, most of which he distributed in gifts of free libraries and other institutions. Honoured as a philanthropist, he was twice offered a knighthood, but declined it. His autobiography, *A Few Footprints*, was pub. in 1905.

Edwards, Jonathan (1703–58), Amer. divine, b. at South Windsor, Connecticut, was the son of a clergyman, and was himself ordained in 1727. For nearly 24 years (1727–50) he was associated as minister with Northampton, Massachusetts. Here he successfully piloted his people through the great wave of Revivalism, which swept his par. among so many others after

the preaching of George Whitefield. But his vigorous crusade against the circulation of immoral literature, and, above all, his insistence on admitting none but true converts to the Holy Communion, forced him to give up his pastorate. His *Enquiry into . . . Freedom of Will*, 1754, has estab. him as one of America's foremost metaphysicians, while his spiritual nobility shines out in his book, *The Nature of True Virtue*, in spite of the cloud of a somewhat austere Calvinism. He has been called the 'Spinoza of Calvinism.' See life by A. V. G. Allen, 1889; F. H. Foster, *Genetic History of New England Theology*, 1907; V. L. Parrington, *Main Currents in American Thought*, vol. i, 1927.

Edwards, Richard (c. 1523-66), poet and playwright, *b.* Somerset. Educ. at Oxford, he was entered at Lincoln's Inn, but apparently never practised law. He became Master of the Children of the Chapel Royal, and had a high reputation for his comedies and interludes. His *Palamon and Arcite* was acted before Elizabeth I at Oxford in 1566, but *Damon and Pythias*, 1577, a comedy, is his only extant play. He compiled one of the early anthologies, *The Paradise of Dainty Devices*, 1576, which contains many of his own poems. See life by L. Bradner, 1927.

Edwin, Aedwine, or Edwine (c. 585-632), king of Northumbria, son of Ella of Deira. E. married Ethelburga, daughter of Ethelbert of Kent (q.v.), in 625, and was baptised by Paulinus, 627. This resulted in the rapid, if temporary, conversion of NE. England to Christianity. E. was killed by Cadwallon of Wales at Hatfield, 1927.

Eekhout, Gerbrandt van den (1621-74), Dutch painter, *b.* Amsterdam; he was a pupil of Rembrandt and imitated his style closely. His chief subjects are biblical, and of these his small pictures are the best. Some of his pictures are: 'Tobit,' in the Brunswick Gallery; 'The Woman taken in Adultery,' at Amsterdam; 'Simeon in the Temple,' at Dresden; 'Christ among the Doctors,' at Munich.

Eeden, Frederik Willem van (1860-1932), Dutch poet and novelist, *b.* Haarlem. He took his degree in medicine at Amsterdam in 1886 and for a time followed the medical profession. In 1885 he became the editor and co-founder of the paper *De Nieuwe Gids*, which was the organ of the younger literary group. In this he pub. his first novel *De Kleine Johannes*, 1887, a religious story in which he expressed his own deep religious mysticism. His social ideals led him to start a community centre at Bossum which was not, however, a success. In 1922 he was converted to Rom. Catholicism. His greatest poetical work is *De Broeders* (*The Brothers*, 1894), a realistic drama of a feud between 2 brothers to which is given a deep spiritual significance. He wrote a number of plays for the theatre. His best known novel was pub. in 1900, *Van de Koel Meren des Doods* (Eng. trans. *The Depths of Deliverance*, 1902). His journals, *Mijn dagboek* (9 vols.), which illuminate his spiritual life,

have been pub. since his death. See A. Verwey, *F. v. Eeden*, 1940.

Eekloo, industrial tn in the prov. of E. Flanders, Belgium, 11 m. NE. of Ghent. The chief manufs. are cotton, linen, and wool. Pop. (1955) 17,700.

Eel, a species of the teleostean order Apodes, elongated, soft-rayed fishes with an open duct to the swimbladder and long dorsal and anal fins which are continued to the small tail fin. Transparent leaf-shaped larvae (leptocephali) are a feature in the life hist. Most E.s are marine and even the freshwater E.s of Europe and America (*Anguilla*) migrate to the Sargasso Sea to lay their eggs. And as

EEL

Johannes Schmidt found, the leptocephali of the European E. take about 3 years to cross the Atlantic. There are about 20 families of E.s, which include the conger-E.s (Congridae), snake-E.s (Ophichthyidae), Moray-E.s (Muraenidae), and fresh-water E.s (Anguillidae). There are a number of deep-sea families.

Besides these more commonly known E.s, there are the gulper-E.s (order Lymnini) of the deep ocean, black fishes with immense mouths, long dorsal and anal fins and a long slender tail. The spiny-E.s (order Ophichthini), such as species of *Mastacembelus*, are found in the freshwaters of Africa and South Asia. There is a series of spines along the back. The symbranchoid E.s (order Symbranchioidea) have no pectoral fins and rayless dorsal and anal fins. The best known is the cuchia (*Amphipnous*) of tropical Asia. The eusk-E.s (Ophidiidae) are related to the blennies. Lastly, hag-fishes (q.v.) are sometimes known as slime-E.s.

Eel-pout, see BURBOT.

Eelion, see AETION.

Effendi, formerly used in Turkish as the equivalent of Mister. It is now only used with the 1st person possessive suffix as a mode of addressing both men and women, 'effendim.'

Effervescence. The extent to which gases are soluble in water depends upon pressure and temp. When the temp. is low and the pressure great, the gas is more soluble, consequently when the temp. is raised or the pressure lowered, the gas escapes in small bubbles. This phenomenon is called E. The term is also applied to the tumultuous upheaval of any liquid by a gas produced in it, giving it the appearance of boiling. The similar phenomenon *frothing* is often a nuisance during distillation; it may be partly or wholly prevented by adding bits of broken unglazed earthenware to the liquid undergoing distillation.

Efficiency. In any method of transmitting energy from point to point, or of transforming one kind of energy into another, some of it is dissipated or becomes useless. The ratio of the energy available at the end of the process to the total energy supplied is called the E. of the process. Thus, in transmitting mechanical energy by means of shafting, some of it is used in overcoming friction of bearings, etc. The numerical value of the E.s of machines varies very widely. In a simple machine, such as a pulley, the E. may be as high as 80 per cent, and in a screw jack, as used on motor cars, as low as 30 per cent. It must be remembered, however, that the loss of E. is compensated by the fact that the friction prevents the screw jack running backwards when left free. In transmitting electrical energy, some of it is converted into heat in the wires or cables which carry the current. As this loss is proportional to the square of current, it is advisable to transmit energy at high voltage so that the current for a given energy will be correspondingly low. In processes for transforming energy from one kind to another, the E.s show wide variations, and the object of most improvements in 'transformers' or engines is to increase the E. A locomotive engine may transform less than 10 per cent of the heat of the coal burned into available mechanical energy. But in transforming mechanical energy into electrical energy, or *vice versa*, the E.s are usually greater, as much as 92 per cent of the energy supplied being available for use after transformation. The term E. is sometimes used in speaking of electric lamps, where it expresses the candle power per unit of electrical energy supplied.

Efflorescence, in chem., is the term applied to the crumbling to powder of crystals, caused by the loss of water originally present in them. It occurs whenever the vapour pressure of the water in the crystal is greater than that of the moisture in the surrounding air. Glauber's salt and ordinary washing-soda are good examples of efflorescent substances. The converse of E. is deliquescence (q.v.).

Effusion of Gases, see GAS and GASES.

Effusive or Eruptive Rocks, see IGNEOUS ROCKS.

Eft. The terms E. and newt are applied to almost all species of lizard found in the Brit. Isles. See NEWT.

Egadi, Isola, see AEGADIAN ISLANDS.

Egan, Pierce, the Elder (1772-1849),

sporting author, b. London. He is principally remembered for his *Life in London: or the Day and Night Scenes of Jerry Hawthorn, Esq., and his elegant friend, Corinthian Tom, accompanied by Bob Logic, the Oxonian, in their Rambles and Spree through the Metropolis*, 1821; illustrated by George and Isaac Cruikshank, it was the first work of fiction to be pub. in monthly parts, and was extremely popular. E.'s other works include *Boxiana, or Sketches of Antient and Modern Pugilism*, 1818-24, *The Life of an Actor*, 1825, and *Pierce Egan's Book of Sports and Mirror of Life*, 1832. His son, Pierce E. the Younger (1814-80), wrote a number of novels.

Egas Moniz, António Caetano de Abreu Freire (1874-1955), Portuguese neurologist, b. Avanca. He graduated in medicine at Coimbra Univ. in 1899 and continued there as a teacher, becoming deputy prof. of medicine in 1902. In 1900 he was elected to the Portuguese parliament, in which he served on and off for 16 years. In 1918 he was appointed Portuguese minister at Madrid, returning the same year to become minister of foreign affairs, in which capacity he led his country's delegation at the conference of Versailles, 1919. During these years he continued to teach medicine and began to specialise in neurology. In 1911 he became prof. of neurology at Lisbon. In 1927 he introduced cerebral angiography, a method for radiological visualisation of the arteries of the brain, used for diagnosis of cerebral tumours and other brain lesions. After some years of research on the subject he introduced the operation of prefrontal leucotomy as a method of treating mental disorder. This consists of severing certain fibres in the frontal lobe of the brain. The operation gave a powerful stimulus to research into the treatment of mental disorders and gained for E. M. the Nobel Prize in 1949.

Egbert the Great (fl. 802-39), king of Wessex. He was the son of Ethelmund, who had been driven into exile by Offa of Mercia (q.v.). E. conquered the Britons of Devon and Cornwall in 815. In 825 he defeated Beornwulf of Mercia, and soon after Kent, Surrey, Sussex, and Essex submitted to his rule. E. finally absorbed Mercia in 829 and in the same year Northumbria acknowledged his supremacy. E.'s position of overlordship was now unrivalled and the compiler of the A.-S. Chronicle gives him the title *breotwalda*, saying that he was the 8th king to hold it. In 838 the Cornish Britons joined the Danes in an invasion of Wessex, but were decisively defeated by E. at Hengistun (Hington Down). This marked the end of any semblance of Cornish independence.

Egede, Hans Povelson (1686-1758), Dan. Protestant missionary, b. Harstad, Norway. He studied theology at Copenhagen Univ., and was appointed pastor at Vaagen in 1707. In 1721 he went to Greenland where he worked zealously for 15 years. On the death of his wife in 1736 he returned to Copenhagen, but continued his work for the Greenland mission,

of which he became bishop in 1740. He wrote a book on the natural hist. of Greenland.

Eger: 1. (Ger. Erlau) tn of N. Hungary, cap. of the co. of Heves, near the Mátra Mts (q.v.), 65 m. N.E. of Budapest (q.v.). It was one of the first settlements of the Magyars (q.v.), and once possessed a 12th-cent. cathedral (destroyed by the Tatars), said to have been nearly as fine as that at Cologne (q.v.). The present neo-classical archiepiscopal cathedral is modern. There is a ruined fort, and many 18th-cent. buildings of note, such as the baroque Minorite church. The tn is known for its *Erlauer* wine, is a spa, and has a trade in agric. produce. Pop. 32,000.

2. Czechoslovak tn, see CHEB.

3. Czechoslovak and Ger. riv., see OHŘK. **Egerdir**, lake of Turkey in Asia, situated in lat. 38° N., between the Taurus range and the Sultan Dag. It is about 30 m. long, and drains S. into the Mediterranean.

Egeria, Roman nymph, wife of Numa, worshipped in Rome and Aricia as the goddess of childbirth, and connected with the Camenae (water nymphs). It. predecessors of the Muses.

Egerton, Francis, see BRIDGEWATER.

Egerton, Francis Leveson-Gower, see ELLENBERG, 1st EARL OF.

Egerton, George, pen-name of Mary Chavelita Bright (1860-1945), Australian novelist, b. Melbourne. Her father was Capt. Dunne, and she was 3 times married, her 1st husband being H. H. W. Melville, her 2nd Egerton Clairmonte, and her 3rd Reginald Golding Bright. She travelled widely and at one time planned to be an artist, but turned to writing, her novels including *Keynotes*, 1893, *Discords*, 1894, *Symphonies*, 1897, *Fantasies*, 1898, and *Flies in Amber*, 1905. Two of her plays are *The Backsiders*, 1910, and *Camilla States Her Case*, 1925. She also trans. Knut Hamsen's novel *Hunger*, 1926, and was an original member of the Irish Genealogical Society.

Egesta, see SEGESTA.

Egg, Johann Maier von, see ECK.

Egg (O.E. *ag*; Ger. *Ei*; Swed. *agg*, probably also Gk *ōn*), the female reproductive cell which develops into a new individual. In all but parthenogenetic animals, this process only takes place after fertilisation by the male gamete. When the word is used in this sense, it is directly parallel to the Lat. word *ovum*, and applies to the intra-maternal as well as the extra-maternal existence of the cell. In common speech the word only applies to the extra-maternal *ovum*. *E.s.* vary very greatly in size. In all cases the essential embryo is very small, but variations occur in the amount of yolk present, and in the thickness and structure of the surrounding parts.

Eggs of birds.—Birds lay on the whole the largest *E.s.* The *E.s.* of the extinct *Aepyornis* have a cubic content of over 2 gallons. The ostrich lays the largest *E.s.* of any extant bird. One weighs about as much as 12 hens' *E.s.* At the other end of the scale is the *E.* of the hum-

ming bird which only weighs a few grains. The shell of a bird's *E.* is mainly composed of carbonate of lime. It is often coloured, the colouring being specific to the particular variety of bird. Seven different pigments have been separated from the colouring of *E.s.* Their origin is still obscure, but they are probably derived from the haemoglobin in the blood, and may be in some way similar to bile-pigments. The significance of the colour of *E.s.* is difficult to understand. It probably depends upon the environment of the nest. Thus snakes and such birds as deposit their *E.s.* in holes and in domed nests lay white *E.s.* In such cases coloured *E.s.* would be invisible, and they would be in danger of being broken by the mother. *E.s.* which are laid in open nests, or on the bare ground, are coloured to imitate their surroundings. The brilliant *E.s.* are al-

THE EGG OF A HEN

ways found in nests with elaborate protective devices, or in ones that are carefully hidden.

Eggs of mammals.—Only 2 genera of mammals are oviparous: the *Echidna* or *spiny ant-eater*, and the *Ornithorhynchus*, or *duck-billed platypus*. The *Echidna* carries her *E.s.* in a pouch.

Eggs of reptiles.—These are always white or yellowish. They are smaller than birds' *E.s.* but yet possess a good deal of yolk. The shell is nearly always membranous, but in tortoises, turtles, and crocodiles it is calcareous like a bird's. A few lizards and snakes are viviparous.

Eggs of fishes differ greatly in size and appearance, and some extraordinary varieties are known. Most fishes lay enormous numbers of *E.s.* The sturgeon lays 7,000,000 *E.s.* the turbot over 14,000,000. The number always depends on the risk of destruction, and this rule applies to all animals. For further particulars, see BIRD; POULTRY; REPRODUCTION.

Egg Island, see EIGG.

Eggar-moths belong to the Lasiocampidae, and are well known in Great Britain. They are of large size, covered with scales, are all of a reddish brown colour, and possess a highly developed hind-wing. The length across the wings may vary, as in the genus *Suana*, from 1½ to 4½ in. The walls of the cocoons have sometimes a smooth, shell-like appearance, hence the name.

Egge, Peter Andrias (1869-), Norwegian novelist and playwright, b. Trondheim. In his plays (*Idyllen*, 1910; *Fælen*, 1912; *Narren*, 1914; *De svære valg*, 1924) he gives proof of humour and a fine irony. His short stories dealing with his

native region, Trøndelag, have been particularly successful; also his novels: *Jens i fjordene*, 1920; *Jægtveig og hans gud*, 1923; and *Hansine Solstad*, 1925. See *B. Fjæstad, P. Egge og hans trønderromaner*, 1949.

Egghorn, or Eggeschhorn, mt of the Alps in Switzerland, situated in the canton of Valais, near the head of the Rhône valley, and on the S. slope of the Bernese Oberland. It rises to an altitude of 9625 ft.

Eggleston, Edward (1837-1902), Amer. minister and novelist, b. Vevay, Indiana. He was pastor of the Church of Christian Endeavour, Brooklyn, from 1874 to 1879, after which he devoted himself to literature, his works giving a picture of the life and manners of the Middle West. His 1st novel, *The Hoosier Schoolmaster*, 1871, was so popular that it was trans. into Fr., German, and Dan. Others are *The Circuit Rider*, 1874, *Rory*, 1878, *The Hoosier Schoolboy*, 1882, and *The Graysons*, 1888. See study by W. P. Randel, 1946.

Eggmühl, see ECKMÜHL.

Egham, urb. dist. and tn of the co. of Surrey, England, situated on the r. b. of the Thames, 8 m. from Windsor, and 20 m. from London. The urb. dist. adjoins Berkshire, and has an acreage of 9350. In the urb. dist. are the historic meadows of Runnymede (q.v.). On Cooper's Hill, overlooking Runnymede, is the Commonwealth Air Forces Memorial, unveiled by H.M. the Queen in Oct. 1953. Pop. 25,800 (1954).

Egidio Colonna, see COLONNE.

Egill Skalla-Grimsson (c. 900-83), the most imposing character in the Icelandic family sagas and by common consent the greatest of the Old Icelandic poets. Besides a number of occasional verses, 3 of his major poems have been preserved, only one of them complete. *Egils Saga* (which some scholars think may be the work of Snorri Sturluson (q.v.)) is, after *Njáls Saga*, the greatest of the family sagas, and of this there are 2 complete Eng. translations, while a 3rd is in preparation. Egill was much in England, where he received *prima signatio* so as to be acceptable in Christian society, and there are indications in his poems that the ideas of the heathen religion did not altogether satisfy him. At Brunanburh he fought in Athelstan's forces, and there his brother, Thorolf, a more sympathetic character, was killed.

Egilsson, Sveinbjörn (1791-1852), Icelandic scholar and poet. He was the first man in modern times to interpret systematically the difficult language of the Old Icelandic skalds or poets, and his titanic achievement is the basis of all subsequent research; see his *Lexicon poeticum antiquae linguae Septentrionalis*, posthumously pub. in 1854-60, and since twice ed. by Finnur Jónsson (q.v.), in 1916 and 1931. E.'s Lat. translations of Old Icelandic classics are extensive, and his prose trans. of the Homeric poems into Icelandic is unrivalled. Many of his translations of the Gk classics as well as writings on Old Icelandic subjects still

remain unpublished in the National Library of Iceland.

Egina, see AEGINA.

Eginhard, see EINHARD.

Eglantine, O.E. name for *Rosa rubiginosa* (synonym *eglanteria*), the sweet-briar rose. It is misapplied to the honeysuckle by Milton in the lines from *L'Allegro*:

'Through the sweet briar, or the vine,
Or the twisted eglantine.'

Egmont, Lamoral, Count of, Prince of Gavre (1522-68), Flem. soldier and statesman, b. Hainault. He served as a soldier under Charles V at Algiers in 1541, and in 1546 was made a knight of the Golden Fleece. In 1554 he went as ambas. to England to arrange a marriage between Philip and Mary, which was afterwards solemnised at Winchester in his presence. For his successes at St Quentin in 1557, and at Gravelines in 1558 (where he was in charge of the cavalry), he was made governor of Flanders and Artois. E. did not join in the conspiracy of 1566, though he protested against Sp. misrule in the Netherlands. Alva had him imprisoned at Ghent and, with Horn, E. was beheaded at Brussels on charges of treason, 1568.

Egmont, Mount, extinct volcano (height 8280 ft) of New Zealand, in the S.W. portion of North Island, lat. 39° 15' S. and long. 174° 13' E. It is about 18 m. S. of New Plymouth, and exceedingly beautiful in form.

Ego, term used in philosophy, denotes the individual considered abstractly and not in connection with the world and other persons. It is used in 2 senses, which are termed by Kant 'pure' and 'empirical': the latter term signifies the self in a more concrete sense and includes some part of experience, i.e. an object, while the former, the 'pure ego,' is the conscious subject only, and denotes that everything is referred to a self which experiences it.

In the language of psychology the E. is the object-self of the individual consciousness as distinguished from another (the *alter*). The antithesis of E. and alter necessarily restricts the meaning of E. to the object-self inasmuch as it is in relation to the alter, which is the object of thought. The interpretation of the ego-alter relation has been variously attempted. Some psychologists have developed the thought that the E. is a reproduction of traits first discovered in 'alter' personalities. This view is united with the theory of 'ejection' (someone else thought of in terms of the thinker's own consciousness of himself) by J. Mark Baldwin in the 'dialectic of personal growth'. The self-thought tends to a general form which includes 2 poles, one the E. the other the alter. The elements of content, at first 'projective' in the social environment (i.e. cognised as objects but with no antithesis to subject), are taken up by imitation, thus becoming 'subjective,' a part of the ego, and being then ejected into the other, constitute the alter. See also OBSESSIVE PSYCHO-NEUROSIS. See J. Mark Baldwin (ed.), *Dictionary of Philosophy and Psychology*, 1901-5.

Egoism (Lat. *ego*, I), term used in ethics, generally signifying a system in which the happiness of the individual is the main object in view. Another form of the word, 'egotism,' in direct contrast to 'altruism,' means selfishness. Ethical theorists consider that the self consists of an individual and those things in which he is interested, the self being all-important in the application of moral principles because the egoist, seeking the ideal for himself, stands in direct contrast to the altruist, who seeks it for others. But the distinction between altruism and E. is complicated by the fact that the 2 are often combined. Christian teaching, for example, insists upon duty to self and duty to others, while a truly altruistic system can very rarely be carried out. Indeed those who have studied human character assert that men in general are egoistic, seeing that they aim at the gratification of their personal aims and desires.

Egorievsk, see YEGOR'YEVSK.

Egremont, par. and small tn of Cumberland, England, in the Ennerdale (q.v.) rural dist., on the R. Iken. There are ruins of a 12th-cent. castle. Pop. 6500.

Egret, term applied to sev. species of white herons with long tufts of feathers on the head or neck. The great white E., or the European white heron, is *Casmerodius albus*; and the little E. is *Garzetta* (or *Ardea*) *garzetta*, a native of Europe, Africa, and Asia, which is occasionally to be met with in Britain. See HERON.

Egripos, see EUBOEA.

Egypt, a rep. forming the N.E. shoulder of Africa, bounded on the N. by the Mediterranean, S. by the rep. of the Sudan, E. by the Red Sea, and W. by Tripoli and the Sahara. The W. frontier cannot be very clearly defined; the line properly taken is from the Gulf of Sollum, skirting the oasis of Siwa in the Libyan desert and following S. to Wadi-Halfa, so that the oases of the Libyan desert are included. The N.E. frontier is a direct line from Tabá, the head of the Gulf of Akaba, following up the boundary of Palestine to the Mediterranean Sea, the peninsula of Sinai being included in E. The area is 386,198 sq. m., of which less than 14,000 sq. m. can be regarded as settled or cultivated. The country is divided into Upper and Lower E.; Upper E., or *El-Said*, the happy or fortunate, being the Nile valley, and Lower E., or *Wagh-el-Bahri*, the fertile, being the delta. The chief features of E. are the R. Nile and the desert. Without the Nile, E. would never have existed. The riv., with its rich deposit of alluvial soil carried down from the highlands of Ethiopia and given to the land annually during the overflow, has transformed the desert into the fertile strip of valley and the delta. E. and W. of this cultivated land lies the waste of deserts with occasional oases. The delta is a fan-shaped plain, formed of a deep layer of mud and grey sand, lying on the yellow quartz sands, gravel and clay which were laid there in prehistoric times by the sea. It is an extraordinarily fertile stretch of land, watered by the 2

branches of the Nile, the Rosetta and the Damietta, and intersected with canals. The valley of Upper E. is narrow, and the fringe of mts on either side are of no great height, so that the landscape varies but little and might appear to be monotonous but for the rich and wonderful colouring of all the scenery: the vivid green of the fields, the rich red-brown of the riv., the bright yellow of the rocks, with overhead a deep blue sky and brilliant sunshine. The coast-line of E. covers about 600 m., and except at the delta is rock-bound, possessing no harbours worthy of mention. The delta coast-line is low and forms 2 bays, one being the bay of Aboukir. The source of the Nile (q.v.) is Lake Victoria (Victoria Nyanza) discovered by Speke, 1858. The riv. flows into E. proper N. of the 2nd cataract, a little S. of Wadi-Halfa. The Blue Nile, which rises in Lake Tana in Ethiopia, joins the Nile at Khartoum; this stream brings down an immense quantity of red mud. The trib. Atbara joins 200 m. below Khartoum. The cataracts are 6 in number (see NILE). The important feature of the riv. is its ann. inundation. At the end of May the riv. is at its lowest level; it rises gradually in June and continues rising until the middle of Sept.; it then remains stationary for 2 to 3 weeks, rising again until the end of Oct.; it is then at its highest level and commences gradually to fall, until by May it is once more at its lowest. The riv. rises from 21 to 28 ft; when it did not reach this level the crops failed, and when it exceeded it the land was overflowed and ruin faced the people. Nowhere in the world is there such a large pop. depending solely on the produce of the soil. As the climate is exceedingly dry, the ann. rainfall averaging about 1-50 in., irrigation became as early as the 2nd dynasty (about 4514 BC) an object of national importance. All through the ages can be marked the tireless persistence and mechanical ingenuity employed in the problems of irrigation. During the 19th cent., Mehemet Ali Pasha began a gigantic system of canals, locks, and weirs. A Fr. engineer of considerable ability, Mougel Hey, was employed to carry out this difficult task; his great barrage across the Nile, at the apex of the delta, is still a very impressive work; unfortunately the system was a failure. Later, Brit. engineers undertook the management of irrigation, and in 1902 the Nile dam, at the head of the 1st cataract above Aswán, was completed. It had been planned to raise the dam to such a height that the beautiful temples on the islet of Philae would be submerged; for five years they were spared, but in 1907 the dam was raised, and during sev. months of the year the ruins are no longer visible. The chief lakes of E., from W. to E., are Mareotis, Edku, Burlus, and Menzala; these lie only a few m. from the coast and are shallow and brackish. The 7 famous natron lakes lie in a valley in the desert, 80 m. WNW. of Cairo. In the prov. of the Fayum is the Birket-el-Keroun (q.v.), 30 m. long and 5 m. wide, forming the remains of Lake Moeris, which

Herodotus believed to have been artificially constructed. Certainly Amenemhat III completed what his fathers had begun by building a vast embankment and reclaiming an area of 40 sq. m., also carrying out a scheme of irrigation in connection with this great natural reservoir. The climate is extremely dry. E. lies in an almost rainless area. The days are warm and the nights are cool. Jan. is

Ammon, built by Darius I, and also other interesting ruins of the time of the Ptolemies. Siwa contains the oracle temple of Jupiter Ammon, consulted by Alexander the Great. The tn is built on the rocks and has the appearance of a fortress. It was used for many years as a place of banishment for criminals.

Minerals.—Gold and precious stones were formerly found and mined in the

D. McLeish

THE TEMPLES OF THE INLET OF PHILAE, ON THE RIVER NILE

The beautiful temple is surrounded by the waters of the Nile. It is at times almost completely submerged owing to the action of the dam at Aswán.

the coolest month. On the coast rain falls during the winter months, but snow is unknown. In Sinai, snow occasionally falls during the winter, and heavy storms of rain occur which flood the rocky ravines. One interesting feature of the climate is the continuous N. wind, which blows throughout the year, and the sailing boats are thus able to ascend the Nile against the strong current. During the spring the *Kamsin* occurs, a hot, dry S. wind laden with sand, forming a yellow stifling fog almost obscuring the sun. It lasts from 1 to 3 days. There are 5 large oases or fertile places in the W. desert, Siwa, Baharia, Kharga, Dakla, and Farafra. These have been occupied since 1600 B.C. Kharga possesses a temple of

hills by the Red Sea. The Moslem conquest caused the abandoning of this industry. The turquoise mines of Sinai are still productive. The 1st dynasty of Egyptian kings about 4777 to 4515 B.C. possessed these mines and had them worked, and from that time down, through all the centuries, the turquoise from Sinai have been famous. There are emerald mines at Jebel Zubara. Salt is obtained from Lake Mareotis in large quantities; alum is found in the W. oases; carbonate of soda is taken from the natron lakes; hematite iron is obtained in considerable quantities from Sinai and the Red Sea hills. Porphyry quarries once existed, with granite quarries, at Jebel-el-Fatira, and during the Roman occupation were ex-

tensively worked. Gold-mining began once more in 1905 at Um Rus and Um Garalat. The riparian dists. of the lower valley of the Nile are ill-provided with workable mineral deposits, with the exception of abundant building materials. The mineral resources of E. are therefore situated in its otherwise barren deserts, and this fact has retarded exploration and development, though in recent years much progress has been made. The principal mineral products in 1953 were petroleum (2,351,246 metric tons), phosphate rock (484,126 metric tons), gypsum, natron, sodium sulphate, sulphate of magnesia, talc, ochres, and clay. Gold production in 1954 was 17,387 fine oz.

The flora of E. is not of a very great variety. There are no forests or woods, and all available land is used for agric. purposes. Date palms grow wherever they are allowed, together with the sult tree and tamarisk, the mimosa, the eucalyptus and the cypress, also some few others. The rose grows freely, and the violet and many kinds of daisies and poppies. Jasmine is largely grown, being much loved by the Arab and Egyptian. The famous papyrus is not now grown in E., and the lotus flower (a water lily) blooms no longer on the Nile, though found in the delta and cultivated in private gardens.

Fauna.—The camel and the ass are the common domestic animals of E. The camel is not indigenous, but was introduced at an early period. Horses are few and of very inferior type. There are not a great variety of wild animals; the hyena, jackal, and fox are numerous, and wild boars are still found in the delta. Wild cats and hares abound, and snakes and reptiles of various kinds are exceedingly numerous. The crocodile and the hippopotamus, once famous and sacred, no longer dwell by the Nile in E. The bird life is rich; vultures, eagles, hawks, and buzzards are found in quantities, and water fowl in large varieties, but the sacred ibis has gone. The 5 most familiar animals and flowers usually associated with anc. E. are no longer common, i.e. the crocodile and hippopotamus, the papyrus and the lotus, and the sacred ibis; the 6th most familiar object, the beetle (the scarabaeus), still flourishes in many varieties.

The population of E. is estimated at 22,469,000. There are 3 distinct elements in the native pop. The largest or 'Egyptian' element is a Hamito-Semitic race, known in the rural dists. as *fellahin* (ploughmen or tillers); a 2nd element is the *Bedouin*, or nomadic Arabs of the Libyan and Arabian deserts, of whom about one-sixth are true nomads, and the remainder semi-sedentary tent-dwellers on the outskirts of the cultivated land and of the Nile valley and the Fayum. The 3rd element is the *Nubian* of the Nile valley between Aswân and Wadi-Halfa, of mixed Arab and negro blood. The *fellahin* are chiefly Mohammedan in faith, though the Copts (q.v.), also natives of E., have kept their Christian belief. The *fellah* is a hard-working and industrious

person, of big build, with a fine oval face, smooth black hair (the head is usually shaved), and well-formed features. The women are often of great beauty, both in form and feature, though they lose their youth early. The Copts are racially the purest descendants of the anc. Egyptians. The colouring of the *fellah* varies from a fair yellowish shade in Lower E. to a deeper tone in Middle E., and in Upper E. the majority are a deep bronze. The Hamitic tribes speak a language of their own, and are probably descended from the *Blemmyes*, preserving many non-Islamic religious practices and regarding the serpent as sacred. The foreigners (numbering in 1937 about 230,000) are mainly Greeks, Turks, Italians, Brit., Fr., Syrians, Levantines, and Persians. Following the Suez Canal dispute in 1956, the alien pop. was considerably reduced. Of the total pop. some 80 per cent are illiterate and live in great poverty. Malnutrition and disease are rampant. A very high percentage of the people suffer from trachoma which often ends in blindness; more than half have disabling parasitic diseases; some 15 per cent are malarial and almost as many suffer from various forms of venereal disease. Before the Second World War expenditure on public health averaged no more than 8s. per head, compared with £7 in Britain. In religion 9 out of 10 Egyptians are Muslims, a fact which in part explains the remarkable resignation and even cheerfulness with which the masses endure their lot.

Thanks to the modern systems of irrigation the production of cotton has increased in E. by more than half in 40 years and the country is now also self-supporting in food; but whether this increase in food production can offset the steady rise in pop. without a drastic reduction in the more profitable cash crop, cotton, is one of the problems of the future. The chief tns of E. are Cairo (q.v.), the cap., on the E. bank of the Nile, built by the Arabs at the head of the delta about 12 m. from the div. of the riv., pop. 2,100,000; Port Said (q.v.), 177,800; Alexandria (q.v.), chief seaport, 919,024; Damietta (q.v.), 84,400; Rosetta (q.v.), 24,000; Suez (q.v.), S. entrance to the canal, 108,000. The chief tn in Upper E. is the cap. of the prov. of Fayum, Medinet-el-Fayum, 73,642. Other large tns are Mansûra; Asyût, 90,103; Zagazig, 81,813; Mahalla el Kubra, 115,758; Damanhur, 84,352; Minya, 70,298; Beni Suef, 57,106; Giza, 66,156; and Qena, 42,292. All the foregoing pop. figures refer to estimated figures in 1947, the latest now (1957) available.

Many of the modern tns are built upon the sites of anc. cities referred to later in the section on antiquities. The great industry of E. is agriculture. About 4,000,000 ac. are under perennial irrigation, and from these 2 to 3 crops can be annually harvested; the land under basin-irrigation covers 1,750,000 ac., and only one crop can be grown in the year. Cotton, rice, and sugar are the main summer crops, and maize, millet, wheat, barley, and flax form the winter crops. Although

modern iron ploughs and other agric. machines have been introduced, the native wooden plough is still largely used. In the Fayum there are fields of roses, grown for rose-water and perfumes; saffron, indigo, and henna are also grown. The cotton industry is increasing every year; the average over 1897 to 1905 was £E14,000,000; over 1924 to 1928, £E45,777,088. In 1953-4 the cotton crop exported was nearly 7.2 million qantars (1 qantar of unginned cotton equals 315 lb.; of ginned cotton, 100 lb.), and supplied nearly 75 per cent of the total value of the exports of E. The value of raw cotton exported in 1954 was £E113,102,387; textiles exported totalled £E120,433,290. The common fruits are the date, fig, orange, citron, grape, banana, peach, and apricot. In smaller quantities melons are grown and mulberries, also olives. The date is the most valuable of all the fruits, forming one of the chief foods of the people.

The currency is based on a gold standard. The Egyptian pound equals £1 Os. 6½d. sterling, divided into 100 piastres. There are silver piastres, value 20, 10, 5, and 2, and nickel pieces of 1, ½, and ¼ of a piastre, and in bronze ½ and ¼.

For purposes of local gov. the chief tns constitute 5 governorships, and the remaining country is divided into 14 provs., further divided into dists. The provs. in Lower E. are: Behera, including the oasis of Siwa, Gharbiya, Minufiya, Daqahliya, Qalubiya, and Sharqiya. In Upper E.: Giza, Beni-Suef, Faiyum, Minya, Asyut, Garga, Qena, and Aswan.

Education.—In 1933 education was nominally made compulsory for all children between the ages of 6 and 12 years. In 1944 primary education was made free, and in 1950 secondary and technical education. In 1952-3 there were 403 infant schools with a roll of 111,451 (37,150 girls); 7369 primary, 1,464,446 (524,997 girls); 412 secondary, 180,759 (26,725 girls). Technical schools where courses are given in agriculture, commerce, industry, and domestic science numbered 87 under the auspices of the State, and 10 under private control. The total number of students was given as 32,736 and 2018, of whom under 20 per cent were girls. Teachers' training colleges numbered 114 with 23,963 students, including 11,344 women. When the univ. at Asyut is opened there will be 4 in E., with Cairo, Alexandria, and the Ibrahim founded by the gov. in 1950. The total number of students was then approximately 48,000, of whom not more than 4000 were women. The mosque and univ. of El Azhar, founded at Cairo in AD 972, is famous throughout the world as a seat of Muslim law and religion.

Justice.—With effect from Jan. 1936, all religious courts were abolished by decree in Sept. 1955. This took away from the Mehkemas jurisdiction in matters of personal law, certain charities associated with religion, and succession. Before 1883 the only national courts in E. were the Mehkemas (q.v.).

In 1883 the national courts estab.

throughout the country 151 summary tribunals and 14 judicial delegations. These courts have jurisdiction to try cases up to £E250 and in criminal cases which are punishable by a fine or by imprisonment up to 3 years. They cannot try cases involving trafficking in narcotics, for which the penalty can be imprisonment with hard labour for life, and a fine not exceeding £E10,000. Eighteen central tribunals, each of which consists of 3 judges, try civil cases not within the competence of the summary tribunals. They also hear civil and criminal appeals from the summary tribunals. There are 5 courts of appeal at Cairo, Alexandria, Tanta, Mansura, and Asyut. Three judges of the appeal courts sit as an assize court at the central tribunals to hear cases of serious crime, press offences, and trafficking in narcotics. These assize courts sit once a month. Above the courts of appeal a court of cassation was set up in 1931. It is composed of a president, 2 deputy-presidents, and 14 judges. The court is divided into 3 chambers of 5 judges each. Two have jurisdiction in civil, commercial, and personal law, and 1 in criminal. Prosecutions before the assize courts and the summary tribunals are the function of the *Parquet* under the direction of the *Chef de Parquet* whose dept has a number of officials to whom his function is delegated. The investigation of crime is carried out by the *Parquet* or by the police under the direction of the *Parquet*. In 1946 an administrative court was set up composed of 3 judges, although 5 may sit in cases when the validity of administrative regulations is in dispute. The mixed courts were abolished on 14 Oct. 1949. The complete independence of the Egyptian judiciary was guaranteed under Law No. 188 of 1952 which removed from the Minister of Justice the prerogatives of appointments, promotions, transfers of judges, and certain other powers hitherto held by the minister.

The Egyptian Army.—The fellah, as a soldier, is useless without capable officers; when properly led he is excellent. The ancient conquests, however, have been attributed chiefly to mercenaries. For centuries foreign legions were employed, and Mehmet Ali was the first to conscript the fellahin. It was not until 1883 that conscription was organised on a fair basis, and this was greatly improved in 1900. However, the debacles in which the army was involved on the 2 occasions it came into direct conflict with the armed forces of Israel may well result in drastic reforms. Officially, the total strength of the defence forces is given at 100,000 with a national guard of 50,000. Service in the army is obligatory for all male citizens at the age of 18. The army is said to be composed of 2 infantry divs. of 7 brigades each and 300 tanks which form the armoured formation. But these figures must all be accepted with reservation, especially since the conclusion of agreements with the U.S.S.R. and Czechoslovakia for the supply of arms, agreements which have been generously

implemented. Experts from these countries have been employed by E. German military and air force advisers who were prominently associated with the training of Egyptians withdrew owing to unsatisfactory progress by the trainees. The ignominious defeat of the Egyptian Army in Sinai by the Israelis (1956) revealed vast quantities of military equipment and stores supplied by the E. bloc. The Egyptian Navy and Air Force fared no better than the Egyptian Army against Israel in the 1956 campaign, and suffered serious losses. The estimate of £E38,655,400 in the fiscal year of 1952-3, the latest available, is likely to be heavily increased in the future, particularly on account of E.'s commitments to other members of the Arab bloc.

Finance.—The revenue for the year 1955-6 was £E238,300,000, and expenditure during the same period was the same figure of £E238,300,000. These figures are the estimates; actual figures would be extremely difficult to ascertain and virtually impossible to verify. E.'s revenue may henceforth be expected to benefit from income from Suez Canal dues and from confiscation of foreign property. On the other hand defence measures and other military obligations will increase the budget estimate. The most important sources of revenue are from indirect taxes, i.e. customs, tobacco, excise, surtax on luxuries, and miscellaneous, which amounted to £E101,209,000; and land taxes, £E39,559,000. The total revenue 1954-5 was £E221,850,000, which did not include a further estimated £E6,000,000, being the value of property confiscated from the former royal family. Exports of products and manufs. of E. in 1954 amounted to £E138,273,581, and imports to £E160,278,266. The prin. exports were textiles and raw cotton (*see above*). The main importing countries of Egyptian cotton were India and Pakistan, Germany, (E. and W.), and the U.K. (1954). The main imports by valuation (1954) were machinery, £E21,324,415; metals and manufs., £E14,624,587; chemical products, £E10,518,812. The public debt in Feb. 1953 stood at £E208,000,000. The general reserve fund in Feb. 1951 amounted to £E75,372,021.

Railways.—The prin. lines radiate from Cairo to Alexandria (and on to Rosetta), Damietta, and Ismailia (continuing northwards to Port Said and southwards to Suez). From Cairo the line runs southwards for a distance of over 500 m. to Shellal, the 1st cataract. At this point a steamer connection runs to Wadi Halfa, connecting the Egyptian State with the Sudan Gov. Railways. Westwards from Alexandria and near the coast runs a line to the frontier at Sollum, and on to Tobruk, giving the possibility of later linking with Tripoli. The total length of the Egyptian State Railways (excluding the Auxiliary Railways of Upper E. and the W. Oases Railway) in 1945 was nearly 4200 m. The gauge is standard (4 ft 8½ in.), with the exception of that to the W. oases, which is 2 ft 5½ in. gauge. There are 2 other State-owned lines in E.,

the Auxiliary Railways of Upper E., consisting of 282 m. of standard gauge, and the W. Oases Railways, a length of 140 m., connecting the oases of Kharga with the Nile Valley. In addition to the gov. lines, there are nearly 900 m. of light railways exploited by public companies. A swing bridge, constructed after 1939 across the Suez Canal, estab. connection between Cairo and Beirut, over the northward extension of the Palestinian railway system from Haifa to Tripoli in Syria, a distance of 175 m. There is now a continuous line joining E. and Istanbul.

Exploration.—Owing to its early civilisation, wealth, and dry climate, E. amply repays research. The long period of its own independence, the hist. of Hellenism and of a Rom. prov., the rise of Christianity and spread of Islam are all successively well illustrated in E. As early as the 17th cent. European travellers were interested in auct. E. In 1798 Napoleon took with him scientists who compiled the *Description de l'Égypte* and recovered the Rosetta Stone (q.v.). In the 1840's the Prussian expedition under Lepsius recorded scenes and inscriptions as far S. as Khartoum (many since destroyed). Later in the century an Egyptian Gov. museum and Antiquities Service was instituted with Mariette as director. And since the 1880's sev. societies have been engaged in the exploration of E., notably the Egypt Exploration Society and, both recently closed, the Brit. School of Archaeology in Egypt and the French Institute (with Fr. Gov. support), and, until the Second World War, the Ger. Institute. Surveys and excavations were carried on annually by representatives of univs. and museums in America and Europe and also by wealthy individuals, until the rising tide of nationalism in E. stopped all excavation except that carried out by its own Antiquities Service. Scientific excavation began with Flinders Petrie (q.v.) in 1883. Its aim is to collect and interpret all evidence about the hist. of a site, and not merely to hunt for inscriptions, statues, or other objects that have some value even when torn from their context. In 1922 Howard Carter (q.v.) discovered at Thebes the first almost undisturbed royal tomb, that of Tutankhamen (q.v.). Although the tomb had been entered by thieves shortly after the burial, the contents were found practically complete; and although he was an unimportant pharaoh, they fill a large part of the Cairo Museum. Since then almost every year sees finds, of which some, if not as spectacular, are even more important for the reconstruction of hist. Since 1924 the Antiquities Service have been investigating the step pyramid at Sakkara (*see PYRAMIDS*) and adding to our knowledge of this, the oldest stone building in the world, which they have also begun to reconstruct. Recently they have also been investigating a second step pyramid there, that of Sekhemkhet, probably never finished. Further discoveries of importance have been made in the 1st dynasty cemetery at Sakkara by W. B.

Emery, working for the Egypt Exploration Society on behalf of the Egyptian Gov. It is not yet clear whether this is another royal cemetery comparable to that at Abydos, in which case each king must have had a cenotaph as well as a grave, which is possible in view of the dual nature of the recently united kingdom, or whether it is a cemetery of great officials from Memphis. But already much light has been thrown on the architecture and decoration of buildings, the development of the temple, statuary, and inscriptions, showing that advances previously attributed to the Pyramid Age had already been made in the 1st dynasty. Excavations too, made by the Antiquities Service at Helwan, have disclosed the use of stone slabs for lining non-royal graves of that dynasty. At Giza the Harvard-Boston expeditions discovered, in 1927, the secret tomb in which objects from the burial of Queen Hetep-heres, mother of Cheops, had been reburied after the robbery of her tomb. The alabaster sarcophagus was empty, but an alabaster chest with 4 compartments contained her viscera removed at the time of mummification. The furniture, etc., found in this tomb shows the skill of 4th dynasty craftsmen. The carrying chair, for example, had ebony panels inscribed with hieroglyphs of gold, and the smaller objects included razors and manicure implements of gold, and a jewel case containing 20 silver anklets, inlaid with dragonflies of malachite, lapis lazuli, and carnelian. Recently 2 more boat pits, making 5 in all, were discovered by chance at the pyramid of Cheops (see PYRAMIDS). The pits were roofed with stone slabs and are being opened. This is the first time that such a pit has been found intact. The boats were presumably intended for the journeys of the dead king. In the desert SW. of Abu Simbel an army patrol discovered the diorite quarries used in the Old and Middle Kingdoms. At Medinat Habu at Thebes the Americans have revealed the remains of a royal residence of Rameses III, the founder of the temple, with a system of bath-rooms and drains. This is one of the first palaces found in Egypt. At Thebes too the Antiquities Service has recently found a stela of King Kames which throws important light on the struggle with the Hyksos and the rise of the New Kingdom.

History.—The indigenous Egyptians belonged to the Brown race, and pure examples may be seen to-day among the fellahin of Upper E. The race of the 1st dynasty that united finally Upper and Lower E. is uncertain—they had broader heads and heavier physique than the natives, and probably came from Mesopotamia.

The Old Stone Age evolved in E. as it did in Europe, Asia, and the rest of Africa. The oldest Egyptian palaeoliths are found in gravel, some 100 ft above the present Nile. Little is known about the Mesolithic or Neolithic periods. Sites from the former occur at Helwan and Kom Ombo. The only Neolithic sites studied are in the

Fayum. There, barley and wheat similar to that grown to-day were cultivated, and flax was woven into linen cloth. Domestic animals included cattle, sheep, goats, and pigs. Plain burnished pottery was made, and stone implements, of which partly polished axes and adzes ('gouges') and winged arrowheads are typical. The radio-carbon date for the Fayum Neolithic is c. 4440 bc. The relative ages of the Fayum Neolithic and the Badarian, the earliest prehistoric culture of Upper E., have not been estab., but typologically the Fayum is the earlier. The Badarians made fine rippled pottery. They had stone axes and arrowheads similar to the Fayum examples; and green beads of soft steatite glazed (the earliest known glazing), which copied beads of hard green amazon-stone known from the Fayum. They also had copper beads, the earliest known metal objects in E. During the 2 'predynastic' periods following the Badarian, civilisation developed remarkably, progress being due to contacts with Iraq, at this time ahead of E. Itinerant traders were responsible for most contacts, but latterly small bodies of Asiatics estab. themselves by force, as is seen from the Jebel el Arak knife handle. The carving in relief on such handles and on some large ceremonial palettes and maceheads was an Asiatic technique and many of the motifs employed are Asiatic, though the scenes are Egyptian.

Not only turquoise from Sinai but lapis lazuli from Afghanistan reached E., and cheaper copies of them were made in glazed composition (faience). Serviceable axe and adze heads of copper (? mined in Sinai) were in use, and beads of gold and of meteoric iron are known (although iron did not come into general use in E. for more than 2500 years. Bronze made from copper with a little tin did not come into general use till the New Kingdom.). Towards the end of the period, rare cylinder seals from Jemdet Nasr (in Iraq) were found in graves. These seals were copied by the Egyptians who evolved their own pictorial script. The foundations of Egyptian religion were now laid down, and amulets became more general. From Badarian times the dead were buried in cemeteries, with pots and sometimes implements. It was just before copper tools came into general use that the large flint knives reached the peak of their development. At the same time skill was shown in selecting and working various stones into small stone vases. Slate palettes, on which malachite was ground to make a green eye paint, were often shaped to represent animals or fish. Female statuettes in ivory, clay, and pottery occur rarely as early as the Badarian. In the later predynastic, those of men have pointed beards. The distinctive pottery of this period had designs painted on it, at first in white on a dark red ground, and later in red on a light ground. Many of the latter pots found in graves show a boat with a palm branch at the bow and 2 cabins, over one of which, at least, is the emblem of a divinity.

Old Kingdom.—There were kingdoms of Upper and Lower E. in prehistoric times. Hist. begins with the union of the 2 lands by Narmer and the 'followers of Horus' (the falcon sky-god) who conquered the delta from Upper E., where their cap. was Nekhen (Hierakónpolis) and their religious centre Abydos. The slate palette of Narmer (in Cairo) gives a pictorial account of the conquest. The conquered rulers of the delta are represented as foreigners (from Palestine). Whence the aristocracy, who formed the *First Dynasty*, came is uncertain—the best guess is that they came from Iran, the home of their boats with vertical prows and where, in the marshes, imposing buildings are still made on a frame-work of bundles of reeds, which resemble closely the representations of the 1st dynasty shrines. If so, they no doubt reached the Nile by the Wadi Hammamat. A new cap. was constructed at Memphis, near Cairo, between the 2 kingdoms. The traditional founder of this white-walled city was Menes (q.v.). A cemetery of large tombs with mud brick *mastaba* superstructures painted white with patterns representing coloured mats is being excavated at Sakkara, near Memphis. They date from Hor-Aha to the end of the 1st dynasty. Some of them were possibly royal, but it is impossible to say for certain, so much have they been damaged by robbers. There is another cemetery containing graves attributed to all the kings of this dynasty, including those of Narmer and probably some of his predecessors, at Abydos near This, the traditional home of the dynasty, in consequence sometimes called Thinite. This cemetery has suffered, like the Sakkara one, at the hands of man and time, although some large stone stelae with the names of the kings on them survived there, while none survived at Sakkara. At Sakkara the actual burial was in a subterranean wood-lined chamber, with, at either end of it, 1 or 2 chambers in which were buried the deceased's intimate possessions. In the superstructure, which was 12–15 ft high, and had a panelled façade in imitation of the palace of timber and matting, were up to 45 rooms containing many wine jars and other pots, vessels of alabaster and other stones, copper vessels and tools (knives, saws, adzes, chisels, etc.), furniture, games, and everything necessary for the maintenance in the next world of the state which the king kept in life. Further, particularly at Abydos, from the reign of Zer, the 3rd king, to the end of the dynasty, but in ever decreasing numbers (318 to 26), around the chief graves, in orderly rows, were the graves of servants, craftsmen, and concubines, buried with their royal master. Large slabs of stone were increasingly used portcullis-wise to block the way to the burial chamber, which by the reign of Udumu was paved with granite, as at Abydos. Large slabs of limestone were also increasingly used to line large private graves at Helwan, where one sees the germ of stone masonry, when one row of blocks was placed on another. Fragments of shattered objects left by

robbers show that craftsmen had reached standards in making stone bowls, furniture, and objects of ivory which were never surpassed. Jewellery and copper tools were also of a very high class. Hieroglyphs were used in court circles for labels and tablets which may record events, and though they developed into the classical script of E., not enough have been found to render deciphering certain. The administration of the kingdom was organised under great officials, some of whose names are known, and religion was beginning to take its later form. In addition to Horus and Hathor, who specially protected the king, representations of shrines of the deities Neith, Thoth, and Anubis are known. King Zer left an inscription near the second cataract indicating that he had extended his dominion that far.

Under the *Second Dynasty* there must have been a rising of native elements whose god was Set, who thenceforth was execrated as the enemy of Horus. But though little is known of the disturbed beginning of the dynasty, the last king, Khasekhem, reconciled both parties and changed his name to the plural form Khasekhemui, writing it with the animal of Set as well as the hawk of Horus over it. Two of his statuettes were found at Hierakónpolis. Zoser, founder of the *Third Dynasty* and builder of the first (step) pyramid (q.v.) and stone buildings, was probably related to Khasekhemui. His life-size statue, from this pyramid, is in Cairo. Sekhemkhet, builder of the unfinished step pyramid at Sakkara, left an inscription indicating control over Sinai (mines of copper and turquoise). The *Fourth Dynasty* constructed the pyramids (q.v.) of Giza. They developed the true pyramid form and never again was a pyramid so large as the Great Pyramid of Khufu or Cheops built. The shape was probably connected with the belief that the dead king ascended to the sky for assimilation with the sun god Ra, whose worship now received State recognition. Khufu's successor, Dedef-Ra, was the 1st king whose name is a compound of Ra. The *Fifth Dynasty* was founded by priests of Ra from Heliopolis who seized the throne. In the development of their religion they built near Abu Sir, near their pyramids, unique sun temples, in which the central cult object was the solar symbol, a short obelisk (*benben*), in a court open to the sun and situated on a terrace formed like a truncated pyramid. In the best preserved sun temple was found a brick boat, intended for the night journey of the sun. The most important historical relic of this dynasty is the Palermo Stone, of which the largest fragment is at Palermo. It was a black stone slab on which were recorded briefly the annals of the reigns of all the kings from the 1st dynasty, and the names also of some predynastic kings of both Upper and Lower E. In this dynasty, the art of representing scenes in bas-relief reached perfection. Earthly scenes, which the nobles hoped to enjoy after death—banquets, hunting, fishing, farming, etc.

—were reproduced with picturesque detail and humorous comments, as in the tomb of Ti at Sakkara. At the end of the 5th dynasty, magic spells, some of prehistoric origin, are found in the royal pyramids. The purpose of these Pyramid Texts was to ensure for the king a place among the gods, who were not expected to welcome newcomers. One wonder of the *Sixth Dynasty* is the statue of Pepi I, found at Hierakonpolis. It was over life-size and made of copper plates nailed on a wooden core. At Aswán are the tombs of local princes, who were also merchant adventurers, and made long journeys overland with donkey trains to central Africa. The greatest of them was Herkhuf, who on his last journey brought back a dancing dwarf, to the delight of the young king, Pepi II, who reigned for nearly a century, the longest reign in history. In old age he gradually lost grip of the kingdom. New ideas had been coming in since the 5th dynasty. Although still 'the good god,' the king was no longer thought to be really semi-divine. Pepi I had married 2 commoners. Under these conditions officials in charge of districts tended to become hereditary rulers increasingly independent of Memphis. On the death of Pepi II began what is called the *First Intermediate Period*, a time of civil war and foreign infiltration. In Upper E. the nomarchs were busy organising their little kingdoms. In Lower E. the situation is obscure, but everywhere a social revolution was in train, the aristocracy were dispossessed, cultivation ceased, and famine was widespread. The kingdom was not united again until the 11th dynasty. Nothing is known of the 7th dynasty and little of the 8th (Memphite). The delta was overrun by Semites. About 2240 the chief of Herakleopolis set up an independent kingdom in middle E., thus founding the 9th dynasty. The 10th dynasty was also Herakleopolite and recovered control of the delta, but when they advanced S. towards the kingdom of Thebes, the latter took the initiative, and about 2100 bc began a generation of struggle which left E., about 2060 bc, united again under the Thebans. Various innovations during this unsettled period make up for lack of documentary evidence about the life of the times. The pictures of scenes which the dead man hoped to enjoy in the after-life were replaced in the tomb by models which copy the houses and farms of the period, bakeries, slaughterhouses, breweries, boats, and even units of Sudanese troops. At Rifa and elsewhere, model pottery houses, for the use of the soul while enjoying offerings brought to his tomb, provide evidence about middle-class houses. Probably introduced when Semites overran the delta, a stamp seal, shaped like a button, which has been found from N. of the Aegean to India, was in use; and there was a vogue for little amuletic figures in the round, among which was the scarab beetle. These amulets often had their base made into a seal, and thus combined their original function with that of the

button-seal. Eventually the scarab replaced all others, and lasted, with its emphasis now on the amulet and now on the seal, until the last dynasty. The lack of strong gov. led to an increase in tomb robbery, with frequent destruction of the mummy considered essential to survival after death. Thus arose the custom of burying small mummified figures with the corpse to replace the mummy if destroyed. These figures developed into the *shabti* figures of the Middle and New Kingdoms.

The Middle Kingdom.—The reunion of E. was completed by Mentuhotep III of the *Eleventh Dynasty*, and hereditary nomarchs largely suppressed. Control was estab. over Wawat (near the 2nd cataract); and under Mentuhotep I an expedition was sent down the Red Sea to Punt. The arts revived, and a funerary temple consisting of a pyramid surrounded by 2 colonnaded terraces was built by Mentuhotep III at Deir-el-bahri, opposite Luxor. Five hundred years later Hatshepsut had this temple copied by another built alongside it.

The founder of the great *Twelfth Dynasty* was Amenemhat, vizier of Mentuhotep V. His name shows that the cult of Amen of Thebes was gaining ground. The cap., however, was moved N. to between the Fayum and Memphis, where the kings resided and built pyramids. They regulated the irrigation of the Fayum, increasing its fertility. Amenemhat III built a palace there containing 3000 rooms on 2 floors. It was in existence in the days of Herodotus, and known as the Labyrinth. Palestine may have been invaded; relations with Hyblis and Syria were cordial. Trade was carried on with Crete, and in Sinai new mines were opened. Expeditions were made to Punt. In the S. the frontier was advanced to Semna, beyond the second cataract, and defended by impregnable forts. Beyond this frontier a trading post was maintained in Cush, near the third cataract. Little has survived of the architecture of the 12th dynasty—its material was all re-used in the New Kingdom—but at Karnak a small shrine has been reconstructed from pieces found in a pylon. Its reliefs and hieroglyphs are strikingly graceful. The royal pyramids were small and built of brick. The jeweller's art reached, in E., the highest peak, as witnessed by the treasure found in princesses' graves at Lahun and Dahshur. Royal statues, too, attained a standard never surpassed, particularly those of the Theban school, in which the features are accentuated and the portraits vigorous. Those of the Memphite school, while polished, lack the individuality of the masterpieces of the Old Kingdom, whose tradition they follow. The literature of the period consists of instructions, prophecies, and tales. An example of the former was the advice of the aged Amenemhat I to his son, remarkable for bitterness at the ingratitude of his subjects. The prophecies often announce as forthcoming an event which has taken place, as, for example, that of Neferrohu

announcing the coming of a saviour in the shape of Amenemhat I. Of tales, the best known are those of the Shipwrecked Sailor, Sinuhe, and the Eloquent Peasant. There is also the dialogue with his soul of a man tired of life. The era between the Middle Kingdom and the New Kingdom, which began with the 18th dynasty, is called the *Second Intermediate Period*. It is the darkest of sev. dark ages. It probably lasted about 2 centuries, including the domination of E. by the

Hyksos N. of Hermopolis. His brother and successor, Ahmes, then stormed Avaris, drove the Hyksos out of E., and pursued them into Palestine, where he besieged them in Sharuhen, taking it after a siege. He thus became the founder of the *Eighteenth Dynasty*, with its cap. at Thebes. He also reoccupied Nubia, at least as far as the second cataract. His successor Amenhotep I also invaded Nubia and probably extended the conquest of Asia, for at the beginning of his

D. McLeish

THE GREAT TEMPLE OF DEIR-EL-BAHRI AT THEBES

Hyksos, although Manetho gives it 15 centuries. The first 2 kings of the 13th dynasty probably ruled all E. After that the succession is doubtful. The Hyksos or *hekakhasut*, foreign (Asiatic) chiefs (with some followers), in the first place entered the E. delta because of the invasion of the Near East by Aryans. By 1730 they had founded their cap. at Avaris, establishing themselves first as rulers in the delta, and then extending their control over an anarchic and disunited E. without difficulty.

The New Kingdom.—About 1680 bc there was a native rising under the princes of Thebes, who became the *Seventeenth Dynasty*, and gradually confined the Hyksos to N. Egypt and S. Palestine. Horse-drawn chariots were first used in E. in this conflict. King Sekenenra apparently fell in battle against the Hyksos, judging by the gash in the skull of his mummy. The war was carried on by his son Kames, who defeated the

reign Thothmes I (1530-1520) claimed that his empire reached the Euphrates. Thothmes I came to the throne through his wife. By the 2nd year of his reign he had conquered Nubia, as far as the fourth cataract, advancing later to Kurgus near the fifth cataract. He then had to go to Asia to suppress a revolt in Naharein. The relationship to each other, and rights to the throne, of the next 3 rulers are uncertain. Thothmes II, after a short reign, was succeeded by Hatshepsut (1505-1483), daughter of Thothmes I, whom she resembled in energy. She usurped the position to which her sex did not entitle her, having married Thothmes III, an illegitimate son of Thothmes II, but until she *d.* Thothmes III had no power. She abandoned military undertakings for peaceful projects such as an expedition to Punt, and the construction of her funerary temple at Deir-el-bahri, and other temples, in which she was helped by

her architect-minister Senmut. On her death Thothmes III was faced with a serious situation in Asia, opposed by a coalition under the king of Kadesh. His annals at Karnak describe his defeat of the king of Kadesh at Megiddo and subsequent campaigns in Syria, Kadesh, and Naharin. After the capture of Kadesh E. was supreme in Asia, and there was regular friendly intercourse with Crete. Towards the end of his reign he went to Nubia and carved an inscription beside that of Tuthmosis I at Kurgus, as he had done on the Euphrates. His son, Amenhotep II (1450-1415), was energetic, suppressing a revolt in Asia early in his prosperous reign. His son, Thothmes IV (1415-1405), made an alliance with the Mitanni, who needed support against the Hittites, and married a Mitanni princess, who became mother of his successor Amenhotep III (1405-1378). He was the first pharaoh in whose veins ran Aryan blood, and the consequences were unfortunate. By nature an indolent despot, Amenhotep eschewed war and neglected his empire. Early in his reign he took part in many lion hunts and issued large scarabs commemorating killing over 100 lions. E. had reached its apogee. From the Sudan to the Euphrates it was supreme, and sumptuous temples were built throughout the Nile valley, as far as Suib in the Sudan, where temples were erected for the worship of the divine king and his wife Tiy. The colossi of Mennon opposite Luxor are all that is left of his funerary temple. He also married many foreign princesses. The cuneiform tablets found at Tell el Amarna contain the correspondence of Amenhotep III, and his successor, with the kings of Babylon, Assyria, the Mitanni, and the Hittites and the princes of the Aegean Isles and governors of Egyptian provinces in Asia. They throw much light on foreign affairs c. 1380 BC. The Hittites were expanding, and when they won over some Asiatic princes, Amenhotep IV (1370-1352 BC) failed to support those who remained loyal, and soon Egyptian influence, even in Palestine and Syria, was extinct. Amenhotep IV, who was still swayed by his remarkable mother, Queen Tiy, when he came to the throne, was an example of genius akin to insanity. His parents adopted, possibly to counter the influence of the powerful priests of Amen, the Heliopolitan doctrine of the Aton. In his 6th year, Amenhotep IV proclaimed that the pantheon of E., including Amen-ka, king of the gods, was a fiction, and that only one deity existed, an unknown heavenly force that manifested itself through Aton, the visible disk of the sun. He changed his name to Akhnaton, 'pleasing to the sun disk,' and had the Aton depicted with rays, each with a hand holding the sign of life. This was a declaration of war upon Amen and his priests in their own city. The next logical step was the foundation of a new cap. at a desert place, now known as Tell el Amarna. The whole machinery of the state was in the king's hands and for the moment resistance was

impossible. The property of Amen was transferred to Aton, and the name of Amen obliterated everywhere. In all this he was supported by his beautiful sister-queen Nefertiti. The naturalism and fidelity to truth which had begun to appear in the previous reign are characteristic of the art of this time, while the king was often represented with almost a caricature of his facial and bodily peculiarities. Living his own life with his court and family in the city he had created, his kingdom fell into anarchy and his empire vanished; and when he d.

EGYPTIAN SCULPTURE: QUEEN NEFERTITI

comparatively young his city was destroyed and the old religion restored by the priests of Amen. Leaving only daughters, he may have been succeeded by his son-in-law, Smenkh-ka-ha, who d. young and of whom little is known. Little more is known of the short reign of his 2nd son-in-law, Tutankhamen, whose chief claim to fame is that his relatively insignificant tomb at Thebes escaped serious robbery, and its rather decadent contents, now in the Cairo Museum, are one of the wonders of the world. In his reign the Aton heresy was blotted out and Thebes became again the cap., the young king attempting to complete the colonnade of Amenhotep III in the temple of Luxor. When he d. a priestly official, Ai, reigned for 4 years, being succeeded by the orthodox soldier Horemheb, who had administered Lower E. during the reign of Akhnaton and married a sister of that king. Horemheb had recovered Palestine for Tutankhamen, and then acted as regent for him. He was occupied with the reorganisation of the kingdom, dying an old man c. 1321 BC.

The *Nineteenth Dynasty* was founded by another soldier, Rameses I, who had been honoured by Horemheb and came from the aristocracy of Tanis, the anct cap. of the Hyksos. The worship of Set had been maintained there since the expulsion of the Hyksos, although shunned elsewhere in E., and from the physiognomy of the kings of this dynasty it is clear that Hyksos blood ran in their veins. Rameses, already old, reigned 2 years and was succeeded by his son Seti I (Seti—'man of Set'), 1318–1298 bc. Seti and his successors, Rameses II 'the Great' (1298–1232) and Merneptah (1232–1224), were warriors preoccupied with foreign affairs. They were great builders, particularly Rameses II. Seti I defeated the Hittites in Palestine and reconquered it. He then began constructing an original funerary temple at Abydos, where the earliest kings of E. had been buried, representing himself offering to the cartouches of the royal ancestors back to Mena, a list of great historical value. At Karnak the Hypostyle Hall, begun by Rameses I, mainly built by Seti I, and completed by Rameses II, is majestic but heavy. Seti and Rameses II were buried in large tombs at Thebes, and Seti's alabaster sarcophagus is in the Soane Museum in London. Rameses II (the Osmandyas of Diodorus), whose reign was very long, placed his name in most temples. His more important buildings were the Ramesseum (his funerary temple, with clumsy Osirid pillars and red granite colossi) and the rock-cut temple of Abu Simbel. In both are depicted in vast reliefs the heroic events of the Hittite war in Syria. This war, which lasted from 1296 to 1279 and left both sides terribly weakened, was deliberately provoked by Rameses in an attempt to recover the empire of Thothmes III. Eventually the combatants not only made peace, but an alliance, in face of the rising power of Assyria. This peace was kept for the remaining 46 years of Rameses's reign. But the struggle was the turning-point of Egyptian history—henceforth a story of decline. Rameses was succeeded by his 13th son, the elderly Merneptah (? the pharaoh of the Exodus), who had to suppress a revolt in Palestine in which Israel is first mentioned, and to meet an invasion of the W. delta by Libyans and various Mediterranean peoples, including Achaeans and Sardinians. Then followed 30 confused years, when sev. kings reigned, all with doubtful claims to the throne. Setnakht was the founder of the *Twentieth Dynasty*. He restored order in a short reign, and was succeeded by his son Rameses III (1198–1166), the last great king of the New Kingdom. He reorganised the administration and the army. Tribute was again collected from Asia and Nubia. Quarries were reopened and the funerary temple of Medinet Habu built, the walls recording the campaigns of the reign. His greatest victory was in 1191 over the 'peoples of the sea,' Indo-Europeans, who, after sweeping over Hittite country, Cilicia, and Cyprus, had reached Amorite country and were

threatening E. Advancing by land and sea along the coast of Palestine, Rameses III fell upon and annihilated them. He also repulsed 3 Libyan attacks on the delta. The last 20 years of his reign were peaceful, except for a conspiracy in the harem. There followed sev. unimportant kings, all named Rameses, most of whom were in the hands of the priests of Amen. In the reign of Rameses IX a number of royal tombs in the Valley of the Kings were robbed. Under Rameses XI there was civil war, in which Libyans took part. It was suppressed with the help of Nubian troops under the viceroy Pa-nehesi, and one Heri-hor, an army officer, was made chief priest. Shortly afterwards he became viceroy and vizier, and in 1085 he seized the throne, founding the *Twenty-first Dynasty*. For the next 4 centuries E. was ruled by feeble kings with numerous, more-or-less independent, dynasts throughout the country. Heri-hor was not recognised in the N., where the regent, with his cap. at Tanis, had the best claim to be pharaoh by reason of his marriage to a Theban princess; and Heri-hor's son Piankhi on his death succeeded his father only as chief priest. Thenceforth the throne was held for a time in turn by the 2 families, Piankhi's son coming to the throne as Pinedjem I; but later the kingdom was divided by 2 pairs of kings, and with the end of the 21st dynasty (950 bc) came the end of the rule of Thebes. A powerful family of Libyans had become estab. at Heracleopolis. They were immigrants who had come to Africa with the 'peoples of the sea' in the 20th dynasty, and who, as mercenaries, now formed a large part of the army. They had been rewarded with land for their services, and had become egyptianised. One of them now seized the throne as Sheshonq I (950–929), founding the *Twenty-second Dynasty*, and marrying his son, Osorkon I (929–893), to a daughter of Psusennes II, the last Tanite king of the previous dynasty. He asserted his authority in Upper E., and it was probably then that some priests of Amen left Thebes for Napata, whence was to come the 25th dynasty. Sheshonq (the Shishak of the Bible) attacked Palestine after the death of Solomon, and sacked Jerusalem, refilling his treasury and temporarily increasing the prestige of E. Then followed 150 years of increasing anarchy, in which rival Libyan chieftains and the priests of Amen at Thebes were the chief actors.

The Late Period.—Eventually, c. 730 bc, there were 2 movements to put an end to this anarchy, one led by Tefnakht of Sais (24th dynasty) and the other by Piankhi of Napata (25th dynasty); and the hist. of E. becomes a duel between Sais and Napata, with the recently arisen power of Assyria intervening. Tefnakht first united the delta, occupied Memphis, and then moved on Middle E., where he clashed with Piankhi on his way down the Nile. Undoubtedly inspired by the priests of Amen at Napata to restore the anct glories of E., it is uncertain whether

the 25th dynasty were Egyptian descendants of Heri-hor or Sudanese descendants of the kings of Cush (Dongola), in whose ter. Napata lay. If the latter, they were fully egyptianised. Kashta (d. 751 bc) began by entering Upper E. and forcing the Libyan 'wife of Amen' at Thebes to adopt his daughter Amenirdis. Piankhi (751-716 bc) advanced down the Nile and captured Memphis, 731 bc. Many delta dynasts submitted, but Tefnakht hid in the marshes. Leaving the dynasts to pay tribute, Piankhi returned to Napata to celebrate his victory, and Tefnakht came out of hiding. Shabako (c. 707-696 bc) then estab. the Cushite administration firmly over E., and transferred the cap. from Napata to Thebes. Manetho stating that he burned Tefnakht's son Bekenrnof (Hocchoris) alive. In his reign the army of Senacherib the Assyrian invaded Judah, but was forced, by plague, to retire (701 bc). In 686 his successor, Esarhaddon, advanced against E., defeated Taharqa (688-663) on the frontier and took Memphis. Taharqa retook it in 669, but lost it again to Ashurbanipal, who then occupied Thebes (666 bc). The Assyrian reinstated various Egyptian princes as vassals, among them Psammetik I, the founder of the *Twenty-sixth (Saite) Dynasty*. Tanwetamani, Taharqa's successor, made a last attempt to recover E., but was driven out by Assyria and had lost control of E. by 654 bc. His descendants ruled the Sudan for another 1000 years, with their cap. first at Napata and then at Meroe. For some time they claimed the throne of E., but an expedition sent by the Saite, Psammetik II (594-588 bc), in which Gk mercenaries with the iron weapons first introduced to E. by the Assyrians took part, reached Napata and, defeating the Cushites, freed the Saites from fear of their rivals. Saite propaganda against the Cushites has caused it to be forgotten that it was they, not the Saites, who started the reformation in Egyptian religion and art with archaising tendencies. The 25th dynasty were buried under pyramids at Napata, and copied the temples and statuary of the Old Kingdom pyramid builders. Taharqa in particular added to temples in E. and Cush, building fine copies of 5th dynasty temples at Kawa and Sanam Abu Dom. Psammetik I (663-609) freed E. from Assyria with the help of Gk mercenaries, Gk merchants having formed a depôt near Sais that was to develop into Naucratis. Necho (609-593) destroyed Josiah of Judah and his army seized Syria, but in 605 bc his army was defeated at Carchemish by the Babylonians, who drove him back to E. Uah-ab-ra (588-567), the Hophra of the Bible and Apries of the Greeks, occupied Phoenicia and encouraged Judah to revolt against Babylon, failing to give adequate support. Jerusalem fell to Nebuchadnezzar II, and many inhab. were carried into captivity, a remnant, including Jeremiah, fleeing into E. Towards the end of his reign a revolt, inspired by anti-Gk nationalism and supported by the displaced Libyan

military class, led to the replacement of Apries by the Egyptian general Amasis (568-525), who, in view of the prevailing xenophobia, concentrated the Gk merchants at Naucratis and Gk troops at Memphis. By the end of his reign Persia, supreme in Asia, was about to attack. In the 1st year of his son, Psammetik III (525 bc), Cambyases invaded E. and took Memphis. E. now became a *Persian* prov. (27th dynasty). Herodotus, the Gk historian, naturally gives an unfavourable account of the Persians, but there is evidence that they respected Egyptian beliefs, and under Darius tried to codify Egyptian laws. Darius built a temple at Kharga and exploited the trade of E., reopening the canal between the Mediterranean and Red Sea, first opened by Necho. After the Persian defeat at Marathon, the Egyptians revolted but were easily crushed. After further Persian defeats by the Greeks, another revolt was led by Inaros the Libyan and Amyrtaeus of Sais in the reign of Xerxes, which was supported by an Athenian fleet of 300 triremes. The fleet reached Memphis and enabled the rebels to defeat the Persians at Papremis. The latter took refuge in Memphis, where they were besieged for 18 months before finally defeating the rebels. An eponymous grandson of Amyrtaeus succeeded, after 6 years, in freeing E. from the Persians (404 bc), becoming sole king of the *Twenty-eighth Dynasty*, 404-398 bc. The *Twenty-ninth Dynasty* (from Mendes) carried on the struggle against the Persians with the help now of Sparta and now of Athens. It was eventually replaced by Nectanebo I (378-360) of Shennytos, founder of the *Thirtieth Dynasty*, with the support of the priests of Sais, whom he rewarded at the expense of the Greeks of Naucratis. His strained relations with the Greeks encouraged Artaxerxes II to attempt to reconquer E. The first Persian invasion was repulsed, and Nectanebo made additions to sev. temples. His successor, Teos, tried to make friends with the Greeks, introducing taxes to enable him to strike drachmae to pay Gk troops. He was thus enabled to set out for Asia at the head of a mixed force of Greeks and Egyptians. But, owing to the treachery of his brother whom he had left as regent, his nephew, Nectanebo II (359-341), won over half his forces and so secured the throne. He suppressed a revolt at Mendes and then built a number of monuments, the last Egyptian works of art. Artaxerxes III, Ochus of Persia, then decided to reconquer E., and after a long campaign succeeded in doing so. Eight years later Darius III was defeated by Alexander the Great at Issus, 333 bc; and the same year, encouraged by an Egyptian who had helped him in the battle, Alexander entered E., which was now so decadent that it welcomed its new master. He tactfully recognised the gods of E. and got himself recognised by Amen at Siwa. In 331 bc he founded Alexandria to take the place of Naucratis. In the div. of his conquests, E. fell to the share of one of his

generals, Ptolemy, son of Lagos, who founded the Ptolemaic Dynasty. He contrived to get possession of Alexander's body, and struggled to add Cyrenaica, Cyprus, and Palestine to his empire. Under the rule of the Ptolemies, in spite of heavy taxation, E. once more prospered. Ptolemy I commenced the famous library and museum at Alexandria. He wrote a hist. of Alexander's campaigns, and he introduced the worship of Serapis. Ptolemy II completed the lighthouse at Alexandria known as Pharos, regarded as one of the 7 wonders of the world. The splendour of his court was famous. Manetho the priest wrote his hist. of E. during this reign. Ptolemy III, Euergetes I, made war on the Seleucid kingdom, and marched into Babylonia, receiving the submission of Iran. He left more monuments than his fathers, among them the temple of Edfu, finished by Ptolemy XII. Ptolemy IV won the battle of Raphia (217) in Palestine against the Seleucids. He was a debauchee, and the decline of the Ptolemaic kingdom began during his misrule. Ptolemy V came to the throne at the age of 5, and Egypt suffered from incompetent regents. Antiochus the Seleucid recovered Palestine, giving Ptolemy his daughter, Cleopatra, in marriage at the peace. Many nationalist risings by Egyptians were severely suppressed. The joint reigns of Ptolemy VI and Ptolemy VII, the sons of Ptolemy V, were notable for strained relations with the Seleucids, family strife, and the intervention of Rome. In 134 the kingdom was divided, Ptolemy VII taking Cyrene. In 145 Ptolemy VI *d.* in battle in Syria. His infant son was immediately murdered by Ptolemy VII, who married both Cleopatra the mother and Cleopatra her daughter. He left Cyrenaica to an illegitimate son (who left it to Rome on his death), while Cleopatra and her sons, Ptolemy VIII and IX, inherited E. and Cyprus. A period of domestic strife followed, and a native rising in which Thebes was damaged. Ptolemy X came to the throne with the support of Rome, married his cousin Berenice III (q.v.), and immediately murdered her, being assassinated himself by the enraged mob. This ended the legitimate family. Ptolemy XI, Anuletas, an illegitimate son of Ptolemy VIII, was then chosen. He was not recognised at first by Rome, but eventually Caesar persuaded Rome to recognise him. Expelled by popular hatred, he spent 3 years in Rome and was then restored by Gabinius, proconsul of Syria. Dying in 51, he left E. to his daughter Cleopatra (q.v.), aged 17, and her young brother Ptolemy XII. Egyptian hist. then coalesces with that of the Rom. world, with the murder in E. by Ptolemy XII of Pompey after his defeat by Caesar (48). Cleopatra then used her fascinations to persuade Caesar to support her in her quarrel with her brother. One story is that she had herself carried into his camp wrapped in a bundle of rugs. Cleopatra was placed on the throne to rule with her younger brother, Ptolemy

XIII; the child *d.* soon afterwards; tradition says he was poisoned by Cleopatra's order. She then lived openly as Caesar's mistress, but after his assassination she went no more to Rome, and her son, whom she asserted to be Caesar's child, called Caesarion, was associated with her on the throne as Ptolemy XIV. The Rom. triumvir, Mark Antony (q.v.), succeeded Caesar in her affections; the story of their love is well known; it was the ruin of both Antony and E. When Octavianus sailed to E. he murdered the little Ptolemy XIV, Mark Antony *d.* by his own hand, and Cleopatra, knowing her kingdom lost, and refusing to become a Rom. captive, *d.*, according to tradition, by applying an asp to her breast. Thus ended the reign of the Ptolemies, and E. now became a Rom. prov. The Ptolemies left many beautiful monuments behind them, among them those on the is. of Philae. The last native king of E., Nectanebus, built a temple to Isis there, which Philadelphus reconstructed. The unfinished kiosk, known as 'Pharaoh's bed' is one of the most beautiful ruins on the is.; the temple of Ptolemy (Euergetes I) is also famous for its beauty. As a Rom. prov. 30 bc, E. was under the rule of a prefect. The first was Cornelius Gallus. In his time the Nubians raided Aswan and stole a statue of Augustus. The Romans then marched to Napata, which they sacked, after meeting the queen (Candace) of Meroe there, but failing to recover the statue. During the reign of Claudius the valuable Indian trade was secured for E. Most of the Rom. emperors from Tiberius onwards adopted Egyptian names and titles in E. Hadrian twice visited E., and founded Antinoe. Graeco-Rom. buildings of this period are numerous. Under Marcus Aurelius the suppression of a serious rebellion caused lasting damage to the prosperity of the country. One Rom. general called Avidius Cassius struggled to make himself emperor of E., but he was slain by his own troops.

When Christianity first began in E. is not quite certain, but probably very early; many Egyptians adopted it as the hope of a future life coincided with their own views. It must always be remembered that the Egyptians thought more of the future life than the present, and that from the earliest times they were a deeply religious race: it was obvious therefore that having adopted Christianity they would do so thoroughly, and under Severus they suffered severe persecutions which merely added to their zeal, and they soon made Alexandria a centre of Christian learning. During the rule of Caracalla (AD 211) all the men who could possibly bear arms as soldiers were massacred in Alexandria, because of some real or fancied insult to Caracalla. Under the rule of Decius the Christians again suffered terrible persecutions. In AD 270 Zenobia, the famous queen of Palmyra, invaded E., and Athenodorus, her son, governed E. jointly during the reign of Claudius. When Aurelian became emperor he perceived the dangerous policy

of the Palmyrene queen, as her son was already having coins struck bearing the imperial title. Aurelian drove the Palmyrenes from E. His army was led by Probus, and E. was ruled by Rome again. Probus became governor of E., and under his rule repelled the tribes of Blemmyes who came from the E. Sudan and who were dominating the whole of the Thebaid. Under Diocletian the country was still troubled by them, and a formidable revolt broke out led by Achilleus, who called himself the Emperor Domitianus. Diocletian came to E. and captured Alexandria, and Achilleus was slain. The Blemmyes retired to the Sudan, and an arrangement was made to pay them a fixed annual sum on the understanding that they ceased from raiding Rom. ter. A temple was built at Elephantine where both sides swore to observe this covenant. 'Pompey's Pillar' was erected during Diocletian's rule to commemorate part of the corn tribute being paid to the Alexandrians. The Christians at this period were again persecuted with savage cruelty and they fled to the deserts in large numbers, building and hiding in obscure monasteries. In 378 Theodosius the Great proclaimed Christianity to be the religion of his empire. E. at once turned her attention to converting the temples of the auct gods of her country into churches. The temple of Serapis at this time was the scene of a bloody conflict between the Christian mob and the remnants of the pagans; finally it was converted into a church for the use of the Christians. This was the real death-blow to Paganism; the Christians showed as little mercy as the pagans in asserting the supremacy of their belief. During the reign of Justinian, while the army was occupied in quelling an invasion of the Blemmyes, Chosroes, the Persian, invaded E. and easily conquered her, holding her for 10 years. Heraclius defeated the Persian and won back the country for a little while, but one stronger than he was rapidly gathering forces on her borders to take and possess her finally. E., weakened by her long internal struggles and utterly impoverished by the years of misrule, now fell an easy prey to Amr-Ibn-al-Asi, the gen. of the Khalifa Omar, and the once great E. became a prov. of the newly-founded Arab empire. See below, *Muslim Conquest*.

Religion.—There was no one organised religion in auct E. Magic was a power which gods possessed and by discovery of which man could control the gods. It was particularly necessary after death. No one god was eternal or almighty and the cosmogonies developed at different times and places were not valid all the time. Some gods as Min, Horus, Hathor, and Anubis (q.v.) occurred in the prehistoric period when each locality had a separate deity manifested in some animal or object. Identification of the king with the falcon god Horus led to anthropomorphisation; though usually given a human body gods seldom have a human head, unless, like Min and Ptah (q.v.), they

start with human form. Political changes led to disappearance of some gods and the rise of others. Conservatism and compromise often led to the merging of old gods with those whose importance increased, e.g. Ptah-Sokar, Amen-Ra. Horus was originally a sky god, represented as a falcon. The rivalry of Horus and Set is probably connected with early civil wars. At Heliopolis near Memphis Ra was worshipped as the sun itself. In the 4th dynasty the king became known officially as 'son of Ra.' The winged disk, usual over temple doorways, represents the fusion of Ra, Horus, and the king. About the 5th dynasty in the Delta arose the cult of Osiris (q.v.). Set, Osiris's brother, killed him but was eventually defeated by Osiris's son, Horus, the younger, who became king, and enabled Osiris to rise and become ruler of the dead. In the social revolution of the First Intermediate Period the identification of the dead king with Osiris was extended to commoners, every dead Egyptian becoming known as Osiris So-and-so. This led to a great spread of the Osiris cult, Abydos becoming its centre. Mont, the god of the princes of Amant, became important when they reunited E. as the 11th dynasty; and when they were replaced by the Theban 12th dynasty Amen (q.v.), an obscure god of Thebes, became important; but the real ascendancy of Amen began with the victory of the Theban 18th dynasty over the Hyksos, Ra being eliminated by his association with Amen as Amen-Ra. In the New Kingdom various foreign deities were introduced, among whom were Reshep, Astarte, and Anat. During the Late Period Osiris became supreme god, even taking the place of Amen-Ra as ruler of this world, and, his wife Isis becoming chief goddess, the cult of their son Horus the Child (Harpoocrates) became very popular. When the Greeks came to E. they saw analogies between their gods and those of E. At Memphis they adopted the cult of the ostrified Apis as Serapis (q.v.), and Serapis was chosen by Ptolemy I to be the god common to the Greeks and Egyptians, a fine temple (the Serapeum) being built for him at Alexandria. The worship of Serapis and Isis especially spread eventually to Rome and Greece.

In E. various dogmas were evolved to explain the creation of the world (see NUN). At Heliopolis it was taught that Atum emerged on a mound from watery chaos and created Shu, the air, and Tefnet, cloud, and they created Nut, the sky, and Geb, the earth. At Memphis a complicated reconciliation of this Heliopolitan theory, with Ptah being creator, was evolved.

No detailed account of the creation of man is known, but Khnum, originally a ram god, was said to fashion man on a potter's wheel. Men could become gods after death. An example is Imhotep, the vizier of Zoser, builder of the Step Pyramid, who was deified in the Saite period and later identified with Asklepios.

The earth was generally thought of as a flat disk floating on Nun, the primeval

water, and bounded by mts which supported the sky. The world under the earth was called Duat. The sun appeared in the morning between 2 mts and travelled across the sky in a boat. The sun is represented in various forms, often as a red disk, sometimes between the forelegs of a scarab beetle, pushing it before it, like the ball of dung in which the scarab hides its eggs, the seed of new life as was the sun-rise. Reaching the W. the sun god entered another boat and returned to the E. beneath the earth. Another idea was that the sun was a child which entered the mouth of the sky goddess and passed through her body to be born in the morning, or a calf if she was thought of as the heavenly cow. These ideas could be combined, and the sun god in human form may be seen in his boat sailing over the belly of the heavenly cow. The heavenly cow, Hat-hor, the 'house' or spouse 'of Horus,' the falcon sky god, was an early goddess, with whom Nut, the sky goddess, was later assimilated. Two funerary works, which provide the texts on the tomb walls and sarcophagi of the kings from the New Kingdom and shortened versions in ordinary people's graves, are the Book of Gates and Book of Him-who-is-in-the-Underworld. The first describes the divs. of the underworld and the gates, each guarded by a being with a knife, through which the sun at night had to travel; the second describes the 12 regions corresponding to the 12 hrs of the night through which the sun travelled, and the gods and demons inhabiting them.

Some deities were the personifications of ideas, e.g. Maat (q.v.) = Truth. Hapi represented the Nile flood. Two important gods who never became supreme universal gods but were worshipped everywhere were Thoth and Anubis (q.v.). There were also smaller deities, popular with all classes, which had no sanctuaries of their own, but were worshipped at home. The 2 most important were Bes (q.v.) and Thoueris, represented as a pregnant hippopotamus and believed to ensure protection in childbirth.

Only once in Egyptian hist. was an attempt made to introduce true monotheism—by Akhnaton (q.v.). Officially the king was theoretically divine, the only mortal entitled to direct contact with the gods. He was the mediator between gods and men. It was not until the Second Intermediate Period, with the spread of the cult of Osiris, that equality for all in religion was achieved, and figures of gods begin to appear on the monuments of common people.

Amulets thought to possess magical properties were popular. They include the *scarab* (usually seal as well as amulet), symbol of the creator god Khepera; the *ankh*, symbol of life; the *shen* (circle with tangent, meaning 'protection'), which became the cartouche of the kings; and many others. Magic *shabti* statuettes were buried with the dead; they were supposed to come to life and perform all hard work in the other world for the person buried with them.

Life in Ancient Egypt.—Hieroglyphs, a form of pictorial writing, came into use in the 1st dynasty, and were used for monuments until the 3rd cent. AD. When written cursively (so that the hieroglyphs are hard to recognise) the script is known as hieratic. Another form of cursive, called demotic, arose for use in business, etc., in the 7th cent. BC, when hieratic was confined to religious texts. In the Ptolemaic period Greek became the official language. Coptic is the popular language of E. written in Gk characters with a few others borrowed from demotic, used from the 3rd cent. AD on. For the deciphering of hieroglyphs see CHAMPOLLION and ROSETTA STONE. Writing materials consisted of papyrus, brush, and pigments mixed with water. Papyrus was made from strips of pith from the stems of the marsh plant papyrus, beaten together and dried. Much literature has survived, including documents of all kinds. Some important religious texts have already been mentioned. Tales, both realistic and imaginative, exist, and some love poems. Among chronological works, besides the Palermo Stone and the Abydos king list, already mentioned, is the Turin Papyrus dating from Rameses II, giving names of 300 kings arranged in dynasties similar to those of Manetho (q.v.). Sev. medical papyri show that there were specialists with some knowledge of human anatomy, while treatment was often magical.

The king wore special costumes, including the white crown of Upper and the red crown of Lower E., often united, with the cobra on his brow. Queens regnant were exceptional, see HATSHEPSUT and CLEOPATRA. Inheritance through the female line was recognised, and marriage with the heiress princess brought a right to the throne. Brother-sister marriage in the royal family occurred, becoming general in Ptolemaic times; it probably occurred also among the common people. Polygamy was recognised, but the position of the woman, particularly of the senior wife, the mistress of the house, was high. Children were prized; they had many toys, such as ninepins, dolls, balls, and animals with movable limbs. The man who could read and write was respected, and there were colleges for aspirants to the priesthood, which was partly hereditary. The embalmers of the dead formed a distinct class.

Slavery increased greatly after the wars of the New Kingdom, when a class of professional soldiers also arose. Sudanese mercenaries were always used, and Greeks in the later period.

The wealth of the country came from cultivation of rich alluvial flats regularly inundated by the Nile. Corn, vegetables, date-palms, and vines particularly were grown. Bread and beer were the main items of food and drink. Trade was carried on by barter; coinage only came into regular use under the Ptolemies. Royal expeditions were made to Punt, Syria, Sinai, and elsewhere to obtain timber, metals, etc., but much external trade was always in the hands of

foreigners. Gold, turquoise, lapis lazuli, amethyst, and cornelian were the chief materials of the jeweller, who excelled in his art by the 1st dynasty and reached his zenith c. 2000 B.C. Beautiful furniture, inlaid with ivory, ebony, etc., was produced at the same time for the rich. Jewellery was worn by both sexes; often, in the case of men, with fans as insignia of rank. Metal mirrors, razors, and alabaster containers for pigments and unguents were important toilet articles. From earliest times the Egyptian was a skilled potter, but as luxury vessels pots were early replaced by vessels of stone, and then of copper and bronze. Opaque

to take E. They defeated the Romans at Heliopolis, AD 640. It is probable that Cyrus, the governor of E., may, for reasons of his own, have assisted in betraying the country to the Muslims. It is certain the Copts helped the enemy, and E. was conquered with very little difficulty. The pagan pop. embraced the faith of Islam, but the Copts remained Christians. The Arabic language rapidly spread and gradually superseded Egyptian. Now began a hist. of bloodshed, cruelty, tyranny, and treachery that it would be difficult to exceed. For about the first 100 years the Christians were tolerated, and then a series of terrible persecutions

D. McLeish

THE AVENUE OF SPHINXES AT THE ENTRANCE OF THE TEMPLE OF KARNAK

coloured glass was introduced in the New Kingdom, but transparent glass not until Rom. times. Brightly coloured glazed composition (faience), usually blue or green, was used at all periods for small objects, beads, etc. Linen was woven from neolithic times, and soon reached a wonderful degree of fineness.

The clothes worn by the Egyptians were very simple for a long period: a loin cloth and a belt for the men and a short, tight petticoat for the women, made of linen, wool being unclean. The children went naked, both rich and poor. Later the men wore a skirt reaching to the knees, with a curious triangular front, which stood out as though starched. The women's skirts became longer and were held up by braces over the shoulders, leaving the upper part of the body bare. The people of the 18th dynasty wore more elaborate clothes; cloaks and tunics became fashionable with fringes and embroideries. Sandals were made for the feet and elaborate wigs for the head. The men all shaved their heads, the young boys retaining a long plaited lock on the side of the head until they came to manhood. The women plaited their own hair in fashions which varied with the period.

Muslim Conquest.—In AD 639 Omar I, the 2nd caliph, sent an army of 4000 men

commenced. A series of ineffectual revolts occurred, which were crushed with great cruelty. In 832 the Copts raised a more serious revolt, and Motasin, the feudal lord, failed to suppress them. The caliph Mamun came to E. to assist and the Copts were defeated. All the men who were caught were massacred horribly and the women and children sold as slaves. This finally subdued the Coptic nation. In AD 868 E. was given in fief to a Turkish general called Bayikbeg, the son of a slave, who had risen in the caliph's service; from this time onwards various Arabs, Turks, and Syrians succeeded in obtaining the throne of E.; many of them were murdered, and the struggles of different persons to obtain power, together with heavy taxation, reduced the country to an utterly wretched condition. In 1164 the Franks invaded E. and joined a usurper called Shawar; they were defeated by Shirkuh and his nephew, the famous Saladin (q.v.). Saladin took the title of sultan, and during his rule E. recovered a little. His son Othman succeeded him, and another period of disputes and disasters convulsed the country. The Mameluke dynasty began after the death of the sultan Nagm-al-din, who had purchased vast numbers of slaves and turned them into soldiers; these were called the

Barl Mamelukes. In 1515 war began with Selim I, the Ottoman sultan, who defeated the Mamelukes and incorporated E. with the Ottoman empire; the country then became a Turkish prov.

Modern History.—From this time until the Fr. expedition in 1798 the gov. suffered constant changes; sev. rulers were murdered, with continual bloodshed, cruelty, and internal revolts. The Fr. expedition was presumably to suppress the Mamelukes and restore the authority of the Sublime Porte, but it was the beginning of that dream of Oriental conquest that always possessed Napoleon. Napoleon landed and, after taking Alexandria, defeated the army of Murad Bey and Ibrahim Bey at the battle of the Pyramids. He then estab. a municipal council at Cairo, and the Fr. exercised dictatorial power. The Fr. fleet was destroyed by Nelson and the Eng. In the great battle of the Nile in 1798. Napoleon went off on an expedition to Syria, leaving Fr. governors at Cairo, Alexandria, and Upper E. The Sublime Porte sent a double expedition to recover E. by force. The Fr. general, Kléber, defeated the Turks, and a certain amount of order was restored. Kléber was assassinated, and Gen. (Baron) de Menou succeeded in command. His declaration of a Fr. protectorate over E. convulsed the country again. In 1801 the Eng., commanded by Sir Ralph Abercromby, landed at Aboukir and invested Alexandria. Gen. de Menou attacked them, but he was defeated. Sir Ralph Abercromby *d.* from his wounds received in the battle. The combined Brit. and Turkish armies under Gen. J. Hely Hutchinson and Yusuf Pasha marched to Cairo, and the Fr. general, Belliard, finding himself overwhelmed, agreed to evacuate Cairo and leave E. with his troops. Gen. de Menou at Alexandria was compelled to accept the same conditions, and both left for France, thus terminating the Fr. occupation of E. Troubles arose almost at once. The Turks treacherously tried to exterminate the Mamelukes. Gen. Hely Hutchinson took measures at once against the Turks, who submitted and gave up their prisoners. Mohammed Khorsvid was the 1st Turkish governor after the Fr. occupation. The Turks and Mamelukes continued to fight, and the Albanian soldiers rebelled against the Turks successfully, and Mahommed Khorsvid fled. Tahir Pasha, the leader of the Albanians, seized the gov., but was assassinated 23 days afterwards. Mehemet Ali, an Albanian commander, allied himself to the Mamelukes; this was the beginning of further terrible struggles; one faction of the Albanians placed Ahmed Pasha Khorsvid in the seat of gov. His rule was abominable and the half-starved and ruined people of Cairo waited in misery for a deliverer. Three thousand Kurdish troops were sent from Syria to Cairo to strengthen Khorsvid, but they behaved with such brutal ferocity that Mehemet Ali returned, and was hailed by the people as their leader and saviour. A furious and bloody struggle took place between the forces of the 2 pashas.

Khorsvid was recalled to Turkey, and Mehemet Ali made himself governor of E. The beys (Mamelukes) disputed his authority; Mehemet Ali arranged and carried out successfully a treacherous and horrible massacre of the Mamelukes. In 1807 a Brit. force arrived under the command of Gen. Mackenzie Fraser. The troops entered Rosetta without opposition, but were trapped in the narrow streets; every roof and window rained fire on them from the hidden garrison, 185 Eng. were killed and 281 were wounded. A series of disasters followed. Mehemet Ali marched to Cairo, having allied himself to his enemies, the beys, for the purpose of driving out the Eng. The Eng. were defeated and obliged to retire. Mehemet Ali then proceeded to massacre the remaining beys, and finally remained the sole undisputed possessor of E. He recognised the suzerainty of the sultan, and complied with the command of the Porte to send an army against the Wahabis (q.v.). He returned to Cairo on the day of the battle of Waterloo. Mehemet Ali now turned his attention to Egyptian domestic affairs; he created for himself a monopoly of the industries of the country, and by nationalising the land became the proprietor of all the cultivated soil of E. He started and encouraged the cotton-growing industry in the delta, which was perhaps the best thing he ever did. He ordered the new canal between the Nile and Alexandria to be dug, which was done with forced labour and under such wretched conditions that 20,000 fellahin *d.* before it was completed. The country was still heavily taxed; all the necessities of life were 4 times the price they formerly had been; the land became utterly impoverished; and the finances were in hopeless chaos. In 1838 a commercial treaty with Turkey was arranged which destroyed the monopolies, and matters grew a shade better. Mehemet Ali reorganised his army, and the fellahin and negroes replaced Turks and Albanians. The sultan appointed him governor of Crete, and in 1824 a fleet of 60 Egyptian vessels sailed to Suda Bay to assist the sultan against the Gk insurgents. The European powers intervened and Mehemet Ali withdrew to E. In 1833 the sultan appointed Mehemet pasha of Syria and the dist. of Adana, so that Mehemet now became the sole ruler of a large empire, while he was only responsible for a small tribute to the sultan. In 1841 the powers again intervened: Mehemet was becoming too strong and too aggressive; he was compelled to submit to certain restrictions. He *d.* in 1849 at the age of 80. This remarkable man had achieved a great deal during his long and stormy career. His hist. bears the records of many treacherous deeds and violent scenes of bloodshed, but he was, in spite of all, a wonderful, strong, and interesting character. Among the really good things he accomplished for E. were the fostering of the cotton industry in the delta and the conquest of the Sudan.

His son Ibrahim being dead, Abbas I, Mehemet's grandson, ruled. During his

reign the railway from Alexandria to Cairo was commenced at the suggestion of the Brit. Gov. Abbas was murdered by his own slaves after only 6 years' rule. He was succeeded by Said, the 4th son of Mehemet. During his rule Ferdinand de Lesseps obtained the concession (1856) for the construction of the Suez Canal (q.v.). The Eng. secured the right to start the Telegraph Company and estab. the Bank of E. The national debt was commenced under Said; he *d.* in 1863. Ismail, who succeeded him, did a great deal to reorganise the gov., but his extravagance landed him in bankruptcy; he sold his shares in the Suez Canal to the Brit. Gov., thereby paving the way for the international control of the khedive's affairs. He was compelled to submit to a constitutional ministry, of which he soon found means of getting rid. Ismail was immediately deposed by the sultan, and his son, Tewfik, succeeded him as khedive. In 1879 the Eng. and Fr. re-estab. the constitution; Maj. Sir Evelyn Baring (afterwards Lord Cromer) and M. de Blignyères represented the 2 countries. A movement now began among the Arab troops to remove the foreigners; it was led by a fellow officer, calling himself Ahmed Arabi. This man was promoted and made under-secretary for war, and then member of the cabinet. Arabi possessed a gift of rough eloquence, which appealed to the people; it is probable that he was sincere at heart but an unconscious tool in stronger and more unscrupulous hands. At the instigation of an Arabiac faction, a massacre took place in Alexandria, 1882, and, fearing a serious revolt, the Brit. and Fr. fleets arrived. The forts were bombarded, but the nationalist movement prepared to resist with great determination. The Brit. Gov. decided to employ military force. The Fr. declined to share the responsibility and England acted alone. Troops were landed under the command of Sir Garnet Wolseley, and the revolt was crushed at the battle of Tel-el-Kebir. The khedive returned to Cairo, and a fresh ministry was formed. Arabi was sentenced to death, but his life was spared and he was banished. The task of restoring the country to order fell to Lord Dufferin, the high commissioner, and the practical carrying out of this general scheme was undertaken by Sir Evelyn Baring (Lord Cromer), who was appointed consul-general in 1884. The Sudan now claimed the immediate attention of the country. A religious rebellion had broken out led by a fanatic calling himself a Mahdi of Islam. Col. Wm Hicks Pasha had been sent with 10,000 men to suppress the revolt, but was utterly defeated at the battle of Obeid in 1883. The khedive wished to make another attempt to regain his lost prov., but Sir Evelyn Baring insisted that, there being neither men nor money, the Sudan must wait. The Mahdi was now master of the chief part of the Sudan, though Khartoum and some other places (q.v.) still held out. Gen. Valentine Baker, with an army of 2500 mixed troops, was sent by the khedive to relieve Sinkat and

Tokar; they were defeated with great loss, and Suakin was in grave danger. A Brit. force of 4400 was sent and concentrated at Suakin. Sinkat fell, and Tokar surrendered to the Mahdi. Gen. Gordon and Col. J. D. Stewart, who had been sent by the Brit. Gov. to Khartoum to discover the best method of evacuation, were now entirely cut off from help and besieged in Khartoum, and the problem was how to extricate them. There was a long delay, due to various causes. Gen. Gordon was only provisioned for 5 months; the siege began on 18 Mar. 1884, and held out till Jan. 1885. Sir Charles Wilson, arriving on 28 Jan., found Khartoum in the hands of the enemy and Gen. Gordon murdered 2 days before. Lord Wolseley's Nile expedition, though failing in its ultimate purpose, experienced some severe fighting, and won the battles of Abu Klea and Metemmeh, etc. The Brit. troops were withdrawn in June, and the Mahdi *d.* before the rearguard had left Dongola.

During this time Sir Evelyn Baring was fighting the internal difficulties of E., the question of finance being the hardest to overcome. The Convention of London (1885) enabled E. to raise a loan of £9,000,000. In 1892 the Khedive Tewfik *d.*, and his son Abbas Hilmi succeeded. During this time the Khalifa Abdullah-el-Taishah succeeded the Mahdi and ruled the Sudan. His intention was to conquer E., and though delayed at first by trouble with Ethiopia and various massacres of Egyptians, he arranged his campaign and placed Wad-en-Nefumil, the Dervish Amir (who had defeated Hicks Pasha), in command of the army that was to conquer E. Another large portion of the army under Osman Digna, once a slave-dealer of Suakin, and now one of the greatest generals under the khalifa, was engaged in fighting the Ethiopians. Osman Digna was defeated with great slaughter and fled to Kassala. In 1886 Col. Kitchener seized Osman Digna's stronghold, but Osman himself escaped. Kitchener became governor of Suakin in the same year and sirdar of the Egyptian Army in 1890. It was not until 1898 that the power of the khalifa was broken. The battle of Omdurman marked the destruction of the khalifa's rule. Kitchener marched to Omdurman, driving the enemy back as he went. Among the many deeds of gallantry that occurred must be mentioned the famous charge of the 21st Lancers. They were surprised by 2000 Dervishes but cut their way through with heavy loss. During the battle over 10,000 Dervishes were killed and as many wounded; 5000 were taken prisoner. The black flag of the khalifa was captured and sent to Queen Victoria. The result of this victory was the extinction of Mahdism and the recovery of the Sudan for E. The khalifa fled. On the sirdar's return he encountered the Fr. expedition at Fashoda under Capt. Marchand. Matters were diplomatically arranged, though the crisis became very acute. Capt. Marchand returned to France. The khalifa was killed in an encounter in 1899,

and his son surrendered. Osman Digna was captured at Yebel Warriba in 1900.

Meanwhile the country of E. continued to increase in prosperity. In 1907 Sir Evelyn Baring (now Lord Cromer) resigned, having completed his great work of creating from the ruins of hopeless misrule and ignorant tyranny a country that was steadily progressing and prospering. Sir Eldon Gorst succeeded him. The Anglo-Fr. agreement of 1904 put an end to the foreign complications attendant on the somewhat anomalous position of Great Britain; it recognised the protection and occupation.

The resignation of Sir Eldon Gorst in 1911 was followed by the appointment of Lord Kitchener as Brit. agent and consul-general. Kitchener's administration was marked by great personal prestige, and the policy of his predecessor was to a certain extent reversed. The cry of 'Egypt for the Egyptians' was not quite so insistent, and any measure of independence which Egyptian ministers had previously enjoyed was quietly but firmly withdrawn. The Brit. officials were again ensconcing themselves in administrative posts, and strange as it may seem, these actions seemed to pass without demur on the part of the Egyptians.

The First World War interrupted Kitchener's activities in E. and on 6 Aug. 1914 he became secretary of state for war. Great Britain declared war on Turkey on 5 Nov. This was followed on 18 Dec. by Great Britain declaring E. to be a Brit. protectorate: the khedive was deposed and his uncle, Hussein Kamil, was proclaimed sultan of E. Sir Henry MacMahon, who had rendered political service in India, but was without experience of E., was made high commissioner. In 1916 Sir Henry MacMahon was succeeded in the high commissionership by Sir R. Wingate, governor of the Sudan and sirdar. On 9 Oct. 1917 the sultan Hussein Kamil (or Kamel, q.v.) *d.*, and was succeeded by his brother Ahmed Fuad. During the following year an armistice between Turkey and the Allies was proclaimed, to be followed on 11 Nov. by the armistice between the Allies and Germany. (For the campaign in Egypt, *see* EGYPT, FIRST WORLD WAR CAMPAIGN IN.)

Following the First World War there was a natural resurgence of nationalism led by Saad Zaglul Pasha, an able man of humble origin and a former minister of education and minister of justice, who led a deputation to the high commissioner asking permission to send an Egyptian delegation to London to discuss Egyptian affairs. The request received the backing of Sir R. Wingate, but was refused in somewhat curt terms by the Foreign Office. A carefully worded reply by Zaglul, in which the request was renewed, was also rejected. This refusal determined Zaglul, and early in 1919 he announced the Nationalist programme at a public meeting. This programme demanded no less than complete independence for E. The Brit. Gov. had acted against the advice of its own high

commissioner, Sir R. Wingate, who on account of the advice he had tendered was recalled. The next stroke was the banishment of Zaglul with 3 other prominent Nationalists to Malta, and this was the occasion of rioting and strikes. The Brit. troops were called out, but the riots spread, and on 18 Mar. at Deirut a train was attacked, and 2 Brit. officers, an official, and 5 soldiers were murdered.

A STREET IN CAIRO

For these murders about 30 people paid the extreme penalty on 9 April. Gen. Allenby (q.v.), who had been appointed special high commissioner, succeeded in restoring order, and Zaglul and his fellow-exiles were allowed to return to E.

Acting on the recommendation of Gen. Allenby, the Brit. Gov. proclaimed the end of the Brit. protectorate, and E. was recognised as an independent sovereign state (28 Feb. 1922). This proclamation was subsequently ratified by the Brit. Parliament, which reserved the 4 following points for a later settlement: (1) security of communications between various parts of the Empire; (2) defence of E. against foreign attack; (3) protection of European interests; (4) the Sudan. The Sultan Ahmed Fuad became King Fuad I (q.v.). On 19 April 1923 the constitution of the kingdom of E. as an hereditary constitutional monarchy was proclaimed.

On 19 Nov. 1924 Gen. Sir Lee Stack, Governor-General of the Sudan, was assassinated by Egyptian Nationalists at Cairo. The Brit. Gov. insisted on the withdrawal of detachments of Egyptian troops from the Sudan. In Oct. 1925 Lord Lloyd was appointed high commissioner by the Baldwin gov. and held office till his recall by the Labour gov. in 1929.

In Aug. 1936 an Anglo-Egyptian treaty of alliance was signed, providing for the estab. of a Brit. garrison for a period of 20 years, and Britain's special interest in the Suez Canal zone was recognised. When the Second World War broke out E. loyally fulfilled this obligation, as was shown by the disembarkation at Alexandria of the Australian and New Zealand expeditionary force in the early part of 1940. The capitulations were abolished by the Convention of Montreux of 8 May 1937, the U.K. recognising that the responsibility for the lives and property of foreigners in E. devolved upon the Egyptian Gov. The treaty was ratified by the Egyptian Chamber by an overwhelming majority (202 votes to 11) and by the Senate (108 votes to 7).

During the war Germany and Italy made every effort to persuade E. to betray Britain, but E. as a whole stood firm by her obligations. But an acute crisis arose in Feb. 1942. Hussein Sirry Pasha, the Premier, and a good friend of Britain, had no following in the country and was powerless to suppress a strong clique of intriguers who were stirring up anti-Brit. feeling. King Farouk then called in Mustapha el Nahas Pasha, leader of the Wafd. Nahas's first step was categorically to declare his determination to carry out the terms of the treaty, in the negotiation of which he himself had been the country's leader in letter and spirit. The country now drew inspiration from its new-found unity and responded with a will to its leader's example. This sentiment was vitally necessary a few months later. Until the end of June 1942 there had been no definite threat to E. proper, although in 1940 the forces of Marshal Graziani had reached Sidi Barrani. But at the beginning of July 1942 Gen. Rommel's forces were actually marching on the Nile delta, and for some days the military position was precarious. In such a situation an E. hostile to Britain would vastly have increased the danger from Rommel's Afrika Korps. E. was the base of the famous Eighth Army (q.v.). (For the issue of the campaigns in E. and Cyrenaica see under AFRICA, NORTH, SECOND WORLD WAR (CAMPAIGNS IN.)) Rarely can any international undertaking have paid such solid dividends as the Anglo-Egyptian Treaty. Had there been no treaty, had not Anglo-Egyptian relations been so regularised, E. could not but have taken advantage of Britain's pre-occupations to further her own interests. On the other hand, a treaty which demanded more of E. than it in fact did might well have defeated its own ends. Criticism of E. for not taking an active military part is misconceived. E. duly

severed diplomatic relations with the Axis (q.v.), but she was not obliged under the treaty to make active war upon Britain's enemies; nor, indeed, was the Egyptian Army in a condition to measure its strength against the Italians, much less the Germans. Moreover, it was an open secret that some of the Egyptian Army leaders with good connections in the palace favoured the Axis, whose political principles appealed to them more than those of the W. democracies. Indeed, it was from the palace that came the chief opposition to cordial co-operation with the Allies throughout the war. The crisis came in 1942 when the Brit. Eighth Army had just been driven back for the second time across the borders of Tripolitania, the Japanese seemed to be all-conquering in the Far E., and Russia at bay at Stalingrad. It was then that the Brit. ambas. (Sir Miles Lampson, afterwards Lord Killarn) demanded an audience of King Farouk and supported his demands by surrounding the Abdin Palace with Brit. troops. It was on the ambassador's insistence that the king summoned to the premiership Nahas Pasha, leader of the largest political party, the traditional upholders of national independence. The demand might therefore seem to have been inexplicable, but Nahas had signed the treaty and it was calculated, and rightly, that of all E.'s politicians he might be most relied upon to uphold its terms. Nahas continued in power for the ensuing 2 years, in face of increasing political and economic difficulties, until a scandal involving public charges of corruption, sensational even by Middle E. standards, gave the king an opportunity to dismiss him and his party. Nahas was replaced by the Saadist party leader, Ahmed Maher, who was murdered a few months later after declaring war on the Axis.

In Dec. 1945 the Egyptian Gov. demanded a revision of the 1936 treaty on the plea that it had been made in the midst of an international crisis and that the war had exhausted the treaty's prin. objectives. It was also averred that the presence of foreign troops, even though stationed in distant areas, was wounding to national dignity and could only be interpreted by public opinion as a tangible sign of mutual mistrust. The Egyptian note said that E. would shrink from no sacrifice in order to place her military potential in a state enabling her to repel aggression pending the arrival of the reinforcements of her allies and of the U.N. (q.v.). The Brit. Gov. was willing to revise the treaty arrangements 'in the light of their mutual experience and with due regard to the provisions of the United Nations Charter.' This exchange of notes followed months of growing agitation by most sections of politically-conscious Egyptian opinion for the withdrawal of Brit. troops. On 23 Sept. 1945 the cabinet of Nokrashy Pasha took the extreme step of issuing a communiqué calling for evacuation of Brit. troops and for the incorporation of the Sudan with Egypt. Two months earlier even

Nahas Pasha had presented similar demands to the Brit. ambas. on his own initiative. On 12 Nov. 1945 King Farouk, in his speech from the throne on the opening of Parliament, repeated the demand for 'an end to all restrictions on Egyptian independence'. In the first fortnight of Feb. 1946 students—E.'s professional demonstrators—staged anti-Brit. demonstrations in Cairo and Alexandria. There were collisions with the police and in the result Nokrashy's gov. resigned. As his successor the king chose Ismail Sidky Pasha (q.v.), a doyen of Egyptian 'big business' and wealthy elder statesman. His return did not please the young Nationalists or the nascent Egyptian Labour movement. The climax came on 21 Feb. with riots in Cairo. Brit. service clubs and institutes were attacked and looted. Brit. troops opened fire on the mob and some 20 Egyptians were killed. The Brit. Gov., angered at the failure of the Egyptian authorities to protect Brit. property and personnel, demanded compensation and the punishment of the guilty. The Egyptian Gov. conceded the demands in principle and their new-found firmness had at least the effect of restoring order in the cap. Although the fiercer front shown by Sidky Pasha kept the cap. reasonably quiet, in Alexandria there was a violent outbreak on 4 Mar. in which, for the first time, Brit. lives were lost. In Jan. 1947 the Egyptian Gov. broke off negotiations, and later appealed to the Security Council of the U.N. to instruct Britain to withdraw troops from E. and the Sudan and the existing administrative regime in the Anglo-Egyptian Sudan. The Security Council, however, did not make any recommendation. Nevertheless the Brit. Gov. evacuated its troops from Alexandria and Cairo early in 1947.

E. was involved in the Arab-Jewish struggle over the partitioning of Palestine, which was recommended in Nov. 1947 by a committee appointed by the General Assembly of the U.N. The Arab League refused to recognise partition and, following the termination of the Brit. mandate in Palestine, Egyptian troops invaded Palestine in the S., while the Transjordan Arab Legion and Syrian and Lebanese troops invaded the country in the N. and E. (May 1948). A truce supervised on 11 June, by which date the Egyptian Army had reached Isdud, 20 m. S. of Tel Aviv, and occupied positions running S.E. from Majdal through Fuluja to Beersheba and linked up with the Arab Legion at Bethlehem. When hostilities were resumed the Arabs sustained sev. defeats and accepted a renewal of the cease-fire (19 July). Israeli troops then decided to take the offensive against E. and a large Egyptian force was surrounded at Fuluja, 20 m. N.E. of Gaza. E. then became the sole target of Israeli pressure. Israeli troops entered Egyptian ter. in Dec. but were driven back and a truce was finally arranged for 7 Jan. 1949, a general armistice being signed at Rhodes on 24 Feb. (see further under PALESTINE).

In July 1952 there was a revolt against the palace; a *coup d'état* resulted in the abdication of King Farouk, and for a short while his infant son, Ahmed Fouad II, reigned. Ex-King Farouk left E. without any apparent regret on the part of his erstwhile subjects, and the abandoned and confiscated property of the royal family, valued at £E6,000,000, provided a welcome windfall to the exchequer. In the following June (1953) Gen. Mohammed Neguib, who had precipitated the abdication of Farouk, proclaimed E. a rep. with himself as president and Prime Minister. In less than a year (April 1954) he was compelled to resign his official offices by the Revolutionary Council (14 Nov.) and ceased to be president. A council of ministers carried on the affairs of state until early in Mar. 1956, when a gov. was formed with the Prime Minister Lt.-Col. Gamal Abdel Nasser, who has since become president, as virtual head of the State. In Dec. 1955 it was announced that the U.S.A. and the U.K. would give E. financial support for the construction of the proposed high dam at Aswan. There were formal qualifications regarding ratifications by the govts. concerned. Further sums of money in support of the project were expected, and indeed assured, by the World Bank. The initial sum of money involved was estimated at \$1,300,000,000. In July 1956 the offer of financial assistance was suddenly withdrawn by both the U.S.A. and the U.K. as 'not being feasible in the present circumstances'. It is still a matter of conjecture what precisely were the 'circumstances' referred to, but it may be assumed that they were associated with E.'s acceptance of military equipment and military advice from the Communist bloc and the president's changing rôle from that of a conventional president to that of a dictator. Nasser's reaction was violent and decisive. On 26 July, at Alexandria, he announced that the Egyptian Gov. had nationalised the Suez Canal Company.

The seizure of the canal was regarded as illegal in W. Europe and the U.S.A., but it was soon obvious that no effective joint action by the protesting states against E. was possible. The Suez Canal Users' Association, set up after the seizure, proved powerless. Only in Britain and France was there any serious demand for stern action against E. Then in Oct. 1956 hostilities broke out once again between E. and Israel. Israel, undoubtedly provoked by E.'s increasingly hostile attitude, invaded Egyptian ter.; France and Britain called on both belligerents to cease fighting. E. ignored the ultimatum, and in consequence a joint Anglo-Fr. force invaded E. from the air and, without more than a token defence by the Egyptian Army, occupied Port Said. The Egyptian Air Force suffered crippling destruction on the ground, and there was little evidence of any organised resistance to the allied force, which could probably easily have occupied the whole length of the canal. The Anglo-Fr. action resulted in E.'s

blocking the Suez Canal and making it impassable: the very thing which Britain and France had acted to try to avoid. World opinion, with which both the U.S.A. and Russia concurred, was ranged against this use of force by the U.K. and France, and W. influence in the Middle East was destroyed as the result of their action. Meanwhile, Israel had advanced into the Sinai desert with the avowed purpose of destroying Egyptian strong points and other places from which raids into Israeli ter. were frequently taking place. In this invasion Israel was technically the aggressor. Again there was a total collapse of E.'s defence force.

The Anglo-Fr. forces had as their main objective, so the respective govts. proclaimed, the protection of the Suez canal, free navigation of which was threatened by the invading Israeli forces. In the event, Britain, France, and Israel were branded as aggressors at the U.N. and called upon to cease their military activities. A U.N. force was organised to safeguard the canal from further attacks and to prevent further outbreaks of violence between Israel and E. in Sinai. Serious opposition to the Brit. Gov.'s action by the Labour party, uneasy public opinion in the U.K., and veiled threats of intervention by Russia were all factors which contributed to a sudden halt of military operations in the canal zone. The blockships sunk by E. in the canal were later removed by engineers acting under orders from the U.N.

The apparent success of Nasser's policy in the U.N., the *fait accompli* of his seizure of the canal, the holding to ransom of the mercantile marine of all nations wishing to use the canal, and a demand for the payment of canal dues in advance and in convertible currency, all these factors more than outweighed the effect of E.'s defeat on every field of battle. Nasser's, and thus E.'s, prestige soared within the Arab world. E.'s dependence on the E. bloc became more real, and a general realignment of U.S.A. policy in the Middle East became necessary. One of the many consequences of the abortive Franco-Brit. venture was the confiscation of property owned by the nationals of these countries in E. Much hardship was caused; evacuation by the respective govts. was followed by deportations, and the long chapter of Anglo-Egyptian association brought to an unhappy close. Egypt, First World War Campaign in. Although Turkey was not in a state of war with Great Britain until 5 Nov. 1914, she had been under Ger. influence for some years before the First World War broke out, and an alliance existed between the 2 countries. In Oct. 1914 Germany's fortunes were at a low ebb; she had lost the battle of the Marne, Russia had overrun E. Prussia, the Austrians had suffered heavily at Lemberg, and reinforcements to Brit. arms were moving freely from India and the dominions. The time had therefore arrived for Turkey to come into the arena of war and play her allotted rôle by striking at Britain through Egypt. The pre-war Brit. garrison was required in France, and in Sept. 1914 the 42nd (E. Lancs) Territorial Div. was sent out to replace it. Troops from India, Australia, and New Zealand also arrived, and by the end of 1914 about 70,000 troops were concentrated in E. Early in Nov. 1914 a Turkish force under Jemal Pasha advanced through the Sinai peninsula against the Suez Canal. Jemal's chief of staff was Col. Kress von Kressenstein, a Bavarian officer of great ability and energy. They advanced in 3 columns, and arrived at the canal on 25 Jan. 1915. Their strength was about 12,000-15,000 men. They raided Kuber, 7 m. N. of Suez, on 27 Jan., and Kantara on 28 Jan. On the night of 2-3 Feb. a general attack was made between Serapeum and Tussum, but was repulsed by gun-fire. All attempts to cross the canal failed. The next operations were against the Senussi (a Muslim nonconformist sect founded in 1835), who occupied the W. desert, with centres at Kufra and Siwa. The sect had many adherents in E. and was susceptible to Turkish propaganda. The Kaiser sent Sayed Ahmed, their leader, arms and munitions by submarines, which were landed on the coast of Tripoli. In Nov. 1915 they captured the crew of H.M.S. *Tara*, which had been torpedoed near Sollum, and committed other hostile acts against the Brit. This led Gen. Sir John Maxwell, the Brit. com-

mander-in-chief in this theatre, to take offensive action against them. Actions were fought at Hazalín and at Agadir in Dec. 1915 and Mar. 1916 respectively, in which the Senussi lost heavily. An armoured car detachment under the command of the duke of Westminster found 40 survivors of the *Tara* in a distant camp and rescued them.

When the Gallipoli Peninsula was evacuated the Brit. troops went to E., and the whole of the garrison was reorganised under Gen. Sir Archibald Murray. The total force amounted to 13 divs., 6 of which were sent to other theatres of war. A line to the E. of the Suez Canal was occupied, where a much-advertised Turkish advance was awaited. They were under the command of Kress von Kressenstein, and numbered about 18,000 men. By the middle of July 1916 they were in touch with the Brit. outposts. On the night 3-4 Aug. they attacked Romani, but, being heavily counter-attacked, fell back in disorder, having suffered 9000 casualties, 4000 being prisoners. The Brit. followed up this success and drove the Turks out of E., the Sinai Peninsula and eventually out of Palestine.

Egypt Exploration Fund, now E. E. Society, was founded in 1882 by Miss Amelia Edwards (q.v.), who was greatly interested in Egyptian antiquities, and who was one of its first secretaries. Indeed, she gave up her other literary work to devote her time to writing about Egypt, one of her books being *Pharaohs, Fellahs, and Explorers*. The object of the society is to make surveys, explorations, and excavations at ant. sites in Egypt, and to publish the results. Some of the distinguished men who have worked for it are Flinders Petrie, F. L. Griffith, N. de G. Davies, B. P. Grenfell, and A. S. Hunt.

Egyptian Bean, name sometimes given to the bean-like fruits of *Nelumbo nucifera*, the sacred Lotus, now found only in Asia and Australia. The seeds are eaten in some parts of India, and are believed to be the *beans* which Pythagoras forbade his disciples to consume.

Ehrenbreitstein, Ger. tn in the Land of North Rhine-Westphalia (q.v.), on the r. b. of the Rhine (q.v.) opposite Koblenz. Until 1919, in which year it was demilitarised in accordance with the treaty of Versailles (q.v.), it was called the 'Gibraltar of the Rhine.' Its historic fortress, situated on an almost inaccessible rock 387 ft. high, is believed to date from the time of the Emperor Julian (q.v.), and has been many times reconstructed and added to. In the 11th cent. it was in the possession of a noble called Erembert, from whom its name is derived, and in the 12th cent. it was in the possession of the archbishop of Trier. The tn was taken by the Fr. in 1631, by the Imperialists in 1637, and again by the Fr. in 1799. Pop. 3000.

Ehrenburg, Il'ya Grigor'evich (1891-), Russian writer of Jewish origin. He lived many years abroad, mostly in Paris, both before and after the revolution, and

has many features of a Montparnasse *bohémien*. Starting as a Symbolist poet, he soon turned to prose and has written in all genres, from novel to newspaper reporting; most of his writing is a kind of fictionalised Journalism. A cynic and nihilist, he has always ably mirrored the prevalent mood of his milieu—the patriots' gloom at the sight of Russia's agony under the rule of Bolshevik barbarians (*A Prayer for Russia*), the acceptance of revolution by the National Bolsheviks (*Meditations*, 1921), the repulsion to both capitalism and regimented Communism felt by many intellectuals (*Julio Jurenito*, 1922), the complex emotions created by industrialisation (*The Second Day*, 1933), the hatred of Germans (*The War*, 1943), the post-war anti-W. party line (*The Storm*, 1948), the post-Stalin 'thaw' (*The Thaw*, 1954-6), etc.

Ehrlich, Paul (1853-1915), Ger. chemist, b. Strehlen, Silesia. His first notable discovery was of 'tri-acid stain.' At the Koch Institute, Berlin, his standardisation of antitoxins won for him the appointment in 1906 as head of the Institute for Experimental Therapeutics, Frankfurt-on-Main. His chief discovery was of Salvarsan as a remedy for various diseases, including syphilis, made in conjunction with the Jap. doctor S. Hata. He shared the Nobel Prize for medicine with Metchnikoff in 1908. See M. Marquardt, *Paul Ehrlich* (Eng. trans.), 1949.

Elbar, Sp. tn in the prov. of Guipúzcoa, famous for its damascened 'Elbar work.' Pop. 14,150.

Elbenstock, Ger. tn in the dist. of Karl-Marx-Stadt, 27 m. SW. by S. of Karl-Marx-Stadt (q.v.). It is in the Erzgebirge (q.v.), near the Czechoslovak border, in a tungsten and uranium mining area. It is known for its embroidery. Pop. 9000.

Eichendorff, Joseph, Freiherr von (1788-1857), Ger. poet, b. Lubowitz, one of the most famous of the Ger. Romantics. His chief romance is *Aus dem Leben eines Taugenichts*, 1826, and his chief dramas are *Ezzelin von Romano*, 1828, and *Der letzte Held von Marienburg*, 1830. He is best known, however, as a lyric poet. His language is simple and musical; his poems convey a profound sincerity, and seem the spontaneous expression of a serene mind. E. achieves a rare harmony between language and thought. Some of his poems have been set to music by Schumann, Mendelssohn, and Wolf. Among his best poems are those expressing his longing for nature: *Durch Feld und Buchenhallen*; *In einem kühlen Grunde, da geht ein Mühlenrad*; *Wenn Gott will rechte Kunst erweisen*. See J. Nadler, *Eichendorff's Lyrik*, 1908; H. Brandenburg, *Joseph von Eichendorff*, 1922; W. Köhler, *Eichendorff*, 1937.

Eichhorn, Hermann von (1848-1918), Ger. soldier, b. Breslau. Won the Iron Cross in the Franco-Ger. war of 1871. In the First World War he served throughout on the Russian front. He came into prominence as one of Hindenburg's chief lieutenants in the E. Prussian campaign, in which he took a notable part in the

2nd battle of the Masurian Lakes (Feb. 1915). As commander of the Tenth Army he directed the operations against the Niemen, and was in command of the forces which captured the important stronghold of Kovno in Aug. 1915, whereby the Russians were compelled to abandon Brest-Litovsk and the whole of Poland. In 1918 he was made field-marshal and Ger. commandant in the Ukraine. Bombed in the streets of Kiev by social revolutionists, he d. of his injuries.

Eichhorn, Johann Gottfried (1752-1827), Ger. scholar, b. Dörrenzimmern. In 1788 he was made prof. at Göttingen, where he lectured both on oriental languages and on political economy. He was one of the first to subject the Gospels to the ordinary methods of literary criticism, and is important as one of the first rationalist critics of the Bible.

Eichstätt, or Eichstadt (formerly **Eistet**), Ger. tn in the *Land of Bavaria* (q.v.), in the deep, rocky valley of the Altmühl (q.v.), 54 m. NNW. of Munich. Its bishopric was founded by St Boniface (q.v.) in the 8th cent., from which century dates its shrine of St Walpurga (q.v.), sister of St Willibald (q.v.). The beautiful cathedral is partly 11th cent.; and there are sev. fine baroque buildings, and a massive Renaissance fortress (now a museum). Pop. 12,000.

Eider, riv. of Germany in Schleswig-Holstein (q.v.), which forms the boundary between Schleswig and Holstein. It rises SW. of Kiel, and flows N. and then generally W., on a very winding course, to the North Sea at Tönning. It is navigable as far as Rendsburg, and from here is connected with the Baltic by the Kiel canal. Length 117 m.

Eider-Duck, popular name of a species of *Somateria* of the duck family Anatidae. They inhabit N. regions and are to be found on the coasts of the Atlantic and Pacific. The commonest species, *S. mollissima*, is occasionally found in Britain in the breeding season. The bill and feet are olive green, and the down is much valued in commerce for stuffing quilts and cushions. Other well-known species are *S. spectabilis*, the king E., which furnishes most of the down exported from Greenland; *S. stellerti*, known as Steller's E.; *S. fischeri*, the spectacled E. The common E. nests on rocky is. near the shore from the Farne Is. to Spitzbergen and is protected in Norway and Iceland.

Eidograph (Gk *eidos*, from *graphein*, to write). This is a machine which is often used instead of a pantograph, and is employed for copying drawings, maps, and plans on the same scale, or for enlarging or reducing them in any proportion.

Elfel, volcanic plateau in Germany, in the *Land of Rhineland-Palatinate* (q.v.), stretching from the Belgian frontier to the Rhine and Moselle (qq.v.). The heights reach from 1500 to a little more than 2000 ft, and the surface is generally undulating, with ridges and well-wooded valleys. The plateau is composed principally of Devonian rocks and limestone, with numerous fossils.

Eiffel, Alexandre Gustave (1832-1923), Fr. engineer, b. 15 Dec., at Dijon. Studied at the Ecole Centrale for 3 years. His first work was the construction of the iron bridge over the Garonne at Bordeaux, where he worked his 'caissons' with compressed air. The bridge over the Douro at Oporto, the viaduct of Garabit, as well as other metal bridges, are also his work; and it was he who designed the immense locks for the Panama Canal. His best-known work is the E. Tower, on the completion of which in 1889 he was made an officer of the Legion of Honour. In 1907 he pub. *Recherches expérimentales sur la résistance de l'air, exécutées à la Tour Eiffel*. Later he made experiments in aeronautics, on which he pub. 2 books and also a report in 1919, and, in 1920, *L'Idée aérienne*.

Eiffel Tower, iron structure which stands in the Champ de Mars, Paris, on the S. bank of the Seine. It was designed

E.N.A.

THE EIFFEL TOWER, FROM THE SEINE

for the Paris Exhibition of 1889 by Gustave Eiffel (q.v.) and was erected 1887-9. It consists of 3 stories or platforms, the platform of the summit being 985 ft above the ground. Almost 7500 tons of iron were used in its construction. The ascent to the top is made by powerful electric lifts. The tower is an important wireless telegraphy, broadcasting, and television station, and meteorological centre.

Eiger (Ogre), mt of Switzerland, in the Bernese Oberland; height 13,042 ft. First ascent 1858. Its immense N. face, which towers above Grindelwald, was one of the last great unsolved climbing problems in the Alps, until it was scaled by an Austro-Ger. party in 1938.

Eigg, or Ege, Island, is. belonging to the Hebrides, W. Scotland, situated 5 m. SW. of Skye. It has an area of 12 sq. m. The S. extremity, called the Scaur of Eigg, is a remarkable basaltic cliff, reaching 1546 ft in height. In one of the caves 200 of the Macdonalds were suffocated by the Macleods. Pop. (with Rùm) 215 (1951).

Eight, Piece of, popular name given to an old Sp. silver coin. It was divided into 8 silver reals, hence the term P. of E. Other names for it were *plastre* or *dollar*. Its value was about 4s. See METROLOGY.

Eight Hour Law, Act passed by Congress in 1868 limiting the hrs of daily service of labourers and mechanics employed upon work done for the U.S.A. or for any Ter. or for the Dist. of Columbia to 8 hrs.

Eight Points, see ATLANTIC CHARTER.

Eighth Army, formed in Nov. 1941, of the Brit. forces in the W. Desert, thus carrying a stage further the reorganisation under which the Middle East forces were divided into a W. Army (Egypt and the W. Desert) and an E. Army (Palestine and Syria); the creation of the E. A. separated the Brit. forces in the W. Desert from those in Egypt and was in fact a new incarnation of the Army of the Nile or Desert Army which, under the command of Matland Wilson and the supreme direction of Wavell, won the first great victory over the Italians in the W. Desert. Under Sir Alan Cunningham the E. A. launched its own first offensive against the Axis forces on the Egyptian frontier on 18 Nov. 1941. But if the Brit. victory was indecisive the battle ended in Jan. 1942 with Tobruk relieved, the Axis frontier garrison destroyed, and Rommel's (q.v.) mobile Afrika Korps hurried back to the Gazala line. But Rommel's attack in the following May brought a reversal of fortune. His superior armour won a decisive victory over Ritchie, who had taken command in the middle of the previous battle, and Tobruk was lost and Rommel's Axis Army advanced to Alamein and threatened Egypt. But Auchinleck, assuming personal command of the weakened remnants of the E. A., brilliantly averted disaster. The way to Alexandria was barred still more securely at the end of Aug. when Rommel launched a great offensive against the Alamein line; for under its new commander, Montgomery, and commander-in-chief, Alexander, the E. A. hurled the Axis back in the now classic battle of El Alamein. In the first week of Oct. the E. A. launched its most famous offensive, driving the Afrika Korps right across Libya, Cyrenaica, and Tripolitania. It broke the Mareth Line and entered Tunisia to co-operate with Anderson's First Army and the Amer. forces already there in shattering Axis resistance and completely destroying the last armies of the enemy in Africa.

For the Brit. Empire El Alamein was the turning-point of the Second World War. The battle proved not only the first great engagement lost by Germany, but the means to a succession of Allied victories across Africa and S. Europe. In the E. A. were men from almost every part of the Brit. Empire and they were welded together by superb training into a supremely efficient and confident military formation. Together with the Americans and the Brit. First Army they were the first Allied troops to assault the fortress of Europe. Among the divs. of the E. A. that invaded Sicily there were only 2 from the old Desert Army, and Canadian regiments had now joined it. But the spirit and tradition which had brought the E. A., after bitter disappointments, on its triumphal advance of 2000 m. under Montgomery were the same, and the Crusaders' Cross still remained their proud badge. In Sept. 1943 the E. A. landed on the It. mainland and by Christmas they were N. of the Rome line. Its constitution had now become not merely imperial but international. The original design of this campaign was that the E. A. should draw Ger. divs. down to the S. while the Amer. Fifth Army landed at Salerno. Later the task was to hold as many of Kesselring's Ger. divs. as possible in Italy in order that the Allied armies on the W. Front should have fewer to overcome. Combined movements of the E. A. and the Fifth brought about the fall of Rome 2 days before the Allied invasion of Normandy in June 1944. The E. A., under the immediate command of Lt.-Gen. Leese and Field-Marshal Alexander's supreme command, moved from the Adriatic to the Cassino front unsuspected, then drew most of the Ger. troops eastward and so enabled the Fifth to break through the Gothic Line. In the spring of 1945 the E. A. opened the offensive with a magnificent start in which, besides Brit., New Zealand, and Indian troops, Polish and It. units shared. The swift success of this advance brought the E. A. to Trieste and into Austria and so to the close of its famous career. In the course of nearly 4 years its constitution repeatedly changed. The Australians who had served early in its hist. returned to their own land to meet the Jap. menace. Some of the Brit. and Indian troops also went E. From Italy divs., including the famous 'Desert Rats'—the 7th Armoured Corps with a desert rat for its emblem—were withdrawn to take part in the invasion of France in the Twenty-First Army Group. Later its Canadian corps was also sent to France. See: H.M. Stationery Office, *The Destruction of an Army, 1942, The Battle of Egypt, 1943, and The Mediterranean and the Middle East*, Volume II, 1956; R. J. Crawford, *I was an Eighth Army Soldier*, 1944; Viscount Montgomery, *El Alamein to the River Sangro*, 1948. The E. A. H.Q. was disbanded in July 1945. See also AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN; ITALIAN FRONT IN THE SECOND WORLD WAR.

'Eighth (8th) Army News,' see ARMY NEWS SERVICES.

Eighth United States Army, activated on 10 June 1944 at Memphis, Tennessee, with staff drawn almost entirely from the Second Army. Lt-Gen. Robert L. Eichelberger assumed command on 7 Sept. 1944. In the first 7 months of 1945 the E.U.S.A. cleared the Southern Philippines and set up bases on Leyte which equipped and supplied major units for Luzon and Okinawa. E.U.S.A. occupation of Japan, begun on 30 Aug. 1945, was extended to responsibility for all ground forces in Japan on 1 Jan. 1946. At peak strength this force consisted of 5 corps, 11 divs., 3 regimental combat teams, and hundreds of smaller units—a total of 250,000 men. Lt-Gen. Walton H. Walker succeeded Gen. Eichelberger on 3 Sept. 1948. The Brit. Commonwealth Occupation Force, which arrived in Japan in Mar. 1946, comprised the equivalent of another corps, and was under the operational control of the E.U.S.A. At the beginning of the Korean War, on 28 June 1950, no U.S. combat units were in Korea; the 4 divs. of the E.U.S.A. then in Japan were untried troops, but they were committed and joined battle at Osan. Gen. Walker's E.U.S.A. was reinforced by additional U.S. divs. The Rep. of Korea originally had 8 divs.; many S. Koreans, however, were integrated (100 to each company unit) with E.U.S.A. forces. Forced back to the Pusan perimeter, the U.N. forces eventually surged all the way to the Yalu R.

The U.N. Army, truly an international force, in Nov. 1950 consisted of troops of the Korean Rep., U.S., U.K., Australia, the Philippines, Turkey, Thailand. Later, troops from Canada, France, Greece, the Netherlands, Colombia, Belgium, Ethiopia, the Union of South Africa, and Luxembourg were added. Gen. Walker was killed on 23 Dec. 1950, and Lt-Gen. Matthew B. Ridgway (q.v.) succeeded to command of the E.U.S.A. The Chinese Communists entered the war in force on 26 Nov. 1950, and U.N. troops were forced back across the 38th parallel. A renewed E.U.S.A. offensive in mid-Feb. recaptured Seoul by Mar. 1951. Gen. MacArthur was replaced by Gen. Ridgway. Lt-Gen. James A. Van Fleet took over the field forces; and Gen. Mark W. Clark was named commander of U.N. forces in Korea. The battle now resolved into bitter see-saw fighting that eventually resulted in a stalemate. The agreement on truce terms was signed on 8 Aug. 1953. The U.S. Defense Dept summary of army dead was 18,924; of wounded, 69,941; total battle casualties for all U.S. services were 126,726. On 18 Aug. 1954 the U.S. announced that it would withdraw 4 of its Eighth Army divs. from Korea, leaving 2. See *The Army Almanac*, 1950; Charles E. Dornbusch, *Unit Histories of World War II and Korea*; Kyung Cho Chung, *Korea Tomorrow*, 1956; *Korea 1950*, U.S. Gov. Office of Military History, 1952.

Eik, in Scots Law, is an additional confirmation (q.v.) in respect of estate omitted from that originally confirmed.

Elkon Basilike (*The Pourtraiture of His Sacred Majesty in his Solitudes and Sufferings*). This work was pub. immediately after the death of Charles I, and being written in the first person was ascribed to Charles himself. Gauden, later bishop of Worcester, claimed that he started the work about 1647, and submitted it to Charles, but those in favour of Charles's authorship say that he wrote the first 6 chapters before 1645, i.e. before the battle of Naseby.

Eildon Hills are 3 high hills situated near Melrose, Roxburgh, Scotland. The central peak rises to an elevation of 1385 ft. and commands a most magnificent view of the surrounding country. The remains of a Rom. camp are to be seen on one of the hills, and sev. legends are told concerning the hills. The poet Thomas the Rhymer is associated with them, and Scott remarked that, standing on the Eildons, he could point out 43 places famous in war and verse.

Eilenburg, Ger. tn in the dist. of Leipzig, near the Mulde, 13 m. N.E. of Leipzig (q.v.). It was very badly damaged in the Second World War. There is a ruined castle, and there are plastic and metal industries. Pop. 20,000.

Ellithya, or **Ilithya**, personification of the pains of childbirth, worshipped as the goddess of labour. But since moon-goddesses had influence over birth, she was identified at times with Artemis, Hera, and Aphrodite. Cretan legend said E. was *b.* at Knossos, whence her cult spread to Delos and Attica. Another version says she came to Delos to assist Leto. She is at times linked with the Fates, who also control childbirth.

Eimeo, see MOOREA.

Einarsson, Indridi (1851–1939), popular Icelandic dramatist, who invariably used Icelandic folklore or hist. for his themes. Some of his plays have been trans. into foreign languages, 2 of them into Eng. His autobiography, *Síð og líf* ('Seen and Experienced'), 1936, gives a vivid picture of life in Icelandic literary circles from 1870 to 1920.

Einarsson, Stefán (1897–), Icelandic scholar, prof. of A.-S. in the Johns Hopkins Univ. (q.v.), author of sev. important works in Eng., Icelandic, and German, on Icelandic language and literature, including a grammar for advanced students, and a *History of Icelandic Prose Writers 1800–1940*.

Einbeck, Ger. tn in the Land of Lower Saxony (q.v.), 40 m. S. of Hanover (q.v.). It grew up around the 11th-cent. monastery of St Alexander, and was later a member of the Hanseatic League (q.v.), and the seat of the princes of Grubenhagen. It was already known in the 14th cent. for its beer. Some of the old walls and watch towers remain, and there are fine anct churches and houses. Carpets and weaving machinery are manufactured. Pop. 18,000.

Eindhoven, industrial tn in the prov. of N. Brabant, Netherlands, on the R. Dommel, 19 m. ESE. of Tilburg. It is the site of the famous Philips works, manufacturers of incandescent lamps,

radio apparatus, television sets, etc., founded in 1891 and since expanded to a group of large factories. The pop. of E. has increased from 6000 in 1910 to 151,740 in 1954. Other manufs. are textiles, trailers, and cigars.

Einhard, Einhart, or Eginhard (c. 770-840), Frankish historian, the biographer of Charlemagne (q.v.), b. in E. Franconia. Owing to his extraordinary ability he came under the notice of Charlemagne at an early age. His artistic skill gained for him the name of 'Bezaleel,' and the basilica of Aachen, as well as other buildings, have been attributed to him. He became a confidant of the emperor, and on Charlemagne's death Louis, his son and successor, appointed E. tutor to his own son Lothair. His best work is *Vita Caroli Magni* (Eng. trans. A. G. Grant, 1905; H. W. Garrod, 1915), which is a splendid biography of Charlemagne and is perhaps the finest historical biography of the early Middle Ages. His authorship of *Annales Regum Francorum* is not certain.

Einsiedeln, tn in the canton of Schwyz, Switzerland, 25 m. S.E. of Zürich. It is the most famous pilgrim-resort in Switzerland, with a Benedictine abbey, founded about 934 on the site of the cell of St Meinrad, who was murdered in 861. It was dowered with land by 2 emperors, and became an independent principality of the Holy Rom. Empire. The church (1719-26) is 446 ft long, and is one of the most noble works of the baroque period. The abbey library comprises 100,000 vols., and 1300 MSS., some of the 8th to the 12th cents. The celebrated chemist Paracelsus was b. here in 1493. The reformer Zwingli (q.v.) was par. priest of E. 1516-18. Pop. 9000, Ger.-speaking Rom. Catholics.

Einstein, Albert (1879-1955), proponent of the theory of Relativity (q.v.), b. Ulm, Württemberg, son of Hermann E., a Jew, described as owner of electro-technical works. The family removed to Munich during the childhood of Albert, who was slow in learning to speak, shy, and unsocial, with a taste for music. His early education was Jewish at home, Catholic at school. When older he attended the Luitpold Gymnasium at Munich. In 1894 the family removed to Milan, and Albert began wandering tours in N. Italy. He wandered into Switzerland, and at Aargau studied mathematics and physics at the canton school. With a view to schoolmastering, he began studying at Zürich Technical School at the age of 17, and remained there 4 years. He afterwards acted as tutor at Schaffhausen and Bern. In 1901 he was naturalised a Swiss citizen; and he was engaged as a technical expert in the Patent Office at Bern, 1902-5. In 1903 he married a S. Slavonic student from whom he was afterwards divorced. In 1905 he pub. in the *Annalen der Physik*, papers on the production and transformation of light, the Brownian movement, molecular dimensions, and the electro-dynamics of moving bodies. The last-named brought him under the notice of Max Planck (q.v.). In

1909 he became prof. extraordinary at Zürich of Theoretical Physics; in 1911 prof. ordinary at Prague. In the autumn of 1912 he returned to Zürich as prof. at the Polytechnic. Early in 1914 he was appointed director of the Kaiser Wilhelm Physical Institute at Berlin, in which city he resided until 1933, when, owing to his Jewish origin, he was deprived of his appointment and took refuge in England. Later he went to America and became a prof. at Princetown, New Jersey. His second marriage was with a cousin of the same surname. By 1916 he had pub. *Die Grundlage der allgemeinen Relativitätstheorie*; followed by *Über die spezielle und*

Topical Press

ALBERT EINSTEIN

die allgemeine Relativitätstheorie, 1921. E. gave a new direction to thought on the propagation of light and allied subjects by pointing out that time and space are not absolute, but merely relative to the observer. He gradually overcame the great mathematical difficulties, and his work has affected that of all subsequent mathematicians and physicists. His theory was not verifiable experimentally until he applied it to gravitation, when he predicted that the deflection of a ray of light by the sun should be twice what the Newtonian theory would indicate. Observations made during the total eclipse of 1919 confirmed the E. theory. In Jan. 1921 he was lionised by philosophers and astronomers in U.S.A. and England. His predicted equivalence of mass (m) and energy (E) according to the relation $E = mc^2$, where c is the velocity of light, has been abundantly verified and is strikingly demonstrated in the production of nuclear power (q.v.) and the explosion of atom bombs (q.v.). His doctrine has invaded philosophical as well as scientific fields of thought. Newton's dynamics still suffice to a high degree of accuracy for

most practical purposes, but for ultimate physical concepts Newton's theory is superseded by E.'s. He has written books on other subjects, among them *About Zinism*, 1930; *Why War?* (with S. Freud), 1933; *My Philosophy*, 1934; *The Evolution of Physics* (with L. Infeld), 1938; *Out of my Later Years*, 1950; *The Meaning of Relativity*, 1950. See P. Frank, *Einstein, His Life and Times*, 1948.

Eindhoven, Willem (1860-1927), Dutch physiologist, b. Samarang, Java, and educ. at Utrecht Univ., where he qualified in medicine in 1885. In the same year he was appointed prof. of physiology at Leyden and held this chair until his death. He directed much of his research to the development and perfection of recording instruments, his most valuable work being in the improvement of the strong galvanometer (1901) which he adapted to portray the electrical changes occurring in the heart (1903). Through his work, modern electrocardiography became a reality. He also introduced phonocardiography (mechanical recording of heart sounds) in 1907. E. was awarded the Nobel Prize in 1924.

Eire, see IRELAND, REPUBLIC OF; and see ERIN.

Eisenach, Ger. tn in the dist. of Erfurt, at the W. end of the Thüringerwald (q.v.), 30 m. W. of Erfurt. It dates back to about 1065, and was founded by the Landgrave of Thuringia; later it passed into the hands of a Saxon family, and eventually, in 1741, it became the property of the duchy of Saxe-Weimar (see SAXE-WEIMAR-E.). There are sev. medieval churches, a 16th-17th-cent. tn hall, and an 18th-cent. ducal palace, now a museum. A statue of Martin Luther (q.v.) commemorates his sojourn in the tn, where he attended the Lat. school, 1498-1501. E. is popular as a spa and holiday resort, and has manufs. of machinery, motor vehicles, and chemicals. Johann Sebastian Bach (q.v.) was a native. Pop. 53,000.

Eisenberg, Ger. tn in the dist. of Gera, 12 m. NW. of Gera (q.v.). It was the cap. of the duchy of Saxe-E. 1680-1707, and went to Saxe-Altenburg (q.v.) in 1826. There is a 15th-cent. church, and a 17th-cent. palace (now the tn hall). Textiles, foodstuffs, and china are manufactured. Pop. 15,000.

Eisenerz, Austrian tn in the prov. of Styria. It is a mining tn at the foot of the Erzberg (5030 ft), which has the largest open-cast iron-ore deposit in Europe. There is an anct. Hussite church. Pop. 9700.

Eisenhower, Dwight David (1890-), Amer. soldier, 33rd president of the U.S., son of David J. E. of Swiss forbears who came to America before the Amer. Revolution, b. Denison, Texas, and spent his boyhood at Abilene, Kansas. Graduated from West Point in 1915.

In the First World War he was chiefly engaged in training troops of the tank corps at home, and his promotion up to a point was not rapid, his rank at the opening of the Second World War being still lieutenant-colonel; but by 1942 he

was one of America's 17 lieutenant-generals and thereafter was advanced more rapidly than any other Amer. officer, his outstanding qualities being quickly discovered by Gen. Marshall (q.v.). In Feb. 1942 he became chief of the plans div., War Department, General Staff. In Feb. 1943 he was appointed temporary general. In the following June he was appointed commanding general European Theatre of Operations and from that post proceeded to N. Africa. After the expulsion of the Axis forces from Tunisia and

U.S. Information Service,
American Embassy

DWIGHT D. EISENHOWER

Sicily he was appointed supreme commander of the allied forces and worked on the plans for the launching of the 'Second Front'; the success of the landings and ensuing battle of Normandy owed much to his organising abilities. For more than a quarter of a century E. had been an inspired student of mechanised warfare and in large-scale manoeuvres in America he showed remarkable originality in his direction of this type of combat. In 1922 he was assigned to the Amer. Battle Monuments Commission and went to France to compile a guide-book of the Amer. battlefields there—a useful study in view of his destined appointment in 1944. Later at the Fort Leavenworth Command and General Staff School E. finished first. He was a moving force in the estab. of the Army Industrial College while he worked in Washington on plans for war mobilisation. In 1935 he went to the Philippines as assistant military adviser to the commonwealth under Gen.

MacArthur and for the ensuing 5 years played a major role in devising the defences of the ls. In the *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force 6 June 1944 to 8 May 1945* (H.M.S.O., 1946) is told the story of the planning, courage, work, and final results of the operations in Europe. Through the whole report is to be detected Gen. E.'s impression of complete allied unity, though towards the Brit. Chiefs of Staff in London he often felt impatience, chiefly because they 'regularly queried their commanders in the field concerning tactical plans' (*Crusade in Europe*).

He indicates that 3 episodes were the most decisive in ensuring victory--the battles at the Normandy beaches, the Falaise pocket, and those W. of the Rhine in Feb. and Mar. 1945. 'Victory was won,' he states, 'before the Rhine was crossed.' King George VI conferred on E. the O.M. at Buckingham Palace on 12 June 1945. He retired from the U.S. Army in 1948 after 33 years' service, and in the same year became president of Columbia Univ., New York.

In 1950 he became supreme commander of Allied Powers in Europe, and organised the defence forces in the North Atlantic Treaty Organisation. Nominated by the Republican party in 1952, he was elected U.S. president, and assumed office in Jan. 1953. Major problems of Eisenhower's administration included the Korean War and the question of disarmament and control of nuclear weapons. Proposals made by the president led to the first International Conference on the Peaceful Uses of Atomic Energy, held under the auspices of the U.N.O. at Geneva in 1955. A serious heart attack in Sept. 1955 caused world-wide concern, but he made a good recovery. In June 1956 he underwent an emergency operation for ileitis. Medical opinion being that his health would suffer no permanent impairment, E. accepted the Republican nomination in 1956 and was re-elected in Nov. for a second term as president of the U.S.A. His position in Amer. politics has been classed as unique by many observers: he has become to vast numbers of his countrymen a national symbol, his party allegiance being of little or no significance. This is borne out by the election of Nov. 1956 when, though E. was overwhelmingly re-elected as president, his party failed to gain control of congress. E.'s presidency has been marked by general prosperity at home, and until the eve of his re-election by an apparent easing of tension abroad. His critics both in the U.S.A. and more especially in W. Europe have however suggested from time to time that the president has been too content to be carried along by events, rather than to attempt to shape events by his own positive action, in the Roosevelt tradition. See his *Crusade in Europe*, 1949; and K. S. Davis, *Soldier of Democracy*, 1945; H. C. Butcher, *My Three Years with Eisenhower*, 1946.

Eisenstadt (Hungarian **Kishmárton**), Austrian tn, cap. of the prov. of Burgen-

land, on the Nensiedler-See (q.v.). It is in the centre of vineyards, and has a great castle of the Esterházy (q.v.) family, and a house in which Haydn (q.v.) lived. Pop. 7000.

Eisenstein, Sergei (1898-1948). Russian film director, *b. Riga*. Set the task, after the Russian Revolution, of founding a school of cinema, he rivalled in a short time the Americans, Germans, and Fr. His best work, which made him one of the world's greatest masters and innovators of film technique, was achieved with the silent films: *The Strike*, 1924, *Battleship Potemkin*, 1925, and *October: Ten Days that shook the World*, 1927. Later films were *Alexander Nevsky*, 1938, and *Ivan the Terrible*, 1943.

Eisleben, Ger. tn in the dist. of Halle, at the E. ft of the Lower Harz Mts, 19 m. W. of Halle (q.v.). From the 12th to the 18th cents. it was the cap. of the co. of Mansfeld. In 1780 it went to Saxony, and in 1815 to Prussia. E. was the bp. of Martin Luther (q.v.); the house in which he was *b.* (now a museum) and that in which he *d.* are both in the old part of the tn. There are sev. Gothic churches of note. Copper, silver, and slate are mined in the area, and there are manufs. of textiles and foodstuffs. Pop. 30,000.

Eisner, Kurt (1868-1919). Ger. Journalist and statesman of Jewish descent, *b. Berlin*, his real name being Salomon Kosnowsky. He became associate editor of the Socialist newspaper *Vorwärts*. He organised a bloodless democratic revolution in Bavaria in 1918, becoming Premier and subsequently 1st president of Bavaria, but was murdered by Spartacist soldiers early in 1919.

Eisteddfod, Welsh term used originally for any kind of session, later restricted to a session of the bards (q.v.) held to discuss matters pertaining to their craft and to codify the regulations of their guild. These early *eisteddfodau* were not necessarily competitive, like the modern E., although bardic contests figure as early as the 6th cent. in the story of King Maelgwn Gwynedd. The first competitive E. of which we have trustworthy record is the great festival held by the Lord Rhys at Christmastide, 1176, in his new castle of Cardigan. That festival is not called an E. in the contemporary chronicles but its eisteddfodic features are unmistakable: it was proclaimed a year in advance not only in Wales but also in England, Ireland, and Scotland; there were 2 chief contests; the one was poetic, to test the skill of the bards in the traditional Welsh metres; the other was musical, open to the minstrels and pipers of any nation. The prize in each case was a chair. These prizes were supplemented by bounteous gifts from the Lord Rhys. In 1430 a similar festival, but now under the estab. title E., was held at Carmarthen under the patronage of the Lord Gruffudd ap Nicholas. A notable feature of the Carmarthen E. is that for its sessions Dafydd ab Edmwnd, the most learned bard of N. Wales, codified the rules which the bards of Wales must follow when writing in the traditionally strict

metres of the *Awdl*, or formal alliterative ode. The prin. or Chair Poem at the National E. of Wales to this day must be written to these same metrical rules maintained by an unbroken tradition of over 5 centuries. The rules were revised by the Chief Bard Tudur Aled at an E. held in Caerwys in 1523. A still more important E. was held at Caerwys in 1568 by command of Queen Elizabeth I. Here again there were contests—the best poet receiving a silver chair, the best singer a silver tongue, the best harper a silver harp, and the best crowder a silver *crwth*; but in addition to these contests this 2nd Caerwys E. was held by royal commission for the purpose of examining all claimants to bardic privileges and licensing all genuine poets and musicians, so that henceforth only those who carried the certificates of successful candidates were allowed to travel about the country from mansion to mansion seeking reward for their songs of praise. The National E. of Wales is still held under royal patronage, Queen Elizabeth II being herself a member of the Gorsedd (q.v.) of the Bards of Wales; and the Gorsedd, or Society of Bards, still holds examinations in Welsh poetry and music and presents certificates to successful E. candidates every year. Despite the royal patronage of 1568, during the next 2 centuries the E. deteriorated to nothing more than feeble impromptu contests between a few rural bards met together at a tavern for a carousal, the meeting-place and date being advertised in the popular 'almanacks.'

The modern conception of an E., as a gathering where the public generally are welcome as well as the bards, owes its origin to the famous Corwen E. of 1789. This, like the subsequent series of successful *eisteddfodau* at the close of the 18th cent. and the beginning of the 19th, was held under the patronage of that patriotic society of London Welshmen the 'Gwyneddigion.' The Gwyneddigion *eisteddfodau* reverted to the ant. custom of proclaiming the festival and its subjects a year and a day in advance, thus giving candidates time to prepare worthier odes and essays than could be expected from mere impromptu efforts. This new conception of an E. rapidly spread throughout Wales during the first half of the 19th cent., giving rise to a crop of prov. festivals fostered by prov. or co. societies and patronised by the local gentry and clergy. To these influences must be added the local patriotism of the rapidly growing industrial towns of S. Wales with the fervent hymn-singing congregations of their nonconformist chapels and their valley choirs. These new forces eventually overflowed into the *eisteddfodau* by the inclusion of choral competitions for the first time, in addition to the traditional contests in bardism and minstrelsy. In spite of the now enhanced popularity of the E. as an entertaining competitive folk-festival of the Welsh people, until about 1870 *eisteddfodau* remained sporadic, local, or prov. events. Wales still holds a few prov. and scores of small-

scale local *eisteddfodau*, but the National E. of Wales, held alternately in N. and S. Wales for Aug. Bank Holiday week in every year, is regarded as the supreme festival of the Welsh people. It was estab. in 1880 as a national institution by the joint efforts of the National E. Association and the Gorsedd of Bards. In 1937 both these societies merged to form the present governing body known as *Llys yr Eisteddfod Genedlaethol* (The Court of the National E. of Wales). The holding of the National E. for a full week has now become so colossal an undertaking, with ramifications in literature, music, drama, art, publicity, transport, finance, hospitality, and catering for a daily attendance of about 15,000, that the local organisation now depends very largely on the experience of the Court both for guidance and for substantial financial backing to supplement individual subscriptions received annually from all parts of Wales.

The festival is held entirely in the Welsh language and is regarded as the Mecca of Welsh culture, to which Welshmen love to flock from all parts of the globe. It is maintained as a purely voluntary effort and receives no gov. grant towards its concerts, plays, art exhibitions, or pubs. Other Celtic competitive festivals estab. on the E. model are the Oireachtas of the Rep. of Ireland and the Mod (q.v.) of Scotland.

In recent years the word *eisteddfod* has been misapplied to designate a colourful and competitive international festival of folk-dancing and music held at Llangollen, but it will be seen from the list, of the term that a festival devoid of bardic and literary content and conducted in Eng. cannot be an E.

Eklogite, see ECLOGITE.

Ekron, city of the Philistines on the borders of Judah and Dan, where Beelzebub was worshipped. It was the place from which the Ark of the Covenant, which had been captured by the Ascalonites, was returned to Israel. At a later period it became part of the ter. ruled by the Maccabees. E. was one of the 5 allied cities or Pentapolis (the others being Gaza, Ascalon, Ashdod, and Gath) of the 'Philistines' or Philistines (1 Sam. v. vii, xvii; 2 Kings i and Zeph. ii, and Zech. xvi). Its present inhab. number about 475 and in its neighbourhood is a Jewish agric. settlement founded by Baron Rothschild in 1884.

Elaeagnus, family Elaeagnaceae, genus of shrubs and trees, of which *E. angustifolia*, the Oleaster of S. Europe and W. Asia, *E. argentea*, S. U.S.A., are deciduous while *E. pungens* of Japan is evergreen. All are cultivated in gardens in Britain.

Elaeocarpus, genus of Elaeocarpaceae. *E. serratus* bears an olive-like fruit used

by the natives of India as an ingredient of their curries; *E. peticulatus* has white flowers and is one of the most ornamental of Australian plants.

Elaeococca, genus of Euphorbiaceae. The seeds yield valuable oil. *E. verrucosa* of Japan produces seeds supplying oil for burning, and *E. vernicia* of China furnishes oil used for painting.

Elaeodendron, family Celastraceae, genus of 40 species of tropical shrubs and trees. *E. capense*, the Cape Phillyrea of South Africa, *E. glaucum* of India, *E. orientale* of Madagascar, and *E. sphaerophyllum* of South Africa may be grown in heated greenhouses in Britain for their ornamental, laurel-like foliage.

Elaeolite, crystalline plutonic rock of the syenite family composed largely of nepheline and alkali feldspar. It does not contain quartz, but is rich in many other minerals which contain alkalis.

Elaelabalus, or **Heliogabalus** (c. AD 203-222), Rom. emperor, b. at Emesa. His original name was Varius Avitus Basianus, but he received the name E. or H. from the Syro-Phoenician sun-god whose priest he became while still a child. Thanks to the intrigues of his grandmother, Julia Maesa, he was proclaimed emperor in 218 and estab. in that position by the assassination of Macrinus. E. appears to have been well-nigh raving mad; his brief reign was marked by the most abominable excesses, and he was eventually murdered by the praetorian guards.

El Alamein, see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IX.

Elam, auct name for prov. of Persia situated along the lower course of the R. Tigris. Susiana (from the name of Susa, its prin. city) was the name given in classical hist. to the S. portion of this area, which now falls mainly in the Persian prov. of Khuzistan. This portion was called by the Greeks Elymais (q.v.).

Elan, riv. of Wales, flowing through Cardiganshire and Radnorshire to join the Wye S. of Rhayader. Dams have been erected on this riv. to form reservoirs for the city of Birmingham; on the R. (Iwerwen, a trib. of the E.), the highest gravity dam in Great Britain (184 ft high, 1166 ft long) has been constructed to create another reservoir.

Eland, popular name of a genus of large and almost exclusively African antelopes, characterised by the general absence of horns in the females and by those of the male being devoid of rings, angulated in front, and usually spirally twisted. Both sexes have a large dewlap, and the crowns of the upper molar teeth are low and broad. The common E. (*Taurotragus oryx*) formerly ranged over the greater part of S., E., and Central Africa, but is now extinct in the S. of the continent. Its complete extirpation is probably only a matter of time, the animal being frequently slaughtered for its hide. The magnificent species known as Lord Derby's Eland (*T. derbianus*) inhabits more wooded country, occurring from Senegambia to the Sudan and Portuguese Guinea.

Elanet, or **Elanus**, genus of Falconidae closely allied to the kites, found in all the continents. *E. caerulus*, the black-winged kite, is common to Africa and Asia, and is occasionally seen in Europe. *E. scriptus* belongs to Australia; *E. dispar*, the black-shouldered hawk, occurs in America. All are birds of prey and some will eat even insects.

Elaps, see CORAL SNAKES.

El Arish is a small tn on a slight eminence about half a m. from the Mediterranean shore, in the Sinai Peninsula, Egypt. It contains Rom. remains including sev. marble columns, and is the site of the anct Rhinocolura. It was taken by the Fr., 1779, in whose possession it remained for some time. At A. Sir Sidney Smith concluded a convention with the Fr. Army, which was afterwards disavowed by the Brit. Gov. Pop. 10,000.

E.L.A.S. (Gk *Ellinikos Laikos Apelevtherotikos Stratos*), a Gk liberation army of the left in the Second World War, originally a section of E.A.M. (q.v.).

Elasmobranchii, or **Selachii**, a class of fishes with an inner cartilaginous skeleton and with the skin generally bearing placoid scales which have a tooth-like structure. The fin-rays (ceratotrichia) are horny. In all living E. the males have paired intromittent organs which are modifications of the pelvic fins. The class consists of the Euselachii and the Holocephali (chimaeras) which are the survivors of a long fossil hist.

The Euselachii are subdivided into the Pleurotremata, the sharks, and the Hypotremata, the rays, and these are again divided into families. The gill clefts of sharks are lateral; the anterior margins of the pectoral fins are free, and the eyes have free margins. The gill clefts of rays are ventral; the anterior margins of the pectoral fins are fused to the head or body, and the upper margins of the eyes are not free. Five pairs of open gill slits are usually present, but some sharks have 6 or 7 pairs. The shape of the body varies considerably. Some forms, like the blue shark, are adapted for cruising in the open sea. Others, like the carpet shark, are adapted for life on or near the ocean bed, and rely on protective coloration and strategy to secure their prey. Others, like some rays, live on the floor of the sea, but are able to move rapidly by undulations of their pectoral fins. These fish dart on their prey, cover it with their bodies, and devour it at leisure. Most of the larger sharks and all rays, except the skate family Rajidae, are viviparous. But the largest shark, the whale-shark, and the dogfishes lay large eggs encased in a horny capsule.

Elasticity is the property of a substance which enables it to tend to recover its initial form and size after it has suffered a deformation and the deforming forces have been removed. Matter is conveniently divided into 3 states, solid, liquid, and gas, although the distinction cannot always be clearly made. A solid has a definite shape and resists any tendency to change its shape, i.e. solids possess rigidity. Liquids and gases take up the

shape of their container, but whereas gases always fill the container, liquids have a definite volume and in consequence can possess a free surface. Liquids and gases do not in general resist an attempt to change their shape but, together with solids, resist any tendency to a change of size.

Bodies with similar properties in all directions are said to be *isotropic*. The properties of *anisotropic* bodies are different in certain directions and present somewhat complicated problems which will not be considered here.

The best known example of E. is the ability of rubber to recover from stretching, bending, twisting, shearing, and compression, properties which are possessed to a certain extent by all solids. Consider first a wire hanging vertically from a rigid support, and arrange a device to observe the variation of its length with the weight attached to its free end. It is found that for small weights the extension is proportional to the weight applied, provided the observations are not extended over a very long period of time. The relation was first recognised by Robert Hooke in 1678 and stated in the form *ut tensio sic vis*, i.e. for such an extension such a force. In more precise terms, *stress* is proportional to *strain*, where strain is defined as the extension per unit length of the wire and stress is the force applied per unit area of cross-section. The ratio of stress to strain is thus a constant for a given material and is known as the modulus (q.v.) of E. For the case of a 'wire' suffering a uniaxial strain, the constant is termed *Young's Modulus* (E), and therefore $mg/A = Y(\delta l/l)$ where mg is the force due to gravity acting on the applied mass m , A is the area of cross-section, and δl is the extension of a length l . When the wire is extended it also exhibits a decrease (δr) in its radius (r), and the ratio of the fractional transverse contraction to the fractional longitudinal extension is a constant for a given material and is called Poisson's ratio, σ . Thus $\sigma = (\delta r/r)/(\delta l/l)$ and has a value between 0.25 and 0.40 for most metals.

For larger extensions than those so far considered, Hooke's Law ceases to apply and when the load is removed the wire fails to return to its original size. It is then said to have been taken beyond its *elastic limit*, and to have acquired a permanent set, i.e. it has suffered a plastic, as distinct from an elastic, deformation. For yet larger extensions the relation between stress and strain becomes more complicated for some metals, owing to a process known as 'hardening,' but eventually all solids reach a breaking stress usually consequent upon a localised constriction or 'necking.' Young's modulus, Poisson's ratio, the elastic limit, and the breaking stress are of importance in engineering (see STRENGTH OF MATERIALS). The bending of a beam, e.g., can be estimated in terms of Young's modulus, the dimensions of the beam, and the load applied to it.

When the stress is applied uniformly in all directions to a body, as e.g. when it is

submerged in a fluid contained in a rigid vessel and pressure is applied to the surface of the liquid, the body suffers a change in volume which is proportional to the applied stress. The strain is now defined as the change in volume per unit volume ($\delta v/v$) and the constant of proportionality is the *Bulk Modulus*, K . It can be shown that there is a relation between the elastic constants E , K , and σ , namely $E = 3K(1 - 2\sigma)$.

When a shearing stress is applied to a body, layers of material move relative to each other, as may be seen, e.g., when a pack of cards is placed flat on a table and its shape distorted (but its volume unchanged) by pressing forwards and slightly downwards on the top card. An elastic body, of course, would return to its original shape after such a shearing deformation, but the pack of cards remains in its distorted shape. The angle of shear, θ , is the angular displacement of a plane initially perpendicular to the direction of the shearing stress, and the ratio of this stress (F/A) to θ is known as the modulus of rigidity (n). It can be shown that $E = 2n(1 + \sigma)$. The values of E and n are relatively easy to obtain from experiments, the former by stretching and the latter from twisting (see below), but K and σ are more difficult to measure directly. It is often easier to calculate K and σ from values of E and n , using the equations quoted. The modulus of rigidity, n , can be found as follows. In order that one end of a wire may be twisted through an angle ϕ with respect to its other end, it is necessary to apply a couple or torque given by $\pi nr^4\phi/2l$ where r is the radius of the wire and l its length. The variation of ϕ with the couple is observed. The value of n may also be found by a torsional oscillation experiment. If a wire is firmly clamped at its upper end and a body of moment of inertia I is fixed to its lower end, the period of torsional oscillations is given by $T = 8\pi I/nr^4$, and provided the elastic limit is not exceeded the value of T is independent of the amplitude of the oscillation.

The E. of gases is of particular interest because the values obtained for the bulk modulus depend on the rate of change of the vol. When the vol. of a gas is changed there is an evolution or absorption of heat. If the change takes place slowly, heat can be exchanged with the container and its surroundings. But for rapid alternating changes of vol. no heat will be exchanged. The classic example of the latter situation occurs in the transmission of sound (q.v.) in a gas. The bulk modulus can be shown to be numerically equal to the pressure, P , of the gas for slow variations of vol., and for rapid variations it equals γP , where γ is the ratio of the specific heats of the gas at constant pressure and at constant vol. The velocity of sound in a gas is then given by $\sqrt{\gamma P/\rho}$ where ρ is the density of the gas.

The E. of materials arises from the forces acting between molecules or atoms. The bulk modulus measures the force

required to make the average distance between the atoms greater or less, and shows that the force between atoms is repulsive for very small separations but for larger distances becomes attractive. The other moduli for solids are a measure of the force required to distort the arrangement of the atoms in the solid.

When rubber and certain synthetic materials are subjected to stresses their behaviour differs from that of most other substances in that, even after considerable deformations have been produced, rubber and rubber-like materials revert to nearly their initial form when the stress is removed. The common feature of all such elastomers is that they are built up of molecules each of which has a long chain of atoms. These molecular chains have relatively few or weak links with neighbouring chains, and in the unstretched material most of the chains are coiled back irregularly upon themselves like the strands of a tangled skein of wool. When a stress is applied the chains are straightened out, and arrange themselves more nearly parallel to one another. Atoms are continuously in vibration, however, and the result of this is that, when the stretching force is removed, the chains tend to revert to their coiled up configuration, and the material spontaneously retracts to its original length. Many naturally occurring fibrous materials such as silk, collagen, and wool also have long chain molecules. They do not, under normal circumstances, exhibit long range E. of the same order as rubber because the links joining neighbouring chains are more numerous and prevent the chains becoming randomly bent, but the stretchiness of wool is probably due to a straightening out of the long chain molecules. See MATERIALS, STRENGTH OF; MODULUS; PHYSICAL CONSTANTS. See A. E. H. Love, *A Treatise on the Mathematical Theory of Elasticity*, 1927; R. Houwink, *Elasticity, Plasticity, and Structure of Matter*, 1937; R. V. Southwell, *An Introduction to the Theory of Elasticity for Engineers and Physicists*, 1942.

Elastin and Elastic Fibre, see TISSUE.

Elatea (modern *Drachmani*), largest tn of Phocis in anc. Greece: situated near the Cephissus and not far from one of the chief passes leading from Thessaly to Boeotia. There was a temple of Aesculapius, and another dedicated to Athena Cranaea which was excavated in 1883. E. was captured by Philip of Macedon in 338 B.C., an event to which Demosthenes refers in a celebrated passage of the *De Corona*.

Elater Beetle, see CLICK BEETLES.

Elaterin, active principle of elaterium. It is a chemical substance, its formula being $C_{12}H_{14}O_8$. It is extracted, by means of boiling alcohol, from the juice of *Ecballium agreste* in the form of colourless hexagonal crystals which are insoluble in water. Elaterium is a vegetable extract obtained from *Ecballium elaterium*, a perennial tropical plant. It is very bitter, and a powerful purgative.

Elaterite, an elastic bitumen. It is blackish-brown in colour, translucent, and

is found in soft, sticky masses in Derbyshire, near Edinburgh, and in Fifeshire. It is sometimes called mineral caoutchouc, and is very much like India-rubber.

Elatia, see CITHAERON.

Elatinaceae, dicotyledonous family of small herbs of wet places, 2 genera, cosmopolitan. *Elatine hexandra*, and *E. hydropiper*, the water-pepper, are small, submerged annuals found in ponds, etc., in Britain.

Elba (Gk *Aithalia*, Rom. *Ilva*), It. is. in the Tyrrhenian Sea, administratively part of the prov. of Leghorn (q.v.). The nearest point on the mainland is Piombino (q.v.), from which it is separated by a channel 6 m. wide (the Strait of Piombino). The is. is mountainous (Mt. Capanne, 3340 ft.), and the coastline is very irregular. Iron-ore has been mined since early times, and marble, lead, sulphur, and alabaster are also exported. Vines, olives, mulberries, and cereals are grown, and there are sardine and tunny fisheries. The is. is famous as the realm which the fallen Napoleon I (q.v.) ruled from 3 May 1814 until 26 Feb. 1815. In the Second World War the is. was taken by Fr. forces on 19 June 1944. The cap. is Portoferraio (q.v.). Area 85 sq. m.; pop. 30,000.

Elbasan, tn of Albania, in the prefecture of the same name, on the r. b. of the R. Shkumbi, with numerous mosques, in a fertile plain. Olives and maize are cultivated. Pop. about 15,000, of whom 85 per cent are Muslims. E. was captured by the Serbs during the Balkan wars but was returned to Albania. In the Second World War in the fighting against the Italians (who had seized Albania before the war) the Greeks advanced on E. in Dec. 1940. The tn was bombed by the R.A.F. in Jan. 1941, but the Ger. advance from the N. in Greece prevented further operations against E.

Elbe (Czech *Labe*; anc. *Albis*), riv. of Czechoslovakia and Germany. In Germany it is next in importance to the Rhine (q.v.); it provides passage for ocean vessels as far as Hamburg (64 m. from the mouth), and it is navigable for smaller boats as far as its junction with the Vltava (525 m.). The E. rises at an altitude of 1600 ft. on the S. slopes of the Riesengebirge (q.v.), and flows at first S. and then N. and NW. At Mělník its vol. is more than doubled by the confluence of the Vltava (q.v.), while at Litoměřice its waters are reddened by the Ohře (q.v.). Soon, after piercing the basaltic Mittelsgebirge, it crosses the Bohemian frontier into Germany near Děčín (q.v.), flows past Dresden and Meissen, and begins, in a NW. direction, its long course over the N. Ger. plain. Passing the tns of Torgau, Wittenburg, Magdeburg, Hamburg, and Altona, and swollen with the waters of the Mulde and Saale (q.v.) from the left, and the Havel (q.v.) and Elde from the right, it finally reaches the North Sea at Cuxhaven (q.v.). Above Hamburg the riv. separates into 2 streams, which unite again shortly. At Kolln the width is 100 ft. at Dresden 960 ft. whilst near the estuary it varies from 4 m. to 9 m. Since 1871 great improvements, including har-

bours, docks, and canals, have been made in E. navigation, although the riv. is still subject to inundations. Sev. canals have effectively joined up the E. and Oder (q.v.) systems, while the E.-Trave canal (42 m.) of 1900 allows direct communication between Lübeck and the E. The very heavy vol. of goods traffic is carried by steamers and barges.

International changes resulting from the First World War, and especially the recognition of Czechoslovakia as a separate nation, gave a new political importance to the E., which was declared by the treaty of Versailles (q.v.) to be an international riv. below the confluence of the Vltava, under a committee on which Germany, Czechoslovakia, Britain, France, Italy, and Belgium were represented. The drainage area of the E. basin is estimated at 56,000 sq. m. Length 725 m.

In the operations on the W. Front in 1945 Gen. Bradley, Amer. gen. commanding the Central Group of Armies, was directed by Gen. Eisenhower (q.v.) in April to seize any opportunity of capturing a bridgehead over the E. and to be prepared for operations farther E.; but it was anticipated that these would be unnecessary, as the speed of the Russian advance from the E. would probably lead to a junction with them over the riv., if not W. of it. The Amer. Ninth Army reached the E. S. of Magdeburg, on 11 April and crossed the riv. the next day. A second bridgehead S. of Wittenberg was achieved by the 5th Armoured Div. of 13th Corps on 13 April. On 14 April the 3rd Armoured Div. of 7th Corps reached Dessau, immediately S. of the confluence of the Mulde and E. rivs. On 21 April Brit. troops, who had won a bridgehead a few days previously, expanded their hold and crossed the riv. near Lauenburg, S.E. of Hamburg, on 29 April. On the 25th Amer. patrols of the 69th Div., which had probed eastward from the Mulde, met elements of the Russian 58th Guards Div. in the Torgau area on the riv. The junction of the E. and W. fronts had been effected on the riv. and Germany was cut in two. Thus the object of the central thrust under Gen. Bradley had been achieved. While the Amer. forces in the centre were halted on the E. and Mukle other forces turned to the completion of the operations in the N. and, accordingly. In the N. sector 21st Army Group was directed to seize other crossings over the E. in the Brit. Second Army zone, secure Hamburg and advance at speed on the general area of Kiel-Lübeck. On 2 May Brit. forces crossed the E. again and turned down its r. b. toward Hamburg which surrendered to the 7th Armoured Div. on 3 May. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGN IN THE SECOND WORLD WAR, and WESTERN FRONT IN THE SECOND WORLD WAR.

Elberfeld, see WUPPERTAL.

Elbeuf, or **Elboeuf**, Fr. tn in the dept of Seine-Inférieure, on the Seine, 14 m. S. by W. of Rouen by rail. It has been one of the chief centres of the woollen industry in France since the 13th cent. The tn

was badly damaged in the Second World War. In Aug. 1944 the Germans made a desperate stand at E. to guard the ferries as the Ger. Army withdrew across the Seine. Pop. 16,000.

Elbing, see EBLAG.

Elblag (Ger. **Elbing**), tn of Poland, in Gdansk prov., on the navigable E. R., at the SW. end of the Frisches Haff (q.v.). Until 1945 it was in E. Prussia. The tn was founded in the 13th cent. by settlers from Bremen and Lübeck, and it became a member of the Hanseatic League (q.v.) and an important port for trade with England. From 1466 until 1772 it belonged to Poland. During the Thirty Years War it was in Swedish hands (1626-36). In 1772 it passed to Prussia. The greater part of the tn was destroyed in the Second World War during the Russian advance into Germany. Since the end of the war there has been much reconstruction. There are engineering and electrical industries. The shipyards of E. have been famous since the middle of the 19th cent. Pop. 40,000 (1940, 86,000).

Elbogen, see LOKET.

Elbow, see ARM.

El'brus, highest mt in the Caucasus, in the main range, its W. peak attaining a height of 18,170 ft. The other summit, which was reached for the first time in 1868 by Freshfield, is 18,347 ft above sea-level. It is an extinct volcano, whose glaciers cover 16 sq. m. The Daksan glacier extends down to a distance of 7350 ft above the sea. See R. L. G. Irving, *Ten Great Mountains*, 1940.

Elburz Mountains, lofty range in the N. of Persia, along the S. border of the Caspian Sea. The E. consist of a series of narrow, extremely steep folds, with a number of peaks reaching over 10,000 ft. within a distance of 30 m. from the Caspian shore, which is 88 ft below sea-level. The highest peak of the E. M. is Mt Damavand, a volcanic cone, N. of Tehran, rising to over 18,000 ft. At the broadest point the E. M. are 60 m. wide. On the N. slopes ann. rainfall exceeds 100 in. and forests grow up to a height of 7000 to 8000 ft. The Talish Hills in the W. link the E. to the massifs of the Caucasus and NW. Zagros. To the east long. 56° the E. M. are succeeded by a plateau dividing them from the Kopet Dagh and Ala Dagh. The Sefid Rud, rising near Sanandaj in Kurdistan, breaks through the E. M. and enters the Caspian east of Rasht, and the Harhaz, rising some 25 m. N. of Tehran, flows through the Lar plateau, where it is known as the Lar R., turns NE. and enters the Caspian near Amol.

El Capitan, granite peak, 7564 ft high, in the Yosemite valley, on the W. slope of the Sierra Nevada, in California, U.S.A.

Elche (ancet Ilici), Sp. tn in the prov. of Alicante, famous for its immense forest of palm trees, irrigated by canals, which provides all Spain with leaves for Palm Sunday. E. has also the only mystery play in Spain, performed on 14 and 15 Aug. each year. Leather goods are manufactured. Pop. 53,850.

Elchingen, Ger. vil. in the *Land of Baden-Württemberg* (q.v.), 8 m. S.E. of Aalen (q.v.). Marshal Ney (q.v.) was created duke of E. after his defeat of the Austrians here in 1805.

Eloho Challenge Shield, *see under* BISLEY.

Elder, Presbyterian (church official). The session of a Presbyterian church is composed of E.s, preaching and ruling. The preaching E. is the minister, who is ordained and inducted by the Presbytery and is the moderator of the congregational session. The ruling E.s are elected for life by the congregation, and are ordained and inducted by the moderator of the session. In some Amer. branches of the Presbyterian Church the E.s are only elected for a certain number of years. The session has the spiritual gov. of the congregation in its hands, and only through it can members of the congregation appeal to a higher court of the Church. When John Knox set up the Presbyterian gov. in Scotland he meant the ruling E.s to be salaried office-bearers and thought that they should be elected annually. However, the alienation of the Church funds from eccles. to secular holders prevented his idea from being carried into effect. An E. should, in the words of Paul (1 Tim. iii. 2), 'be blameless, the husband of one wife, vigilant, sober, of good behaviour, given to hospitality, apt to teach.' The courts of the Presbyterian Church are entirely made up of E.s, preaching and ruling, e.g. the congregational session, 1 preaching E. and 1 ruling E. for about every 20 members. The Presbytery and Synod generally are 1 preaching and 1 ruling E. from each congregation; the General Assembly, a certain number of each from each Presbytery within its gov. Thus the Presbyterian Church claims apostolic authority for its Church gov.

Elder, *Sambucus*, family (Caprifoliaceae); a genus of deciduous shrubs or small trees, rarely herbs. *S. nigra*, the common E. or Scotch bourtree, is native to Britain and Europe, with flowers and berries used in wine-making, and stem-wood used for fishing rods, toys, etc. It has sev. varieties of ornamental horticultural interest. *S. racemosa*, a small shrub of 8 to 10 ft. is ornamental in foliage. *S. canadensis*, Danewort, is a native herbaceous perennial, with pink-tipped flowers in summer.

Elderberry Wine, prime favourite with country people, resembling Burgundy or port when properly made, requires 4 lb. ripe, dry berries (no twigs) to each gallon of water. (*See* WINES, HOME-MADE for general directions and precautions.) Bruise berries, pour on the boiling water, cool to 98° F., stir in 1 oz. crumbled yeast, and leave 3 days, stirring daily. Strain, stir 3½ lb. sugar into the juice, leave 4-6 weeks to ferment, bottle, and store in a cold dry place for a year. Try at 6 months.

Elderflower Wine, *see* WINES, HOME-MADE.

Eldon, John Scott, 1st Earl of [(1751-1838), lawyer and statesman, b. Newcastle, almost blighted his prospects by

making a runaway marriage as soon as he had won his fellowship at Univ. College, Oxford. He was called to the Bar in 1776, and from that time success smiled on him. He entered parliament, became solicitor-general in 1788, attorney-general in 1793, chief justice of the court of common pleas (1799), and was lord chancellor for many years. His only politics were a lively hatred of the Rom. Catholics, and he was a poor speaker, a tedious but sound judge, and a victim to parsimony. But he had a large share in establishing modern equity as a coherent body of principles no longer measurable by 'the length of the Chancellor's foot.' *See* W. E. Sutcliffe, *Sketch of the Lives of Lords Stowell and Eldon*, 1846; W. S. Holdsworth, *Some Makers of English Law*, 1938.

El Dorado: 1. Means in Spanish 'The Golden,' and was the name given to a fabulous city long believed to exist somewhere in the interior of S. America. The belief in the existence of the mythical city of gold was based on the tales of a Sp. soldier, Martinez, set adrift by his companions when exploring the Orinoco. Finding his way back some months later, he narrated how he had been taken by the Indians to a great inland lake with golden sands, on which was a vast city roofed with gold. Certainly as early as 1500 confused accounts were given to Sp. sailors about a rich city abounding in gold and precious stones, situated on the borders of Lake Parima somewhere within Guiana or Guyana. Numerous Sp. expeditions set out to find it and most of them came to grief on the Amazon. One of the seekers was Don Diego de Ordaz, governor of Quito, who was the first man to build a tn (St Thomas of Guiana at the confluence of the Caronius Orinoco in ter. now belonging to Venezuela). Among other futile expeditions, of which E. D. was the imaginary goal, were those of Orellana (1540), Philip von Hutton (1541-3), who told how once he had caught a glimpse of the gleaming city, and Jiménez de Quesada (1569). Also in quest of E. D. was Sir Walter Raleigh, who set out in 1595, having sold his wife's and his own property in order to raise £10,500 for the expedition. In this ill-fated expedition he lost his son, his health, and his fortune. Undeterred by his chief's failure, Capt. Keymis, at Raleigh's expense, undertook a 2nd voyage and purported to identify E. D. with some spot on Lake Parima. The purely legendary Manoa, with roofs and walls of precious stones, to which Martinez said he had been taken, long occupied a conspicuous place on the map, till Humboldt proved it to be a fiction. But though E. D. was swept from the atlas, it has secured a high niche in literature as the goal of happiness after which humanity never wearies of striving. *See* D. G. Brinton, *The Myths of the New World*, 1896.

2. City of S. Arkansas, U.S.A., co. seat of Union co., chief tn in the pioneer oilfield of the state. It is a trade centre for a lumber and farm area. Pop. 23,076.

Elea, see **ELIS**.

Eleanor of Aquitaine (Guienne) (c. 1122–1204), queen of France and afterwards of England, daughter of William X, duke of Aquitaine. She married Louis VII of France in 1137. The marriage was annulled in 1152. The same year she married Henry of Anjou who became Henry II of England, 1154. E. was implicated in her son's (by Henry) rebellion, 1173, and was imprisoned until 1185. She acted as regent during her son Richard I's absences. E. had great territorial wealth of her own; Aquitaine was her marriage dowry and its acquisition considerably increased Henry II's prestige and power. She is traditionally represented as extremely hot-tempered and was clearly a born intriguer.

Eleanor of Castile (d. 1290), queen of Edward I of England and half-sister of Alfonso X of Castile, surnamed the Wise, accompanied her husband to the Crusade in 1270, and is traditionally said to have saved his life by sucking the poison from a wound inflicted by a poisoned arrow; she was buried at Westminster. The route of her funeral procession was commemorated by a series of crosses erected by her husband at each halt.

Eleanor of Guienne, see **ELEANOR OF AQUITAINE**.

Eleanor of Provence (c. 1221–91), queen of Henry III of England, daughter of Raymond Berenger IV, count of Provence. She married Henry in 1236, and much of Henry's favouring of foreigners was said to be due to her influence. She took the veil in 1276 and d. at Amesbury, Wilts.

Eleatic School, The, school of Gk philosophy which fl. from 570–450 BC, so called because its leaders were natives of the Gk colony, Elea, in S. Italy. Parmenides may not have been its founder, but he at least, with Zeno, became identified to a peculiar and especial degree with its salient principles. After the death of its great exponents, the E.s gave themselves over to futile verbal debates, whilst their serious contributions to mental science formed the basis of Plato's metaphysics. Parmenides and his adherents dilated on the unity of being and all phenomena, and on the paradoxical conception that 'the All is One,' and argued that this truth is hidden from the masses because their senses mislead and confuse them. Thought alone can attain to this conception by soaring high above the domain of the false and sensuous seemings. Other members of this school were Xenophanes and Melissus (qq.v.). See J. Burnet, *Early Greek Philosophy*, 4th ed. 1948; J. E. Raven, *Pythagoreans and Eleatics*, 1948.

Elecampane, or *Inula helenium*, a composite plant with aromatic and bitter leaves and root. Formerly much used as an antiseptic aromatic herb, the root being candied and used for chest troubles. An ingredient of absinthe.

Election (in theology), see **PREDESTINATION**.

Election, Equitable Doctrine of, in law, the choice which a beneficiary must make between 2 alternative rights or benefits

conferred by the same will, deed, or other instrument. This necessity would arise if A, by his will, gave property of his own, x, to B and purported to bequeath to C property, y, which B owned or was entitled to claim. B must elect either to (i) take 'under the will' by taking x so that C receives y, or (ii) take 'against the will,' in which case he may retain y but must compensate C out of x. See E. H. T. Snell, *Principles of Equity* (24th ed.), 1954.

Elections, in Great Britain. **PARLIAMENTARY**.—The election writ.—Polling districts.

The authorisation for the issue of writs for a general election is the royal proclamation announcing the dissolution of

ELECAMPANE

parliament and the date of the summoning of a new parliament. Writs are issued by the Clerk of the Crown as soon as possible after the pub. of that proclamation. When the House of Commons is in session, the writ for a by-election arising from the death of a member, or the vacating of his seat by elevation or succession to the peerage, or from some other legal cause, is made out by the Clerk of the Crown for constituencies in Great Britain or the Governor of Northern Ireland for constituencies there, on the authority of the Speaker's warrant which is issued on the order of the House of Commons on a motion by the chief whip of the party to which the member belonged. This motion takes precedence over all other business of the House. If the House is in recess the Speaker may issue his warrant on 2 members certifying to him that the seat is vacant, but cannot do so where the vacancy arises from the lunacy of the sitting member, or where he has accepted the Chiltern Hundreds.

Writs are sent to the returning officers of the constituencies (in co. constituencies the sheriffs, in hors. the mayor or chairman of the local council). The method of distribution is normally by post, the writs being transmitted as registered letters to local postmasters, who remit them to the

returning officers, although there is power to determine by order in council which method shall be used. Neglect or delay in delivery of a writ is a misdemeanour. Pub. of the notice of election, stating the time and place at which nominations may be delivered, and the date of the poll in the event of a contest, must be made not later than 4 p.m. on the 2nd day after that on which the writ is received. A general election usually takes place within 21 days of the dissolution. The Representation of the People Act, 1918, provides that the interval between the proclamation and the meeting of the new parliament shall be not less than 20 clear days.

Returning officers attend at the place specified in the notice for the receipt of nominations, which may be delivered between 10 a.m. and 3 p.m. (on Saturdays between 10 a.m. and noon) on any day after the pub. of the notice of election, and not later than the 8th day after the proclamation. For by-elections the hrs for receiving nominations are the same, but the last day is fixed by the returning officer, not earlier than the 4th day after pub. of the notice, and not later than the 9th day after the writ is received, for a co. constituency. In a bor. constituency the days are the 3rd and 7th respectively. Each candidate must be nominated on a separate nomination paper, signed by a proposer and seconder, and bearing the names of 8 other persons assenting to the nomination. No persons can subscribe more than 1 nomination paper at the same election.

Nomination papers must be made available by the returning officers to any registered elector requiring them. The paper has to contain the full name, address, and description of the candidate, but reference to his political activities is prohibited, and there need not be any reference to his rank, profession, or calling except where this might be necessary to identify him. Any person nominated as a candidate must signify in writing his willingness to stand; that written consent must be deposited with the returning officer at the same time as the nomination papers, and it must also contain a declaration that the candidate is aware of the contents of the House of Commons Disqualification Act, 1957, and that to the best of his knowledge and belief he is not disqualified from membership of the House of Commons.

A candidate must also deposit £150, either in legal tender or by banker's draft. This will be forfeited if the number of votes cast for him or her does not exceed one-eighth of the total, otherwise it will be returned as soon as possible after the declaration of the poll. Withdrawals of nominations must be made in writing, during the period permitted for deposit, and delivered to the returning officer. Objections may be made up to 1 hr after the time fixed for the close of nominations, but if after that time the number of candidates nominated does not exceed the vacancies they will be declared elected. The returning officer will then publish a statement showing the names,

addresses, and descriptions of those nominated, together with the names of those subscribing to their nominations, and similar particulars about those who had been nominated and the reasons why they might no longer be so.

Expenditure by a candidate or by his agent at a general or by-election is limited to £450 plus 2d. for each elector in a co. constituency or 1d. in a bor. Within 14 days of the declaration of poll all bills for the campaign must be in the hands of each agent; they must be settled within the next 14 days, and a complete statement must be sent to the returning officer within 35 days of the election being held. These returns are subject to public scrutiny for 2 years, after which they may be returned to the candidate or his agent or destroyed. Eventually statistics showing how much a candidate spent in the election, and how much he or she was entitled to spend, are pub. by order of the Home Secretary and the secretary of state for Scotland. Failure to send in a return and declaration of expenses within the prescribed period is an illegal practice which may preclude a successful candidate from sitting and voting in the House of Commons, on the liability of forfeiting £100 for each day he does, until the return is made.

Polling dists. are fixed by local authorities, who also designate the polling stations. Polling in a general election takes place between 7 a.m. and 9 p.m. on the 9th day after the last day for the delivery of nomination papers. For a by-election the hrs are the same, but the polling day is fixed by the returning officer between the 7th and 9th day after the last day for receipt of nominations. In computing any period of time, Sundays, Christmas Day, Good Friday, bank holidays, days of public thanksgiving or public mourning are disregarded.

The poll.—All polls are held on one day. Poll cards, bearing the name of the constituency, the elector's name and qualifying address, his or her number on the register, the date and time of the poll, and the location of the polling station, are sent to each elector by the returning officer. The recording of votes takes place in a booth screened from observation. Voting is effected by making a cross on the ballot papers opposite a chosen name. The secret ballot was introduced in 1872 when election by nomination was abolished. At a parl. election a person is not entitled to vote in more than 1 constituency, or more than once in the same constituency. Ballot papers contain only the names and descriptions of the candidates as shown in the official notice of nominations, and are marked with an official mark, either embossed or perforated, which is kept secret and not used for an election in the same constituency for at least 7 years. The use of motor cars for conveying electors to the polls was regularised under the Representation of the People Act, 1948. The number of cars employed must not exceed 1 for every 1500 electors in a co. constituency and 1 for every 2000

in a box. All cars for this purpose must be registered with the returning officer, who issues a certificate authorising their use.

Presiding officers for the polling stations and a suitable staff of clerks for duty are selected by the returning officers, whose expenses are met by the Treasury. The presiding officer will be responsible for supervising the conduct of the poll at his station. The only persons permitted to enter the station other than voters are the candidates and their election agents, polling agents appointed to attend the station, clerks appointed to attend, police constables on duty, and companions of blind persons. At the close of the poll the presiding officer must seal the ballot boxes and deliver them, together with the various election documents, to the returning officer, who opens them and arranges for the count.

No persons other than the returning officer, the candidates, their wives or husbands, their election agents, and the counting clerks can attend the count except by permission of the returning officer. All those assisting at polling stations, or attending or assisting at the count, have to make a solemn declaration not to divulge unlawfully any information about the voting. The penalty for so doing is a term of imprisonment of up to 6 months. Any election official guilty of tampering with nomination or ballot papers is guilty of a misdemeanour and liable to imprisonment for up to 2 years; any other person who does so is liable to a term of up to 6 months. Breaches of official duty render offenders liable to a fine of up to £100. The rule by which a returning officer had only a casting vote in the event of a tie was abolished in 1948, and his ordinary vote was restored. Now a tie is resolved by lot. Immediately after the declaration of the poll, the counted and rejected papers, together with all the other election documents, are sealed in separate packets and sent to the Clerk of the Crown. They are retained by him for 1 year, and then, unless otherwise directed by the House of Commons or the High Court, they are destroyed.

The Parliamentary Franchise.—Those entitled to vote as electors in a parl. election in any constituency are those resident there on the qualifying date, who are Brit. subjects of at least 21 years, and not subject to any legal incapacity to vote. Peers, aliens (except those who have been naturalised), persons under 21, or of unsound mind, or convicted of certain offences, are among those disqualified, but the incapacity of a peer to vote does not extend to peeresses in their own right, or peeresses by marriage who might otherwise be qualified. Registration on the register to be used at the election is a pre-requisite. The residential qualification was estab. by the Representation of the People Act, 1918, and 10 years later the Representation of the People (Equal Franchise) Act assimilated the franchise for men and woman in parl. E. The preparation of the register of voters, first provided for under the Reform Act, 1832,

is the duty of the registration officer (in the co. constituencies the clerk of the co. council, and in bors. the tn clerk). Registers are prepared once a year from details provided in a house-to-house inquiry conducted under the terms of the Electoral Registers Acts, 1949 and 1953. They contain a list of parl. and local gov. electors, and are pub. not later than 15 Feb. each year for use in the ensuing year beginning on 16 Feb. The qualifying date is the preceding 16 Oct. in England, Wales, and Scotland, and 15 Sept. in Northern Ireland. A person who is not of full age on the qualifying date, but is so on 15 June, is entitled to vote at elections in Great Britain between 2 Oct. of that year and 15 Feb. of the following year. Registers can be scrutinised at co. and tn halls or other council offices and head post offices. Persons whose names are omitted may claim registration, and objections to persons whose names appear may also be heard. Appeals against decisions of the registration officer are made to the co. court. Provisions are made for service voters—whether in the armed forces or some other branch of the Crown service overseas—including their wives who may be resident outside the U.K. Such persons make a declaration in a prescribed form and are treated as resident at the address specified in the declaration. The penalty for a false declaration is imprisonment up to 3 months, or a fine of £50, or both, on summary conviction, or up to 6 months, or a fine of £100, or both, on conviction on indictment. Service voters can vote by proxy or post on making application. Those unable to attend at the polling station because of occupation or infirmity may vote by proxy or post as absent voters. Separate lists are maintained of absent voters or those entitled to vote by proxy or post.

Petitions to unseat the member declared elected at a parl. election are made to the High Court in England, Wales, and Northern Ireland and to the Court of Session in Scotland within 21 days of the return being made to the Clerk of the Crown, or within 28 days where there is an allegation of any corrupt practices. A petition alleging an illegal practice must be lodged within 14 days of the receipt of the return and declaration of election expenses by the returning officer, or within 28 days of any payment or act in furtherance of such an illegal practice. Such petitions are tried by 2 judges of the High Court or Court of Session from a rota kept for the purpose. Their decision is made in writing to the Speaker. The penalty for corrupt withdrawal of a petition is a term of imprisonment not exceeding 12 months or a fine of £100 or both. A candidate at a parl. election who is reported by an election court guilty of a corrupt practice is incapacitated during 5 years from the date of the report from being elected for any constituency and during 10 years from being elected for the constituency for which the election was held. Persons convicted of corrupt practices on indictment are also subjected to a total incapacity to be elected for any

constituency for 5 years. If reported as guilty of such a practice through his agents or personally guilty of an illegal practice the candidate will be incapacitated from election for the constituency in which the election was held for 7 years, but this local incapacity lasts only for the duration of the Parliament for which the election was held if the candidate is reported guilty of an illegal practice through his agents. There are provisions for mitigation and remission of incapacities arising from further proceedings where the incapacity has arisen from the report of an election court.

Corrupt and illegal practices at elections.

—Corrupt practices are personation, bribery, treating, and undue influence. They are punishable either on indictment or summarily, and it is the duty of the Director of Public Prosecutions to investigate reports of such practices and institute proceedings. Personation is voting in person or by proxy for someone else whether alive, dead, or fictitious. It is a felony, and the penalty on conviction on indictment is imprisonment for a term of up to 2 years. If convicted by an election court the term is not exceeding 3 months or a fine of £200, or a term not exceeding 3 months or a fine of £100, or both. If convicted summarily. Bribery is the giving of money or procuring of office with the intention of corrupting the voter in the exercise of his or her vote; treating is the giving, providing, or paying wholly or in part for entertainment to influence any voter to use or refrain from using his vote; undue influence is the use or threatened use of force, violence, or restraint, the infliction of injury, harm, or loss to or on persons to induce or compel them to vote or refrain from voting, or by abduction, duress or by any fraudulent device or contrivance to impede or prevent the free exercise of the franchise. Any person convicted on indictment of any of these 3 corrupt practices is liable to imprisonment for a term of up to 12 months or a fine not exceeding £200. If convicted by an election court the term is up to 6 months and the fine £200, but in a court of summary jurisdiction the penalty is a term of up to 3 months, or a fine of £100, or both. The penalty for an illegal practice is a fine of not more than £100 on summary conviction. Illegal practices include voting or applying to vote by proxy when subject to legal incapacity, or for someone subject to such incapacity, or voting more than once, or voting personally when registered to vote by another method; making payments in contravention of provisions for payment of expenses through an election agent; failing to send a declaration or return of expenses; making payment or incurring expenditure in excess of the permitted maximum; paying claims or making payment of expenses outside the permitted time; candidate or agent failing to comply with provisions relating to returns and declarations of expenses; making a false statement of fact about the character or conduct of a candidate; use of foreign radio station for political

propaganda at an election; acting or inciting others to act in a disorderly manner at an election meeting; making false statement about the withdrawal of candidates; lending, letting, employing or hiring of cars to convey voters to the poll; payment for bands, music, torches, flags, or banners; printing, publishing, and distributing election materials not bearing the name of the printer and publisher. Other practices which are prohibited include the hiring, letting, or using of licensed premises for committee rooms, the employment of paid canvassers, and canvassing by police officers.

Qualifications and disqualifications for membership.—Membership of the House of Commons is remarkably free and unrestricted. Candidates must be Brit.

subjects, and at least 21 years of age. Persons who are disqualified from membership include: aliens (but not one who has been naturalised); infants under the age of 21; those suffering from lunacy or idiocy; Eng. or Scottish peers (but Irish peers unless elected as representative peers are eligible); bankrupts; convicted felons; those guilty of corrupt practices at election; clergymen of the Church of England, the Church of Scotland, or Rom. Catholic priests (but not non-conformist ministers); the holders of offices specified in the House of Commons Disqualification Act, 1957, deemed to be incompatible with election as an M.P. Those disqualified by virtue of office include judges of the High Court, the Appeal Court, and co. courts in England, Wales, and Northern Ireland, the Court of Session in Scotland, and the Courts-Martial Appeals Court; the recorders of London, Liverpool, and Manchester, or recorders in their own bors.; chairmen or paid deputy chairmen of quarter sessions in London or Lancs, or in their own area of jurisdiction; stipendiary magistrates; sheriffs or sheriff substitutes in Scotland; Official Referee to the Supreme Court; civil servants (whether estab. or not or employed whole or part-time—including foreign service and overseas civil services, but not the Royal Observer Corps unless the service is whole-time); any member of the armed services (but not an officer on the retired or emergency list or holding an emergency commission or on any reserve, or a pensioner recalled for service); any police officer employed by the police authority in Great Britain and Northern Ireland; any member of any legislature of any country or ter. outside the Brit. Commonwealth; returning officers (but only in constituency for which they act); commissioner of police for the metropolis and for the City of London; colonial governors; chairmen and members of courts, tribunals, boards, corporations, and councils set up under various acts of parliament; election commissioners; governors of the Bank of England, the B.B.C., or prisons; clerks or deputy clerks to co. co. bor., or bor. councils. A person who was previously barred from membership because of holding a pension from the Crown or because of any contract agreement or commission for or on behalf of

the Crown is no longer disqualified. The 1957 act laid down a detailed list of individual disqualifying offices in place of the former 'offices of profit under the Crown' to enable a prospective candidate to see clearly whether he had incurred, or was likely to incur, disqualification by the acceptance of an office. There is provision to amend the list by Order in Council.

LOCAL GOVERNMENT.—Local gov. franchise depends on residence in the area, or the possession of a non-residence qualification, i.e. the occupation as owner or tenant of rateable lands or premises of an ann. value of £10 or more, excluding occupation of furnished dwellings for less than 9 weeks, and excluding occupation as lodger. Those entitled to vote must also be Brit. subjects aged more than 21 years and not be subject to any legal incapacity. The preparation of registers is effected simultaneously with those for parl. election under the same procedure; as far as possible the same registers are used, with a mark indicating the voters entitled to participate in local gov. E. only. Most of the rules governing the conduct of local E. are the same as those for parl. election with appropriate variations or exceptions. In metropolitan bors. the tn clerk is the returning officer; in bors. where the election is in wards it is an alderman appointed by the council, but where the bor. is not divided into wards it will be the mayor; for co. councils he is appointed by the council, but in some circumstances may be the mayor of a bor. within the co. As in parl. election no person may give more than 1 vote for any 1 candidate. Petitions against E. must be presented within 21 days of the date on which they were held and are heard by a barrister of not less than 15 years' experience, but not one who is an M.P., or holds an office of profit under the Crown other than that of a recorder. In Scotland such petitions are heard by the sheriff or the sheriff substitute of the co. The maximum expenses in a local gov. election are £25 and 2d. for each voter on the register above 500.

Borough elections.—Where a bor. is not divided into wards there is 1 election of councillors for the whole bor.; where the bor. is divided into wards there is a separate election of councillors for each ward. Councillors are elected for 3 years, one-third going out of office each year. Aldermen are elected by the council for 6 years, half of them retiring at the end of 3 years. E. are in May. Women may be elected as councillors or aldermen.

City of London.—Common Council is legislative as well as representative. The Lord Mayor is nominated by livery voters of the City Guilds and elected by the Court of Aldermen. Aldermen and common councilmen are elected by ratepayers and inhab. of sev. wards, aldermen for life, councilmen being re-elected annually by the same voters. In 1952 the Common Council decided to reduce its membership from 206 to 159—or 25 per cent—by St Thomas's Day (21 Dec.) 1959. Casual vacancies occurring by death or resigna-

tion between 1 Jan. 1953 and the fixed day in 1959 would not be filled unless the representation of the ward fell below the number specified in the resolution reducing the numbers.

See also ELECTORATE; FRANCHISE, LOCAL GOVERNMENT. See J. F. S. ROSS, *Elections and Electors*, 1955.

Elections, Presidential (U.S.A.). By the Federal Constitution each state is to appoint a number of electors equal to the whole number of senators and representatives to which the state is entitled in Congress. These electors then vote for the president and vice-president. Theoretically, the people at large have no direct voice in the election, and the electors, or electoral college, have an unfettered freedom of choice. The party system ensures that the persons nominated at the great national party conventions for the offices of president and vice-president shall ultimately be voted for by the members of the electoral college. The electors themselves are polled for by a direct vote of the citizens on a 'general ticket,' but the candidates for the office of elector are all nominated beforehand by party associations, with the result that the choice of the new president and vice-president follows as a matter of course. By the Constitution Congress may determine the time of choosing the electors and the polling day. The election is held every 4th year. For qualifications of the president, see CONSTITUTION.

Electorate, the persons entitled to elect the representatives to the communal assembly. In England and other Teutonic lands the families enlarged into clans, occupying each its original common ter., early developed into the territorial unit of the *mark* or *township*. The township, then, was the lowest territorial div. and political unit of a tribe, and possessed its own assembly and peculiar political organisation. This unit, which in other countries is the commune, in England becomes either the *municipal corporation* or *par.* The electoral system of England (apart from the representation of the classes in the cos.) grew out of the principle of representation as evolved in the tns of the Middle Ages. Their adaptability to this end was due partly to the fact that even before the Conquest they possessed a complete political organisation, partly to the wealth that accrued to them from the grant of the charters of incorporation. Other territorial divs., such as the shire and the hundred, co-existed with the tn or bor., but in most cases the latter, especially after acquiring charters, were for all judicial and administrative purposes independent of those divs. The tns soon developed a strong organisation for administrative as well as judicial purposes, and, through the institution of merchant and craft guilds fostered by the crown, rapidly acquired wealth from their exclusive privileges of buying and selling free from exorbitant tolls and from corporate property. The guilds all tended to become the governing body of the tn and still further developed their privileges

of self-gov. and self-assessment. The result was that they became close corporations, election to which was coveted, and the representation of which in parliament was desirable. Parallel with the development of the bor. franchise, the co. representation was evolved through the elective principle of the old co. court (q.v.). In pre-Norman times the freeholders assembled in the co. court or shire-moot for fiscal and judicial purposes, and to the moot also came burgesses, and the reeves from the tns. Later the tn representatives seceded, having through the grant of charters gained a right to send out their own representatives to bargain with the exchequer officials. The co. freeholders continued to elect knights, who either assembled in the co. court or were summoned by the sheriff to some central point for the same purposes, or to be consulted about a grant. When this representation for purposes of assessment became a representation for deliberative purposes too, election to parliament in the modern sense began. At first tns did not appreciate the honour of sending members to parliament, and the representation, such as it was, was chiefly the co. representation of the classes. Many acts were passed in the beginning of the 15th cent. to regulate the franchise in the cos., and in 1430 an act restricted the right of voting for knights to persons possessing freeholds in the shire to the value of 40s. a year, and all copyholders and villeins were disfranchised. The forty-shilling freeholders remained the only co. voters until the Reform Act of 1832. In the intervening centuries, however, the bors., grown wealthy, began to realise the value of the right of election. Control over the royal expenditure meant the power to secure the redress of grievances. The Crown could increase or diminish the number of bors. represented—a power based on the doctrine that bor. privileges were gifts of the Crown, and that their status was historically that of the royal demesne; the number of shire knights, on the other hand, could not be altered. From this fact and the subsequent association of the knights with the burgesses as representatives of the people instead of the classes, the representation of the 3rd estate of the realm was saved from the extinction that the corresponding bodies encountered abroad. But the representation of the 3rd estate was as yet a far cry from the democratic ideal. The bors. rapidly became corrupt, the franchise passing into the hands of a close body of corporators who frequently sold the bor. seats to the king's ministers. By the beginning of the 19th cent. the bor. had practically ceased to represent public opinion. From the time of the Reform Act in 1832, which abolished the 'rotten' bors. and gave the vote to everyone occupying a house or shop to a clear ann. value of £10, a series of acts has extended the franchise. In 1884 the franchise conferred in 1867 on householders and lodgers in bors. was extended to similar persons in the cos. A year later the entire country was divided into numerous co. and bor.

constituencies, each co. being subdivided into 2 or more constituencies, each returning 1 member, the idea being to create equal electoral dists. The principle of div. adopted by the Redistribution of Seats Act, 1885, accorded with the democratic feeling that had grown since Rousseau preached equality. In the days of rotten bors., when the total pop. was only 7 million, of whom 5 million could not read or write, there were 558 members of the House of Commons, which means that each member represented on the average no more than 500 voters as against about 55,670 to-day. The net result of the reforms of the 19th cent. was an accession of power to the executive and the E. at the expense of the House of Commons. Before the Reform Act of 1832 a defeat of the ministry did not necessarily involve its resignation. Both the ministry and the majority in the House were for the most part in the confidence of the king. But after 1832 a general election became for the first time a vote to return a House pledged to support some particular politician, with the result that a change of ministry necessarily followed. This has subsequently developed into support for a particular political party and its programme, which is set out fully before the E., rather than for an individual politician. The distribution up to 1918 was far from perfect. The progressive shifting of the pop. and the huge absolute increase in the whole pop. since 1885 rendered the old distribution in numerous instances peculiarly inequitable and far removed from the spirit underlying the idea of equal electoral areas. The result was an agitation for various reforms, some having for their object the substitution of a purely personal for a proprietary qualification, others the representation of the political opinions of the minority. On the introduction of adult suffrage by the Representation of the People Act, 1918, the E. increased from 8,357,000 to 16 million, including 6 million women. The Representation of the People (Equal Franchise) Act, 1928, increased it considerably (see ELECTIONS), the large increase over 1918 being accounted for by reducing the age limit for women from 30 to 21 years of age and by giving all women the vote on equal terms with men. Permanent commissions for the redistribution of House of Commons constituencies were set up for the first time in 1944. Formerly such commissions had been appointed *ad hoc*, ceasing to exist on the completion of their task. The decision to put them on a permanent basis arose from a recommendation of a departmental committee on electoral reform in 1942, which was endorsed by the Speaker's conference in 1944. As the redistribution of constituencies in relation to the E. began to make itself felt rapidly and acutely, it became apparent that there was a great advantage in having permanent machinery to maintain constant reviews of constituencies, and where necessary effect periodical adjustments. The commissions are required by law to submit reports in not less than 3 or more than 7

years. The rules governing their reviews provide that the number of constituencies in Great Britain shall not be substantially more than 613, of which Scotland should have not less than 71 and Wales not less than 35. Discretion is given to them to depart from a strict application of those rules if special geographical considerations, including shape, size, and accessibility of a constituency, make that desirable. A far-reaching redistribution of seats—which included the abolition of plural voting, the ending of univ. representation after 345 years, and the amalgamation of representation for the Cities of London and Westminster—reflecting the social and industrial movements of the preceding decades, and hoping to achieve greater equality in the size of constituencies, was made in 1948 and put into operation at the general election of 1950. The number of seats in the House of Commons was reduced from 640 to 625. A further and considerable redistribution occurred before the 1955 election, arising out of the first review by the commissions under the House of Commons (Redistribution of Seats) Act, 1949. The number of constituencies was increased to 630. Eleven new divs. were created and 6 others abolished. Major alterations were made to 172 constituencies in England and Scotland, 43 minor adjustments being made to constituencies in England, Wales, and Scotland. No variations were made in Northern Ireland. The commissions in their task had sought to divide the total E. by the electoral mean of 55,670, and to avoid having any constituency of more than 80,000 or less than 40,000. The Eng. and Scottish bodies foreshadowed further adjustments in some areas in future, arising from drifts of pop. because of the development of new tns. Changes giving effect to the recommendations of the commissions are made by order in council.

The principle of equal electoral areas obtains in the U.S., Canada, and South Africa; other countries, like Switzerland, still adhere to the system of representation of com. or ter. divs. for administrative purposes, like the old Eng. shires, hundreds, and chartered tns. A system of double election prevails in the U.S.A. and in France. In the U.S.A. the E. elect the members of the Electoral College, which is thus composed of states' representatives, who elect the president. There are 531 votes in the Electoral College, and therefore 266 secure a majority.

See CABINET; FRANCHISE, LOCAL GOVERNMENT. See also J. F. S. ROSS, *Electors and Electors*, 1955.

Electors, the German Imperial (Kurfürsten), the princes in whom was vested the right of choosing the emperor or king of the Romans. Under the Carolingians the crown was hereditary, then Germany became an elective monarchy, and finally by 1257 the number of electors was fixed at 7. The Golden Bull (q.v.) of 1356 listed these as 4 lay princes, the Elector Palatine of the Rhine (imperial steward), the duke of Saxony (marshal), the mar-

grave of Brandenburg (chamberlain), the king of Bohemia (cup bearer), and 3 spiritual electors, the archbishops of Mainz, Trier, and Cologne (chancellors). During the Thirty Years War the duke of Bavaria was made an elector (1623) in place of the Elector Palatine, who was, however, restored as 8th elector at the Peace of Westphalia (1648) which finally established the electorate. In 1692 the 9th electorate of Brunswick-Lüneburg (recognised in 1708 as Hanover) was added. Changes took place during the Fr. ascendancy, and the electors' powers really came to an end (1806) on the dissolution of the Holy Rom. empire. The E. had considerable power during disputed successions, but gradually, and especially from the Thirty Years War onwards, the imperial crown became in practice largely hereditary. See O. Harnack, *Das Kurfürstenkollegium*, 1883; and E. Henderson's trans. of the 'Golden Bull' issued by Charles IV, 1356, in *Select Historical Documents of the Middle Ages*, 1896.

Electra (Gk 'the bright one'), daughter of Agamemnon and Clytemnestra, and sister of Iphigenia and Orestes (q.v.). She saved her brother from Aegisthus and Clytemnestra, who intended to kill him after Agamemnon, and later helped him to avenge Agamemnon's death. She married her brother's friend, Iphylades, and bore Medon and Strophilus. Her tomb was shown later at Mycenae.

Electric Accounting Machines, machines for book-keeping, calculations, statistics, and inventories. The punched card system of the Hollerith method permits business transactions of all kinds to be recorded, not in written books, but on specially designed manilla cards by means of perforations. The numerical significance of the holes is determined by their position in the cards. Cards can be designed for any purpose and information is recorded by a hand-operated key punch capable of very high speeds. Accuracy of punching is checked by a second operator in a verifying key punch. The punched cards—which form, as it were, mobile figures—can be classified, sorted or selected in an electrical sorting machine. After sorting, the cards are passed through a tabulating machine which will either list each individual card or, alternatively, accumulate totals of the sorted groups of cards and print these totals in appropriate forms. Invoices, statements, ledgers, and any kind of statistical return or inventory can be rapidly compiled by the Hollerith method, which eliminates subsidiary book-entries and produces results direct from the original record, the punched card. In addition to the advantage inherent in high speed the greatest flexibility in operation is provided by an easily manipulated control panel. Digital electronic computers of the type described in ELECTRONIC COMPUTATION are beginning to be used for book-keeping and other clerical jobs of a routine nature and are likely to play an increasingly important part in this role. With their inherent high speed of calculation and data-processing and large internal storage capacity for the holding

of and ready access to information regarding ledgers, records, files, reference tables, etc., they are very suitable for the rapid preparation of invoices, bills, demand notes, pay slips, statements, etc., with simultaneous analyses and the production of 'urgent action' notes and summaries as required. For input of new data such machines usually make use of punched paper tape, punched cards, or magnetic tape; for storage, magnetic cores, drums, and tape; and for output, typewriters or line printers. The problem to be solved must first be broken down into a series of basic operations, often conveniently specified by flow diagrams; the machine is then automatically controlled by means of a programme based upon these operations. The programme so derived can be used repeatedly and can be modified at any time to bring the operations in line with changing demands.

Electric Batteries, see ACCUMULATOR; CELL, VOLTAGE.

Electric Bells and Alarms. Chief parts of an ordinary E. B. are the electromagnets A and the armature C to which the knocker of the bell is attached. C is connected by a thin spring to the point D. At P there is a screw which makes contact with a spring attached to C. B represents the bell itself. The terminals T are connected to the external circuit. The action is as follows: initially the screw P is in

FIG. 1

contact with the spring attached to C; a complete circuit is formed as soon as a bellpush is operated and when the current flows the magnet becomes excited and attracts to it the armature C; this breaks the circuit at P, the current stops and the magnets then cease to attract C, which flies back under the action of the spring attaching it to D and again makes contact at P. In this way the circuit is alternately made and broken at P, thus giving to the armature C an oscillating motion which causes the striker to ring the bell B.

The above type is called an *electric trembling bell*.

Indicators.—When a number of push-buttons are installed in the same house, it is necessary to know which bellpush was operated to ring the bell. The indicator is a simple device designed for this purpose. It consists essentially of an electro-magnet M (Fig. 2) and an armature A pivoted at P, with a flag attached at its lower end. When the current passes the magnet is excited and attracts the armature, causing the flag to rotate about P. When the current stops the armature falls back under the action of gravity and continues to swing like the pendulum of a

FIG. 2

clock for some time after the current has ceased to flow. One of these is put in series with the bell for each position of a push-button, and thus acts as a signal.

Burglar alarms.—These generally consist of devices so placed that any movement of a window or a door will close a contact and set a bell ringing. The bell continues to ring until a control switch is operated.

Fire alarms. See under FIRE BRIGADES AND FIRE-FIGHTING. For minor faults in household systems, see under HOUSEWIFERY.

Electric Cables, see CABLES.

Electric Circuit, see CIRCUIT, ELECTRIC.

Electric Coherers, see COHERERS.

Electric Condensers, see CAPACITOR.

Electric Conductors, see CONDUCTORS, ELECTRIC.

Electric Discharge, escape of electrons from a charged body due to high potential of the electrode, to low pressure of the surrounding gas, or both. The E. D. may take various forms according to the conditions in which it is produced or maintained. At atmospheric pressure, a brush D., consisting of a purplish glow with streamers, accompanied by a hissing noise, appears round a sharp point or edge and round a thin wire at high potential (see CORONA). A spark occurs between 2 electrodes in air when the voltage is of the order of 30 kV per cm. distance between them; the value depends on the manner in which the voltage is increased, whether gradually or as an impulse, on the shape and size of the electrodes, and the distance between them (see SPHERE GAP). The spark establishes a momentary conducting

path through the air, and if sufficient power is fed into the path to maintain the conductivity, the spark may develop into an arc (q.v.). In a tube with air at reduced pressure and with an electrode at each end, the brush D. occurs at lower voltage than in the open air, and as the pressure is decreased it passes into a spark, which again broadens into a steady purple glow, while a dark space appears at the negative electrode. A more copious discharge is obtained in a vacuum tube from a heated cathode consisting of an oxide-coated filament. See THERMIONICS; ELECTRIC LAMPS; RECTIFIERS.

Electric Distribution, see DISTRIBUTION, ELECTRIC POWER.

Electric Fence, a wire fence of galvanised steel charged by high-voltage, low-current impulses at the rate of 40 per min. from a special unit with a transformer, supplied from a 6-V. accumulator. One such unit can work a 20-m. fence. The shock to an animal touching the wire is harmless but deterrent.

Electric Furnaces, see FURNACES; METALLURGY.

Electric Fuses, see FUSES.

Electric Generator, see ELECTRIC MACHINES.

Electric Heating for domestic purposes is based on the generation of heat RI^2 by a current I in a wire of resistance R . The wire must withstand prolonged heating, in open fires up to 900° C., without deterioration, and is made of nickel-chromium or nickel-chromium-iron alloy. The heating-element in the smaller appliances, kettle, percolator, iron, is usually a coil of wire or ribbon wound on a mica sheet, the whole enclosed in metal casing. The immersion heater consists of a spiral of resistance wire in watertight sheathing, usually with a screwed boss and sometimes with a thermostat. *Space-heating* is direct heating of a room by convection heaters or radiators. In convection units the element is enclosed in a metal casing and the air heated by contact with the element is circulated and discharged into the room at about 120° F. Sometimes a fan is added. Radiators may be of the ribbed sectional pattern, filled with water or oil and with an immersion heater at the bottom, or they may consist of 1, 2, or 3 tubes along the skirting-board, also with immersion heater. Panel heaters of various sizes and shapes are available; low-temp. panel heaters (80–120° F.) are often embedded in the walls. The open E. fires consist either of a porcelain former with a heating spiral, or a large porcelain knob wound with wire and set in a bowl-shaped reflector, or a wire-wound refractory rod in a parabolic reflector. *Storage heating* of water in a tank for hot-water supply or central heating is by immersion heaters with thermostat or by electrode boilers (see FURNACES). For large tanks 3 immersion heaters are used, one on each phase of 3-phase supply. Electrically heated boilers of both types are widely used for industrial purposes in Norway and Sweden.

The table gives some indication of the power consumption of heaters.

Kettles . . .	250–300 W. per pint capacity
Iron . . .	500 W.
Open-coil fires . . .	0.7–3 kW.
Panel . . .	35 W./sq. ft.
Panel embedded . . .	25 W./sq. ft.
Convection unit . . .	2–30 kW.
Section radiators . . .	0.5–3 kW.
Tubular radiators . . .	60 W./ft run
Immersion heater . . .	1–3 kW.

See also HEATING.

Electric Indicators, see ELECTRIC BELLS AND ALARMS.

Electric Insulators, see INSULATORS.

Electric Lamps.—*Arc Lamps*.—The intense light produced by the carbon arc (q.v.) was first observed by Davy (1810). When E. supply became available, arc L. were widely used for public lighting, but their use is now confined to projectors, medical applications, and, especially, cinemas, where very intense light is required. In the high-intensity arc, the carbons are copper-coated and the positive core contains some rare earths which assist in forming the crater and produce a very intensely luminous ball of gas. With a current of 60 amp. the carbons burn at a rate of 11 in. per hr and a small motor is needed for automatic continuous feeding of carbons. The d.c. arc on 40 V. gives the steady light required, with ballast resistance. A motor generator or a mercury-arc rectifier converts the mains a.c. supply into d.c.

Discharge Lamps.—These consist of a glass or quartz tube with 2 electrodes filled with a gas. The light is produced by the collision of electrons emitted from the cathode with the molecules of the gas. All discharge L. have, like the arc (q.v.), a falling volt/ampere characteristic and must be connected in series with a current-limiting device, usually a choking-coil, since they are mostly used on a.c. In the hot-cathode type, the emission is aided by the heating of the cathode when discharge is started, and these L. burn on mains voltage. The sodium vapour lamp is of U-tube form, of special glass to withstand attack of the vapour, enclosed in a vacuum flask. There is a filling of neon to start the discharge. The lamp emits a bright yellow light. It is highly efficient but not suitable for indoor use. The mercury vapour lamp emits a bluish-green light containing a large amount of ultra-violet (invisible) radiation. If fluorescent powder is deposited on the inside walls of the tube, the powder is excited by the ultra-violet rays, and by suitable choice of powders the colour is improved and full use is made of the radiation. In the low-pressure type there are 2 electrodes and a small amount of argon to assist the starting, which requires a special starting-switch arrangement. The high-pressure lamp has 2 main and 1 starting electrodes in argon filling. The cold-cathode type requires high-voltage supply, obtained through a transformer. The filling is neon or mercury vapour and fluorescent

powders are used. Discharge L. are the most efficient types at present available.

Incandescent Lamps.—The first electric filament lamp, invented by Joseph Wilson Swan of Sunderland and, independently, by Thomas Edison (1878), had a carbon filament in an evacuated glass ball. Modern incandescent L. have mostly a tungsten coil in an evacuated or a gas-filled bulb. The gas is usually nitrogen or argon; it must be inert and is used to counteract deterioration of the filament at high temps. *See also LIGHTING.*

Electric Lighting and Wiring, *see ELECTRIC LAMPS; ELECTRIC HEATING; FUSES; SWITCH; also ELECTRICITY IN THE HOME; LIGHTING.*

Electric Machines. (1) When a coil is moving in a magnetic field so as to embrace a varying flux, an e.m.f. is induced in the coil, proportional to the number of turns and the rate of change of the flux. (2) When a coil carrying current is placed in a magnetic field, the action between the field and the current tends to move the coil. These are the principles of (1) generators, converting mechanical into E. energy, and (2) motors, converting E. into mechanical energy.

If a coil is rotating in a linear magnetic field, the e.m.f. completes 1 cycle of a sine-wave in 1 revolution (*see ALTERNATING CURRENT*). The same effect is obtained with a stationary coil and a rotating magnetic field. In modern alternators a number of coils are fitted into slots in the inner surface of a laminated 'stator' frame (Fig. 1) and the field

FIG. 1

system, the 'rotor,' is excited from a low-voltage d.c. generator usually mounted on the main shaft, the terminals being connected to brushes bearing on sliprings connected to the field windings of the rotor pole pieces. Thus sliding contacts are confined to the low-voltage circuit and the heavily insulated armature circuit is stationary. A coil placed similarly to coil 1 with respect to another pole-pair has an induced e.m.f. synchronising with that in coil 1. The spacing of the coils bears a definite relationship to the pole-pitch of the field magnets, so that the e.m.f.s induced in each of the series of coils shall simultaneously attain their maximum values. The e.m.f. in coil 1 is a maximum in the position shown, and the cycle is completed (Fig. 2) when the next N-pole comes under slot A. The

FIG. 2

number of cycles per sec., the frequency $f = \frac{1}{60} \times (\text{r.p.m.}) \times (\text{number of pole-pairs})$, or, at the usual frequency 50 c/s, the $(\text{r.p.m.}) \times (\text{numbers of poles}) = 50 \times 60 \times 2 = 6000$. Steam turbines run at high speed, 1000–3000 r.p.m., and 'turbo-alternators' have from 2–6 poles, and rotors of smaller diameter. The spaces between pole pieces are often filled in with wood to give a smooth surface. Water turbines turn slowly, and the rotors have from 12–24 ('salient') poles corre-

FIG. 3

sponding to a speed of 500–250 r.p.m. A rough estimate of the power in kVA is $4.65 \times n D^2 L$, where $n = \text{r.p.m.}$, $D = \text{internal stator diameter (metres)}$, $L = \text{axial length (metres)}$. At present the usual voltage is of the order of 10 kV; the power of large machines may be 60–80 MVA or more. If a 2nd series of coils are fixed like coil 2 (Fig. 1), the e.m.f. induced in these will lag behind the e.m.f. in coil 1 by $1/4$ period (Fig. 3), and if 3 sets are fitted (Fig. 4) the e.m.f.s will differ by 120°

FIG. 4

degrees in phase (Fig. 5). There are then 3 independent circuits. The 3-phase alternator is now the usual type (see **THREE-PHASE SYSTEMS**). The 3 circuits are so connected that they have 1 terminal in common, the 'neutral point' (n.p.), so that the phase voltages, from the

FIG. 5

other terminals to the n.p., are at 120 degrees to one another. The n.p. is often earthed.

Direct-current generators (dynamos) have a stationary (usually 4-pole) field, a cast-iron yoke with pole pieces projecting inwards to the armature and carrying the field windings. The rotating armature has a soft-iron core with axial slots for the

FIG. 6

conductors. The coil ends are taken out to commutator (q.v.) segments on which fixed carbon brushes are bearing. The commutator is a copper cylinder fixed on but insulated from the shaft and split axially into strips (segments) insulated from one another. The moment the e.m.f. in a coil changes sign through zero the segments change brush, so that the voltage between 2 brushes remains unidirectional. The series generator has the field winding in series with the armature (Fig. 6), so that when the load current increases, the field also increases and the voltage rises as shown in the characteristic. When saturation of the field core is reached, the voltage drops. This type of machine finds but very little use.

Shunt-wound dynamo field connections are shown in Fig. 7. A rheostat is inserted in the field circuit for controlling the field current and thus the voltage of the dynamo. The terminal voltage is a maximum on open circuit and falls as the load increases. This drop is due to an increase in armature current, the demagnetising effect on the field of the increased armature current and the reduction in the field current consequent upon the lower terminal voltage (Fig. 7). These machines are suitable for steady load conditions and where the voltage variation is of no importance. They are used for exciting the field windings of alternators and rotary converters, and for battery charging.

Compound-wound dynamo field connections are shown in Fig. 8. There are 2 windings, one in series with the armature and a shunt winding across the brushes. The shunt winding maintains the voltage at no load and the series winding provides additional field strength to compensate for the voltage drop on load. By suitably proportioning the series winding in relation to the shunt winding, the voltage characteristic can to a great extent be controlled. Fig. 8 shows characteristic curves for a compound wound dynamo (see **COMPOUND WINDING**).

When a dynamo is required to supply power at some distance over-compounding is necessary to compensate for the in-

creased line voltage drop at the higher loads.

When a generator supplies current to an external circuit, the current in the armature reacts on the field and the reaction is such as to oppose the motion; the greater the load, the more mechanical power is needed to drive the generator. In d.c. generators, the field produced by the armature current is superposed on the generator field, and the resultant distortion is balanced by 'interpoles' between the main poles (see **COMPENSATING COIL**).

A machine designed as an alternator will run as motor once it is started and run up to 'synchronous' speed as determined by the number of poles and the frequency of the armature supply. The

synchronous motor may be made self-starting by fixing a small induction-motor rotor on the shaft, but it can only act as motor, taking load, at synchronous speed. If overloaded it stops. If the field is not fully excited, the supply cur-

to 5 h.p. need no starting device and are connected straight to the mains. Single-phase induction motors need a 'phase-splitting' device for producing a quasi-rotating field at the start. Induction motors are used for lifts, cranes, machine

FIG. 7

rent 'lags' behind the voltage; if over-excited, the supply has a leading power factor. In networks containing a large number of induction motors and where a low (lagging) power factor is causing trouble (over-load) the installation of an over-excited synchronous motor 'improves' the power factor (q.v.) and thus

tools, textiles machines, and in electric traction. The commutator motor is a series-wound motor; as both field and armature current follow the same cycle and reverse together, the action between field and armature remains unidirectional. Single-phase motors are used in traction, and small motors for domestic appliances

FIG. 8

relieves the network. Apart from this use as 'phase-advancers,' synchronous motors are used as motor generators for driving fans, paper machines, centrifugal pumps, and in electric clocks. The stator of a 3-phase induction motor is supplied from the a.c. mains and the result of the 3 e.m.f.s in the phase windings is a rotating field. The rotor is a drum of copper conductors connected at the ends to a ring ('squirrel-cage' motor). The action of the rotating field on currents induced in the rotor conductors makes the rotor follow the field with a small time lag or 'slip,' dependent on the load. The induction motor is simple and robust and will start on load. Motors up

are usually commutator motors and can be used on both a.c. and d.c.

The design of a d.c. motor is in principle as that of a generator and all 3 types of field winding are used. The action of the field on the current-carrying armature coils sets the armature in motion, but once the armature is rotating the field also generates an e.m.f. in the coils, opposing the motion, the 'back e.m.f.' The volt drop across the armature is the difference between the supply volts, V , and the back e.m.f., B . If the armature resistance is R , the armature current I , $B = V - RI$. The back e.m.f. is proportional to the magnetic flow Φ and the speed N , constant $\times N\Phi$. Thus, if V and I

are constant and the field Φ is weakened, the speed increases. A shunt motor has a nearly constant speed; the field is across the mains and must be switched on first. The armature must be switched on through a resistance which is gradually cut out as the speed—and thus B —increases. The shunt motor thus does not start on load. As the load increases, the speed drops slightly and the current increases. The motor is protected against overload by a relay which opens the circuit at a maximum current value. The various precautions on starting (and re-starting) are taken care of in the usual motor-starters. In the series motor, the armature current is also the field current and on no load ($I = 0$, $V = \text{constant} \times N \times \phi$) the speed would become infinite. Series motors have a high starting torque and are eminently suited for traction purposes. A series motor is usually started by a controller (q.v.).

See H. Cotton, *Design of Electrical Machinery*, 1934; M. G. Say and E. N. Pink, *The Performance and Design of Alternating Current Machines*, 1943; A. E. Clayton, *The Performance and Design of Direct Current Machines*, 1945; A. J. Coker, *AC Motors and Control Gear*, 1945.

Electric Meters. Instruments for routine measurements of current, voltage, power, and energy. *Ammeters* and *voltmeters* are based on the same principles and are similar in design: the current in a fixed resistance is also a measure of the volt drop. The ammeter is always connected in series in the circuit in which the current is to be measured, the voltmeter is connected straight across the terminals between which the voltage is required. In the moving-coil M., a coil carrying the instrument current is pivoted in the field of a permanent magnet, the movement being controlled by springs which also serve as loads for the current. The deflection of the coil is proportional to the current. A pointer is fixed on the coil. The meter can only be used on d.c. The scale is uniform. The moving-iron meter has a pivoted iron vane carrying the pointer, the vane is attracted into a coil carrying the instrument current, with a force dependent on (current)². The meter can be used on both d.c. and a.c. The dynamometer, mainly used as voltmeter, has a fixed and a moving coil, both carrying the instrument current, and the deflection of the coil moving in the field of the fixed coil is thus independent of the direction of the current. The rectifier instrument is a combination of a circuit with 4 copper-oxide rectifiers and a moving-coil meter. The instrument is intended for use on a.c. and the scale graduation is in root-mean-square values (see ALTERNATING CURRENT) although the rectified values are mean values. When used on d.c. the scale readings are therefore too high by 11 per cent. In the hot-wire meter the expansion due to heating (RI^2) of the wire carrying the instrument current is trans. into deflection of a pivoted pointer. In the thermocouple meter the e.m.f. generated at the junction by heating due to the instrument current is

measured by a moving-coil meter. Both thermal instruments can be used on a.c. and d.c.; the latter is particularly suitable for weak h.f. currents. *Wattmeters* have a fixed coil taking the current in the circuit and a high-resistance volt coil connected to the supply terminals and moving in the field of the current coil. This type can be made to read accurately on both d.c. and a.c. In the induction wattmeter the current coil and the voltage coil are both wound on fixed iron cores set at an angle to one another. The (alternating) current field generates eddy currents in a pivoted spring-controlled disc, which interact with the voltage coil field, and

the equilibrium position of the disc depends on the product of the 2 fields. *Quantity meters* measure the quantity of electricity in a d.c. circuit, e.g. the ampere-hours (Ah) used in charging an accumulator (q.v.) or obtained on discharge. In one type, the fall of level of a solution of caustic soda in a graduated tube measures the electrolytic action of the current. The diagram shows a sketch of Ferranti's meter. HH is an electro-magnet with a steel core E. This forms a uniform field inside an iron ring HH, filled with mercury in contact with the electro-magnet only at a point A. A light fan C is suspended in the mercury. The current passes along E to the mercury through A, and then radially to the ring HH. This causes the mercury to rotate, taking the fan with it. The driving force varies as the (current)². The fluid resistance on the fan varies as the (speed)². Thus, the speed of the fan varies as the current, and the number of revolutions varies as the quantity of electricity.

In a d.c. circuit on constant voltage, the current is a measure also of power, and the quantity is a measure of energy. Hence quantity M. also serves as energy supply M. In a.c. supply, energy M. are mostly of the motor type, the rotating armature being

connected with a revolution counter. The field coils carry the whole current, the armature only a shunt current; a resisting torque varying as the speed of the armature is supplied by a 'brake disc.' The number of revolutions of the armature then measures the energy supplied. In the induction meter, both current and voltage coil are wound on fixed iron cores as in the induction wattmeter (see above), but the motion of the disc is not restricted, its revolutions are counted and give the number of watthours.

The range of an ammeter may be extended by means of extra shunts. These are often included in the instrument and extra terminals are provided, with indication of the factor with which the readings must be multiplied. The ranges of voltmeters are extended by high resistances in series.

OHMMETER

Standardisation of an ammeter is carried out by comparing the ammeter reading with a current-determination by measurement based on different principles. In the electrolytic method, using the silver voltameter, the measurement of current is reduced to the weighing of silver deposited and determination of time. In the Kelvin balance the attraction between coils through which a current is passing in opposite directions is measured against a mechanical force, and thus the current strength is measured. Voltmeter readings may be compared with the Weston cadmium standard cell, which has a voltage of 1.0186 V at 20° C, by means of a potentiometer (q.v.). Standard resistances are available, and with the help of these an ammeter can be standardised when a standard voltmeter is at hand, or *vice versa*. Resistance is usually measured on the Wheatstone bridge in its compact form of the P.O. box (see WHEATSTONE BRIDGE). For routine testing of insulation resistances of installations, etc., which normally are of the order of megohms (10⁶ ohms), the ohmmeter or 'megger' is used. The original form has 2 coils fixed with their axes at right angles, one in series with the unknown resistance X, the other, a high-resistance coil, across the 'supply'—a small hand-operated generator G, with permanent magnet field. At the intersection of the coil axes is pivoted a magnetic needle with a pointer. Turning the generator handle the needle is under the action of 2 forces

at right angles, one due to the volt coil, the other to the current, and takes up a position such that the tangent of the angle of deflection equals the ratio of the 2 forces, i.e. $V/I = X$ (see GALVANO-METER, *Moving-magnet*). In the modern Evershed-Vignoles megger, the 2 coils are fixed on a pivoted frame carrying the pointer and the magnet is fixed. The handle is provided with a slipping clutch.

Frequency meters for power-supply frequencies are mostly of the vibrating-reed type. A set of reeds of graded natural vibration frequencies are fixed at one end, the free ends facing the graduated glass scale at the front of the meter. When the whole system is electro-magnetically excited by connection to the supply, that reed vibrates whose natural frequency equals the supply frequency, and the vibrating end shows as a vertical band on the scale. The high frequencies used in radiocommunication are usually measured on a wavemeter (q.v.).

Electric Ray, see TORPEDO.

Electric Strength, a measure of the insulating quality of a slab of material, and proportional to the thickness of the slab. If a 1 cm. thick slab is placed between 2 electrodes and the voltage between them is gradually increased, the maximum voltage that can be applied without causing any puncture in the material is the E. S. expressed in V/cm. Amer. writers often use V/mil.

Electric Supply, supply of energy in electric form, has become a vital factor in the life of a developing country, a country with a rising standard of living. Development depends on increase in production, and as the increase in working pop. becomes stagnant, the lack must be made good by increased mechanisation. In a highly industrial country like Sweden, production increased between 1939 and 1953 by 52 per cent, the number of workers by 15 per cent, and industrial consumption of power by 102 per cent. For every worker employed, industry uses 20,000 kWh per annum as against 17,000 kWh in the U.S.A. and 7500 kWh in W. Germany. Similarly, the scarcity of domestic service has led to extensive mechanisation of the home. Domestic and other private consumption is nearly 1/4 of the total in Switzerland, Norway, and Sweden. Over-all consumption per inhab. is in

France . . .	1030 kWh per annum
Germany . . .	1100 " " "
Great Britain . . .	1500 " " "
Italy . . .	470 " " "
Norway . . .	5600 " " "
Sweden . . .	3200 " " "
Switzerland . . .	3000 " " "
U.S.A. . .	2850 " " "

Total consumption of E. energy in Europe and America rises by c. 6 per cent per annum—it doubles in 12 years. The basic need of a country is thus an adequate supply of energy, available at all times, at any place where it is to be utilised. Natural sources of energy are fuel and water-power. Rising prices and dwindling of resources urge economy in use of fuel, and exploitation of available water-power. Efficient use of fuel is possible only in modern large-scale plant; transport and distribution to individual consumers is wasteful—sometimes uncertain. Thus the problem of utilisation of natural resources, and of energy S., becomes a national problem, beyond the powers of the local independent authority. Both fuel and water-power are unevenly distributed. The table shows recent estimates of water-power resources (from the Swedish Association of Supply Companies).

pattern is, of course, somewhat different in other countries. In Sweden the bulk of water-power is in Norrland, the extreme N., from where at present 6 double-circuit 220 or 380 kV trunk lines run to mid-Sweden's industrial dists., there interconnected with the S. systems. All the W. European countries are interconnected, and exchange of E. energy takes place across the frontiers, though the system is not worked as a complete 'Grid' with central control. Connection with the Brit. Grid by submarine cable across the Channel would enable Great Britain to profit from connection with Fr. water-power stations. In the future, E. S. may become an international problem. See HYDROELECTRIC POWER; INTERCONNECTION; POWER STATIONS; GRID SYSTEM.

Electric Traction, application of E. power to driving of vehicles. The power may be generated on the vehicle itself by

	Installed power MW	Exploitable water-power, MW	
		at minimum flow	at average flow
Africa	920	184,000	630,000
Asia	11,000	114,000	636,000
Europe	40,300	46,900	162,000
North America	38,700	67,800	242,000
South America	3,050	46,100	460,000
Oceania	1,440	17,200	134,000
Total	95,110	476,000	2,264,000

Since neither water-power nor fuel is always found where it can be immediately utilised, it becomes necessary to convert the energy in the natural sources into some form suitable for transport and distribution to consumers. E. energy has the advantages, given a well-designed network and adequate primary energy, of being always available—on 'tap'—when and where wanted, requiring no storage, no handling, being easily turned into light, heat, motive power, or used for electrolytic processes, being easily distributed over the premises. From the suppliers' point of view, the advantages lie in effective adjustment to varying demand through central control, possibilities of automatic regulation, and of continuous supervision of the working of the system from the central control. It is significant that though fuel, transport, steel, copper, building, and wages have increased enormously in cost, the rise in price of the kWh is (in Great Britain) very small. In many countries nil. The problem of continuous supply of energy thus becomes a problem of constructing a transmission network linking up a number of suitably placed power stations (q.v.), and including regional substations from which distribution lines supply tns, industry, rural dists., and railways. Such is the 'Grid' (q.v.) in Great Britain. The

accumulators, as in the delivery vans, or by an internal-combustion engine, usually a Diesel, as in railcars and locomotives (q.v.). In both cases the motors are d.c. series motors. When power is obtained from the ordinary high-voltage 3-phase supply, it may be converted to d.c. by rotary converters or mercury-vapour rectifiers in substations along the track. The supply to the cars or trains is usually 600 V. for tramcars and general suburban lines, 1500 V. for suburban locomotives, and 3000 V. for longer-distance trains. At 600 V. the (series) motors are supplied at full voltage, at the higher voltages they are connected 2 and 2 in series. At the lower voltages the power may be supplied by a 2rd rail on which slides a contact shoe as collector, the track rails forming the return conductor. At higher voltages overhead lines are used. For trains, special suspension of the contact wire is needed to avoid sparking at the high speeds used. A 'catenary' wire is suspended from the pylons, and from the catenary the contact wire is suspended by a number of wires of unequal lengths, taking the sag of the catenary into account, so that the contact wire hangs horizontally and is nowhere rigidly supported. Sometimes an auxiliary wire is used, suspended horizontally from the catenary and carrying the contact wire.

The current-collector is usually a pantograph controlled by 2 sets of springs and a compressed-air cylinder and piston. The portion making contact with the wire is a graphite-greased aluminium bow. In a.c. traction systems the motors are usually single-phase commutator motors, the frequency is 16 $\frac{2}{3}$ or 25 c/s. The fuel supply voltage is carried by the contact wire and stepped down by transformers on the locomotive. Substations are thus avoided, and voltages up to 33 kV may be carried by the contact wire.

Experiments are in progress on the use of a.c. transmission at 50 c/s with germanium or mercury-vapour rectifiers on the locomotive supplying d.c. motors. In N. Italy there are sev. 3-phase systems of which the most notable is the Genoa-Milan railway, which employs 3000 V, 3-phase current, all of which is obtained from hydroelectric power stations.

Trolleybuses require 2 overhead lines, 1 for the supply and 1 for the return current, and consequently 2 trolleys. The wires are usually 4/0 S.W.G. hard-drawn copper. Ministry of Transport regulations stipulate that the supply line shall be completely insulated, the return line earthed at the station but otherwise insulated. Other paragraphs of the regulations specify the maximum permissible leakage current (0.01 A per m.), sectionalising of lines (0.5 m. maximum) and routine insulation testing. The supply is protected by circuit-breakers and over-current relay. The vehicle has usually 1 motor only, though some designs use 2, mounted forward or in the middle of the chassis. The motor power varies between 50 and 80 b.h.p. according to seating capacity (35-66) and wheel base (4 or 6 wheels). The motor is d.c. series-wound or, if regenerative braking is used, compound-wound. Some types use a series motor with double armature for series-parallel working. The voltage preferred in Great Britain is 500 V. A hand brake is always fitted and where regenerative braking is not used rheostatic or vacuum brakes are supplied. The trolleybus must be turned at the terminals, and where no loop circuit through adjoining streets can be provided, a turning circle must be made in the road. Some buses are provided with an accumulator battery for manoeuvring independently of the overhead for short stretches. A trolleybus was first used experimentally in the U.S.A. in 1882 and during 1900-12 various lines were operated both on the Continent and in England (Keighley, Bradford, Leeds). But the modern large-scale development in design and application dates from 1926, when the first 6-wheel double-deck buses with pneumatic tyres, built by Guy Motors Ltd., were put into operation in Wolverhampton. This system has remained the model of passenger transport service and was soon followed by replacements of trams by trolleybuses and installation of new routes in Great Britain, on the Continent, and overseas, earning for England the name of 'the Home of the Trolleybus.' Of all heavy

vehicles the trolleybus is the least noisy. Unlike the tramcar, it loads and unloads its passengers at the kerb and is not confined to a track, but can give way to other traffic. Unlike the petrol bus, it emits no fumes, its maintenance costs are low, since the smooth acceleration of the electric motor causes less wear than the jerky gear-changing, and the fire risk is low. Moreover, it constitutes a valuable load balancer on the E. power station. (See Brit. Standard Specification 173.)

Electric Waves, see ELECTROMAGNETIC WAVES.

Electric Welding, see WELDING.

Electric Wiring, see ELECTRICITY IN THE HOME.

Electrical Fume Precipitation, see FUME PRECIPITATION.

Electrical Units, see UNITS, ELECTRICAL. **Electricity, Atmospheric**. The occurrence of lightning and thunder shows that the atmosphere is in a state of electrification. This was shown by Franklin, and also by Dallard, some 150 years ago, using an ordinary kite. Subsequent investigation has shown that such a separation of electric charge, with its consequent electric field, is always present even in fine weather. The earth's vertical electric field (or potential gradient) is the quantity most easily measured, and it is found to vary diurnally and seasonally in a fairly regular way, and to vary irregularly with the local meteorological conditions. The older techniques measured it directly by allowing an exposed conductor at a known height above the earth's surface to attain the potential of its surroundings, which potential was then measured by means of a quadrant or capillary electrometer. More recently electrometer valves have been used as potential measuring devices, and radio-active conductors have been employed to improve the rate of attaining potential equilibrium, although serious errors are possible with such conductors, especially in windy conditions. A modern technique is to measure the surface charge density induced by the earth's potential gradient. A horizontal plate at the earth's surface is grounded through a resistance, and is successively covered and uncovered by an earthed screen. Alternating potentials occur across the resistance which can be amplified and detected in the usual way. This method does not give the sense of the earth's field unless a phase sensitive rectifier is used.

The normal 'fine weather field' of the earth is of the order of 100 volts/meter directed downwards, i.e. the earth's surface charge is negative. It is lower over the oceans than over land, is higher in foggy weather than in clear conditions, and decreases with altitude. On account of the presence of ions, caused by cosmic and solar radiation (see COSMIC RAYS), the atmosphere has a small but finite conductivity, and it is estimated that the total current flowing to the earth's surface

is about 1800 amperes. This current would neutralise the earth's surface charge in about 1 hr unless there were some other process tending to maintain the charge. It is thought that this reverse current is due to thunder-storm activity.

A typical thunder cloud is negatively charged at its base, and positively charged near its top. If it discharges to ground from its base the negative charge which is brought to the earth will tend to maintain the surface charge. The average current per storm centre has been found to be about 0.3 to 0.6 amperes, so that the continuous activity of some 4000 storm centres would be sufficient to maintain the surface charge. This figure is in good agreement with direct observations on the number of storm centres, and the diurnal variation of thunder-storm activity and the undisturbed potential gradient are closely related, both having a maximum about 18.00 G.M.T.

Many theories have been put forward to explain the mechanism of charge separation in thunder clouds. Some of these involve the breaking of falling water drops, whilst others consider the rain to carry downwards the ions on which its drops have condensed. No theory which is entirely satisfactory has yet been advanced, but that of Simpson and Scrase has achieved some success. It is known that if 2 similar insulators are rubbed together they acquire a negative charge, leaving the air positively charged. If the collisions between falling ice crystals showed this effect the negative charge would be carried to the base of the cloud as is observed. Although there is no direct experimental evidence that ice crystals can acquire a charge by such a collisional process, there is indirect confirmation in the facts that the region of maximum charge separation is at a temp. below the ice-point, and that exceptionally high fields are characteristic of polar blizzards. *See also* LIGHTNING; METEOROLOGY; THUNDER-STORM.

Atmospherics.—Owing to the very rapid growth of radio communication, the question of A. electrical disturbances and their minimisation is very important. Space is always agitated by electric disturbances, due to ionisation by the wind or the sun's rays, or by thunder-storms, with their electric discharges, or by cosmic ray effects. In tropical regions these 'atmospherics' or 'statics,' as they are called, become very prevalent, owing, no doubt, to the great heat of the sun. The disturbance itself is an impulse of E. of exceedingly short duration, and in a radio receiver gives rise to an unpleasant crackling and hissing sound. In the case of receiving signals which have to pass over large expanses of ocean, these static disturbances sometimes make reception impossible: were it not for these statics, trans-oceanic communication could be carried out on ordinary wave-lengths and on a power of 1 kilowatt. The interference can be eliminated to a certain extent by the use of well designed aerials (q.v.). Lightning used to be a very serious problem to the overhead trans-

mission engineer, but this interference has been overcome by the use of choke coils in series with the line, and also by surge absorbers which are large condensers and, as their name implies, absorb the resultant surge in a line when it is struck by lightning. *See* ATMOSPHERICS.

Electricity in the Home. Introduced first for lighting, electricity is now widely used also for domestic heating and cooking and for running an ever-increasing number of appliances such as radios, refrigerators, irons, vacuum cleaners, and razors.

Circuits.—Led into the building through a duct, the supply cable goes first to a sealed box containing the Authority's fuse. Thence the supply goes, via a meter, to the consumer's fuse box where it divides to form sev. circuits, each with its own fuse. There will generally be 1 5-amp. fuse for the lighting circuit, 1 30-amp. or 15-amp. fuse for the power circuit feeding 2- or 3-pin sockets on the walls, 1 30-amp. fuse for the cooker circuit, and perhaps others.

Fuses.—Electric current flowing through a wire generates heat. To avoid the risk of too high a current breaking down the insulation of the wiring and perhaps causing fire or shock, a fuse is inserted into each branch of the circuit so that all the current has to pass through a strand of wire of low melting point. If the current starts to exceed the safe level for that branch of the wiring, the fuse wire is heated to melting point and the circuit is thereby broken. Fuses in the consumer's box are easily replaced, the main switch being so arranged that the box cannot be opened until the switch is off. Some plugs are provided with fuses, and many electrical appliances have them

built in to avoid damage through short-circuiting.

Wiring.—The wire itself, usually of copper, is always insulated according to the current it is designed to carry by a rubber or polyvinyl chloride (plastics) sheath and sometimes also a sheath of asbestos and one of lead, to form the cable. This cable is led through the building, usually in steel tubing (conduit) concealed in chases cut in the walls or running under floors, over ceilings, etc., to the various switches and fittings. Switches are designed with a spring connection, so that the circuit is made or broken quickly and completely, avoiding sparking, overheating, and risk of fire; they are covered in to avoid any risk of shock, and any damaged cover should be replaced without delay. In bathrooms, where the human body may be wet and earthed through the plumbing system, electric shock would be especially dangerous, and extra precautions need to be taken; any switches should be either outside the bathroom or fixed in the ceiling and cord-operated. Fittings include the various devices for connecting the lamps, etc., to the cables, and for their support; the most familiar is the 'ceiling rose.' Heavy lamps or shades should not be hung from the cable or flex alone; they should be independently supported by chains or brackets.

Electric heaters.—The heating 'element,' whether in a cooker, a boiling ring, or an electric fire, is usually a long spiral of special wire supported in grooves in a fireclay block. This wire is bright and springy when new, but when heated by the current it blackens and becomes brittle; therefore it should not be poked about to obtain lights for spills, etc. Electric fires are now required by law to be equipped with safety guards.

Other electrical appliances are usually supplied with the makers' instructions for use, which should be carefully followed. Apart from replacing lamps, fuses, etc., it is generally unwise for the amateur to attempt his own repairs; the temptation to be satisfied with something less than thorough safety precautions is great. Apart from the risk of damage to expensive appliances, many fires have been caused in this way. The safest general rule is to consult a competent electrician when things go wrong. For minor faults in household systems, however, see **HOME-MAKING**; see also **ELECTRIC HEATING**; **ELECTRIC LAMPS**; **HEATING**; **LIGHTING**.

Electro-chemistry deals with chemical changes brought about by the expenditure of electrical energy, and with the production of electricity from the energy transformed during a chemical change. In this short article it will be impossible to deal with the theoretical questions of E. in more than brief outline. The methods of preparation of substances by means of electrolysis of solutions at moderate fusion temp. will be considered, and also some of the recent applications of electrical methods to chemical analysis and synthesis. For the refining of metals, electro-plating, electro-deposition, and

high-temp. furnaces, see **METALLURGY**. (For the production of electricity see **CELL**, **VOLTAIC**; **ACCUMULATOR**, etc.) There are 3 main methods by which electrical energy can be made to effect chemical changes.

(1) **By electrolysis of electrolytes.**—Solutions of salts, acids, and bases (e.g. alkalis) conduct electricity, at the same time undergoing decomposition into the metal and the acid radical, hydroxyl, or halogen; the metal being produced at the cathode and the acid radical at the anode. Water is the solvent generally employed, but for organic substances alcohol or benzene, etc., may be used. When hydrochloric acid is electrolysed, we have hydrogen liberated at the cathode and chlorine at the anode. Here the primary products of the action are liberated, i.e. H and Cl. Sometimes, however, these products react in the solution. This is the case with potassium hydroxide (KOH). The primary products are potassium and hydroxyl, but unless special methods of prevention are attempted, the products obtained are hydrogen and oxygen, the liberated potassium reacting on the solution at the cathode to give hydrogen according to the equation $2K + 2H_2O = 2KOH + H_2$, while the hydroxyl decomposes to water and O_2 . The H_2 and O_2 are called secondary products of electrolysis. Grotthuss (1805) evolved the theory that the current first decomposed the molecules of the electrolyte before electrolysis occurred, and this theory was universally accepted until 1887, when the results of Van't Hoff's work on osmotic pressure of solutions were pub. Van't Hoff showed that for dilute solutions the dissolved material is subject to laws similar to those governing the volume and pressure of gases, and as a result of this the theory of Grotthuss lost ground. Arrhenius (1887) advanced the theory of the dissociation of the electrolyte in solution into ions, i.e. atoms or groups of atoms carrying charges of positive and negative electricity. The dissociation is not brought about by the electric current, but the ions exist in the solution irrespective of whether a current flows or not. This theory, together with the discovery of the migration of the ions towards the electrodes, forms the basis of the modern explanations of electrolysis (see **SOLUTIONS**). The laws of Faraday state that the amount of decomposition is proportional to the quantity of electricity passed through the solution. Losses by secondary reactions may reduce this theoretical yield and hence the current efficiency of a cell is expressed in terms of the proportion of the actual yield to the theoretical. Again, when an electrolyte is being decomposed by an electric current, a counter e.m.f. is set up in the decomposition cell, and hence the effective e.m.f. is the difference between the total and the counter e.m.f. In order, therefore, to produce an electrolytic deposit the decomposing current must have a higher e.m.f. than that which is set up in the decomposition cell. Thus $E - e = CR$, where e is the counter

e.m.f. and R is the total resistance. Also

$R = \frac{d}{a} \times \text{specific resistance of the electrolyte}$, where d and a are the distance apart and the area of the electrodes respectively. For economical working the resistance R must be made as low as possible, therefore the electrodes are set as closely as working conditions permit and are of large area. The specific resistance must also be kept low and this is found to diminish with rise of temp. in the solution, and with increase of the strength of the solution (within certain limits).

Electrodes and cells.—The negative electrode at which the metal is liberated may be of iron, lead, or copper, while the positive electrode may be carbon, platinum, or platinum-iridium alloy with 15 per cent iridium. Cells are made of various materials dependent on the nature of the solution. Wooden cells coated with pitch are used with acid liquors, or lead tanks in the case of H_2SO_4 , while stoneware is used for alkaline solutions. Some few processes and technical cells will now be described.

Sodium by Castner's process.—The method consists in the electrolysis of fused sodium hydroxide, contained in an iron pot. The products of the electrolysis are oxygen, hydrogen, and sodium. The sodium floats on the surface of the molten caustic and is removed from time to time with a perforated ladle which allows the caustic to drain through. The escape of oxygen and hydrogen in this process represents so much waste electrical energy, and attempts have been made to obtain the metal from the fused chloride. Borchers's apparatus is then used, which consists of a U-tube made in 2 parts, a narrow limb of iron and a broad limb of fireclay. The narrow limb itself is anode, and the sodium produced there flows down a side pipe to a receiver. The chlorine evolved at the anode is led by a pipe to a receiver and used for the manuf. of bleach. The practical difficulties to overcome when using the fused chloride are serious, owing to the higher temp. required and also to the corrosive action of the liberated chlorine.

Brine cells.—The first products of the electrolysis of brine are chlorine at the anode and alkali hydroxide at the cathode. If these products are required they must not be allowed to mix; while if hypochlorite, chlorate, or perchlorate are required, the chlorine and hydroxide must be allowed to react with one another.

Castner's process.—A rectangular tank is used, which is divided into 3 compartments by 2 non-porous partitions dipping into narrow gutters of mercury which cross the bottom of the tank. The 2 outside tanks contain brine, in which are gas carbon anodes, while the centre one contains water and an iron grid, which acts as the cathode. The alkali metal is electrolysed into the mercury in the anode compartments, and is electrolysed out in the cathode compartment. In the cathode compartment the mercury amalgam acts as the anode and hydroxide is formed. The whole cell is slowly rocked,

causing the mercury to flow from one compartment to another, and so the liberated alkali metal is brought into contact with the water. The chlorine is led off by tubes at the top of the anode compartments to bleach chambers. With a 30 per cent solution at $40^\circ C.$, and a current density of

ELECTRO-CHEMISTRY: CASTNER'S PROCESS

1 ampere per sq. cm., the current yield of hydroxide is 90 per cent.

Margreaves-Bird cell.—This consists of a cast-iron box, divided into 3 compartments by 2 asbestos diaphragms made in copper gauze, which forms the cathode. The anode compartment through which brine circulates is the space between the diaphragms, and the anode is a row of gas carbons. No liquid is in the cathode compartment except that which percolates through the diaphragm. Carbon dioxide and steam are blown through the 2 outer compartments and convert the hydroxide formed on the diaphragm to sodium carbonate.

Hypochlorite cells.—Of these the Kellver cell is one of the simplest. It consists of a glazed stoneware vessel divided into compartments by glass plates which fit into grooves on the side of the cell, and around which is wound platinum-iridium wire. These form the cathode on one side of the plate and the anode on the other. The solution enters through holes in the bottom of the cell and the liberated chlorine and hydroxide react to give hypochlorite which flows out at the top of the cell in a cooling vessel. The solution is treated in the same manner several times until the strength is great enough.

Chlorate cells.—These do not differ materially from hypochlorite cells. Earlier cells, however, used a diaphragm to prevent reduction of the hypochlorite from which the chlorate is produced. Reduction can be avoided now by the use of potassium chromate without the use of a diaphragm. The solution flows continuously through the cell, the flow being regulated so that the temp. is about $50^\circ C.$ The percentage of chlorate in the solution is about 3 per cent, and it is crystallised out in cooling vats. Similar cells are used for perchlorates; no description of a special cell has been pub.

Oxygen and hydrogen. Simple electrolysis of acidulated or alkaline water yields oxygen and hydrogen. Cells are used with iron electrodes placed close together. An e.m.f. of 2½ volts is generally used, and the gases are drawn off under hoods or bells and compressed into cylinders. Many other chemical substances are now prepared by electrolytic methods, e.g. persulphates, sodium, peroxide, and organic compounds.

(2) *By electrical discharges through gases.* The fixation of nitrogen by means of electricity has claimed much attention during recent years. When an electric spark is passed through air, nitric oxide is the main product. The reaction is a reversible one, but owing to the researches of Nernst and Haber the conditions for the reaction $N_2 + O_2 \rightleftharpoons 2NO$ are well known. It was found that the best yield of nitric oxide is obtained by using a cool high tension arc and reduced pressure, so that little decomposition of the gas takes place. Electrical plants have been established in Germany, where air is treated at the rate of about 75,000 litres per min., the yield of nitric acid obtained being 57 grams per kilowatt hr. The production of ozone from oxygen is illustrated in the Siemens-Halske ozoniser. In this, air is subjected to the action of a silent electrical discharge (actually pressures of over 4000 volts are employed) after being dried with calcium chloride. The ozonised air is then used for the sterilisation of water by forcing it against a stream of water to be treated, as it drops down a tower.

(3) *By the production of high temperatures (Electrothermal).*—Various electric furnaces have been designed towards this end (see METALLURGY). Carborundum, calcium carbide, graphite (from anthracite), carbon disulphide, and steel (from pig iron) are made by reactions effected by the heat produced in electrothermal reactions. Other applications of electricity include the settling of dust in gases and the drying of peat, by using the principle of electro-osmosis (see OSMOSIS).

Electro-chemical analysis.—Four different methods of quantitative analysis are in use, viz.: (1) potential measurements for determining the concentrations of ions too dilute for gravimetric calculation; (2) conductivity measurements for determining concentrations; (3) titration with a galvanometer in place of an ordinary indicator; and (4) ordinary electroanalysis in which the metal is deposited on a platinum electrode and weighed. The electrolytic method is widely employed, and consists in depositing by electrolysis the substance to be determined on one of the electrodes in a form that can be easily weighed. Metals are deposited in the pure state on the cathode or amalgamated with a mercury cathode. Lead and manganese are deposited as peroxide on the anode. Using a silver anode, chlorine, bromine, and iodine may be obtained and weighed as chloride, bromide, or iodide of silver. See H. J. S. Sand, *Electro-chemistry and Electro-chemical Analysis*, 1939-41.

Electro-chronograph, see CHRONOGRAPH. **Electrocution**, method of inflicting the death penalty by means of a high voltage current passed through the body. First used in U.S.A. in 1888, it is supposed to be less revolting than any other form of capital punishment (q.v.).

Electrode Boilers, see FURNACES.

Electro-deposition, see ELECTRO-METALLURGY.

Electrolysis. When an electric current is caused to flow through certain liquids they undergo chemical change, their components being chemically separated. Faraday called this phenomenon of decomposition by the electric current 'electrolysis,' and the liquid conductors which show it he called 'electrolytes.' The conduction of the current in an electrolytic solution is accompanied by a migratory movement of the parts of the dissolved substance. These parts are called 'ions,' those moving in the direction of the positive current being the 'cations,' or positive ions, and those in the opposite direction the 'anions,' or negative ions. The solid conductors by which the current passes into the solution are termed 'electrodes.' The electrode toward which the cation moves is named the 'cathode,' that toward which the anion moves the 'anode.' E. was first studied by Nicholson and Carlisle in 1800. They found that platinum wires dipping in water became covered in bubbles when attached to the poles of a primitive electric cell, the Volta Pile. Hydrogen was evolved at the negative pole, the cathode, and oxygen at the positive pole, the anode, the volume of hydrogen being twice that of oxygen. The processes involved are conveniently considered in terms of the electrolysis of copper sulphate, see also ELECTRO-CHEMISTRY. Thus, suppose some copper sulphate is dissolved in water and placed between copper electrodes. The mere act of solution causes the appearance of ions of copper, i.e. atoms which are charged with positive electricity, and sulphate ions carrying negative charge. These ions are moving about freely. If a current of electricity is now passed through the solution, the copper ions move towards the cathode, and on arrival there the charge is neutralised by the negative charge at the cathode. They thus become electrically neutral, and are identical with ordinary copper. The metal therefore deposits on the cathode. Similarly, the sulphate ions move to the anode, where neutralisation of charge takes place. Now the sulphate radicle is incapable of separate existence, so the copper of the anode is immediately attacked, giving rise to copper sulphate, which passes into solution. If the same experiment is done using platinum electrodes, copper is deposited at the cathode as before, but the liberated sulphate radicle immediately attacks the water present to form sulphuric acid and oxygen. Faraday showed that when sev. cells of acidulated water were placed in series and a current passed through, the amount of chemical action was the same in each, even if the electrodes in the various cells were of different metals and of different sizes. He also passed the current through 1 cell, and then through 2 in parallel. The amount of chemical decomposition in the first cell was equal to the sum of that in the other 2. Faraday therefore framed his first law, which states that 'the mass of any substance liberated during electrolysis is proportional to the quantity of electricity which passes.' Thus

an apparatus for the decomposition of water can be used to measure quantity of electricity. Such an apparatus is called a *voltameter*. Faraday then examined the amounts of different metals deposited from their solution by the same current and formed his second law, that *'the masses of different substances liberated by a given quantity of electricity are proportional to the chemical equivalent weights of the substances.'* The amount in grammes of a substance which is deposited by a current of 1 ampere flowing for 1 sec. is called the electro-chemical equivalent of the substance. The ratio of the electro-chemical equivalents of two substances is the same as that of their chemical equivalents.

It has been shown experimentally that Ohm's law is obeyed by electrolytes. The electrolytic cell is placed in the 4th arm of a Wheatstone bridge (q.v.). Owing to

CAPILLARY ELECTROMETER

polarisation a direct current cannot be used. But if an alternating current is used the effects of polarisation are overcome, because the gas deposited on an electrode by the passage of electricity in one direction is immediately removed by its passage in the opposite direction. An ordinary galvanometer cannot be used to detect an alternating current. A telephone is used instead. An alternating current of suitable frequency produces in the telephone a buzzing sound which is a minimum when the current is a minimum. The alternating current is obtained from an oscillator. It is found that for very dilute solutions the conductivity (reciprocal of the resistance) is proportional to the concentration.

Theory of voltaic cell.—The source of energy of a voltaic cell is the chemical action. For example, in a Daniell cell there is a solution of zinc in sulphuric acid and liberation of copper from copper sulphate. Energy is evolved in the first action and absorbed in the second. The difference goes to provide energy for maintaining the current and doing external work. The work done by a cell giving a current i is Eit where E is the e.m.f. and t the time. If we know the electro-chemical equivalents of zinc and copper we can determine the amount of zinc dissolved and the amount of copper

deposited in time, t , by a current, i . A knowledge of chemistry gives us the data for the amount of energy evolved by the solution of this amount of zinc and deposition of this amount of copper. Thus it is possible to calculate E , and values obtained agree closely with those observed. The exact seat of the potential difference was debated by physicists for years. Volta located it at the junction of dissimilar metals. Faraday at the junction of the metal and electrolyte. It has been shown by experiment that there is a potential difference between the metal and electrolyte. One instrument used is the capillary electrometer (see fig.). It consists of a glass tube, D , drawn out to a fine capillary tube at E . This tube, D , is partially filled with mercury and dips into the electrolyte in a vessel, C . In the bottom of the vessel is placed some mercury, B , which is connected to one terminal of a cell. The mercury in D is connected to the other terminal of the cell. Thus an e.m.f. is applied in the surface between the mercury and the electrolyte. This e.m.f. is adjustable. The surface tension of the area of contact of the mercury and solution at E is affected by its electrical state, as e.g. when a current crosses the interface. There is a certain e.m.f. due to the contact of these liquids. As the applied e.m.f. is gradually increased, having the mercury in D at a lower potential than the electrolyte, the surface tension of this layer increases, and the mercury in D must be raised to keep the level of mercury in E the same. This is viewed through a microscope, A . As the applied e.m.f. is increased the level in D must be raised till it reaches a maximum, and then it has to be lowered again. The value of the applied e.m.f. at the turning point of the level of mercury in D is equal and opposite to the contact e.m.f. between mercury and the electrolyte. The result of experiments with this electrometer favours the view that the e.m.f. of a cell is the sum of the contact differences of potential between its electrodes and the acid. Polarisation can be explained on this contact potential theory. If the electrodes are platinum and the electrolyte sulphuric acid, hydrogen forms a film on the cathode, and oxygen a film on the anode. The difference of potential of the film of hydrogen and the acid is greater than that between the acid and oxygen. Thus a current tends to flow in the opposite direction to the direct current. See ELECTRO-CHEMISTRY; ELECTRO-METALLURGY; PHYSICAL CONSTANTS.

Electrolytic Cells, see ELECTRO-CHEMISTRY; ELECTROLYSIS.

Electromagnetic Induction, see INDUCTION, ELECTROMAGNETIC.

Electromagnetic Waves consist of associated variations of electric and magnetic fields. They are called, in order of increasing frequency or decreasing wavelength, radio waves, heat rays, light rays, ultra-violet rays, X-rays, and gamma rays (q.v.). The first relation between electricity and magnetism was estab. by Oersted in 1820. He noticed that when an electric current was made to flow

through a wire a nearby compass needle, initially parallel to the wire, was deflected. Eleven years later Faraday discovered that an electric current could be induced in a circuit by moving a magnet near it such that the magnetic flux through the circuit was changed. Maxwell (1831-79) was convinced that Faraday was right in his belief that the dielectric (q.v.) is the true seat of electric phenomena. When an electric field is set up in a dielectric, the molecular electric dipoles tend to orient themselves along the field, i.e. the dielectric becomes polarised. Thus a change of field is associated with a displacement of electricity within the dielectric. Maxwell considered that this 'displacement current,' as he called it, would have the same magnetic properties as the current in a conductor. He went further and assumed that space was filled with 'incompressible electricity' which could suffer an electric displacement, i.e. that a displacement current could flow even in a vacuum. The displacement current can be shown to be equal to the rate of change of electric displacement (q.v.) and this concept does not demand that a model of space should be constructed in the simple manner used by Maxwell.

The important concept of displacement current opened the way for the formulation of Maxwell's equations which summarise the essential relations between electric and magnetic fields. For a medium of dielectric constant ϵ , and magnetic permeability μ , in which there is no conduction of electricity and no accumulation of electric charge, the equations take the form:

$$\left. \begin{aligned} \epsilon \frac{\partial E_x}{\partial t} - \frac{\partial H_z}{\partial y} - \frac{\partial H_y}{\partial z} \\ \epsilon \frac{\partial E_y}{\partial t} - \frac{\partial H_z}{\partial z} - \frac{\partial H_x}{\partial x} \\ \epsilon \frac{\partial E_z}{\partial t} - \frac{\partial H_y}{\partial x} - \frac{\partial H_x}{\partial y} \end{aligned} \right\} \dots \text{Equ. 1}$$

$$\left. \begin{aligned} -\mu \frac{\partial H_x}{\partial t} - \frac{\partial E_z}{\partial y} - \frac{\partial E_y}{\partial z} \\ -\mu \frac{\partial H_y}{\partial t} - \frac{\partial E_z}{\partial z} - \frac{\partial E_x}{\partial x} \\ -\mu \frac{\partial H_z}{\partial t} - \frac{\partial E_y}{\partial x} - \frac{\partial E_x}{\partial y} \end{aligned} \right\} \dots \text{Equ. 2}$$

$$\frac{\partial}{\partial x} (\epsilon E_x) + \frac{\partial}{\partial y} (\epsilon E_y) + \frac{\partial}{\partial z} (\epsilon E_z) = 0 \dots \text{Equ. 3}$$

$$\frac{\partial}{\partial x} (\mu H_x) + \frac{\partial}{\partial y} (\mu H_y) + \frac{\partial}{\partial z} (\mu H_z) = 0 \dots \text{Equ. 4}$$

FIG. 1

where E_x, E_y, E_z and H_x, H_y, H_z are the components of the electric and magnetic fields along 3 mutually perpendicular directions x, y , and z . In equation 1 the terms $\partial E/\partial t$ represent the displacement current which produces a magnetic field, and if the material carries an 'ordinary' current of density j units of current per unit area the left hand sides must include further terms $4\pi j_x, 4\pi j_y$, and $4\pi j_z$ respectively. Equation 2 expresses Faraday's law of induced electromotive force. Equation 3 is the mathematical equivalent of Gauss's theorem in electrostatics, and for a charge density ρ within the material the right-hand side equals $4\pi\rho$. Equation 4 expresses Gauss's theorem in magnetism, and indicates that free magnetic poles do not exist. The constant c is the ratio of the magnitudes of the electromagnetic and electrostatic units of current.

Maxwell showed in 1862 that a medium with properties expressed by these 4 equations would be capable of transmitting transverse waves with a velocity of $c/\sqrt{\epsilon\mu}$. For a vacuum ϵ and μ are

FIG. 2

equal to unity and the velocity is c . Maxwell remarked that the ratio of the units, c , 'agrees so exactly with the velocity of light calculated from the optical experiments of M. Fizeau, that we can scarcely avoid the inference that light consists in the transverse undulations of the same medium, which is the cause of electric and magnetic phenomena.' This inference is now universally accepted although the 'medium' is not now regarded as essential in the unsophisticated sense considered by Maxwell (see *ETHER*). It is sufficient to state that a periodic variation of electric field at a point in space is associated with a corresponding variation of magnetic field at right angles to it, and that this electromagnetic disturbance or wave travels with the same velocity as that of light.

Experiments by Hertz.—About 13 years after Maxwell pub. his theory, Hertz made known the fact that he had produced and detected electro-magnetic waves, and also that their velocity was approximately that of light. It can be shown that the discharge of an electrified system of capacity C through a circuit of self-induction L is oscillatory and of period $2\pi\sqrt{LC}$. The oscillations, however, rapidly die away. It is known that a vibrating tuning fork held near an open pipe will throw the air column into vibration, and elicit a note from the pipe if the length is adjusted so that its period

is the same as that of the fork (see **RESONANCE**). In a similar way an oscillating discharge in a circuit will produce an electric oscillation in another circuit which possesses the same periodic time. Hertz used the same principle to detect E. W. Fig. 2 shows the simple vibrator used by him. It consists of 2 brass plates, A and B, to each of which is attached a stiff wire carrying a brass knob. These are gilt and placed about 2 or 3 millimetres apart, so that when A and B are oppositely electrified a spark passes. Electric oscillation is set up, the spark passing back and forth from A to B. The frequency of oscillation in Hertz's experiment was about 30 million cycles per sec. At each passage of the charge, induced currents appear in neighbouring conductors, and if the periodic time of oscillation in one of these should happen to be the same as that of the vibrator, the oscillations induced in it will become multiplied,

FIG. 3

and may attain considerable intensity. The resonator made by Hertz (Fig. 3) consisted simply of a circle of wire, the ends terminating in brass knobs, whose distance apart could be adjusted. The length of the wire was such that its period was the same as that of the vibrator. When the vibrator is in action the induced current swings backwards and forwards in the circle from one knob to the other, and finally attains such a strength that sparking actually occurs between the knobs. For testing the laws of reflection and refraction of waves Hertz used more delicate apparatus. He concentrated the radiation by use of zinc reflectors bent to the shape of parabolic mirrors. By connecting the knobs of the vibrator to an induction coil continuous sparking takes place. There is then no need for the plates A and B. The resonator was a similar pair of knobs placed at the focus of a parabolic mirror. With this apparatus he proved that E. W. are reflected from the walls of a room. He also had a huge prism made of pitch, and found that the waves were refracted by it. He determined the index of refraction and found it to be 1.69. The index of refraction of pitch for light waves is between 1.5 and 1.6. The discrepancy is due to the fact that the wave length for the E. W. used was very great compared to that of light, and an agreement can hardly be expected.

Hertz placed the receiver in front of a huge sheet of zinc, from which waves from the vibrator were being reflected. By investigating the field in front of the zinc with his resonator he showed that stationary waves were being produced. He was able to find the wave length of the disturbance for a known period of the vibrator. Thus he found the velocity of the E. W. and found that it was approximately that of light. He also demonstrated the polarisation of these waves; in fact they behave in all ways like light waves. All these experiments of Hertz go to support Maxwell's theory in a striking way. Practical application of Hertz's results has been made by Marconi and others in wireless telegraphy (q.v.). See RADIOCOMMUNICATION; RADIO WAVES; PROPAGATION.

Electro-metallurgy, broadly speaking, is the application of electricity to metallurgical processes; hence in its widest sense it is often applied to processes in which electricity is used merely as a source of heat to motivate purely chemical or physical reactions, e.g. the electric arc furnace for steel-making and electric welding. More correctly the term should be limited to electrolytic processes.

Electro-deposition embraces the electrolytic extraction of a metal from its salts, either molten, e.g. aluminium, or in aqueous solution, as in electro-plating and its specialised application electro-forming. In order to understand the principles of electro-deposition, consider the case of silver. When silver nitrate is dissolved in water it ionises into the positively charged silver ion and the negatively charged nitrate ion. If 2 pieces of metal, to act as electrodes, say a spoon connected to the negative terminal of a battery and a piece of sheet silver connected to the positive terminal, are immersed in the solution, the current will begin to flow in at the piece of silver, through the solution and out again at the spoon. The spoon, being the negative electrode, is called the cathode, and the piece of silver, being positive, is the anode. As the current flows the silver ions are attracted to the cathode, pick up their missing electrons, and become silver metal which deposits on the spoon. The nitrate ions migrate to the anode, give up their excess electrons, and then react with the water to form nitric acid and release bubbles of oxygen from it. At the same time some of the silver from the sheet-silver electrode dissolves and keeps the silver-nitrate content of the solution constant. In electro-plating the nature of the plate can be governed quite widely from mat to shiny and from strongly adherent to crumbly by control of the condition of the bath, e.g. composition, acidity, temp., presence of certain 'addition agents,' current density, etc. Some metals which give a good bright, non-tarnishing finish to the basis metal of the article to be plated do not adhere very well to it, and also being porous may allow moisture to permeate through and set up corrosion which eventually causes the plate to strip off. A case in point is chromium plate

on steel. To overcome this difficulty layers of one or more metals which supply the missing properties are deposited first, e.g. copper first on steel for adhesion, then a layer of nickel for corrosion protection, and finally chromium for its non-tarnishing lustre. Alloys may be deposited by electrolysis a solution of the mixed salts of the component metals, e.g. brass can be plated out from a mixed copper and zinc solution. The same principles apply to the electrolysis of molten salts. In the case of bauxite dissolved in cryolite, a very heavy current is required because of the high energy of association binding aluminium and oxygen together. Electroforming is the reproduction of any surface, metallic or otherwise, by electro-deposition methods. An example is the copying of the 'master' gramophone record in order to be able to mould thousands of replicas for sale. To do this the master of wax is coated with a very fine metallic powder to render it conducting. It is then made the cathode in a bath of copper sulphate, a plate of copper being the anode, and a current passed until the copper which plates out on the disk is thick enough. Next the wax is stripped off and the copper negative used to make, by similar plating processes, a hard steel negative in the form of a die. Two such dies, one with the obverse and the other the reverse recording, are then placed in a press where the resinous material of which the final record is made is heated to the plastic state, pressed and cooled, and becomes the positive replica of the original wax recording. In electrotyping the same principle is applied for the formation of a copper printing medium from a wax or plastic original (see further PRINTING).

Electrometer, instrument for the accurate measurement of electric potential (q.v.).

Attracted disk electrometer (Fig. 1) consists of a metal disk, S, which is supported

FIG. 1

by 3 fine springs, so that it lies slightly above the plane of a guard ring, AB. The function of this ring is to keep the surface charge density on S constant, and thus avoid errors usually connected with edges of conductors. Another metal disk, CD, is placed on an insulating stand and parallel to S. It can be moved nearer to S by means of a micrometer screw. In using the instrument the guard ring and disk are connected to earth, and are thus at zero potential. The disk CD is connected to the conductor whose potential is required and the disk S is consequently attracted towards CD. The disk CD is moved until the disk S is

in the plane of AB. The distance, d , between S and CD can be read off on the micrometer screw. The force, f , required to bring S into the place of AB is determined, when CD is absent, by placing known weights on S. It can be proved that if V is the potential of CD, $V = \sqrt{\frac{8\pi f}{A}}$ where A is the area of the disk S.

Thus V can be determined.

Quadrant electrometer.—This E. was devised by Lord Kelvin and is extremely sensitive. In the simple form a light aluminium disk (called the needle) is supported in a horizontal position by a metal-coated quartz fibre (Fig. 2). Any

FIG. 2

force tending to displace the needle is opposed by the torsion in this fibre. A shallow metal box divided into 4 quadrants, A, B, C, D, surrounds the needle. Each of the quadrants is supported on an insulating pillar. Opposite quadrants are connected together. When the needle is in equilibrium and the quadrants uncharged, it lies over the junction line between 2 quadrants. The needle is charged to a high potential. It still lies over the junction line as before. Any deflection of the needle is noted by the reflection of light from a small mirror attached to it, which reflects the light on to a scale. The position of the spot of light is observed when the needle is in equilibrium. If one pair of quadrants is put to earth and the other connected to the body whose potential is required, the deflection of the spot of light is proportional to the potential. If the opposite pairs of quadrants are connected to 2 sources of potential, V_1 and V_2 , and if V_0 is that of the needle, which must be great compared to V_1 and V_2 , the deflection of the needle is approximately proportional to $V_0 (V_1 - V_2)$. Thus if the deflection is noted for a known difference of potential, a difference of potential producing any other deflection can be ascertained.

Lindemann electrometer, a small and very sensitive instrument, essentially a modified quadrant E. The suspension is a taut horizontal quartz fibre carrying a

short glass 'needle.' The quadrants are in a vertical plane and enclose the needle.

String electrometer.—Two very thin platinum wires hang together and are joined at their lower ends to a retaining 'spring' of quartz. Parallel to them are placed stout wires, connected to earth. The potential is applied to the platinum wires and they separate, in the same way as the leaves of the gold-leaf electroscope (q.v.). They are observed by a microscope.

See ELECTROSTATICS; ELECTROSCOPE; POTENTIAL, ELECTRIC.

Electromotive Force (e.m.f.). see CURRENT ELECTRICITY—*Electromotive Force and Resistance.*

Electron. the elementary corpuscle of negative electricity. Plücker (1859) showed that when an electric discharge took place in evacuated tubes, rays were given off from the cathode. Sir J. J. Thomson (1897) showed that these cathode rays (q.v.) were composed of fast-moving particles carrying negative charge. By the application of a magnetic field they could be deflected, but could be brought back again under the action of an electric field at right angles to the magnetic field. The ratio of the charge of an E. to its mass (e/m) was calculated from these experiments. The value of e was found by Townsend and C. T. R. Wilson by experiments on the condensation of water on charged nuclei when sudden expansion was allowed to take place (see WILSON CLOUD CHAMBER) and more accurately by Millikan, who balanced the weights of small charged droplets of oil or mercury against the forces exerted upon them by an electric field of known strength (see OIL DROP EXPERIMENT). A more accurate method is obtained from measurements with X-rays (q.v.).

E.s. are produced by a number of physical processes; by high voltage discharges in gases at low pressures; by heating metals or certain oxides to near-incandescence (see THERMIONICS AND THERMIONIC VALVES); by illuminating metal surfaces with ultra-violet or ordinary light (see PHOTOELECTRIC EFFECT); by irradiating substances with X-rays (q.v.); by radioactive disintegrations of nuclei (see BETA PARTICLES); and by the conversion of a gamma-ray (q.v.) near a nucleus into a negative E. and a positive E., i.e. a positron (q.v.).

Fast E.s. are known as beta-particles and have a greater mass than that of an electron at rest (m_0), as given by the relativistic relation $m = m_0/\sqrt{1-v^2/c^2}$, where m is the mass at a velocity v , and c is the velocity of light. E.s. are found in atoms (q.v.) and have definite energies which were taken by Bohr to be associated with definite orbits about the nucleus. Transitions from one energy level to another are accompanied by the emission or absorption of light quanta or X-rays. The rest mass of the electron is $9 \cdot 109 \cdot 10^{-31}$ g., and its charge is $4 \cdot 803 \cdot 10^{-10}$ electrostatic units of charge.

See R. A. Millikan, *Electrons (+ and -)*, *Protons, Photons, Neutrons, and Cosmic Rays*, 1935.

Electron Microscope. When a large wave on the surface of the sea meets one of the piles of a pier it can be observed to divide as it passes the pile, and then to recombine and pass on with its form practically unchanged. On the other hand, ripples of waves of short wave-length are reflected or are broken up into a pattern when they meet such objects, so that whereas it would be impossible to deduce anything about the shapes or positions of the piles by observations of large waves that had passed between them, the ripples carry with them implicit information about the obstructions. This behaviour is typical of other waves besides those on the surface of water, and waves that meet an object do not provide useful information about it unless their wave-lengths are comparable with, or smaller than, the dimensions of the object. Ordinary light consists of waves whose wave-length is about 1 twenty-millionth of an in., and there is thus a natural limit to the size of the smallest objects that can be examined with an ordinary microscope, no matter how well designed and constructed it may be. By using ultra-violet radiation (i.e. radiation of shorter wave-length than that of light of the visible spectrum) somewhat smaller objects can be observed, but the improvement is not great.

During the 3rd decade of the present century it was found that E.s. (and other material particles) possess many of the attributes of a wave motion, although in many respects they behave also as particles. The waves associated with them are peculiar in that their lengths depend upon the masses of the particles and upon their speeds, the wave-length decreasing as the speed increases. It is, moreover, a simple matter in the laboratory to accelerate E.s. to such speeds that their waves are much shorter than those of light. If, therefore, it is possible to cause E.s. to follow curved paths, in the same way as a beam of light is bent or refracted in passing from one medium to another, it should be possible to use E. waves in a microscope in the way light is used in an ordinary microscope, and at the same time avoid the limitations which the wave-length of light imposes. E.s., however, are charged particles, so a beam of moving E.s. can be refracted by an electrostatic or magnetic field, and if the field is of suitable shape and intensity it serves as an E. lens in the same way as a glass lens does with light waves. At the present time magnetic lenses are preferred to electrostatic for most purposes, but either can be used. The usual type of E. microscope works as follows. A beam of E.s. is produced in a cathode ray tube and accelerated to a high speed by the use of a high voltage. The beam passes through a 'lens' which concentrates it upon the specimen, whose thickness must be sufficiently small to permit most of the E.s. to pass through without excessive scattering. The lens is a shield of mild steel surrounding a magnetising coil, and ending in specially shaped pole pieces which thus constitute a short concentrated

magnetic field. The beam of E.s emerging from the specimen passes through a lens that acts as the objective lens of the M. and produces a magnified image, and thence through a projection lens whose function is to form a yet more magnified image on a photographic plate. After development this shows the structure of the object in terms of its E. density. Since collisions with air molecules would interfere with the paths of the E.s the E. M. must be evacuated. This is a disadvantage since it makes the apparatus more elaborate and makes it difficult to use specimens that

playing 'digital' methods and those using 'continuous variable' or 'analogue' methods. E. digital computers perform arithmetical operations on numbers represented by sequences of pulses usually in the scale of 2. Their mechanical ancestor is the abacus (q.v.), still used in the Far East. Modern E. machines work at a pulse repetition rate of up to 4,000,000 pulses per sec. and incorporate 'memory units,' better known as 'stores,' which enable information and instructions to be stored, referred to, and modified at E. speeds. This facility makes it possible

THE ELLIOTT 402 COMPUTER

are liable to damage during drying (e.g. biological material). The complexity and expensiveness of the apparatus are further disadvantages, but the E. M. is nevertheless a very useful instrument since it provides the means for examining objects far smaller than the smallest of those that can be seen in the best optical microscopes, and magnifications up to about 100,000 are attainable.

See R. W. G. Wyckoff, *Electron Microscopy: Technique and Applications*, 1949; V. E. Cosslett, *Practical Electron Microscopy*, 1951; C. E. Hall, *Introduction to Electron Microscopy*, 1953.

Electron Volt, a unit of energy frequently used in atomic physics. It is the energy acquired by an E. when it moves between 2 points at a potential difference of 1 V. One E. V. is equal to 1.60203×10^{-12} erg. An electromagnetic quantum, e.g. a gamma-ray (q.v.), of 1 MeV. (million eV.) energy has a wavelength of 1.2396×10^{-10} cm. or 0.012395 Angström unit.

Electronic Computation. E. computing machines fall into 2 classes: those em-

ploying 'digital' methods and those using 'continuous variable' or 'analogue' methods. E. digital computers perform arithmetical operations on numbers represented by sequences of pulses usually in the scale of 2. Their mechanical ancestor is the abacus (q.v.), still used in the Far East. Modern E. machines work at a pulse repetition rate of up to 4,000,000 pulses per sec. and incorporate 'memory units,' better known as 'stores,' which enable information and instructions to be stored, referred to, and modified at E. speeds. This facility makes it possible for them to organise the details of their own activity as calculation proceeds. Usually in these machines numbers are equivalent in length to about 10 decimal places, but larger numbers can be handled by refined programming techniques. In some respects they resemble human brains but the popular term 'electronic brain' is a misnomer, since they rely for their intelligence upon the human being who prepares the programme of operating instructions for the job in hand. Analogue computers rely on the measurement of some physical quantity, such as length or voltage, and are used where speed is more important than accuracy. Typical mechanical prototypes are the slide rule (q.v.) and the mechanical differential analyser (q.v.). Most analogue computers rely mainly on the fact that the voltage across a resistance is proportional to the current flowing, while that across a capacitance is proportional to the time-integral of current. Voltages representing variables can thus be added, integrated, and so forth, according to the equation to be solved, and the solution is provided in

the form of a graph, recorder chart, or cathode-ray tube. Present-day instruments can produce sev. thousand solutions per sec., so that the effect of changing equation parameters is readily and quickly observable. Computers in Brit. offices are growing in number; one such machine calculates the pay-roll for 10,000 employees in about 4 hrs, replacing 37 full-time clerks using ordinary office machinery. See also AUTOMATION.

Electronic Engraving, invention which challenges orthodox methods of engraving plates for printing. It usually works by photo-electric cells and eliminates the acid method. The general scheme is to have 2 frames, either cylindrical or flat, the drawing or photograph to be reproduced being placed on one and the plate to be engraved on the other. A scanning arm actuated by electronic devices travels over the original and causes the blank plate to be engraved with a facsimile, the product being ready for printing. The models in operation include: The *Elgrama* (Elgrama Ltd., Zürich) uses zinc or copper plates for half-tones and colour plates, and plastic for line blocks. Plates up to 16½ in. by 11½ in. can be produced in 13 different screens with from 50 to 200 lines per in.; there are 8 colour shades between black and white. The *Elgrama* is equipped with 2 cylinders, one for the original and one for the blank, and a block roughly 11½ in. by 8½ in. takes about half an hr to produce. The *Klischograph* (Dr-Ing lt. Hell, Kiel, Germany) mounts the original face downwards on to a glass plate with a sheet of thermo-plastic face upwards underneath, the picture being scanned from beneath by a light beam. Photo-electric cells pick up the reflections, which are transmitted to the engraving head. A maximum size plate (8 in. by 6 in.) takes 18 min. to produce. The *Scan-a-Graver* (Fairchild Graphic Equipment Inc., Jamaica, N.Y.) uses 2 cylinders. The console model provides for a maximum size plate, 12 in. by 8 in., and there are available 4 screens, 65-120 line. A smaller model, the *Cadet*, working on the same principle, offers screens of 65 and 85 line only. It will produce a plate 8 in. by 6 in. in about half an hr. A development is called the *Scan-a-Sizer*, its advantage being that it can enlarge or reduce 4 times and handles a plate 16½ in. by 13 in. A fourth machine, the *Luxograph* (Minceel & Co., Paris), was for a time on the market, but information from the makers states that it has been acquired by the Fairchild organisation and incorporated with the *Scan-a-Graver*. The result may be a new and improved design, but of this no details are available.

The great advantage of E. E. is the speed with which plates are produced. Mainly for this reason E. E. machines have been installed in newspaper offices, including *The Times*, and they are of special value in country towns situated some distance from the nearest process-engraving works.

Electronic Theory of Organic Chemistry. Prior to 1930, organic chem. was viewed in

the light of Rutherford's nucleus atom and of the Lewis-Langmuir theory of valency. As the structure of the atom became more completely known, electronic theories of Lapworth, Robinson, and Lowry were put forward to explain the reactions of organic compounds, and these theories have been expanded or modified, notably by Ingold and Dewar. These theories are based on the displacement of electrons in a molecule. In organic chem., bonds of a mainly covalent character are dealt with, and if atoms or groups are not identical, then the nucleus of one of the atoms will exert a stronger influence on the bond electrons than will the other. This indicates a permanent polarisation represented in the dipole moment (q.v.), e.g.

This influence is propagated along the chain in the direction of the arrow although its effect on the β -atom is reduced and is almost negligible on the γ -atom, e.g.

This permanent effect of electron displacement is the *inductive effect*. Hydrogen is chosen as reference for measurement of relative inductive effects, and any atom or group that attracts electrons more strongly than hydrogen has a $-I$ effect (electron-attracting), such as the NO_2 group, halogens and phenyl (C_6H_5) group. If the attraction for electrons is less than that for hydrogen, the atom or group has a $+I$ effect (electron-repelling), such as alkyl groups. The inductive effect explains why dichloroacetic acid is more acidic than the monochloro derivative and why this is more acidic than iso-butyric acid. Chlorine atoms are electron-attracting and the withdrawal of electrons is thus greater in the dichloro than in the monochloro compound. The acidic hydrogen atom thus becomes more positive in dichloroacetic acid and consequently the compound becomes more acidic, since the acidity is due to the hydrogen ion.

The methyl groups, being electron-repelling, tend to make the H atom of the carboxyl group less positive, so preventing its ionisation to a large extent, with consequent reduction in acidity.

The second method of electron displacement involves the successive and complete transfer of 2 electrons from a double bond to a neighbouring atom, and this *electromeric effect* can be transmitted along a conjugated chain giving rise to activated molecules. The effect is only temporary but is brought about instantaneously and then only at the demand of the attacking reagent.

e.g. $\text{>C} \overset{1}{=}\overset{2}{\text{C}}-\overset{3}{\text{C}}=\overset{4}{\text{C}}$ becomes

The curved arrows indicate the direction of the electron transfer, and if the system is activated throughout, the electrical charges will be strongest at the ends of the chain. Hence the reaction of such a system as above with, say, HBr, i.e. H^+ and Br^- ions, will give a product in which the H^+ is attracted to carbon atom number 4 and the Br^- to carbon atom 1.

The third type of electron displacement is connected with the theory of *resonance* or *mesomerism*. This theory was developed on chemical grounds since it has been found that no structural formula can explain all the properties of certain compounds. For example, aldehydes and ketones (q.v.) can be represented as

but experimental work has shown the carbonyl group ($\text{>C} = \text{O}$) to possess a certain amount of polar character, i.e.

This has been explained by resonance, and the structure of the carbonyl group which describes all the properties of that group cannot be represented pictorially but must be considered as intermediate between the non-polar and dipolar structures, i.e. a resonance hybrid of these 2 structures, viz.:

These electron displacement effects have helped to explain much in organic chem., e.g. reactions of aldehydes and ketones, aromatic substitution, and the mechanism of many molecular rearrangements.

Electronics is a branch of electrical engineering dealing with the theory, design, and application of apparatus based on flow of electrons outside ordinary conductors in which Ohm's law is valid, i.e. in vacuum, gases, vapours, certain crystals, and semi-conductors. The prin. devices are the thermionic valve and its offspring, the cathode-ray tube and electron microscope, the X-ray tube, the photocell, and the transistor (semi-conductor). The main applications are in telecommunications, in measurement technique, rectifiers, analysis, control and regulation, computers, recording, and medical science.

Electroosmosis, see ELECTROPHORESIS.

Electrophoresis, sometimes termed cataphoresis. If solid particles, liquid drops, or gas bubbles are present in a liquid, and are so small that they settle out slowly or not at all, then, when electrodes are introduced into the liquid, a movement of the particles occurs, and they travel towards one or other of the electrodes. The direction and speed of motion depend upon the existence of electric charges at the surfaces of the particles, and hence upon the nature of the particles. The phenomenon is called E., and is used for the separation of particles or large molecules, e.g. proteins, from others that are generally similar. A related phenomenon is that of *electroosmosis*. If electrodes are placed at each end of a tube containing liquid, and the tube has a porous plug of solid material somewhere within it, charging the electrodes causes liquid to flow through the plug towards one or other of the electrodes. On reversing the polarity of the electrodes the flow is reversed. Similarly, if the liquid is forced through the plug by mechanical pressure a difference of electrical potential is set up between electrodes placed in contact with the ends of the plug. This potential difference is called the streaming potential.

Electrophorus, the simplest of influence or electrostatic induction machines. It consists of a disk or 'cake' of resin, or some other material easily excited, A, and a polished metal plate, B, with an insulating handle, CD. The metal plate should be slightly smaller in diameter than the resin disk. The latter is electrified by striking it with dry flannel or fur. The metal plate is then placed upon it. The plate will not touch the disk except at a few points, and there will be almost no conduction of charge from A to B, because resin is an insulator. Between most of the surface of the plate and that of the disk there will be a thin film of air. Thus B will be electrified by induction (q.v.), that is, positive electricity will appear on the face of B near to A, and negative electricity on the face farther away. If the metal plate is now touched with the finger, the negative charge will be con-

ducted away, but the positive charge will be 'held in position' by the charge at A. Thus on removing the plate it will be found to have a positive charge. Another and more satisfactory explanation is in terms of potential. When B is placed upon A it is given a negative potential because of the nearby negative charge of A—other nearby objects are assumed to be earthed or uncharged. On connecting B to earth its potential changes from negative to zero, and to do this it must

ELECTROPHORUS

lose negative charge. But B was originally uncharged and therefore finally it has a positive charge. B can be charged by this method many times without appreciably altering the charge on A. A is often fitted into a shallow metal vessel, called the sole, which increases the utility of the arrangement. See ELECTROSTATICS; INDUCTION, ELECTROSTATIC; POTENTIAL, ELECTRIC; ELECTROSTATIC MACHINES.

Electro-plating and Electro-refining, see ELECTRO-METALLURGY.

Electroscope, an instrument used for the detection of electric charge or the difference of potential. One of the simplest forms, as used by Cavendish, consists of 2 pith balls on silk threads attached to the

GOLD LEAF ELECTROSCOPE

same point of suspension. They are at first attracted to a charged object, but after touching it and sharing its charges they are repelled and repel each other. A much more sensitive instrument consists of 2 gold or aluminium leaves, A, suspended from a brass rod, C. This rod terminates in a disk, D, after having passed through an insulating plug, F. Thus A, C, and D form one conductor, which is well insulated. The leaves, A, are sometimes surrounded by a cylinder of wire gauze, B. In some instruments this is replaced by strips of foil placed on the glass vessel surrounding the leaves. When the leaves are electrified, they repel each other to an angle which depends on the potential difference between the leaves and the wire gauze. These instruments are suitable for qualitative work, but an electrometer (q.v.) is essential for quantitative measurements. See ELECTROSTATICS; ELECTROMETER; POTENTIAL, ELECTRIC.

Electrostatic Machines produce high voltages, but relatively small currents, by the application of the principle of induction (q.v.) and the phenomenon of point discharge. An *electrophorus* (q.v.) is the simplest machine, allowing any number of charges to be produced from a charged plate without diminution of the charge on the plate. The *Wimshurst machine* consists of 2 vertical parallel disks of varnished glass or ebonite arranged to rotate in opposite directions. In the figure the disks are drawn with different diameters to facilitate the illustration of the action of the machine, but in practice they are usually the same size. A number of strips of tinfoil (T) are attached to the outer faces of the disks. Fixed conductors, terminating in brushes pressing against the disks, ensure that the strip of tinfoil opposite the brushes is in electrical contact with a strip at the opposite end of the diameter on the same disk. Consider a positive charge on a strip 1A of tinfoil on disk A. When it comes opposite the strip 1B on disk B touched by the brushes, it induces a negative charge on that strip and a positive charge on the diametrically opposite strip 2B, with which 1B is in momentary contact. As the disk rotates, the strips 1B and 2B leave the brushes and remain negatively and positively charged respectively. These charges are collected on 2 Leyden jar (q.v.) condensers (L) by means of metal combs (C), which have pointed teeth situated a short distance from the tinfoil strips on the rotating plates. The action of the combs depends on E. induction, which produces an opposite charge on the points and in consequence a high electric field which leads to point discharge. Before the charged strip 1B reaches the collecting combs, it comes opposite the strip 5A (say) which is joined to the diametrically opposite strip 6A, and induction again takes place with similar results, i.e. 5A and 6A leave the brushes with a positive and negative charge respectively. These charges are also collected on the appropriate combs. The 2 Leyden jars

are usually connected to brass knobs (S) a few cms. apart, and voltages up to 50,000 volts can be obtained sufficient to cause spark discharges between the knobs to take place. See VAN DE GRAAF MACHINE.

WIMSHURST MACHINE

Electrostatics. A Gk philosopher, Thales, who lived about 600 BC, discovered that amber, when rubbed, acquired the property of attracting light substances, such as pieces of pith or cork. Towards the end of the 16th cent. Wm Gilbert (q.v.) found that this property was also possessed by many other substances, such as sulphur and glass. All such phenomena are studied under the science of electricity, the name being derived from the Gk word for amber. E. is that part of the study which deals with electricity in equilibrium. Gilbert's work was followed up by Robert Boyle, who added to the list of electrics. In 1729 Stephen Gray discovered the properties of insulators and conductors. If an electrified piece of sulphur is laid on another piece of sulphur it retains its electricity for some time. The same thing occurs if it is suspended by a piece of dry silk thread. If, however, it is rubbed gently with a damp cloth, or with the hand, or touched all over with a piece of metal foil, it loses its charge. The sulphur and dry silk thread are called insulators, whilst the hand, the damp cloth, and the metal foil are conductors. If a metal rod is held in the hand and rubbed with a dry cloth, no electrification apparently takes place, but if the metal rod has an ebonite handle by which it is held, the rod becomes electrified on rubbing. In the first case electricity is produced on the metal, but it is immediately conducted away by the hand. In the second case the ebonite handle, which is an insulator, prevents the electricity escaping. Whilst Gray was pursuing his researches in England,

scientists on the Continent were busy making and perfecting electrical friction machines and condensers, and about this time the Leyden jar (q.v.) was first used. It was during this period also that Charles Dufay discovered that there were two kinds of electrification. This can be estab. as follows: A wire stirrup is suspended by means of a dry silk thread. In the stirrup a rod of glass or ebonite can be suspended after it has been electrified. Electrify one end of an ebonite rod by rubbing it with a piece of dry flannel, and suspend it in the stirrup so that it hangs in a horizontal position. Now electrify another rod of ebonite by rubbing it with flannel and bring it near the electrified end of the suspended rod. The latter is repelled. Now electrify a piece of glass by rubbing it with dry silk, and bring it near the suspended ebonite. The latter is attracted. However, 2 pieces of electrified glass repel each other. These experiments show that there are 2 different kinds of electrification produced on the ebonite and glass. Dufay called the electricity produced on the ebonite 'resinous' or negative (-), and that produced on the glass 'vitreous' or positive (+). If the flannel and silk are very dry it is found that, after rubbing, the former attracts the suspended ebonite rod whilst the latter repels it. This shows that when a piece of ebonite is rubbed with flannel the ebonite becomes negatively electrified whilst the flannel becomes positively electrified. In the case of glass and silk, the glass becomes positively electrified and the silk negatively electrified. These experiments led to the proposition of the 2-fluid theory. All unelectrified bodies were supposed to contain vast equal quantities of vitreous and resinous fluids. When a body was electrified, it was supposed to gain an additional quantity of one fluid, and lose an equal quantity of the other, so that the total amount of fluid did not alter. In later years Benjamin Franklin (1706-90) maintained the existence of one fluid only, which unelectrified bodies possess in a certain normal amount. A positively charged body has more, a negatively charged body less, than this normal amount. Franklin also used a Leyden jar (q.v.) to show that the energy of an electrical condenser is stored in the dielectric (q.v.; see also CAPACITOR). On the basis of these and other experiments, Michael Faraday (1791-1867) and James Clerk Maxwell (1831-79) made important theoretical advances. John Canton (1718-72) was the first to discover the phenomenon of electric induction (q.v.). Charles A. de Coulomb (1736-1806) and Henry Cavendish (1731-1810) investigated independently the law of electric attraction and repulsion, and at the beginning of the 19th cent. Faraday first began to make quantitative measurements.

The discovery of the electron (q.v.) in the last few years of the 19th cent. opened the way for a restatement of explanations of electrostatic phenomena. Faraday had recognised that ordinary atoms were

possessed of equal quantities of positive and negative electricity. The phenomenon of electrolysis had suggested to C. J. Stoney in 1874 that a definite unit of charge could be identified. Helmholtz (1881) and Lodge (1885) saw the importance of this 'smallest known particle of electricity,' which was termed the 'electron' by Stoney in 1891. On this theory a negatively charged body has more electrons than it possesses in its usual neutral state, and a positively charged body has a deficiency of electrons. Insulators do not allow a flow of electrons within their bulk, but conductors do.

Variation of electric force with distance.—It was shown by Franz Aepinus (1724-1802) that the electric force between

FIG. 1

2 charged bodies diminishes as the distance increases. Coulomb, who made experiments with a torsion balance of his own invention, was the first to publish evidence that the force varies inversely as the square of the distance between the electrified bodies. Coulomb experimented first on the couple required to produce a twist in a wire, and found that the couple is proportional to the angle of twist and that for a given twist the couple varies as the 4th power of the diameter of the wire. Coulomb's balance consists of a small gilded pith ball, A (Fig. 1), placed at one extremity of an arm, ABC, of shellac. This arm is suspended by a very fine silver wire, so that it hangs in a horizontal position. At the top of the silver wire is a graduated screw, so that the wire can be subjected to a known twist. A second ball, E, is suspended by an insulating rod, so that it just touches A. The whole apparatus is placed within a cylindrical glass case. The ball A is then charged, and E brought up to it. When they touch the charge is shared between them and they repel each other. E is fixed, so

the rod ABC is twisted through an angle, α (Fig. 2). The wire is now given a known twist, γ . The rod ABC takes up another position, making a different angle, β , with its original position. Knowing these 2 angles, the distance between the balls can be ascertained and the force between them is known from the twist given to the wire. The final twist in the wire is $(\beta + \gamma)$. The original twist was α . Suppose now γ be made such that the distance, d , between the balls is halved, it will be found that $(\beta + \gamma)$ is 4 times α ; if the distance d is reduced to $\frac{1}{2}d$, $(\beta + \gamma)$ will be 9 times α , and so on. Since the force between the balls varies directly as the twist in the wire, it must vary inversely as the square of the distance between them. Coulomb was thus able to show that this law was approximately if not absolutely true. Cavendish employed another method of testing the inverse square law. It can be shown mathematically that if the inverse square law does hold, then there is no electric field

FIG. 2

inside a uniformly charged conducting sphere. If the power is anything except the inverse square then there is an electric field within the sphere and hence an electric charge. Cavendish took a conducting globe and supported it on an insulating stand. He then enclosed the globe in 2 hemispherical conducting shells, which fitted exactly together to form a spherical shell without anywhere touching the globe. He then made connection between the globe and the shell by means of a wire pushed through a hole in the shell, and charged the shell, afterwards removing the wire by means of a silk thread in such a way that the shell was not discharged. He then removed the hemispherical shells and tested the inner globe for a charge. For this test he used 2 pith balls which were suspended side by side. He found that the globe was uncharged, and so demonstrated that there was no electric field inside a charged conducting sphere, and also that the charge of a conductor resides on the surface. Thus he deduced that the inverse square law held.

Electricity as a measurable quantity.—Most of the preceding experiments have been qualitative. But we can speak of giving an insulated conductor a definite amount of electricity just as we can speak

of pouring a definite amount of water into a leakproof vessel. The following ice-pail experiments, due to Faraday, justify the use of the term 'quantity of electricity.' Faraday placed a pewter ice-pail, A (Fig. 3), on an insulating stand, C, and connected the outside to a gold-leaf electroscope, D. A charged metal ball, B, was then lowered into the pail by means of a silk thread. As it approached, the leaves of the electroscope (q.v.) gradually diverged. The divergence attained a maximum when B was well inside the pail. On moving B about inside the pail, it was found that the divergence of the leaves did not alter. Another uncharged ball was lowered into the pail and allowed to share the charge on B. Still the deflection was unaltered. Finally, the balls were allowed to touch the inside of the pail. The deflection of the leaves did not change. On drawing the balls out again they were

FIG. 3

found to be uncharged. It is thus concluded that the divergence of the leaves depends on something which remains constant however the ball is moved about inside A. This something we shall call a quantity of electricity, and this quantity remains constant, not depending on the position or nature of the charged body. Having accepted the idea of quantity of electricity, we can show that the induced charge (see INDUCTION, ELECTROSTATIC) on the inside of the vessel is equal and opposite to the inducing charge, because when the ball touched the inside of the vessel the quantity on the outside, as indicated by the electroscope, did not change. Again, the charge on the inside of the vessel must be equal and opposite to that on the outside, since, if the ball were taken out before touching the inside, the pail would be uncharged and the leaves would collapse. It should be emphasised that the deflection of the gold-leaf electroscope indicates the difference of potential (q.v.) between the leaves and the case. However, the potential of the leaves is proportional to the charge applied to them and the associated apparatus.

Unit of quantity.—The electrostatic unit (e.s.u.) of quantity of electricity is defined as that quantity which, when

placed on a small particle 1 cm. from a similarly charged particle, repels it with unit force (1 dyne), the particles supposed to be in a vacuum. The practical unit is the coulomb = 3×10^9 e.s.u. It can be proved by means of the torsion balance that the force between 2 charges, e_1, e_2 , is proportional to their product. Thus if f be the force and r the distance between the charges e_1 and e_2 , $f = \frac{e_1 e_2}{K r^2}$ (where K is the specific inductive capacity, q.v., which has unit value for vacuum).

FIG. 4

Electric intensity.—The electric intensity at a point in an electric field is the force in dynes which would be exerted on a small particle charged with unit positive quantity of electricity and placed at the point. It is a vector quantity.

Gauss's theorem.—Suppose we have an imaginary surface, S, surrounding a charge e , at O (Fig. 4). Consider a small element of area a at AB (say). Let N be the electric intensity normal to AB. Then Gauss's theorem states that the sum of all the products aN (or ΣaN , as it is written) is equal to $4\pi e$. If AB is small, the intensity of N over it can be taken as uniform and acts along BO, and is equal to $\frac{e}{OB^2}$. With centre O and radius OB draw a sphere cutting OA in R

FIG. 5

(Fig. 5). The intensity normal to AB is then $\frac{e}{OB^2} \times \cos \angle RBA$. The product of the area and this intensity is $(\text{area } AB \times \frac{e}{OB^2} \times \cos \angle RBA)$. This is equal to $(\text{area } BR \times \frac{e}{OB^2})$, since area BR is equal to $(\text{area } AB \times \cos \angle RBA)$. With centre O describe any sphere cutting OA in P and OB in Q (Fig. 5). Then area PQ : area RB = $OQ^2 : OB^2$. Therefore area $BR \times \frac{e}{OB^2}$

= area $PQ \times \frac{e}{OP^2}$. This holds for all such elements, AB . Thus $\Sigma \Delta N$ is the same for the sphere as for the imaginary area S . But for the sphere N is constant and equal to $\frac{e}{OP^2}$ and $\Sigma \Delta$ is equal to $4\pi OP^2$. Therefore for any surface S surrounding O the product $\Sigma \Delta N$ is equal to $4\pi e$. The proof can be extended to any number of charges. It can similarly be proved that $\Sigma \Delta N$ for surfaces not surrounding the charge is zero.

Intensity at a point, P , outside a charged conducting sphere.—Through P draw a sphere normal to OP (Fig. 6). The intensity normal to this sphere is everywhere the same and equal to that at P (f say). Thus

FIG. 6

$\Sigma \Delta N$ is equal to $f \times 4\pi OP^2$, and this is equal to $4\pi e \therefore f = \frac{e}{OP^2}$. If σ is the surface charge density on the sphere, the charge e is $4\pi(OP)^2 \times \sigma$. The intensity at a point very near the sphere is then $\frac{e}{OP^2} = 4\pi\sigma$. This is Coulomb's law. Thus the conducting sphere acts as external points as if its charge were concentrated at the centre. Therefore the potential at a point indefinitely near the sphere, and therefore that of the sphere itself, is $\frac{e}{r}$ (r is the radius).

Capacitance of a conductor.—When a charge e is given to a conductor, initially at zero potential, it acquires a potential V . The ratio e/V is found to be constant for a given conductor in a given relation to other objects and is known as the capacitance of the conductor. From the discussion above, the potential of an isolated conducting sphere carrying a charge e is e/r , where r is the radius. Hence its capacitance e/V is equal to r . The cm. is the e.s.u. of capacitance. The practical unit is the farad which is the capacitance of a conductor the potential of which rises by 1 volt when it receives a charge of 1 coulomb. See CAPACITANCE; CAPACITOR.

Energy of a system.—Suppose a sphere is initially uncharged and a charge, E , is brought up to it in very small amounts, e . Suppose at any time the potential of the sphere were V . The work done in bringing up a charge e would be eV . The potential would be raised to V_1 (say). The work in the next instalment would be eV_1 . Represented graphically we get a

diagram as shown (Fig. 7). The total work done is represented by the sum of the areas of all the vertical strips. If e is made very small, the sum of these strips approximates to the area OPQ , i.e. it is $\frac{1}{2}EV$ (where E is the total charge and V the final potential). The energy of a sphere is therefore $\frac{E^2}{2C}$, i.e. $\frac{1}{2}E^2/C$ or $\frac{1}{2}CV^2$ where C is the capacitance.

Lines and tubes of force.—A line drawn such that its direction at any point is in the direction of the intensity at that point

FIG. 7

is called a line of force. If a tubular region of space be imagined as bounded by lines of force it may be called a tube of force or a Faraday tube. The lines of force from a positively charged sphere are shown (Fig. 8). The dotted lines are lines of equipotential. An equipotential line is one which passes through all points of the same potential.

FIG. 8

See also ELECTROMETER; ELECTROPHORUS; ELECTROSCOPE; INDUCTION; ELECTROSTATIC; LEYDEN JAR; POTENTIAL; ELECTRIC; DIELECTRIC; ELECTROSTATIC MACHINES; VAN DE GRAAFF MACHINE. References for further reading are given under ELECTRICITY AND MAGNETISM.

Electro-technical Industries, see CHRONOGRAPH.

Electro-therapy. Static E. as developed by the Wimshurst machine, galvanic E.,

usually obtained from about 40 Leclanché or bichromate cells yielding about 60 volts, and faradic E. as produced by a simple form of induction coil are all used in the interests of medicine. Electricity may be used to produce physiological effects, as when it is applied to the skin, and when 1 electrode is applied to the spine and the other to a muscle. In the first case the sensory surfaces are affected, a pricking and burning sensation being produced and the skin made red, showing increased vascularity. The second action is on the motor apparatus and causes the muscles to contract as the current is made and broken. During the First World War, and subsequently, sinusoidal currents were employed, rapid ones to stimulate relaxed muscles and slow sinusoidal current to restore paralysed muscles. Again, when a broad plate electrode is applied to any part of the body, and the other electrode, consisting of a platinum or steel needle, is inserted into a tumour (say), and a current measured in milliamperes ($\frac{1}{1000}$ of an ampere, this being the unit used in E.) passed, an electrolytic effect will be obtained and the tissue will be decomposed. If the platinum electrode be positive the surrounding tissue will condense and contract round it; if it be negative then the tissue will break up into a loose frothy material. Some nervous and muscular diseases can be diagnosed with the aid of galvanic and faradic currents. Certain diseases of the spinal cord and the cerebro-spinal nerves alter the normal action of the muscles under the electric current. These abnormal effects are referred to as 'reactions of degeneration.' For the treatment of disease the 3 forms of current are used: the static for nervous disorders, e.g. neuralgia; the galvanic for acute neuralgia, atrophy of the muscles, diabetes, joints enlarged and stiffened by rheumatism, tonsillitis, etc.; and the faradic for nervous exhaustion accompanied by insomnia, functional disorders of the generative organs, acute rheumatism, neurasthenia, and other diseases. By passing a suitable current between electrodes applied to appropriate parts of the body, a heating effect is produced, which may act as a sedative to pain, or may stimulate repair of broken-down tissues. Such diathermic treatment is used also for fibrosis of the limbs, empyema, and tuberculous bones.

Electrically produced rays, ultra-violet and X-rays are used separately and in conjunction. (See CANCER: X-RAYS; ULTRA-VIOLET RAYS.) The body itself produces electric currents, and those of the heart are utilised in the diagnosis of cardiac diseases by means of an instrument known as the electrocardiograph. The electric currents produced by the brain are recorded by the electroencephalograph, and this instrument is used in the diagnosis of diseases of the brain, being particularly useful in the diagnosis of epilepsy (q.v.). In conclusion it might be said that belts, rings, and all other contrivances which are advertised as having an electric or magnetic

action only cure in proportion to the faith of the wearer. They have no electrical effect, and if they had, the irregularity of their action and the lack of control of direction of the current would render them very uncertain. The so-called magnetic belts are worse than useless, since it is not known that even the most powerful magnets have any influence on the bodily functions. Electromagnets are occasionally used to extract from tissues small pieces of steel, e.g. broken needle points. See H. Morris, *Medical Electricity for Massage Students*, 4th ed. 1953.

Electrotropism, a very poorly investigated subject dealing with the sensitiveness of plant organs to the action of electric currents. If a plant be grown so that its roots dip into a liquid through which a current is passing, then some of the roots will incline to the anode and some to the cathode, thus showing the acquirement of polarity. See TROPISM.

Electrotyping, see ELEKTRO-METALLURGY; PRINTING.

Electrum had 2 meanings in antiquity: (1) a mixture of gold and silver; (2) amber. In the former sense it occurs in Sophocles's *Antigone*, where mention is made of Indian gold and the 'Electrum of Sardis' as objects of the highest value. This is the native E., but it was also made artificially, and, according to Pliny, E. contained gold and silver in the proportion 4 : 1. It was used for plate and also for money, and coins are still in existence of this metal struck by the kings of Bosphorus, by Syracuse, and by other Gk states.

Electuary (Gk *ekleichen*, to lick out), a term used in medicine for a method of prescribing powdered drugs mixed into a paste with honey or syrup and originally meant to be licked off the spoon. A typical example is compound confection of gualacum, commonly known as Chelsea Pensioner, which is used as a remedy for constipation and rheumatic pains.

Elegit, a writ ordering the seizure of a debtor's land to satisfy a judgment. See EXECUTION.

Elegy (Gk *elepos*) appears to have meant originally a song to flute accompaniment. In anct Gk and Rom. times the term was applied to any poem in elegiac metre, i.e. in alternate hexameters and pentameters. It was not confined to laments, but embraced the warlike poems of Tyrtæus, the love poems of Minnervnus, and the gnomic or reflective verse of Solon and Theognis, all authors of the 7th or 6th cent. BC. It was also used for the poetry of the Alexandrian age, notably that of Callimachus, and 2 famous dirges, Bion's lament for Adonis and Moschus's lament for Bion. The Rom. poets followed Alexandrian fashions and used elegiac metre extensively. Propertius, Tibullus, and Ovid used it for amatory verse, and the last-named also employed it in his *Fasti*, a series of poems on the Rom. calendar, and his letters from exile. Later the use of the form became still more general, and in the 5th cent. AD Rutilius Namatianus wrote in elegiac

verse describing his journey from Rome to France.

In Eng. literature the term E. is applied to a mournful poem or lament, usually for the death of some particular person. Famous examples are Spenser's *Astrophel*, 1586, for Sir Philip Sidney; Milton's *Lycidas*, 1637, for Edward King; Shelley's *Adonais*, 1821, for Keats; and Matthew Arnold's *Thyrsis*, 1867, for A. H. Clough. All these employ the pastoral convention used in Moschus's lament for Bion. Two very famous Eng. E.s which fall outside this pattern are Gray's *Elegy in a Country Churchyard*, 1750, a meditative poem which has a general application, and the personal but also philosophical and religious *In Memoriam*, 1850, which Tennyson wrote in tribute to Arthur Hallam. See C. M. Bowra, *Early Greek Elegists*, 1938; M. Lloyd, *Elegies, Ancient and Modern*, 1903.

Element is any substance which, as far as our knowledge extends, is composed entirely of atoms of identical or almost identical chemical properties (though not necessarily identical in structure—see ISOTOPES). In other words an E. is a substance which up to the present has not been split up into portions possessing different chemical properties. E.s used to be classified as metals and non-metals, and arsenic, boron, bromine, carbon, chlorine, fluorine, hydrogen, iodine, nitrogen, oxygen, phosphorus, selenium, silicon, sulphur, and tellurium; but this list was increased by the discovery of argon, helium, krypton, etc., and in any case, because of the merging of non-metals into metals by stages which make this classification difficult and arbitrary, the periodic system of Mendeleev, as modified in the light of modern knowledge of atomic structure, has been generally adopted (see CHEMISTRY). Most of the E.s, except those of the argon group which are only found free, are usually found as compounds, although carbon, copper, gold, hydrogen, nitrogen, oxygen, silver, and sulphur are found in considerable quantities in their free state. The term E. could formerly be applied in only a tentative manner to any form of matter, because with the advance of science it was always possible that some substance once regarded as an E. might be found to consist of simpler forms, e.g. didymium was found to consist of neodymium and praseodymium. The following is a list of the E.s with their symbols (q.v.), and approximate atomic weights:

Element.	Sym- bol.	Approx. At. Wt.	At. No.
Actinium . . .	Ac	229	89
Aluminium . . .	Al	27	13
Americium . . .	Am	243	95
Antimony . . .	Sb	122	51
(stibium)			
Argon . . .	A	40	18
Arsenic . . .	As	75	33
Astatine . . .	At	210	85
Barium . . .	Ba	137.5	56
Berkelium . . .	Bk	245	97

Element.	Sym- bol.	Approx. At. Wt.	At. No.
Beryllium . . .	Be	9	4
(glucinum)			
Bismuth . . .	Bi	209	83
Boron . . .	B	11	5
Bromine . . .	Br	80	35
Cadmium . . .	Cd	112.5	48
Cæsium . . .	Cs	133	55
Calcium . . .	Ca	40	20
Californium . . .	Cf	246	98
Carbon . . .	C	12	6
Cerium . . .	Ce	140	58
Chlorine . . .	Cl	35.5	17
Chromium . . .	Cr	52	24
Cobalt . . .	Co	59	27
Copper (cuprum) . . .	Cu	63.5	29
Curium . . .	Cm	243	96

Germanium . . .	Ge	72.5	32
Gold (aurum) . . .	Au	197	79
Hafnium . . .	Hf	178.5	72
Helium . . .	He	4	2
Holmium . . .	Ho	163.5	67
Hydrogen . . .	H	1	1
Illinium . . .	Il	146	61
Indium . . .	In	115	49
Iodine . . .	I	127	53
Iridium . . .	Ir	193	77
Iron (ferrum) . . .	Fe	56	26
Krypton . . .	Kr	83	36
Lanthanum . . .	La	139	57
Lead (plumbum) . . .	Pb	207	82
Lithium . . .	Li	7	3
Lutecium . . .	Lu	175	71
Magnesium . . .	Mg	24.3	12
Manganese . . .	Mn	55	25
Masurium . . .	Ma	98	43
Mercury . . .	Hg	200.6	80
(hydrargyrum)			
Molybdenum . . .	Mo	96	42
Neodymium . . .	Nd	144.5	60
Neon . . .	Ne	20	10
Neptunium . . .	Np	237	93
Nickel . . .	Ni	58.7	28
Niobium . . .	Nb	93	41
(columbium)			
Nitrogen . . .	N	14	7
Osmium . . .	Os	191	76
Oxygen . . .	O	16	8
Palladium . . .	Pd	106.5	46
Phosphorus . . .	P	31	15
Platinum . . .	Pt	195	78
Plutonium . . .	Pu	242	94
Polonium . . .	Po	210	84
Potassium . . .	K	39	19
(kalium)			
Praseodymium . . .	Pr	141	59
Protoactinium . . .	Pa	234	91
Radium . . .	Ra	226	88
Radon (niton) . . .	Rn	222	86
Rhenium . . .	Re	187	75
Rhodium . . .	Rh	103	45
Rubidium . . .	Rb	85.5	37
Ruthenium . . .	Ru	101.5	44
Samarium . . .	Sm	150.5	62
Scandium . . .	Sc	45	21
Selenium . . .	Se	79	34
Silicon . . .	Si	28	14

Element	Sym- bol.	Approx. At. Wt.	At. No.
Silver (argentum)	Ag	108	47
Sodium (natrium)	Na	23	11
Strontium	Sr	87.5	38
Sulphur	S	32	16
Tantalum	Ta	181.5	73
Tellurium	Te	127.5	52
Terbium	Tb	159	65
Thallium	Tl	204.5	81
Thorium	Th	232	90
Thulium	Tm	169.5	69
Tin (stannum)	Sn	118.5	50
Titanium	Ti	48	22
Tungsten	W	184	74
(wolframium)			
Uranium	U	238	92
Vanadium	V	51	23
Xenon	Xe	130	54
Ytterbium	Yb	173.5	70
(neo-ytterbium)			
Yttrium	Y	89	39
Zinc	Zn	65.5	30
Zirconium	Zr	91	40

It should be noted that with the rapid advance of atomic science the possibility of making new E.s artificially has arisen. Thus plutonium, used in the Nagasaki and Bikini bombs, was made by bombarding atoms of uranium with neutrons (q.v.). Sev. other 'artificial' E.s are known (e.g. americium and curium) and their chem. promises to be of great interest and importance. Recently E. number 101, Mendelevium (Mv), has been prepared by bombarding E. 99 with alpha particles.

Elemental Spirits, or Angels of the Elements, were imaginary beings who were supposed to preside over the 4 elements, the spirits of fire being called Salamanders, those of water, Undines, those of air, Sylpha, and those of earth, Gnomes. They were supposed to dwell in their respective elements, and the belief in their existence was a very popular one in the Middle Ages. Paracelsus wrote a treatise on them. See H. Diels, *Elementum*, 1899.

Elementary Education, non-secondary, state education provided for the majority of children up to the compulsory attendance age; obsolete in U.K. since 1944 Education Act. See EDUCATION: INFANT SCHOOLS.

Elemi, oleo-resin obtained from the pitch-tree, a native of Manila. When pure it is pale yellow in colour and resembles honey in consistency. It has an aromatic odour and is soluble in alcohol and ether.

Elenchus (Gk *elegchos*, commonly trans. by the Lat. *argumentum*, *inquisitio*, *confutatio*, and *demonstratio*), a term frequently used in the Aristotelian system of logic to denote argument, replication, refutation, or the subject or nature of dispute, or demonstration. Aristotle himself defines E. as 'a syllogism of contradiction.' In the last 2 books of the *Organon* he classifies and discusses the different kinds of 'sophistical elenchi' or modes of argument used by sophists; e.g. the sophism designated *ignoratio elenchi*, or sinister deviation from the point under

discussion, consists, according to Aristotle, in proving something irrelevant.

Eleocharis, or **Spike-rush**, genus of cosmopolitan plants in the family Cyperaceae. *E. palustris*, *E. pauciflora*, *E. acicularis*, and others grow in marshy places in Britain. *E. tuberosa*, a native of E. Asia, has edible tubers.

Elephant (Lat. *elephantus*; Gk *elephantos*, ivory), a representative of the Proboscidea, an order of mammals. There are 2 existing species of Elephantidae, *Elephas maximus*, Indian E., and *Loxodonta africana*, or African E. A number of extinct forms serve to connect the E., to a limited extent, with other subungulates, such as the conies, but as the absolutely intermediate type has not

Satur photograph
AFRICAN ELEPHANT

been discovered, the origin of the Elephantidae is conjectural. The young Indian E.s are hairy, thus showing some similarity with the mammoth. The most remarkable characteristic of the order, and the one from which they derive their title, is the long, flexible, prehensile proboscis, into which the nose is produced. This trunk, as it is called, is delicately sensitive. It has the nostrils at the extremity, and is used for the purpose of conveying food and water to the mouth. E.s have no canine teeth in either jaw, and their tusks are developed only in the upper jaw; young E.s have a very minute pair of milk-tusks which are shed at an early age; the permanent tusks continue growing throughout life, and so remain open at their bases, which are enclosed in sheaths of the premaxillary bones, extending upwards in the skull as far as the nasal cavity. The tusks of young E.s are tipped with enamel, but this soon wears off and they then consist of ivory alone. The build of the E. is huge and bulky, the head being disproportionately large, the ears large and flapping, the neck very short and thick, and the limbs long and stout. The feet are short and broad, and have 5 toes each, of which the middle one is the largest. E.s are strictly herbivorous, subsisting chiefly upon roots, twigs,

leaves, and young shoots. There is no authentication of the widespread belief that E.s may live for over 100 years. The oldest recorded age is 60 years. The Indian E. is distinguished by its high, bulging forehead and small ears, as well as by its smooth and nearly naked skin. The average height of the adult male does not exceed 9 ft., and that of the female 8 ft., but this is often considerably exceeded, and there is an enormous skeleton in the museum at Calcutta of an E. that lived about 1850-60, which measures 11 ft 3 in. from the shoulders. The height of the Indian E. is almost precisely twice the circumference of its forefoot. Herds of E.s consist of from 30 to 50 individuals, all of which belong to a single family, a female being invariably the leader. They are fond of bathing and rolling in wet mud, and when heated they squirt water over their backs by means of the trunk. The African E. differs chiefly from the Indian species in the enormous size of its ears, which, when in repose, completely cover the animal's shoulders. The forehead is rounded and sloping. Its colour is a somewhat darker grey, and its disposition fiercer, than that of the Asiatic species; also it is more rapid in its movements and has remarkable powers of getting over precipitous ground. Owing to persecution for the sake of its tusks, the African E. has grown much rarer, and is now only found S. of the Sahara, whereas formerly it was spread over the whole of the wooded dists. The white E. is a pure albino, and is sometimes found in Burma and Siam. See G. H. Evans, *Elephants and their diseases*, 1910; D. D. Lyell, *The African elephant and its hunters*, 1924; Rowland Ward, *The elephant in east Central Africa*, 1953.

Elephant Seal, or **Sea-elephant** (*Mirounga*), the largest of the seals, so called because of its size and the proboscis of the male. The latter measures up to 20 ft in length but the female is only 9 to 10 ft in length. It is found in the N. Pacific and the S. ocean; it feeds on squid. It is hunted for its blubber.

Elephant-shrew, name given to sev. insectivorous quadrupeds in the family Macroscelididae. They somewhat resemble the kangaroo-mice in appearance, and use their long hind-legs in similar fashion when they leap over the plains of Africa. The snout is so long that it looks like a proboscis, whence the name. *Macroscelides typicus* is a common specimen, and is called also the jumping-shrew or proboscis-rat.

Elephanta Island (locally called **Chara-puri**), small is. in Bombay harbour, about 5 m. from Bombay, India. It received its name from the Portuguese on account of a colossal statue of an elephant which once stood on the is., but is now in Bombay. It is celebrated for its cave temples, one of which contains a huge 3-faced bust about 18 ft high, representing Siva in his 3-fold character of Creator, Preserver, and Destroyer. See J. Fergusson and J. Burgess, *The Cave Temples of India*, 1880; V. A. Smith, *A History of Fine Art in India and Ceylon*, 1911.

Elephantiasis, chronic condition in

which the legs become thickened and straight up and down like an elephant's. The disease also affects other parts, as E. of the scrotum. It is due to a blocking of the lymphatic glands and channels, combined with irritation of the skin, generally because of external contamination or inflammation. In the tropics blocking of the lymph channels is commonly due to a threadlike worm, known as Filaria, and its eggs. In cold climates the condition is rarely seen, but when it is the blocking is due to various causes. See FILARIASIS.

Elephantine (the *Fezzet-ey-Taher*, or flowery isle, of the Arabs), beautiful is. in the Nile opposite Assuan. It was the prin. place of worship of Khnum or Khnoum, a ram-headed god, who enjoyed great repute as a creator, and was famous for its pottery, a peculiar pink ware with a brownish-pink face.

Elephant's Foot, **Tortoise Plant**, or *Dioscorea elephantipes*, family Dioscoreaceae. It has a peculiar root-stock, with a rough and indented bark, shaped like an elephant's foot. It contains a great quantity of starch and was used freely by the Hottentots for food; hence it is often called Hottentot's bread.

Elephant's Tusk Shell, see DENTALIUM.

El Escorial, see ESCORIAL.

Elets, see YELETS.

Elettaria, see CARDAMOM.

Eleusinia, festival and mysteries, celebrated, originally, only at Eleusis, in honour of Demeter and Persephone (q.v.). They were the most venerable and sacred of all the (4) mysteries. At first initiation was restricted to inhab. of Attica. Later all Greeks were admitted, but barbarians and murderers were excluded. Those who wished to take part in the greater E. were first admitted to the lesser E., held every year in the month of Anthesterion at Agrae on the Ilissus. They might then, as *mystae*, take a part in the great E. the next autumn, but were not actually initiated into the greater mysteries for a year. These were celebrated every year in the month of Boedromion for 9 days, on the 2nd of which the *mystae* were purified. The 3rd was spent in fasting and sacrifice, and on the 4th the *kathartes kathodos*, a procession with a basket of pomegranates and poppy seeds, took place. On the 5th the *mystae* carried torches to the temple of Demeter, where they spent the night, and on the 6th, the most solemn of all, a statue of Iacchus, son of Demeter, garlanded with myrtle and bearing a torch, was carried along the sacred way with shouts and songs. That night the *mystae* were initiated into the last mysteries (*epopteia*), and confirmed the oath of secrecy already taken at the lesser E. On the 7th day the initiated (*epoptae*) returned to Athens. The 8th was an extra day for the benefit of those who arrived late, and on the 9th (*plemnochae*) a libation was poured to the E. and W. with mystical formula. The object of the E. was to excite and strengthen in the initiated faith in life and a system of rewards and punishments after death. See K. Kourouniotes, *Eleusis* (trans.), 1936. See also EUMOLPUS.

Eleusis, tn and deme of Attica, 12 m. distant from Athens. It possessed a magnificent temple of Demeter, and it gave its name to the festival and mysteries of the Eleusinia (q.v.). The tn had been from time immemorial a seat of the worship of Demeter; but after its conquest, which is supposed to have taken place under King Erechtheus, the Eleusinia became a festival common to both cities, though the superintendence of the festival remained with the descendants of Eumolpus, the king of E. Much damage was done to anct monuments, especially Rom. remains, on the site during the Second World War.

Eleuthera, is. of the Bahamas (q.v.). Brit. West Indies, separated from Abaco by the Providence Channel. The soil is fertile and tomatoes, pineapples, oranges, and lemons are cultivated. The main settlement is Governor's Harbour. The is. was colonised by a band of religious refugees from Bermuda, who sailed for the Bahamas in 1647 and settled on E., under the auspices of the Company of Eleutherian Adventurers—a body of Protestant merchants and members of parliament. See *BAHAMAS, History*. Area 164 sq. m.; pop. 6450.

Eleutheropolis, see BEIT GUVRIN.

Elevation, in astronomy, is the height above the horizon of an object on the celestial sphere, measured by the arc of a verticle circle passing through it and the horizon.

Elevators, see CONVEYORS.

Elevators, Grain, see CONVEYORS AND ELEVATORS; HYDRAULIC MACHINERY; LIFTS.

Elf (O.E. *ælf*, *ylf*), a supernatural, diminutive being of early Teutonic lore. E.s were believed to be tricky sprites, much given to interference in human affairs. They stole children and placed changelings in their stead, they visited people in their sleep and gave them nightmares, and sometimes inflicted them with diseases, and with their E.-bolts they struck down human beings and cattle alike. They also E.-locked women's hair, i.e. they tangled it into a matted mess, which it was considered unlucky to undo. E.s were dwarfish and generally black in appearance. See also FAIRIES. See T. Keightley, *Fairy Mythology*, 1828; S. Nilsson, *Primitive Inhabitants of Scandinavia*, 1868; W. Sikes, *British Goblins*, 1880; J. Rhys, *Celtic Folklore*, 1901; C. H. Duncan-Jones, *Book of Fairies*, 1933.

El Fasher, cap. of Dar-Fur, Sudan, and centre of the caravan routes across NE. Africa. Pop. about 15,000.

El Ferrol, see FERROL (DEL CAUDILLO), EL.

Elgar, Sir Edward William (1857-1934), composer, b. Broadheath, Worcs. Practically self-taught, as conductor, executant, and as composer. E. spent his early years at teaching, which he disliked. His music is deeply imbued with the mysticism, not only of Christianity (he was a Rom. Catholic), but also of paganism, as is realised, for instance, in *King Olaf*. E. devoted much of his attention to choral writing, and, besides

Olaf, produced *Caractacus* and other extensive works for solo voices, chorus, and orchestra, the most original and inspired being his setting of Newman's *Dream of Gerontius*, 1890, which was followed by *The Apostles*, 1903, and *The Kingdom*, 1906. *The Dream of Gerontius* is one of the finest works in Brit. choral music, yet was at first received with indifference, but since its eulogism by Richard Strauss it has become widely popular. It is as an instrumental composer, however, that E. is likely to prove most enduring. His early orchestral works include the now classical *Enigma*

Herbert Lambert
SIR EDWARD ELGAR

Variations, 1899, and the striking overtures *Cockaigne*, 1901, and *In the South*, 1903. Later came the 2 symphonies (1908 and 1911), both worthy to rank with the classic symphonies, the splendid *Introduction and Allegro* for strings, 1905, the great violin concerto, dedicated to Kreisler, and the cello concerto, 1919, which Casals ranks among the few masterpieces in this medium. E.'s songs, chamber-music, and smaller works are often poetic, but add nothing to a reputation founded on *Gerontius* and the A7 Symphony. On the whole, the character of his music is deeply psychological and yet broad, noble, generally accessible, and, above all, unmistakably individual. His orchestration especially is superb, and his harmony original and strongly chromatic. The tune 'Land of Hope and Glory,' which occurs in the *Coronation Ode* for Edward VII and one of the *Pomp and Circumstance* military marches, has long been so popular in Great Britain as to be ranked next to 'God Save the Queen' as a national song. His masterly art, as

exemplified most magnificently of all in the symphonic study *Falstaff*, 1913, was well sustained in his *Spirit of England* and *For the Fallen*, both composed in 1916 during the dark days of the First World War. Even if his chamber music produced after that war does not reveal him at his best, he is still, all round, the greatest Eng. composer since Purcell. He was Master of the King's Music in 1924; received the O.M. in 1911, and a baronetcy in 1931. See Basil Maine, *Elgar: his Life and Works*, 2 vols., 1933; W. H. Reed, *Elgar* (Master Musicians), 1939; Diana McVeagh, *Elgar*, 1955; Percy M. Young, *Elgar*, 1955.

El Ghor, see ARABAH.

Elgin, co. of Scotland, see MORAY.

Elgin: 1. Cap. of Morayshire, royal and parl. bor. of Scotland, on the R. Lossie. There are ruins of the fine cathedral, 'lantern of the North,' founded 1224 (burnt 1390, rebuilt later), in the form of a cross, also of the chapter-house and Grey Friars' monastery. The ruined palace of the bishops of Moray is 2 m. N., on Loch Spynie, and 6 m. S.W. is the Cistercian Pluscardine Priory (1230), restored by Lord Bute. There are brewing and woollen industries, saw-mills and sandstone quarries. Pop. 10,535.

2. City in Illinois, U.S.A., on Fox R., 35 m. WNW. of Chicago, in a dairying area. It manufs. watches, electrical appliances, shoes, etc., and is the seat of E. Academy. Pop. 44,200.

Elgin, **Earls of**, Scottish title, borne by the Bruce family. The 1st earl, whose family was by descent connected with Robert I of Scotland, was given his earldom by Charles I in 1633. He was succeeded in 1663 by Robert Bruce, who was created earl of Ailesbury in 1664, and became lord chamberlain in 1687. Thomas Bruce, the 3rd earl (c. 1655-1741), was a courtier of James II, and, for refusing to take the oath of allegiance to William and Mary, was under suspicion. He was imprisoned as a Jacobite conspirator (1690-6), but was allowed to flee to Brussels in 1696. The 9th earl of Kincaidine (1732-71) succeeded as 5th earl of E. in 1747. Thomas Bruce, the 7th earl of E. (1766-1841), sold to the nation, in 1816, the collection of sculptures known as the 'Elgin Marbles' (q.v.). He was a soldier and diplomat, and was Brit. envoy to the sultan of Turkey (1799-1803), where he gathered together his collection.

His son, James Bruce, the 8th earl (1811-63), was also a diplomat. He displayed great ability as governor of Jamaica (1842-6) and of Canada (1847-1854). In 1857 he was sent as an envoy to the Far E., where he concluded the treaty of Tientsin with China (1858), and, on the Chinese refusing to ratify it, he captured Peking (1860). He was appointed viceroy of India in 1862. Victor Alexander Bruce, the 9th earl (1849-1917), was b. near Montreal. He became treasurer of the Household and 1st commissioner of public works during Gladstone's administration (1886), and viceroy of India (1894-1899). He was chairman of the commission of the Scottish Church case (1904),

and was appointed by Campbell-Bannerman secretary for the colonies (1905-8). The 10th earl, Edward James Bruce, was b. in 1881 and succeeded his father in 1917. See *Letters and Journals of the 8th earl*, 1872; and lives by J. G. Bourinot, 1903, G. Wrong, 1905, and J. L. Morison, 1928.

Elgin Marbles, famous collection of ant. Gk sculptures, brought to England (c. 1812) through the agency of the 7th earl of Elgin, after whom they are named, and acquired for the Brit. Museum in 1816 for £35,000. They are portions from the frieze of the Parthenon (designed by Phidias) and other buildings on the Athenian Acropolis. Elgin's act was denounced as 'vandalism,' but if left these treasures would probably have been destroyed by the Turks who were using the Parthenon for target practice. The vessel in which Lord E. shipped 250 ft of the frieze (originally 524 ft in length) was shipwrecked and E. had to pay £74,000 for its recovery.

Elgon, mt 60 m. NE. of Lake Victoria, on the borders of Kenya and Uganda (14,140 ft). An extinct volcano, it can be climbed quite easily. It is well wooded and of great beauty.

El Greco, see THEOTOCOPULI.

El (Heb. 'elevation'), Israelite priest and judge. He was of the family of Ithamar, the younger son of Aaron. He became guardian of the infant Samuel at Shiloh. He was a weak man overruled by his sons, and his leniency to them brought disaster (1 Sam. i-iv).

Elade-Radulescu, Ioan (1802-72), Rumanian author. As a schoolmaster he wrote many of the first Rumanian textbooks. After 1825 he became for a while the leader of the creators of a new Rumanian literature, translating, encouraging younger authors, founding the first periodicals (1829 and 1837) and the Philharmonic Society, 1834, the beginning of the Rumanian theatre. A leader of the revolution, 1848, he was exiled. He did not regain his former influence on his return 7 years later.

Eliakim, see JEHOIACHIN.

Elias, Mount St, see ST ELIAS, MOUNT.

Elie, burgh and quiet seaside resort of Fifeshire, Scotland, on the Firth of Forth. It has 2 golf courses. Pop. 1190.

Eliquis, see ELQI, ST.

Elijah (Gk *Elias*), 'My God is Yahweh,' greatest and most picturesque of the N. prophets, lived under Ahab and Ahaziah (between 874 and 852 bc). His life was chiefly spent in opposing the worship of Baal, which the former king was encouraging (1 Kings xvii-xix and xxi; 2 Kings i and ii; 2 Chron. xxi. 12-15). Like Enoch, he was trans. to heaven instead of dying a natural death, and it was prophesied (Malachi iv. 5) that he would return before the advent of the Messiah. This prophecy Jesus declared fulfilled in John the Baptist. Elias appeared with Moses at the Transfiguration of our Lord, either as one of two who had been assumed without dying, or as representing the Law and the prophets. E. and Enoch are usually identified with the 2 witnesses in Rev. xi. The festival

of E. is on 20 July. In Greece he is regarded as the patron saint of mts, and Rom. Catholic legend describes him as founder of the Carmelite order. See W. Milligan, *Elijah, his Life and Times*, 1887; T. K. Cheyne, *The Hallowing of Criticism: Nine Sermons on Elijah*, 1888; A. Blunt, *The Prophets of Israel*, 1929; H. L. Taylor, *Elijah and Elisha*, 1931.

Elimination, in algebra, is a process of solving systems of equations which consists in getting rid of a quantity or letter which is common to the equations by forming another that does not contain that letter. For example, given

(1) $x^2 + y^2 = 13$
(2) $x + y = 5$ } eliminate y , i.e. deduce an equation involving x only.

Equation (2) is equivalent to
 $y = 5 - x$

∴ Equation (1) is equivalent to

$$x^2 + (5 - x)^2 = 13,$$

$$\text{i.e. } 2x^2 - 10x + 12 = 0,$$

$$\text{or } x^2 - 5x + 6 = 0.$$

$$\therefore (x - 3)(x - 2) = 0,$$

$$\text{hence } x = 2 \text{ or } 3.$$

The corresponding values of y , derived from (2), are obviously 3 and 2.

Eliot, Charles William (1834-1926), Amer. univ. president and educationalist, b. Boston, Massachusetts. He was the son of a mayor of Boston and treasurer of Harvard Univ. As a matter of course the son went to Harvard, from which he graduated in 1853. After a period of study abroad he returned to his country to become prof. of chem. in the Massachusetts Institute of Technology from 1865 to 1869. He was elected president of Harvard Univ. in 1869, and held this great position for 40 years, after which he was president emeritus until his death. In the country at large he was a motive force in improving primary and secondary schools. In religion he became known as one of the greatest spokesmen for the Unitarian faith. He was an active supporter of President Woodrow Wilson, who offered him the embassy to England, which, however, he declined. His mind marched with Wilson's on the great subjects of disarmament and the League of Nations. Among his works are *Four American Leaders*, 1906, *The Road Toward Peace*, 1915, and *A Late Harvest*, 1924.

Eliot, George, pseudonym taken by **Mary Ann or Marian Evans** (1819-80), novelist, b. Arbury Farm, near Nuneaton, Warwickshire, the youngest child of Robert Evans, land-agent to the Newdigate family, by his 2nd wife. She was b. on 22 Nov., and the best authority for her early life is the easily discernible autobiographical portions of her novels. Many of the characteristics of her father are reproduced in Adam Bede and Caleb Garth, her brother Isaac figures as Tom Tulliver, and she herself appears as Maggie Tulliver. Marian Evans was brought up to the strict observances of religion, and, possibly influenced by an aunt who was a Methodist preacher, she inclined to evangelicalism. In these days she was most austere, theatres were to her something almost unholy, and her

favourite reading was Thomas a Kempis and Bunyan. Young and Whiston, *Rasselas*, and *The Lives of the Poets*. When Marian was 22 her father moved from Arbury Park to Coventry, and she went with him. Here began the 2nd phase of her life. She made the acquaintance of Charles Bray (1811-84), the author of *The Philosophy of Necessity* and other works, and of Mrs Bray, whose brother, Charles Hennell (1809-50), had written *An Inquiry concerning the Origin of Christianity*, 1838. In such company (for Bray, as well as his brother-in-law, was

GEORGE ELIOT

A.P.O.

The portrait by Sir Frederick Burton, 1865

a freethinker) Marian Evans began to doubt, and at last to allow her doubts entirely to conquer her. In 1844 when Miss Brabant (afterwards Mrs Charles Hennell) had to resign the task of translating Strauss's *Leben Jesu*, she it was who brought it to a successful conclusion. This was pub. in 1846, but Miss Evans's name did not appear. Robert Evans, who had been greatly distressed by the change in his daughter's religious convictions, d. in the spring of 1849, and then, after a short continental tour with the Brays, she for a while made her home with these devoted friends. In 1851 she was offered the assistant editorship of the *Westminster Review*, and she filled this post for some years, from time to time contributing to its pages articles and elaborate reviews. This work, which necessitated her living in London, occupied most of her day, but she contrived to find time to translate Feuerbach's *Essence of Christianity*, which was pub. in 1854, the only book to appear under her own name.

The 3rd phase of the life of Marian Evans—the 'George Eliot' period—dates from 1853, the beginning of her acquaintance with George Henry Lewes (1817-78), the author of the *Life of Goethe* and the *Biographical History of Philosophy*. In the following year they decided to live together, though they could not be married, because Lewes had a wife living, from whom, however, he was separated. It was not with light hearts that they took this step, but having taken it they regarded the union as being as binding and as legitimate as if it had had the sanction of the law and the Church, and it endured until the death of Lewes 24 years later. Miss Evans continued to contribute to the *Westminster Review*, and she wrote many reviews for the *Leader*, of which paper Lewes was editor. Lewes was a great believer in the genius of Miss Evans, and in 1856 he persuaded her to see if her gifts lay in the direction of fiction. She made an attempt, and Lewes, without divulging the name of the writer, sent it to Blackwood, who at once accepted it for his magazine. This was 'Amos Barton,' and it was followed by 'Mr Gilfil's Love Story' and 'Janet's Repentance.' These stories were collected in 1858 as *Scenes of Clerical Life*, and were received with enthusiasm in literary circles. Dickens was especially appreciative, and he alone among the critics discerned the sex of the author. Encouraged by the success of these short stories, Miss Evans began a full-dress novel, *Adam Bede*, which was finished 13 months later, and pub. on 1 Feb. 1859. The qualities that marked *Scenes of Clerical Life* were present in *Adam Bede*, which evoked a further chorus of praise and placed G. E. in the front rank of contemporary novelists. *Adam Bede* was followed by *The Mill on the Floss*, 1860, which is often regarded as her masterpiece. The earlier part, which is largely a transcript from life of the youth of herself and her brother, is one of the most beautiful things in Eng. fiction; but taken as a whole the novel gives undue prominence to the childish scenes, a fault the author, in reply to a criticism of Bulwer Lytton, regretfully acknowledged.

Silas Marner, a shorter novel which excels in tenderness of fancy, appeared in 1861; and then G. E., accompanied by Lewes, went to Florence to gather material for a projected historical novel of the time of Savonarola. While Thackeray was editor of the *Cornhill Magazine*, Smith, Elder & Co. offered her the hitherto unprecedented sum of £10,000 for the serial and book rights of the new novel, *Romola*. The first instalment was printed in the *Cornhill* in July 1862, the last in Aug. of the following year, the story being written from month to month. The author said that she 'began it a young woman, finished it an old woman,' and certainly the amount of reading that she did in connection with it was enormous. G. E. had said of *Esmond* that there was too much hist. and too little story. Of *Romola* it may be said that not only was the hist. of the period 'got up' for the purpose of writing the novel but that the

information she had acquired most disastrously outweighed the book. *Felix Holt* appeared in 1866, *The Spanish Gypsy*, a poem, 2 years later, and in 1871-2 was pub. *Middlemarch*. In spite of the over-elaboration of plot and language, *Middlemarch* will for ever be valuable as a picture of prov. life in the early 19th cent., and for the many characters that adorn its vast canvas, although it is disfigured by the exaggeration with which Casaubon is portrayed. This book at the time raised the reputation of G. E. to the greatest height. The novel *Daniel Deronda*, 1876, and *Theophrastus Such*, 1878, though successful, did nothing to enhance her fame. Lewes d. in the winter of 1878, and G. E. lost in him husband, friend, and literary adviser, though it may be doubted whether in this last capacity his influence was entirely for good. She bitterly lamented his loss, and shut herself up from all society for some months. In April 1880, to the general surprise, being then in her 61st year, she married John Walter Cross, whom she had known for many years. She d. on 22 Dec. in that year. G. E. is one of the great names in the annals of Victorian fiction. Her pictures of lower middle-class life in the Midlands are unsurpassed, and when, as in her earlier novels, she is not unduly didactic her merits as a painter of character are great. *Adam Bede*, *The Mill on the Floss*, and *Middlemarch* show her at her best, and so good is each of these that critics are undecided which is the greatest. See lives by J. W. Cross (her husband), 1885; O. Browning, 1898; Sir L. Stephen, 1902; E. S. Haldane, 1927; J. L. May, 1930; A. Fremantle, 1933; R. C. Williams, 1936; S. Dewes, 1939; G. Bullett, 1947; and J. Bennett, 1948.

Eliot, Sir John (c. 1590-1632), politician, b. Cornwall, and educ. at Exeter College, Oxford. He entered parliament in 1614 and was knighted 4 years later. He led the opposition to gov. policy in the parliament of 1626, fiercely denouncing Buckingham (his former patron), and was sent to the Tower. He was one of the framers of the Petition of Right, 1628. In 1629 he was again imprisoned in the Tower, charged with conspiracy against the Crown, and d. there. He was regarded by contemporary sympathisers as a martyr to royal tyranny and has since been idealised as a champion of parl. rights.

Eliot, John (1604-90), Eng. missionary to the Indians of Massachusetts, known as 'the Apostle of the Indians.' He attempted to organise the nomadic tribes into a great Christian community, and was minister of Roxbury church, near Boston, U.S.A. E. trans. the Bible into the Indian language. 1661-3, wrote an Indian catechism, 1653, and grammar, 1666; *The Christian Commonwealth*, 1659; and *The Harmony of the Gospels*, 1678. See W. Walker, *Ten New England Leaders*, 1901.

Eliot, Sir Thomas, see ELVOT.
Eliot, Thomas Stearns (1888-), Brit. poet and critic of Amer. origin. b. St Louis, Missouri, the son of Henry Ware E. (1841-1919), whose father, a Unitarian

minister, had come to live in St Louis in 1834. Before that the family had been estab. in Boston since emigrating from England in the 17th cent. E. graduated at Harvard in 1909, spent a year at the Sorbonne, and returned to Harvard to study literature and philosophy. In 1913 he was given an academic appointment

Camera Press

T. S. ELIOT

there and the following year gained a travelling fellowship which took him to Germany. He also read philosophy at Merton College, Oxford. He married in 1915 and made his home in England. He was for a short time a schoolmaster, then worked in a bank, and in 1917 became assistant editor of the Imagist periodical the *Egoist*. This was followed by his editorship of the *Criterion*, later the *New Criterion*, which for more than 10 years was one of the foremost literary periodicals in London. Since 1925 he has been a director of the publishing firm of Faber and Faber. E. had begun writing poetry at an early age, being influenced strongly by the French Symbolist poets, particularly Jules Laforgue (q.v.). He also owed much to Ezra Pound (q.v.), who encouraged him by his letters and by publishing his work in reviews such as *Poetry*. His first poem to be printed was *The Love Song of J. Alfred Prufrock*, which appeared in *Poetry* in 1915. This and other early pieces were pub. in *Prufrock and Other Observations*, 1917, followed by *Poems*, 1919, and *Ara Vos Prec*, 1919. A collected vol. appeared in 1920. These poems show exact and humorous

observation. They are also a criticism of contemporary urb. life dramatically portrayed through a number of satiric characters. The climax of this phase of apparent disillusionment was reached with the pub. of *The Waste Land* in 1922. This widely celebrated poem, which won the Dial Award of 2000 dollars, applied to modern life the ant. fertility myths studied in Miss Jessie Weston's book, *From Ritual to Romance*, to which E. acknowledged his indebtedness. Great erudition, fused in poetic inspiration, is employed in the juxtaposition of vivid images by which the characteristics of the reality which the poet seeks to express are thrown into relief. The mood in which satire was stronger than sympathy continued in *The Hollow Men*, 1925, and *Sweeney Agonistes*, described as 'Fragments of an Aristophanic Melodrama,' which appeared in the *Criterion* in 1926. Thereafter followed 3 short poems pub. in pamphlet form, *The Journey of the Magi*, 1927, *A Song for Simeon*, 1928, and *Animula*, 1929. E. increasingly devoted himself to the study of good and evil, and the way of escape from the 'waste land' through humility and faith. This found magnificent expression in *Ash Wednesday*, 1930, a poem of profound religious intensity.

At this time poetic drama was enjoying a revival with the work of the Group Theatre, by which *Sweeney Agonistes* was performed. E., however, gained a closer association with the stage during the production of his pageant play *The Rock*, performed at Sadler's Wells in aid of the Forty-Five Churches Fund in the Diocese of London. The choruses, which are fine declamatory poetry, were later printed in the *Collected Poems 1909-1935*, 1936. From this E. proceeded to his first full-length play, *Murder in the Cathedral*, an historical tragedy on the murder of Thomas Becket (q.v.). It was first performed in 1935 in Canterbury and London, and was a marked success. Apart from revivals on the Eng. stage it has since had notable productions in France (1945) and Germany (1946). E.'s next play, *Family Reunion*, was produced in 1939. Its theme is inherited sin and redemption through renunciation. Later plays were *The Cocktail Party*, 1951, and, in lighter vein, *The Confidential Clerk*, 1953. E.'s early poems, which marked a new direction away from 19th-cent. romanticism, have affected the whole course of poetry since their appearance. They were as celebrated for their influence as their achievement. The *Four Quartets*, which were first pub. collectively with that title in 1944, have been described as 'the record of four pilgrimages whose purpose is the rediscovery of and reconciliation with the past.' Each of the 4 poems has for its title the name of the locality with which the poet's meditations are associated: *Burnt Norton*—included in *Collected Poems* in 1936—the name of a deserted house and garden in Gloucestershire; *East Coker*, 1940, a Somerset vil. where E.'s forefathers once lived; *The Dry Salvages*, 1941, a cape of the Amer. coast; *Little Gidding*, 1942, a vil. in Huntingdon.

shire where Nicholas Ferrar (q.v.) once set up a religious community.

In criticism E., himself a critic of dogmatic clarity, is at the head of one trend of thought distinguished by the name classical, being concerned with establishing objective standards. His critical writings, which within their range have attempted a complete revaluation of poetry, are contained in *The Sacred Wood*, 1920, *Homage to John Dryden*, 1924, *For Lancelot Andrews*, 1928, *Dante*, 1929, *Tradition and Experiment in Present Day Poetry*, 1929, *Elizabethan Essays*, 1934, *Essays Ancient and Modern*, 1936, and *What is a Classic?*, 1945. In 1932 E. returned to the U.S.A. to take up the appointment of Charles Eliot Norton Professorship of Poetry at Harvard, 1932-3. A course of lectures delivered at the univ. of Virginia in 1933 was pub. the following year with the title *After Strange Gods, A Primer of Modern Heresy*. His Henriette Hertz lecture on Milton was pub. in 1947. As a high churchman, his *Idea of a Christian Society*, 1939, is a notable plea for a Christian community founded on a national Church. His sociological writings also include *Notes towards the Definition of Culture*, 1948. E. became a naturalised Brit. subject in 1927, and was awarded the O.M. in 1948. He was given honorary doctorates by Harvard, Yale, Princeton, Cambridge, Edinburgh, Bristol, and Leeds. In recognition of his remarkable pioneering work in modern poetry he was awarded the Nobel Prize for Literature, 1948. In 1957 he married his second wife, Valerie Fletcher. See studies by H. R. Williamson, 1932; F. O. Matthiessen, 1935; E. M. Stephenson, 1944; H. Gardner, 1949; M. C. Bradbrook, 1950; and E. Drew, 1952; also selected criticisms, ed. by B. Rajan, 1947; *T. S. Eliot: a Symposium*, 1948; and bibliography by D. Gallup, 1952.

Eliott, George Augustus, see HEATHFIELD, BARON.

Elis, modern **Eles**, in ancient Greece, an important region of W. Peloponnesus, containing the Olympian valley and watered by the Alpheus and Peneus. It lay between Achaia and Messenia, stretching from Araxus and the R. Larissus (N.) to the R. Neda (S.), and bounded on the W. and E. by the Ionian Sea and Arcadian Mts. It was later incorporated in the Rom. prov. of Achaia. The modern Palaeopolis occupies the site of the town of E. Since 1899 a dept. of Greece, with Pyrgos as the cap. Pop. 188,300.

Elizabethville, tn, cap. of Katanga Prov., Belgian Congo, Africa, founded in 1910, 946 m. from Bulawayo, and 1619 m. from Beira. It is a modern tn on regular air routes, both international and continental African. The Star of the Congo Mine is 8 m. away. The smelters of the Union Minière du Haut-Katanga, railway sidings, and native compounds, etc., are in the suburb of Lumbumbashi. Malaria has been considerably reduced here and in other townships of the Belgian Congo, and the sanitary services of E. are highly organised. Pop. (white) 10,558.

Elisavetgrad, see KIROVOGRAD.

Elisha (Gk **Eliseus**), 'God has saved,' son of Shaphat and successor of Elijah, lived during the reigns of Ahab, Ahaziah, Jehoram, Jehu, Jehoahaz, and Jehoash (between 874 and 783 BC), exercising his ministry for nearly 60 years. E. shows a mild and beneficent temperament compared with the fire and austerity of Elijah, whose faithful attendant he was. This comparison is fully brought out by a study of their miracles. See 2 Kings ii-ix. E.'s festival is on 14 June. See also A. W. F. Blunt, *The Prophets of Israel*, 1929; H. L. Taylor, *Elijah and Elisha*, 1931.

Elista, see STEPNOY.

Elixir, from the Arabic *al-iksir* and ultimately from the Gk *zêion* (a drying powder), is primarily an alchemical term for a supposed agent capable of transforming base metals into gold or silver and of prolonging human life indefinitely. It is therefore approximately equivalent to the philosopher's stone. There were 2 main E.s, viz. the Great Red E. and the White E. The latter turned mercury, etc., into silver, while the former turned silver or any other metal into gold. (See ALCHEMY.) The term E. is also applied to a drug of syrupy consistency intended to be slowly swallowed to lubricate the throat in cases of cough and irritation. Another meaning of E. is a medicated flavoured syrup.

Elizavograd, see KIROVOGRAD.

Elizabeth (c. 1437-92), queen of England, daughter of Sir Richard Woodville, 1st earl Rivers (q.v.). She married first Sir John Grey, who was killed at St Albans, 1461. She married Edward IV secretly in 1464 and was crowned queen in 1465. Her elder son by Edward became Edward V (q.v.) and her daughter Elizabeth married Henry VII. Her influence was popularly supposed to have encouraged the laxity and indulgence of Edward's court; it is certain that the extravagant favours she claimed on behalf of her Woodville and Grey connections made her many powerful enemies. Disgraced by Richard III, she later retired to Bermondsey Abbey. Queens' College, Cambridge, was re-founded by her.

Elizabeth I (1533-1603), queen of England, daughter of Henry VIII and Anne Boleyn, b. Greenwich. After Anne's execution Henry's marriage to her was declared invalid, and E.'s early years were spent in semi-obscure and disgrace, though Catherine Parr treated her with great kindness. Later E. was involved in a disreputable, though probably innocent, love-affair with Catherine's 4th husband, Seymour, the lord high admiral, resulting in Seymour's execution. She was well educ. in the New Learning, Ascham, her tutor, speaking highly of her abilities. As she grew older she became increasingly vain and capricious, but the intrigues and dangers of her first 25 years had sharpened her already keen intellect, teaching her, in the last resort, to subordinate emotion to expediency and to act, when really necessary, with decision, ruthlessness, and cunning.

During Mary I's reign, though she had supported her half-sister's claim to the throne against that of Lady Jane Grey, E. soon fell under suspicion. She was accused of complicity in Wyatt's rebellion, and imprisoned. E. was probably not fundamentally religious in temperament: she disliked Protestant excesses and in a more settled age might well have conformed to orthodox Catholicism. But the events of her father's and half-brother's reigns had given the most powerful classes in the country—the nobility, the squirearchy, and the merchants—a vested interest in opposing the restoration of the Catholic Church at least in its capacity as a land-owning corporation; while the Marian persecutions had linked Catholicism with Spain in the popular mind, especially in influential London, so that Protestantism had come to imply patriotism. During Mary's reign E. avoided giving any definite declaration of her own religious position; but circumstances at her accession were such that an early settlement on Protestant lines was virtually inevitable if the Tudor monarchy was to survive.

When E. became queen in 1558 England was divided, bankrupt, and discredited by military defeat. In Mary Stuart there was a strong Catholic rival for the throne. E. emphasised her Englishness; chose a body of trusted advisers ably led by Cecil, and by 1559 felt sure enough of her position at home and abroad to impose (acting through Parliament) a moderate religious settlement intended to satisfy Catholics and Protestants. The Book of Common Prayer and the Thirty-Nine Articles are abiding monuments of the religious hist. of this reign. From the start the settlement satisfied neither extreme. E. was unusual in her age in refusing to persecute on religious grounds alone, declaring she would not 'make windows into men's souls.' But the N. rebellion of 1569 and the pub. of the Papal Bull in England in 1570 forced her to yield increasingly to her advisers' opinion that every Catholic was a potential traitor and should be treated accordingly. Equally, non-conforming Protestants were a challenge to crown authority, though efforts to suppress them had no lasting success.

E.'s foreign policy was aimed at keeping her throne secure and promoting England's greatness. The first of these aims explains why she kept her prisoner, Mary Stuart, alive for so long. While she lived Mary Stuart, though a Catholic, constituted a barrier between E. and the other more dangerous claimant to her throne, Philip of Spain. But after 1586 a head-on collision with Spain was inevitable anyway, and Mary Stuart's position as the prin. Catholic pretender to the crown, coupled with her increasing dependence on Sp. help, meant that her potential danger outweighed her usefulness. Mary's execution quickly followed.

E.'s struggle with Spain forced her into moves which show her diplomatic adroitness and unemotional detachment admirably. She had ignored appeals for

help from continental Protestants when such help would have brought England no material benefit. But to counter Sp. influence she reluctantly sent help to the rebellious Protestant Netherlands, while always disapproving of subjects who rebelled against their sovereign. She entered into 2 series of prolonged negotiations with a view to marrying a Fr. Catholic prince—it is doubtful if she ever intended these to be finalised—firstly to prevent the possibility of a Franco-Sp. alliance against her, and, on the second occasion, to prevent France profiting from the Sp. decline in Flanders to the detriment of Eng. influence there. She staved off a formal war with Spain as long as possible, while encouraging men like Drake to conduct expeditions which were really acts of blatant piracy against Sp. ships and colonies. When war came E. proved an indomitable leader, giving much-needed inspiration and confidence at the time of the Sp. Armada (q.v.).

The parl. hist. of E.'s reign is important for the precedents it created which were to be remembered under subsequent monarchs lacking E.'s capability and popularity. Attempts were made by the Commons to regulate the succession and amend the religious settlement; but these were rapidly scotched by the imprisonment of the ring-leaders and the full weight of E.'s personal displeasure. She took care to flatter at the right time, and to comply when compliance did not really compromise her, as during the last and most turbulent of her parliaments, 1601. She remained financially independent of parliament, even at the cost of over-economy in the sphere of external defence.

Economic progress was considerable during her reign, owing much to E.'s encouragement. Trading and buccaneering encouraged expansion across the seas. Only one of E.'s ventures does not fit the general pattern of successes: her Irish policy. Though she managed to impose some semblance of royal authority over Ireland a good deal more successfully than her predecessors, it was done with great cruelty; while the religious settlement was enforced in such a way that it drove the Irish, whose Catholicism had till then been notoriously lax, into the arms of Rome. Another memorable aspect of E.'s reign was the flowering of the arts, which also owed a good deal to court inspiration. It was the age of Marlowe, Jonson, and Shakespeare.

At her death E. left a country principally and convincingly Protestant; victorious in its chief foreign war; economically buoyant and aggressively self-confident. E. *d.* as she had lived, a very lonely woman, saddened by the treachery of the favourite of her old age, Essex (q.v.). She had outlived her chief adviser, Cecil, her arch-enemy, Philip of Spain, and the one man she had probably once genuinely hoped to marry, Leicester (q.v.). Her achievements were considerable. Yet the basis of her success lay in her own personality, and that she could not pass to her successor. Her address to her last parliament contains the

key to her greatness as a queen: 'This I count the chief glory of my crown, that I have reigned with your loves . . .'. See lives by M. Creighton, 1899, and J. E. Neale, 1934. See also E. Bekker, *Elizabeth and Leicester*, 1890; W. H. Frere, *The English Church in the Reigns of Elizabeth and James*, 1904; A. O. Meyer, *England and the Catholic Church under Queen Elizabeth*, 1916; A. Elizabeth II (Elizabeth Alexandra Mary) (1926-), queen of the U.K. and Northern Ireland and of her realms beyond the seas, b. 12 Bruton Street, London, W.1 on 21 April, 1st child of the duke and duchess of York (subsequently George VI and Queen Elizabeth). She was educ. at home, and was present at her parents' coronation in 1937. In 1940, when she was 14, she broadcast to the children of the Empire; during her father's visit to Italy in 1944 E. was appointed one of the counsellors of state. She entered the A.T.S. at her own request, and was granted a commission, Mar. 1945. E. carried out an increasing number of public engagements, and in 1947, with her parents and sister, visited South Africa, where she celebrated her 21st birthday. From there she broadcast her moving promise, dedicating herself to the service of the Empire.

In July 1947 her engagement was announced to her cousin, Lt. Philip Mountbatten, R.N., formerly Prince Philip of Greece and Denmark, and the marriage took place at Westminster Abbey on 20 Nov. 1947, the bridegroom having been created duke of Edinburgh (q.v.) the previous day. There are 2 children of the marriage: Prince Charles Philip Arthur George (b. 1948), now heir apparent to the throne, and Princess Anne Elizabeth Alice Louise (b. 1950). In May 1948 E. and her husband paid an official visit to Paris; in 1951 they toured Canada (also visiting the U.S.A.). In Jan. 1952 they left London by air on the first stage of a proposed Commonwealth tour, but in Kenya news reached them of George VI's death, and E. returned to England at once, being proclaimed queen on 8 Feb. Her coronation took place on 2 June 1953, and was followed by state visits to Scotland, Wales, and Northern Ireland. In Nov. 1953 E. and the duke of Edinburgh left England on a Commonwealth tour which included visits to Australia, New Zealand (from where E. broadcast her Christmas message to her people), Fiji, Uganda, Malta, and Gibraltar, returning to England in May 1954. Subsequently a crowded programme of public engagements has included state visits to Norway, 1955, Sweden, 1956,

Portugal, France, and Denmark, 1957. The Queen visited the U.S.A. and Canada in the autumn of 1957.

Portrait by Dorothy Wilding, London

H.M. QUEEN ELIZABETH II

In 1957 the Queen's Christmas broadcast was televised for the first time (previously such talks had only been broadcast on sound radio).

Elizabeth (1596-1662), queen of Bohemia, wife of Frederick V, Elector Palatine, and daughter of James I (q.v.) of Great Britain and Anne of Denmark, b. Falkland Castle, Fife-shire. From 1603 till her marriage in 1613 she was brought up in England. In 1619 Frederick was chosen to fill the throne of Bohemia, and from that time onwards E.'s life was dogged by misfortune. The king was routed by the Catholic League and the royal family endured dire poverty in Holland. She had 13 children, among whom were Charles Louis, restored to the electorate in 1648, and Sophia, who afterwards became the mother of George I of England. See R. S. Rait (ed.), *Five Stuart Princesses*, 1902.

Elizabeth, St. of Hungary (1207-31), daughter of Andrew II, king of Hungary, b. Pressburg. She married at a very early age Louis IV, landgrave of Thuringia. He was converted by the celebrated miracle of the changing of the bundle of bread, carried by E. for the poor, into red roses, on his commanding her to display the contents. Louis d. in 1227, and E. thereafter lived as a Franciscan tertiary at Marburg, where she d. Four years later she was canonised by Gregory IX. Her feast is on 19 Nov. See C. F. R. de

Montalembert, *L'Histoire de Sainte Elisabeth de Hongrie*, 1836.

Elizabeth (Elisabeth Philippine Marie Hélène of France) (1764-94), Fr. princess known as 'Madame Elizabeth,' sister of Louis XVI, b. Versailles, guillotined on 10 May 1794.

Elizabeth (Pauline Elizabeth Ottilie Louise) (1843-1916), known under the pseudonym of Carmen Sylva in the literary world, b. Neuwed, Germany, daughter of Prince Hermann of Wied and Princess Maria of Nassau. Married Prince Charles of Rumania in 1869. In 1881 Rumania was declared a kingdom, and the same year E. was crowned queen. The following year she became a member of the Academy of Sciences of Bucharest, and in 1890 she visited England. She pub. rev. vols. of romances, poetry, etc., chiefly written in German, some of which have been trans. into Eng., e.g. *A Royal Story Book*, 1911, *From Memory's Shrine*, 1911, *Sparks from the Anvil; or Thoughts of a Queen*, 1913. She did valuable social work in organising the Rumanian Red Cross, homes for the blind, etc. Queen-dowager, 1914.

Elizabeth, cap. of Union co., New Jersey, U.S.A., 5 m. from Newark, on Newark Bay and Arthur Kill (bridged to Staten Is.). There are factories producing chemicals and electrical machinery; the Singer Sewing Machine Co. have works here, and there are shipbuilding yards, iron foundries, and railway machine shops. E. also manufs. radio, aircraft, and automobile parts, printing presses and types, and paper containers. Settled in 1664 as 'Elizabethtown,' the place has many historical buildings. Princeton Univ. was opened here in 1747. Pop. 112,800.

Elizabeth, new industrial tn of S. Australia, 17 m. N. of Adelaide, opened in 1955. Pop. (1956) 5,000, to be increased to 25,000 by 1960 (by then E. will be the largest country tn in the state).

Elizabeth Angela Marguerite (1900-), queen of Great Britain, wife of George VI of England; youngest daughter of the 14th earl of Strathmore and Kinghorne, b. St Paul's Waldenbury, Herts. She married, 26 April 1923, Prince Albert Frederick, duke of York, subsequently George VI. They had 2 daughters: Elizabeth Alexandra Mary (now Queen Elizabeth II), b. 21 April 1926; and Margaret Rose, b. 21 Aug. 1930. She became queen when Prince Albert succeeded to the throne as George VI on 11 Dec. 1936; was crowned with him in May 1937; and went with the king on a tour of Canada and the U.S.A. in June 1939, the visit being an unqualified success. She broadcast to women of the Empire, 11 April 1943. In 1947 she accompanied the king on a tour of South Africa. After George VI's death on 6 Feb. 1952 she assumed the title of Queen Elizabeth, the Queen Mother. Since her husband's death she has carried out numerous public engagements, notably a visit with Princess Margaret to Rhodesia in 1953. Her sympathy and interest in her people have made her widely loved.

Elizabeth City, cap. of Pasquotank co., North Carolina, U.S.A., on the Pasquotank R., 40 m. from Norfolk, Virginia. It has a fine deep harbour, cotton mills, and a shipyard. The first General Assembly of Virginia met here in 1695. Pop. 12,685.

Elizabeth of York (1465-1503), queen of England, daughter of Edward IV and Elizabeth Woodville, b. Westminster. Sev. marriages were contemplated for her, and Richard III is said to have considered marrying her. In 1486 she married Henry VII, so uniting the Yorkist and Lancastrian lines. She was the mother of Henry VIII and of Margaret, who married James IV of Scotland.

Elizabeth Petrovna (1709-62), empress of Russia, daughter of Peter the Great. She came to the throne in 1741, having overthrown, with the help of the Guards, the infant emperor Ivan VI. She was of an easy-going nature, but serious in matters of gov., and tried to continue the policies of her father. She abolished the death penalty in Russia and was one of the founders of Moscow Univ. The great event of her later years was the Seven Years War.

Elizabeth Tunnel, 60 m. N. of Los Angeles, California, U.S.A., penetrates the Coast Range Mts and is 5 m. long.

Elizabethan Architecture, see ENGLISH ARCHITECTURE.

Elizabethan Standard Weights, see METROLOGY.

Elizabethton, city, co. seat of Carter co., NE Tennessee, U.S.A., making artificial silk and wood products. Pop. 10,575.

Elizabethgrad, see KIROVOGRAD.

Elizavetpol', see KIROVABAD.

El Kantara, tn of Egypt, on the Suez Canal. In the First World War it was the scene of a victory over the Turkish advance guard in 1915. Pop. 25,000.

El Khargeh, or The Great Oasis, large and fruitful valley in the Libyan desert, the most S. of the Egyptian oases. From 80 to 100 m. long and 10 m. broad.

Elk, or Moose (*Alces alces*), the largest living species of deer. It is known in the Old World as the E., but in America as the moose, the American 'E.' or wapiti having less resemblance to the European broad-horned deer than to the red deer. The E. is distributed over the forested regions to the N. of Europe and Asiatic Russia, and it is now everywhere protected by laws, and carefully preserved. It is easily tamed and has frequently been trained to draw sleighs. The antlers, found in the male alone, have their basal portion, which is in the form of a short cylinder, in the same plane as the forehead. The base expands into a huge, broad 'palm,' at the edge of which are short branches. The height at the shoulders is about 6 ft. In the breeding season the males fight with great fury, inflicting such wounds with their horns that the combats frequently result in death.

Elk, Irish, *Cervus megaloceros*, extinct Pleistocene species of deer closely allied to the fallow-deer of the present day, the bones of which are found in Irish bogs and also in certain parts of Great Britain and the Continent. It stood 6 ft in height,

and is characterised by the enormous size of its antlers, which sometimes had a spread of close on 11 ft. Extinct after the coming of man to Europe.

Elk-Hound, small Norwegian dog which much resembles the Eskimo dog (q.v.), but is considerably smaller in size. Its coat is thick, with a full under-coat, and the tail is bushy. The colour is grey, with a darker shade on the back.

Elk Island Park, Alberta, Canada, 30 m. E. of Edmonton (q.v.), the largest fenced animal preserve in Canada. The park was originally reserved in 1906 as a sanctuary for elk, moose, and mule deer in the region. In 1907 it formed a habitat for part of the buffalo herd purchased that year by the gov. of Canada. There is a recreational centre at Astotin Lake.

Elkhart, city in Indiana, U.S.A., on the St Joseph R. in agric. area 15 m. E. of South Bend. It manufs. musical instruments, electrical appliances, and brass, sheet metal, rubber, and paper products. Pop. 35,600.

Ell, see METROLOGY.

Ellä (d. 588), son of Iffa and grandfather of Oswald. He became 1st king of the Deirans, 559.

Ellagic Acid, or **Gallogene** (C₁₂H₆O₆), yellow, odourless powder of agreeable taste only soluble in alkalis. Medicinally, it is used as an astringent in cases of tuberculosis and inflammation of the bowels, becoming active only on reaching the alkaline fluids of the intestines.

Elland, tn in the West Riding of Yorks, England, 3½ m. from Huddersfield, with manufs. of woollens and fireclay goods, and iron and dye works. E. gives it name to an urb. dist., comprising E. Greetland, and Stainland. Stainland has manufs. of worsteds, cotton, and paper. Pop. 19,200.

Ellenborough, Edward Law, 1st Baron (1750-1818), educ. at Charterhouse and Cambridge. In 1771 he became a pupil of the special pleader, George Wood (afterwards a baron of the Exchequer), and 4 years later began practising on his own account with great success. Called to the Bar in 1780, he soon had a large practice. His first great chance came in 1788 when he was retained as leading counsel for the defence of Warren Hastings. His admirable conduct of this case made him famous, and long before it had reached its close he was engaged in many of the most important trials of his day. In 1802 he succeeded Kenyon as lord chief justice, and was raised to the dignity of Baron E. See J. C. Campbell, *Lives of the Chief Justices of England*, 1857 (vol. III).

Ellen's Isle, small is. of Perthshire, Scotland, situated in Loch Katrine. It is celebrated in romance, and immortalised by Sir Walter Scott, who made it the haunt of the Lady of the Lake.

Ellerman, Sir John Reeves (1862-1933), shipowner, financier, and newspaper proprietor, son of John Harman E., of Hull, a native of Hamburg. He early joined the board of Frederick Leyland's company, the first unit of what eventually

developed into the Ellerman group. This group, registered as the London, Liverpool and Ocean Shipping Co., included under the one management the Paypayanni, City, Hall, Westcott, Laurence, and other lines; and in 1913 acquired the share cap. of Bucknall's Steamship Lines, the name of which was changed in 1914 to Ellerman and Bucknall Steamship Company. He was also chairman of Ellerman's Wilson Line. He left a fortune of £30,000,000. Baronet in 1905, Companion of Honour in 1921.

Ellesmere, Francis Leveson-Gower Egerton, 1st Earl of (1800-57), politician and writer, the 2nd son of the 1st duke of Sutherland. On inheriting the estates of the Egertons, dukes of Bridgewater, he took the name of Egerton (1833). In 1846 he was made earl of Ellesmere and viscount Brackley. From 1828 to 1830 he was Irish Secretary, and secretary for war in 1830. Amongst his writings are a trans. of *Faust*, 1823, *Mediterranean Sketches*, 1843, and *History of the War of the Sicilian Vespers*, 1850.

Ellesmere: 1. Urb. dist. in Shropshire, 16 m. NNW. of Shrewsbury. Pop. 2237.

2. Is. of the Arctic regions, Canada, W. of Smith Sound, and opposite NW. Greenland. It is almost entirely ice and snow-covered wastes, with mts rising in some places to 9000 ft. T-3 and other ice is, possibly break off from the ice shelf. See *Arctic*, vol. viii, No. 1, 1955.

Ellesmere Port, urb. dist. and seaport of Cheshire, England, on the Mersey, 6½ m. N. of Chester at the junction of Ellesmere Canal and the Manchester Ship Canal. It is a depot for iron ore and pig iron, with large docks and warehouses, and is regarded as one of the largest oil and petroleum centres in the U.K. Pop. 35,000 (1954).

Ellet, Charles (1810-62), Amer. engineer, b. Penn's Manor, Bucks co., Pennsylvania. The first wire suspension bridge of the U.S.A., at Fairmount, Philadelphia, was his work, and he constructed most of the prin. iron and steel bridges in the U.S.A. He is chiefly remembered as the inventor of naval rams, and in the Amer. Civil war equipped 9 Mississippi R. steamboats as rams, defeating a fleet of Confederate rams. He met his death during a naval engagement.

Ellie Islands, see GILBERT AND ELLICE.

Ellicott, Charles John (1819-1905), prelate, b. Whitwell, near Stamford, where his father was rector. In 1861 he was made dean of Exeter, and 2 years later bishop of Gloucester and Bristol. His episcopate lasted 42 years, and he threw himself vigorously into diocesan work. In 1857 E. was one of the 5 clergymen who pub. a revision of the gospel of St John, followed by revisions of the Romans and Corinthians and other epistles.

Ellil, see ENLIL.

Elliot, Jean, or **Jane** (1727-1805), poetess, b. Minto House in Teviotdale, daughter of Sir Gilbert Elliot, baronet, lord justice clerk of Scotland. She is remembered as the writer of the beautiful 'Flowers of the Forest,' a poetic lament for Flodden, but is not known to have

written any other verse. The poem, composed as the result of a bet with her brother, was at first pub. anonymously as an old ballad.

Elliot-Murray-Kynynmound, Gilbert John, see MINTO, 4th EARL OF.

Elliotson, John (1791-1868), physician, b. Southwark, London. He studied medicine at Edinburgh and Cambridge, and in 1834 became physician to Univ. College Hospital. He practised hypnotism and mesmerism, and in 1838 was compelled to resign his offices on this account. He edited a magazine, *The Zoist*, devoted to the subject, and founded a mesmeric hospital in 1849. E. was one of the first Brit. physicians to advocate the use of the stethoscope. Among his pub. are: *Lectures on Diseases of the Heart*, 1830, *Human Physiology*, 1840, *Surgical Operations in the Mesmeric State without Pain*, 1843. Thackeray dedicated his *Pendennis* to E., who was also a friend of Dickens.

Elliott, Ebenezer (1781-1849), poet, the 'corn-law rhymor,' b. Masborough, near Rotherham, Yorks. He was educ. at various schools, and in 1797 entered his father's iron foundry. He had a successful career at Sheffield as a bar-iron merchant, and on his retirement in 1841 settled at Great Houghton. At the age of 17 he began writing poems, and pub. *The Vernal Walk*, in imitation of Thomson, in 1801. He is chiefly remembered, however, for his *Corn-Law Rhymes*, 1831, which are vigorous, simple, and full of vivid description. They are inspired by a fierce hatred of injustice, and by their sincerity and earnestness are saved from the common fate of political poetry. See his *Life, Poetry, and Letters*, ed. J. Watkins, 1850; memoir by J. Searle, 1850; and W. Odum, *Two Sheffield Poets*, 1929.

Elliott, May Gertrude (Lady Forbes-Robertson) (1874-), actress, b. at Rockland, Maine, U.S.A., sister of Maxine E. She made her first appearance on the stage at New York with E. S. Willard in *The Middleman*, and was first seen on the London stage at Daly's Theatre in 1895 as Sylvia in *The Two Gentlemen of Verona*. She married Sir Johnston Forbes-Robertson in 1900, and played many leading parts with him. Her most successful rôles were Desdemona; Ophelia; the 'slavey' in *The Passing of the Third Floor Back*; Little Britain in *Mice and Men*; and Maudie in *The Light that Failed*. Her later parts included Sarah Gilman in *Sarah of Soho*, 1922; and Maria in *Twelfth Night*, 1927.

Ellipse. In general language an E. is a regular oval. In geometry it may be defined in a number of different ways: (1) The section of a cone by any plane less inclined to the base of the cone than is the side of the cone. (See GEOMETRY) (2) *Higher Plane Geometry*. (2) An oblique section of a right cylinder or the oblique projection of a circle. An E. is the orbit of a particle moving under the influence of a central force, which varies inversely as the square of the distance of the particle. This law is the gravitational law of force.

and an E. represents the orbit of a planet, if the individual planet and the sun are considered alone (the other planets exert attractions and disturb the orbit).

The foci of an E. are the points *S* and *S'* (see diagram) such that the sum of the distances *SP* and *S'P* of any point on the E. from the foci is the same whatever the position of *P*. The straight line *AA'* passing through the foci is the *major axis*, and the line *BB'*, perpendicular to *AA'* at its middle point, is the *minor axis*. If *AA' = 2a* and *BB' = 2b*, $b^2 = a^2(1 - e^2)$,

where *e* is the eccentricity. Also $SP + S'P = 2a$. If *AOA'* and *BOB'* be taken as the axes, the co-ordinates of the point *P* (*ON* and *OT*) are connected by the equation:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

(where *ON = x* and *OT = y*).

The *diameter* is any straight line through the centre, terminated by the E., such as *GOG'*. The *directrix* is the line *MK*, such that the distance of *P* from the focus *S* bears a constant ratio less than unity to the distance of *P* from *MK*.

Ellipsoid, a surface generated by a variable ellipse which always moves parallel to itself, and has its vertices on 2 ellipses, the planes of which are perpendicular to each other and also to the plane of the moving ellipse, and have one common axis. From this definition the equation of an E., $x^2/a^2 + y^2/b^2 + z^2/c^2 = 1$, is easily deduced, *a*, *b*, and *c* being the semi-axes. If $b = c$ the equation becomes $x^2/a^2 + (y^2 + z^2)/b^2 = 1$, and this represents an oblate spheroid if *a* is less than *b*, and a prolate spheroid if *a* is greater than *b*. If $a = b = c$ the surface becomes a sphere, $x^2 + y^2 + z^2 = a^2$. The E. is very largely used in the mathematical theories of elasticity, heat, and light, e.g. the strain E., E. of expansion, or the wave surface in a doubly refracting substance.

Elliptic Compass. The trammel or E. C. is the simplest and most widely used instrument for drawing ellipses. It depends on the fact that if a straight line, *AH* (see fig., p. 738), of fixed length moves with its extremities on 2 fixed straight perpendicular lines, *OA'* and *OB'*, then any point, *C*, on the line, either between *A* and

B or on the line AB produced in either direction, will describe an ellipse.

This is easily proved as follows. Taking OA and OB as axes of x and y , let the co-ordinates of C be x, y , so that $CE = x$ and $CD = y$; then, since $CE/CB = \sin B$ and $CD/CA = \sin A = \cos B$, it follows that $x^2/a^2 + y^2/b^2 = \sin^2 B + \cos^2 B = 1$, and hence the locus of C is the ellipse $x^2/a^2 + y^2/b^2 = 1$, where $a = CB$, $b = CA$.

The point C can be taken anywhere on the line and different forms of ellipses can be described. If C is the middle point of AB the curve becomes a circle whose equation is $x^2 + y^2 = a^2$.

Elliptic Polarisation. Elliptically polarised light, when examined with a Nicol prism, will give an illumination which will vary as the Nicol is rotated. It is thus distinguished from ordinary light, but not from a mixture of ordinary and plane polarised light. It may be distinguished by first passing the light through a quarter wave plate of mica with its axis parallel or perpendicular to the plane of maximum polarisation; for elliptically polarised light thus becomes plane polarised, and may be extinguished on rotating the Nicol prism. See POLARISATION OF LIGHT.

Ellis, Alexander John (1814-90), Eng. phonetician, mathematician, and musician. His original name was Sharpe, but he assumed the surname Ellis (1825). He was associated with Sir J. Pitman, founding the system of printing known as 'phonotypy'. His works include *Phonetics*, 1844, *The Essentials of Phonetics*, 1848, *Early English Pronunciation*, 1869-1889, *Pronunciation for Singers*, 1877, and *The History of Musical Pitch*, 1880. He also wrote papers and books on mathematics and philosophy and produced phonetic texts of standard works, and was editor of *The Phonetic Friend*, 1849, and *The Spelling Reformer*, 1849-50.

Ellis, George (1753-1815), Brit. writer, b. West Indies. He attained notoriety in 1778 with the pub. of *Poetical Tales*, by Sir Gregory Gander. He was one of the

contributors to the *Rolliad*, and in later years, with Canning, founded the *Anti-Jacobin*. In 1790 he pub. *Specimens of the Early English Poets*, and 15 years later *Specimens of Early English Romances in Metre*.

Ellis, Sir Henry (1777-1869), antiquary, with Canning, founded the Bodleian, Oxford, and the Brit. Museum (1800), chief librarian of the Brit. Museum (1827-56). His works include an ed. of Brand's *Popular Antiquities*, 1813, of Dugdale's *Monasticon* (with others), 1817-33, *Introduction to Domesday Book*, 1816, *Original Letters Illustrative of English History* (3 series), 1832-46, *Elgin Marbles of the Classic Ages* and *The Townley Gallery of Sculpture*, 1847. E. was director of the Society of Antiquaries for many years.

Ellis, Henry Havelock (1859-1939), psychologist, b. Croydon. At the age of 16 he made a voyage to Australia for his health and remained there 4 years. In 1879 he returned to England and studied medicine at St Thomas's Hospital. In 1891 he married Edith Lees, and he had also a lifelong attachment to Olive Schreiner, the novelist (q.v.). Between 1897 and 1910 he pub. 6 vols. of *Studies in the Psychology of Sex*, and a 7th in 1928. Others of his works on the same subject are *Mun and Woman*, 1891, *The Erotic Rights of Women*, 1918, and *Little Essays of Love and Virtue*, 1922. He also wrote 3 vols. of essays on art, *Impressions and Comments*, 1914-24, and ed. the Mermel series of Eng. dramatists. His autobiography, *My Life*, appeared posthumously. See study by H. Peterson, 1928.

Ellis, Robinson (1834-1913), philologist and classical scholar, educ. at Guernsey, Rugby, and Oxford. He pub. numerous critical works on Catullus and trans. *Catulli Veronensis Liber*, 1867, 1878, *Fragments of Catullus*, 1871, and *Commentary on Catullus*, 1876. Other works are Ovid's *Ibis*, 1881, *New Fragments of Juvenal*, 1901, *Appendix Vergiliana*, 1907, *The Annalist Licinianus*, 1908, *The Amores of Ovid*, 1912, and various articles in many journals, and classical reviews.

Ellis, William (1794-1872), missionary, sent by the London Missionary Society to the S. Pacific Islands (1816-25). From 1831 to 1844 he was foreign secretary to the London Missionary Society. His visits to Madagascar resulted in *History of Madagascar*, 1838, *Three Visits to Madagascar*, 1858, *Madagascar Revisited*, 1867, *The Martyr Church*, 1870. Other works were *A Tour through Onohyhee*, 1826, and *Polynesian Researches*, 1829. See life by J. E. Ellis, 1873.

Ellis Island, small is. in New York harbour, 1 m. from Manhattan Is., formerly used as an immigrant station and as a magazine.

Elliston, Robert William (1774-1831), actor and manager, first appearing (1791) as Tressel in *Richard III* at Bath. In 1796 he came to the Haymarket, London, and was manager there (1803). E. was considered one of the finest actors of his day, especially in comedy, and was praised by Lamb and Leigh Hunt. He

was lessee of Drury Lane Theatre for many years, and he ran sev. theatres in London and the provs. at the same time. See *lives* by W. Oxberry, 1826, and G. Raymond, 1857.

Ellon, burgh of Aberdeenshire, Scotland, 16 m. N. of Aberdeen, on the R. Ythan. Once the cap. of Buchan, the vill. belonged to Kinloss Abbey. Pop. 1500.

Ellora, the Caves of, in Hyderabad State, India, 19 m. from Aurangabad. The E. group of cave temples comprises 12 Buddhist, 17 Brahman, and 5 Jain works. They are mentioned by an Arab geographer of the 15th cent. as a celebrated place of pilgrimage. The Buddhist caves date from AD 350-750. The Brahman caves were probably constructed in the 7th and 8th cents. AD. There are sculptures of the slaughter of the buffalo demon, Siva and Parvati playing chess, 3 skeleton demon gods, Bhairava with a necklace of skulls, 3 riv. goddesses, etc. The great Kailasa temple, carved out of black volcanic rock, is perhaps the finest Hindu monument of ant. India. The 5 Jain caves date from the 8th to the 13th cents.

Ellsworth, Lincoln (1880-1951), Amer. explorer and pioneer of polar flying, b. Chicago, worked first as an engineer in North America (including Alaska). He served in the U.S. Army Air Corps during the First World War. He joined a geographical expedition to Peru in 1924. The following year he accompanied, and his father financed, Amundsen's first polar flight from Spitsbergen to lat. 87° 44' in 2 Dornier-Wal flying boats, one of which was abandoned after a failure to take off after landing on a lead in the pack ice. In 1926 E. accompanied Amundsen and Umberto Nobile in the airship *Norge* during a successful flight from Spitsbergen, over the North Pole, to Alaska in 71 hrs. He assisted Sir Hubert Wilkins in planning the arctic voyage of the submarine *Nautilus* in 1931, and the same summer accompanied the airship *Graf Zeppelin* on her arctic flight from Germany, over Zemlya Frantsa-Iosifa and back by Severnaya Zemlya and Novaya Zemlya. After 2 unsuccessful attempts, in 1933-4 and 1934-5, he made the first trans-antarctic flight from Dundee Is. (North Graham Land) to the Bay of Whales (Ross Sea). He pub. *First flight across the polar sea*, 1926, and *Beyond horizons*, 1938. See the *Polar Record*, vol. vi, No. 43, pp. 419-20.

Ellsworth, Oliver (1745-1807), Amer. statesman and jurist, b. Windsor, Connecticut; studied at Yale and Princeton, and practised law at Hartford, 1771. Was a member of the General Assembly of Connecticut, and held many legal and political offices in the state. Advised Washington to send Jay to England to negotiate a new treaty. Appointed by Washington as chief justice of the Supreme Court, 1796, and was sent by Adams to France to negotiate a new treaty.

Ellsworth Highland, part of Antarctica (q.v.) discovered by Lincoln Ellsworth (q.v.) on his trans-antarctic flight in 1935. See L. Ellsworth, *Beyond horizons*, 1938.

Ellwangen, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Jagst, 44 m. ENE. of Stuttgart (q.v.). It is first mentioned in 750, and in 764 a Benedictine monastery was founded here. Later it was an eccles. principality. There is a splendid 12th-cent. Romanesque church with 3 towers, and on a hill overlooking the tn is a medieval castle and a pilgrimage church. Pop. 10,700.

Ellwood, Thomas (1639-1713), author and Quaker preacher, b. Crowell, Oxon. He was an intimate friend of and reader to Milton after he became blind. E. first suggested to Milton the idea of his 2nd epic, *Paradise Regained*, after reading the MS. of *Paradise Lost*, 1665. E.'s own works include *Forgery no Christianity*, 1674, *Sacred History of the Old and New Testaments*, 1705-9, *Davidicis*, a poem, 1712, and an autobiography, 1714.

Elm, the name applied to species of *Ulmus*, 4 of which occur in Britain, while all are to be found in N. lands and

COMMON ELM

on Asiatic mts. There are some 18 species of the *Ulmus* genus of the *Ulmaceae* family and all are easily cultivated, flourishing in almost any soil or situation. The fruit is characteristic, being a one-seeded samara, and the leaves are curious, the sides being unequal in size. *U. campestris*, the common or small-leaved E., and *U. montana*, the wych-E. are the best-known Brit. species; *U. americana* is a tall tree and yields a good timber. The common E. is abundant in England, France, Spain, and Italy; it sometimes attains great age and size, endures in smoky conditions and is familiar in London parks. Formerly its timber was used for water-pipes and the keels of ships. The wych-E. also indigenous to Great Britain, is also known as the Scotch E.

Elm Park, see HORNCHURCH.

Elman, Mischa (1891-), Russian violinist of Jewish descent, b. Talmi, Russia. Trained first at Odessa and later by Auer in St Petersburg. He first appeared in London in 1904, and in New York, 1906, and became one of the leading violinists of the world.

Elmes, Harvey Lonsdale (1813-47), architect, b. Chichester; son of James E., architect and writer on architecture, who trained him. In 1836 he won the important public competition for St George's Hall, Liverpool. Although building began in 1836, he d. before it was finished.

Elmina, once an important Dutch trading settlement on the coast of Ghana, with a very fine castle built by the Dutch. E. was the first European settlement on the W. coast of Africa. The first fort was built in 1481 and was named São Jorge da Mina—St. George of the Mine. The castle took 80 years to complete. E. is now little more than a fishing vil.

Elmira, cap. of Chemung co., New York, U.S.A., on Chenung R. (Newtown Creek), 74 m. from Syracuse. An important railway centre. The more important industries include railroad car shops, steel bridge plants, valve and radiator works, and the manuf. of shoes, fire engines, silk and knitted goods and bicycles. It is the seat of E. College for Women, and of the noted reformatory. Pop. 49,716. See A. Winter, *The Elmira Reformatory*, 1891.

El Misti, or **Arequipa, Volcano**, grand, almost extinct volcanic mt of the Andes, Peru (19,170 ft), whose snow-capped peak is clearly seen 10 m. NE. of Arequipa. Harvard Univ. erected a meteorological observatory near the summit, in use from 1893 to 1901. There are various stations at Mont Blanc (15,700 ft), Pampa de los Huesos (13,400 ft), and Mollendo (sea-level).

Elmo's Fire, St. brush-like electric discharge which is sometimes seen on projecting objects, particularly on ships' masts and the aerials and wing tips of aircraft. It may appear as an enveloping fire or in the form of short streamers. It is not dangerous.

It is commoner in S. climates and known by other names, such as fire of St. Clara, corposant, etc. The name is a corruption of St. Ermo, or St. Erasmus, patron saint of Mediterranean sailors.

Elmshorn, Ger. tn in the *Land* of Schleswig-Holstein (q.v.), 44 m. SSW. of Kiel (q.v.). It has textile, engineering, and foodstuff industries. Pop. 35,000.

Elmsley, Peter (1773-1825), philologist, classical scholar, and critic. He assisted Davy in deciphering the papyrus found at Herculaneum, 1819. E. produced excellent critical eds. of sev. dramas of Sophocles and Euripides. See F. E. Grelton (ed.), *Elmsleiana Critica*, 1833.

El Musel, see *GIRON*.

Elmhurst Park, residential vil. in NE. Illinois, U.S.A., a suburb W. of Chicago, incorporated 1914. Pop. 18,800.

El Obeld, or **Il-Obeld**, cap. of Kordofan, Sudan, Africa, 240 m. from Senaar. An Anglo-Egyptian army, under Hicks Pasha, was annihilated by a Mahdist force close by (1883). See *KORDOFAN*. E. O. is the terminus of the railway from Cairo. Pop. 18,000.

Elocution (Lat. *eloqui*, to speak), the art of speaking, embracing vocal quality, pronunciation, use of language, and delivery. At one time this term covered

only method and manner of delivery, including so-called 'expression' and 'gesture'. Later, having a wider use, it implied the art of communication through speaking, were it oratory, verse-speaking, lecturing, or reading aloud. The voice is an inherent part of the speaker, and its successful development and management are usually accompanied by an enlargement of the speaker's whole personality. A good voice depends upon breath, as the motive power, open resonators to impart full tone, and precise articulation to give clarity of utterance. An adequate supply of breath is essential to the maintenance of good tone and to carrying power, to facilitate phrasing and to obviate fatigue. Flexibility of vocal pitch allows for variation and subtlety, and control of the resonators ensures that the tone reflects the intentions, intellectual and emotional, of the speaker. Clear articulation depends upon muscular agility; control over the mobile parts of the resonator, jaw, tongue, lips, and soft palate.

E. should consist in the direct training of the factors, breath, tone, and articulation, and, indirectly, of the training of the vocal cords to supply variety of pitch, together with the training of the ear, which is the final arbiter of sound. If the voice is developed for its musical quality problems of pronunciation are greatly minimised. Musical quality depends upon good physiological usage of the organs concerned, whereas standards of pronunciation are dictated by fashion and by regional and social considerations. To use the voice well can do nothing but good, to conform to any given type of pronunciation is a matter of choice. Delivery is also affected by the rate of speaking, by pauses, and by emphasis. These should be appropriate to the matter of the speech, the size of the room being spoken in, and the number and distance of the audience. Too great speed causes inaudibility and mismanaged emphasis obscures the sense. Good phrasing has rhythmic continuity and variety and is easily understood. The spoken word depends, too, upon the use of language and a well-adapted vocabulary. Co-ordination of the physical factors which engender a pleasant and expressive voice, and well-chosen words delivered with ease and confidence, are the hall-mark of the accomplished speaker.

The term E. has tended to lose its wider implications owing to a pre-occupation with the manner of delivery, thus reverting somewhat to the former use of the word. For many people, now, it has unfortunate associations, hence the increased use of other terms, such as speech-training, voice-training (q.v.), oral communication, diction, etc. E. in its widest sense covers the whole field of communication and interpretation by means of voice and speech which are illuminated by the mind and the whole personality, and by the satisfactory fusion of matter and manner.

Eloge (Gk *eulogia*, praise), an encomium or panegyric oration in honour of a

deceased person, describing his merits and services, especially one pronounced by the secretary of the Fr. Academy, or by a newly elected member on his predecessor.

These *éloges académiques* form a considerable branch of Fr. literature. See the *Éloges* of Fontenelle, 1731. Thomas, 1759-70, d'Alembert, 1779-87. Cuvier, 1819-27, and Flourens, 1833-67.

Elohim (Heb. plural of *Eloah*, God), one of the chief names by which God is designated in the Heb. Scriptures. The plural expresses the idea of greatness and supremacy, and is mainly used with a singular verb as a title of the Supreme Being.

Elohist, see PENTATEUCH.

Eloi, or **Eligius**, St (588-660), a metal-worker who became master of the mint at Paris and adviser of Clotaire II and Dagobert I. He is the patron of jewellers and goldsmiths. In 640 he became bishop of Noyon, and he is famous as the founder of many monasteries and hospitals. His feast is on 1 Dec.

Elongation, in astronomy, the angular distance of a heavenly body from some relatively fixed point, such as the angular distance of a planet from the sun or of a satellite from its primary, as seen from the earth. Thus the maximum angular distance of Venus is about 45 degrees.

El Paso, port and cap. of E. P. co., Texas, U.S.A., on the Rio Grande, opposite Ciudad Juárez (El Paso del Norte), Mexico. The industries include smelting, flour-milling, railway car repairing, box-making, and meat packing, and the trade is in copper, silver, lead, wool, hides, and live stock, especially with Mexico. Seekers for nearly perennial sunshine find it at E. P., at an elevation of 3800 ft. Pop. 130,000.

El Paso del Norte (Mexico), see CIUDAD JUÁREZ.

Elphin, tn of co. Roscommon, Rep. of Ireland, formerly the seat of a bishop. The see, however, no longer exists, having been united with Kilmore in 1833. Pop. 577 (1954).

Elphinstone, George Keith, see KEITH, VISCOUNT.

Elphinstone, Mountstuart (1779-1859), historian and statesman, son of the 11th baron E. Educ. at Edinburgh and Kensington, he entered the civil service of the East India Company (1796), and became one of the founders of Britain's Indian empire. E. was aide-de-camp to Wellesley (1803), sharing in his campaign; envoy to Kabul (1808), and resident at Poonah (1810-17). He helped to win the battle of Kirki against the Marhattas (1817), and was made governor of Bombay (1819-27). He ruled wisely in the Deccan, but refused the governor-generalship of India owing to ill-health. He wrote: *Account of the Kingdom of Cabul, and its Dependencies in Persia, Tartary, and India*, 1815, 1839, *The History of India*, 1841, 1866, and *The Rise of British Power in the East* (ed. by Sir E. Colebrooke), 1887. See life by Colebrooke, 1884.

Elphinstone, William (1431-1514), prelate and statesman, bishop of Aberdeen (1483), and founder of King's College,

Aberdeen (1494, completed 1506). He helped to estab. the printing-press of Chepman and Millar in 1507. His chief work is the *Brenarium Aberdonense*, 1509-10 (reprinted 1853). See A. Gardyne, *Life of W. Elphinstone* (D. Laing's ed.), 1878.

El Reno, tn of Oklahoma, U.S.A., 25 m. W. of Oklahoma City. It is a processing, shipping, and marketing centre for an agric. area. It manufs. chemicals and metal products, and there is flour and feed milling, dairying and meat packing. Its industries also include railroad shops and incubator factories. It is the seat of El Reno Junior College. Pop. 11,000.

Elsass-Lothringen, see ALSACE-LORRAINE.

Elsene, see IXELLES.

Elzheimer, or **Elzheimer**, Adam (c. 1578-1610), Ger. landscape-painter. He worked largely in Rome, and was called by the Italians 'Adamo Tedesco.' His pictures are mostly small, painted on copper, and beautifully finished. He excelled in colour and chiaroscuro, and in imitation of nature, and his scenes by torchlight and moonlight were much admired. E. was founder of the school later represented by Rembrandt and Claude Lorrain, his drawings being very Rembrandtesque in spirit. His works include: 'Flight into Egypt' (Louvre), 'Ceres in Search of Persephone,' 'Tobit and the Angel' (engraved by Count Gondt), 'Christianity Triumphant over Paganism,' 'Martyrdom of St Lawrence' (National Gallery). See lives by W. Drost, 1933, and F. Bothe, 1939.

Elsinore, see HELSINGÖR.

Elsler, Fanny (1810-84), Viennese ballerina who fl. at the same time as Taglioni. Her dancing was impassioned and brilliant, and she had great powers as a mime. She obtained successes in Paris and London, but the peak of her career was her astonishing triumph in America, which she was the first great dancer to visit (1840-2).

Elster: 1. **Schwarze Elster** (Black E.), riv. of Germany, which rises near Bautzen, and flows in a generally N.E. direction to enter the Elbe near Wittenberg (qq.v.). Length about 112 m., of which 37 m. are navigable.

2. **Weisse Elster** (White E.), riv. of central Europe, which rises in Czechoslovakia, and after a few m. enters Germany and flows past Plauen, Gera, and Leipzig to meet the Saale S. of Halle (qq.v.). Length about 120 m., of which little is navigable.

Elstow, par. of Beds, England, 2 m. from Bedford. John Bunyan was b. here in 1628, and was baptised in the church, the nave and part of the chancel of which were originally part of the abbey church of a Benedictine nunnery, founded 1059. The bell tower is now detached. Pop. 400.

Elstree, rural dist. of Herts, England, 5 m. W. of Barnet. In the rural dist. is the residential area of Boreham Wood, with large film studios and other industries. Pop. 24,000.

Elswick, a par. and W. suburb of Newcastle, Northumberland, England. It

increased considerably in importance after the opening of Armstrong's engineering works (1847). Pop. 14,760 (1954).

Eltham, par. in the S. of the bor. of Woolwich, London. E. Palace, built c. 1300 and with later additions, was a royal residence from the time of Edward II until that of Henry VIII. Notable is the Great Hall, built in the reign of Edward IV, with a superb hammerbeam roof. Well Hall in E. has a fine Tudor barn dated 1568, a later addition to a house, no longer standing, that used to be the home of Sir Thomas More's daughter Margaret Roper.

Elton, Charles Isaacs (1839-1900), jurist and ethnologist. His interesting *Origins of English History*, 1882, deals with the Celtic element in the Eng. race. He wrote also *Custom and Tenant Right*, 1882.

Elton, Oliver (1861-1945), Brit. scholar. Educ. at Marlborough and Corpus Christi College, Oxford, he became a lecturer in Eng. literature at Manchester, and from 1900 to 1925 was prof. of Eng. at Liverpool. His works include *The Augustan Ages*, 1899, *Michael Drayton*, 1905, 3 *Surveys of English Literature*, 1912-28, which together cover the period between 1730 and 1880, *The English Muse*, 1933, and *Essays and Addresses*, 1939. He was a Fellow of the Brit. Academy.

El'ton, shallow salt lake in the Stalin-grad Oblast of Russia.

Elvan, name given by Cornish miners to dykes of quartz-porphry, granite-porphry, or other Plutonic rock found in association with granite and penetrating sedimentary strata. The rock is granular and crystalline and is called by geologists 'quartz-felsite.' It is used for road-mending and for building stone.

Elvas, tn of Portugal, in Portalegre dist., near the Sp. frontier, 20 m. W. of Badajoz (q.v.). It was once a strong fortress, was besieged unsuccessfully by the Spanish in 1581 and 1658, and was taken by the Fr. in 1808. The tn is overlooked by 2 18th-cent. forts, and has a 17th-cent. aqueduct and a late Gothic cathedral. There is a trade in grain, olive oil, wine, and plums. Pop. 12,000.

Elwes, Gervase Cary (1866-1921), tenor remembered for his fine interpretation of Elgar's *Dream of Gerontius*.

Ely, city of Cambs, 16 m. NNE. of Cambridge, situated on rising ground near the R. Ouse in the midst of the fens. It was one of the last strongholds of the Saxons; here Hereward's 'camp of refuge' held out against the Conqueror. Its cathedral is one of the most beautiful Eng. churches, and one of the largest in Britain. It presents examples of Saxon, Norman, and early Eng. architecture. On its site St Etheldreda founded, in 673, a monastery, which the Danes burnt down in 870; Ethelwold, bishop of Winchester, founded a Benedictine abbey about the year 1000; the present cathedral was begun in 1083 and finished in 1534. Its length is 530 ft, breadth across the transepts 180 ft, height 62 ft, the W. tower is 225 ft high. Between 1322 and 1342 the central tower fell, and the

decorated lantern tower, built by Alan de Walsingham to replace it, is one of the most interesting features of the cathedral as being the only existing specimen of a Gothic dome. The choir exhibits great splendour of carving and sculpture. Among historical personages connected with E. are Bishop Thurston and King Canute. Oliver Cromwell lived here, 1636-40. King's School, a public school for boys, was founded in 1543. Brewing and market-gardening are carried on, and pottery and clay pipes are manufactured. Pop. 9989. See W. D. Sweeting, *Ely*

ELY CATHEDRAL FROM CASTLE HILL.

Cathedral, 1901; B. E. Dorman, *The Story of Ely and its Cathedral*, 1946.

Ely, Isle of, see ISLE OF ELY.

Elymais, anct. dist. of Susiana, in Persia, which derived its name from the Elymaei or Elym, a warlike and predatory people who were also found in the mts of Great Media, and were probably among the most anct inhab. of the country N. of the head of the Persian Gulf. The cap. was Susa. Another important tn was Malamir on the trade route linking the Persian Gulf with the Isfahan dist. See also ELAM.

Elymas, the title of Bar-jesus, who before Sergius Paulus, governor of Cyprus, withstood Paul and Barnabas (Acts xiii). E. = *Magos*, 'Sorcerer,' and the word seems akin to the Arabic *alama*, 'to know.' E. doubtless regarded Paul and Barnabas as rivals competing for the favour of the governor, and employed his black arts against them. Paul replied in kind; and the blindness that fell upon the 'sorcerer' was demonstration of a power behind the apostle greater than any known to E. Cf. Simon Magus (Acts viii).

Elyot, Sir Thomas (c. 1490-1546), diplomat and writer, *b.* Wilts, son of a judge. From 1523 to 1530 he was clerk of the Privy Council, and Henry VIII employed him on sev. diplomatic missions. He was a friend of Sir Thomas More (q.v.). The best known of his works is *The Boke named the Governour*, 1531, an educational treatise. Others are *The Castel of Helth*, 1534, a medical work, *The Image of Governance*, 1540, and *The Defence of Good Women*, 1545. He also in 1538 pub. the first Lat.-Eng. dictionary, and made various trans. which did much to popularise the classics. See life by D. T. Starnes, 1933.

Elyria, city of N. Ohio, U.S.A., 23 m. from Cleveland, with varied manufs., including aircraft, automobiles, electrical products, and chemicals. Pop. 30,300.

Elysium, or The Elysian Fields, the mythical home of perfect happiness for departed heroes and virtuous men favoured by Zeus. Homer's E. is a beautiful meadow at the W. extremity of the earth, beside the R. Oceanus. Later poets had other ideas of it.

Elytra (lik *chutron*), the name given to the horny sheaths which constitute the fore-wings of beetles. They fold over the back, generally meeting in the middle in a straight line, and serve to protect the hind-wings and the soft posterior parts of the body. The presence of E. is the distinguishing mark of beetles, but they are also to be met with in earwigs.

Elze, Frederick Karl (1821-89), Ger. Shakespearean scholar, *b.* Dessau. He was appointed to the chair of Eng. at Halle in 1875. He wrote *William Shakespeare, Englisches Liederschatz*, 1876, and trans. *Hamlet*.

Elzevir, the name of a family of celebrated Dutch printers and publishers of the 16th and first half of the 17th cents. The E.s issued beautiful eds., whose value time has increased. The family is supposed to have come from Liège or Louvain. The founder of the E. Press was *Louis* (1540-1617), *b.* Louvain, who, as a supporter of the Reformation, took refuge in Leyden and joined Plantin (q.v.) as foreman in 1583. Realising his lack of technical skill, E. concentrated on book-selling. He was successful; agencies from Copenhagen to Naples were opened. After his death his eldest and youngest sons, *Mathew* (c. 1565-1640) and *Bonaventura* (1583-1652), carried on the business. Mathew's son, *Abraham I* (1592-1640), worked with his uncle at Leyden for 26 years, during which time much good work was done. In 1617 *Isaac* (1596-1651), 2nd son of Mathew, set up a printing press and became the first printer of the family. The businesses were combined when Isaac retired in 1625. On the deaths of Bonaventura and Abraham I their sons, *Daniel* (1626-80) and *John* (1622-61), worked together until Daniel went to Amsterdam, joining his cousin *Louis III* (1604-70), son of *Joost* (c. 1575-1617), in publishing and printing, and soon surpassing the Leyden press in the excellence of his productions. The printing section closed. Leyden in 1680

and Amsterdam in 1681. It was Isaac who introduced the small format which combined convenience and accuracy of text appealing to students and a daintiness attractive to collectors. The E.s issued in all about 5300 items, some of them beautiful eds. whose value tends to increase. Even so Updike says: 'To have seen an Elzevir volume in prose and another in poetry in this format is to have seen all—or as many as one wishes to see.' The book business continues in Haarlem. See H. B. Copinger, *The Elzevir Press*, 1927.

Elzheimer, Adam, see **ELSHEIMER**.

Em, measure of type, see **PRINTING; METROLOGY**.

Emanation (Lat. *emanatio*, a flowing forth), anct system of philosophy, according to which all existences have successively flowed or emanated from the Supreme Essence, God. This doctrine is found in Egyptian and Indian mythology, in Neoplatonism, and in Christian Gnosticism.

Emancipation, in the Rom. law, was the act by which a father set his son free from paternal authority. The 12 tables required that the son should be formally sold 3 times, bought back, and then liberated according to the ceremony for freeing slaves. See **ABOLITIONISTS** and **CATHOLIC EMANCIPATION**.

Emancipation of Catholics, see **CATHOLIC EMANCIPATION**.

Emancipation of Serfs, in Russia, see **GREAT REFORMS**.

Emancipation of Slaves, see **ABOLITIONISTS; MANUMISSION**.

Emanuel I (1469-1521), king of Portugal, surnamed the Great, the Fortunate; became king in 1495. His reign is the most brilliant in the hist. of Portugal. A code of laws prepared by the king and a court in which chivalry, art, and science were encouraged greatly improved the internal condition of the country. Externally its possessions were extended by the explorations of Vasco da Gama, Cabral, and Albuquerque, and Portugal became the first naval and commercial power of the world.

Emanuel, Frank Lewis (1865-1948), artist and critic, *b.* Bayswater, London. Educ. at Univ. College, London, the Slade School of Art, and the Académie Julian, Paris. His oil painting, 'A Kensington Interior,' was acquired by the Chantrey Bequest for the nation (1912). He was for many years special artist to the *Manchester Guardian*. Pubs. include *Manchester Sketches, Etching and Etchings*, 1930, *Charles Keene*, 1935, and numerous articles and art critiques.

Emba, riv. of Kazakhstan, Soviet Union. It rises in the Mugodzhur Hills and flows 380 m. into the Caspian. There are important coalfields in its basin.

Embabane, see **MBABANE**.

Embalming, the art of preparing dead bodies for preservation from decay, principally by the use of medicaments, or, in modern practice, the scientific process of disinfecting and preserving the human dead and restoring ante-mortem appearance by arterial injection. It was widely

practised by the ancients, more especially in Egypt, where it was carried to a fine art, and the body so preserved there was called a mummy, a word derived from the Arabic for bitumen. Modern E. dates from the 18th cent., when alcohol, essential oils, camphor, saltpetre, pitch, or resin were used. Other substances used were tan, salt, camphor, cinnamon, and other aromatics. Later on fluids were injected, consisting of sodium chloride, alum, potash, glycerine, or composed of alkalis, arsenic, and alcohol. In the Royal College of Surgeons, London.

E.s in anticipation of war, however, have long since fallen into disuse, and it has even become customary for the belligerents to grant a respite to the enemy's trading vessels to leave their ports at the outbreak of war. The Hague Conventions of 1907 confirmed this, and only that power in a state which is authorised to declare war can decree an E., hence, in its hostile sense, it is an act of war. The sequestration by a nation of vessels or goods of its own citizens or subjects for public uses is sometimes called a *civil E.*, in contradistinction to a general prohibi-

AN EMBANKMENT ON THE MISSISSIPPI

Concrete and steel mats, which will be covered with asphalt, being used to strengthen a Mississippi levee

are still to be seen bodies preserved by Win (1718-83) and John (1728-93) Hunter, the renowned anatomists.

Embankments, mounds, banks, or earthworks raised for the purpose of protecting the land from the inroads of the sea or overflow of rivers; they preserve the level of railways, canals, and roads where a piece of low-lying ground has to be crossed, or they confine a body of water by preventing it encroaching on the land. In recent years land has been reclaimed by the formation of the E. in the IJssel Meer (Zuyder Zee) in the Netherlands, and in the Wash, England. E. are much used for irrigation purposes, e.g. the great dam of the Nile at Aswân. See A. Beazley, *Reclamation of Land*, 1900; R. Minikin, *River and Canal Engineering*, 1920; F. Johnstone Taylor, *River Engineering*, 1938.

Embargo (Sp. 'stoppage'), seizure of a ship or ships, either as a matter of precaution, or in view of hostilities. E. is the most usual form of reprisals, and thus constitutes the temporary or permanent sequestration of the property of individuals by the gov. in times of peace or war.

tion from leaving port intended to affect the trade or naval operations of another nation, known as *international E.*

Embassy, a mission entrusted to an ambas.; the official residence of an ambas. See **AMBASSADORS**.

Ember Days, certain days set apart for fasting and special prayer in the Rom. Catholic and Anglican Churches. The original name is *jejunia quatuor temporum*, the fast of the Four Seasons, of the Prayer Book table of fasts and feasts. It has been suggested that 'Ember' derives from '*tempora*,' or from embers or ashes used as tokens of penitence; but it may also come from the O.E. '*ymbryne*,' a revolution or circuit, i.e. of the seasons. The clergy are often ordained on certain E. D. The council of Placentia (1095) fixed these days for the Wednesday, Friday, and Saturday after the 1st Sunday in Lent, after Whit-Sunday, after 14 Sept., and 13 Dec. The weeks in which E. D. occur are called *Ember Weeks*, and the days *Embertide*.

Embezzlement, unlawful or fraudulent appropriation to his own use by a servant

or clerk of money or goods received by him for and on account of his master or employer. To convict of this felony (*see* CRIMINAL LAW) the prosecution must prove that the accused was a clerk or servant of the person robbed, that the money or goods alleged to be embezzled were received for or in the name of or on account of his employer or master, and that the accused intended to appropriate unlawfully such money or goods. The crime of E. is to be distinguished from larceny (q.v.) in that the original taking of the property was lawful, while the gist of larceny is the wilfully wrongful taking possession against the will of another from the very beginning. Some specific sum must be proved to have been appropriated, it being settled law that a general deficiency in the accounts of the accused will not suffice to prove the charge. Three separate acts of E. may be charged in the same indictment where committed against the same employer or master within 6 months from the first to the last of such acts. If the accused be indicted for E. that will not preclude a conviction for larceny instead, if the facts turn out to be more consistent with the latter crime having been committed. The converse also applies. The punishment for the common law felony of E. is a maximum of 14 years' imprisonment. E. by factors, trustees, and directors is a misdemeanour.

See also FALSIFICATION OF ACCOUNTS.

Authorities: S. Harris, *Principles of Criminal Law*, 1899; H. Archbold, *Criminal Pleading Practice*, 1863.

Emblements, produce of land, such as crops, garden, cereal, and vegetable products, which are the ann. result of the tenant's labour. These are considered in law as belonging to the tenant and not to the landlord; they are subject to the same conditions as personal chattels. Trees, grass, etc., are not E. In the U.S.A. the Eng. common law of E. has been very generally adopted, though in some states the tenant is entitled to compensation not only from his landlord but also from the incoming tenant.

Embolism, plug; a blocking of a blood vessel by a substance carried by the bloodstream from some other part of the circulation. The importance of this condition depends on the source of the plug and its nature, whether it contains infective bacilli, which will cause infective changes at the seat of the plug, or simply acts as a mechanical blocking of the circulation. Both conditions are serious, for when the E. lodges in the brain it may produce paralysis, either with a slow or a sudden onset. Emboli are apt to occur in septic conditions, and are characteristic of pyæmia, a condition in which pus-forming germs are found in the blood. Sudden paralysis of the brain is known as apoplexy (q.v.). E. may originate from the heart. A pulmonary E. may occur in some infected organ. Air E. may occur when air is introduced into a vessel from traumatic injury or during surgical procedures, or during an intravenous infusion. Fat E.

has been known to occur following fractures when there has been much disturbance of the bone marrow.

Embossing, the art of producing raised patterns on the surface of metal, leather, cardboard, or similar substances. Strictly, the term applies only to raised impressions made by means of engraved dies or plates, as opposed to those made by carving, chasing, chiselling, hammering, and the like. Crests, monograms, and addresses are embossed on notepaper. Dies for plain E. are generally cut deeper than those used with colours. In ancient times goldsmiths made much use of this method of decorating cups, vases, bowls, etc., by beating out bosses from the under surface of the metal in ornamental designs. The finishing touches are generally put from the front. E. is largely used in bookbinding (q.v.). *See* Theophilus, *Christian Art of the Eleventh Century*, 1847; L. Haslope, *Repoussé Work for Amateurs*, 1887; J. Harrison, *Decoration of Metals*, 1894; H. Adam and J. Evans, *Metalwork*, 1926; A. Shirley, *Craftwork in Metal*, 1928.

Embracery, the misdemeanour of attempting to influence a juror corruptly to give his verdict in favour of one side or party by promises, persuasions, entreaties, money, entertainments, or the like. A jurymen who corruptly endeavours to influence his fellow-jurymen to take his view is also guilty of E. The jurymen who consents to give a corrupt verdict is equally guilty with the person persuading. The punishment is fine, or imprisonment, or both.

Embrasure. In military architecture, the openings or crenelles between the teeth of a battlement in parapets, flanks of bastions, etc., are called E.s. The name is also applied to the openings in a fort or casemate through which cannon are pointed. In domestic architecture, an E. is the inward enlargement of the cheeks or jambs of a window or door made by slanting the sides.

Embroidery (Fr. *broderie*, from *bord*, edge, which gave the verb *border*, and by transposition *broder*, to ornament the edge), the art of ornamenting in relief with needle and thread of silk, wool, linen, metal, etc., various kinds of fabric. The mummy clothes of ancient Egypt show the earliest extant E., and the 'pomegranates of blue and purple and scarlet' of the book of Exodus were of E. Biblical references to the art abound, and the finest and most elaborate work has always been destined for church vestments and furniture. The Babylonians were renowned embroiderers, whose work was sought after throughout the East. The Phrygians, too, were such marvellous embroiderers that the Greeks came to call their work *phrygiæi*, and the Romans *opus phrygium*; their name for the beautiful gold-embroidered work, *auriphrygium*, gave the Eng. eccles. word *orphrey*. Homer and other classical writers refer to and describe magnificent embroideries. The art reached its greatest perfection in the early Middle Ages, when also it came to be more widely used for secular purposes. The most distinguished

artists did not scorn to make the designs from which the highest ladies in the land executed their embroideries. No workers were more skilled in the craft than the Eng., a fact to which the Bayeux tapestry (which is not tapestry, but E., traditionally ascribed to William the Conqueror's wife and her ladies) and the Syon

or 'Madeira Work.' Later and more elaborate designs are Renaissance E., Richelieu E., Venetian E., Danish white E. (called 'Hedebo'), and 'Pique' E.

The Chinese excel as embroiderers, their best work being done on silk, and their needle-painting (i.e. shaded flat stitch E., by which birds, flowers, etc., are reproduced as by brush painting) is exquisite. Gold and silver thread E. is sometimes used in Chinese and Jap. work. The Hindus use threads of silk, gold, and silver, together with spangles, beads, pearls, coins, and precious stones. Gold and silver E. is frequently used to decorate vestments (q.v.) and church furnishings. It is usually found in combination with many other forms of E., sometimes incorporating jewels and braids and often worked in ant and extremely beautiful designs. While in England to-day all hand E. is a rapidly declining art, even vestment work being largely carried out by machine, traditional hand E. of the finest calibre is still practised in many convents and among vestment workers. Gold and silver E. is usually worked in a frame and the finer materials are mounted on to a thick fabric before E., a stiletto (piercing tool) being used for this kind of E. work on the heavier materials such as brocades, plush, leather, etc. Gold or silver thread is usually couched, i.e. overcast down with a special fine thread of twisted silk of a matching or contrasting colour.

The instruments needed for E., other than the needle, are sharp pointed E. scissors, for cut-out work; a stiletto for piercing holes; and frames on which the fabric is stretched when the E. work is unsuitable to be 'held in the hand.' A square or rectangular frame is used for large and elaborate work, a small circular frame of Chinese origin, called a 'tambour,' being used for small work. In the past, large pieces of E. were sometimes filled in with chain stitch worked with a crochet hook on material held in a circular frame, and this was known as 'tambour work.' Three different kinds of needles are used in E.: crewel needles which are long and sharp and can be obtained in sev. sizes to suit varying thicknesses of thread; chenille needles which are shorter with large eyes and suitable for heavy work fixed to a frame; and tapestry or wool needles used for E. on loosely woven materials, such as canvas, net, and coarse linen, and also for whipping and lacing E. stitches. Good material for E. should be chosen as an artist selects his canvas; and the threads used should usually match the texture of the ground material, e.g. silk thread on a silk material, linen, cotton, or mercerised threads on a linen or cotton background, and wool on a woollen cloth; in the case of tapestry work on canvas, silk or wool threads are generally used. Evenly made stitches, tone or colour effect, and design and arrangement all contribute to obtaining a pleasing result in E.

The prin. E. stitches are: *running stitch* (single or double), which is used for

cope (now in the Victoria and Albert Museum) bear testimony. Later in the medieval period E. was used for heraldic devices, and with this a complicated symbolism of colour and design came into being, and this is still observed in heraldic and eccles. E. Saxony was the first country to produce 'white embroidery' worked on muslin and other white fabrics, which was used almost exclusively for trimming lingerie and household linen. Switzerland, Scotland, and England later became noted for this particular E. which was known as *Broderie Anglaise*. Eng. E.,

outlines, etc.; *back stitch*, used in quilting or as a foundation for threading a self or contrasting colour, e.g. Pekinese stitch (frequently used in Chinese embroideries); *stem stitch* is worked from left to right and is a kind of back stitch used in a variety of ways, such as outlines, fillings, etc.; *herringbone* and *chevron stitches* are border or band stitches also worked from left to right; *looped stitches*, which are usually worked from left to right, include blanket stitch, cretan stitch, buttonhole stitch, feather stitch, chain stitch, and fly stitch, and these stitches can be used in a variety

of ways; *flat* or *satin stitch* (also called Chinese flat stitch) is used in needle-painting by varying the length of the stitch and using a variety of shades and colours; *knot stitches* include the single or Fr. knot, and the more elaborate Bullion stitch. In Jap. E. the design is sometimes worked in knot stitch and outlined with gold thread; *couching* is the laying down of a thick thread, cord, or sev. fine threads along an outline and 'couching' down at regular intervals with a fine thread; *cross stitch* should be worked on material which has an even warp and weft which can be counted easily, and the crossing threads should always be worked in the same direction.

Darning E. is used as a decoration on huckaback towels, for filling in or background work, also on shadow work where some E. stitches are done on the back of a transparent material to form a 'shadow.'

Appliqué or *applied work* is laying a motif over a piece of material and fixing it on with E. stitches. The motif should be cut on the same thread of material as the background to which it is to be attached,

and it is buttonhole stitched, blanket stitched, couched, or satin stitched into position; *découpé* is an inverse form of appliqué, i.e. the design is cut out of the material and a coloured patch inserted beneath it and stitches embroidered over the raw edges. *Smocking* is the use of E. stitches to hold in place fullness or width in a garment, particularly in children's dresses, overalls, etc., and is a traditional Eng. craft. *Eyelets*, *scalloping*, etc., are holes or edgings overcast or buttonhole stitched, used in *Broderie Anglaise*, or the Richelieu and Renaissance work which consists of a similar but more elaborately cut design held together by a series of bars worked in buttonhole stitch over sev. strands of thread. *Drawn thread* is the name given to every sort of needlework for which the drawing of threads (warp and/or weft) is the preliminary step to the E. or interlacing of the loose threads of the material to form a pattern. *Tapestry* (of very ancient origin) is the name given to E. worked on counted threads. The stitches entirely cover the material, which is usually of fine or coarse canvas, the threads used being of silk or wool. Various stitches are used, such as cross stitch, *tent stitch* (i.e. a small single stitch taken across the warp and weft thread of the canvas), gobelin stitch, straight stitch, etc. *Needle weaving* is worked by drawing out threads of a material and darning a band in various coloured threads to make a squared design.

Quilting is the holding into position of 2 or 3 layers of material by the use of E. stitches—running or back stitch—worked to form a pattern. Machine stitches can also be used. Cotton wadding, lamb's wool, flannel, wool domette, or feathers may be inserted between 2 layers of material which are stitched together by drawing a needle and thread through all 3 layers. This is known as Eng. quilting and is used for bed covers, bed jackets, dressing gowns, etc. Soft materials with a sheen are most suitable for this work, as the emphasis on light and shade is part of its beauty. It. quilting has no wool filling, and the design is carried out in double outline through which a cord or thick thread is run, so emphasising the design in relief.

Patchwork is the use of odd scraps of material, preferably of uniform thickness and of the same kind, i.e. all cotton or all silk. The pieces may be tacked over pieces of paper cut to the required size or sizes. The patches are oversewn on the wrong side and the paper torn away afterwards, and sometimes it is finished off by outlining the joins with an E. stitch such as herringbone or feather stitch. Colour and design are important in this old-fashioned art, and examples vary from the purely utilitarian to the most beautiful and artistic creations. Owing to conditions in early Amer. settlements, patchwork there reached a high stage of development.

Machine embroidery.—From the old hand-embroidery craft of Central Europe, and of Switzerland in particular, there developed machine chain-stitching and

mechanical E. Chain-stitch E., carried out all over the world and on a notably large scale in India, can be produced by single-needle sewing-machines of the Singer type. Recent models are fitted with a vibrating needle which stitches a close zig-zag covering stitch of varying width as the work is moved under the needle. The early hist. of sewing and E. machines is closely connected. Neither machine could have developed without the principle of the double-ended needle with centrally placed eye. Such needles were patented by C. F. Weisental in 1775 and by the Viennese tailor, Joseph Madersberger, in 1814. The first practicable mechanical E. frame with 20 double-ended needles simultaneously operated by a pantograph so as to reproduce the design traced by the master-pointer in the hand of the operator was built to the specifications of Joshua Heilmann of Mulhouse in Alsace. The needles were passed to and fro between 2 carriages each mounting 20 pinners and moving horizontally, one at the front and one at the rear of the frame, which itself moved vertically. This hand-frame, the prototype of which was built in 1828 at Mulhouse, was improved so as to carry 170 needles and was brought into service in 1829 at the works of Franz Mange at St Gall in Switzerland. Heilmann's patent frames were built by the firm of Saurer at St Gall, a firm which is still in existence to-day. The use of these frames spread to the neighbouring Austrian prov. of Vorarlberg, to Bohemia (notably Letovice near Brno), and to Saxony (Plauen), all before 1873. The first mechanical frames were used in England by the Manchester firm of Houldsworth, and in Scotland by Gibson Brothers of Glasgow. Other Eng. centres were Macclesfield and Nottingham. The first prov. E. works in the Russian Empire was opened at Kalish in Poland in 1880. Later factories were estab. at Vilna. Moscow had possessed an E. works since 1870. In contrast to these needle-frames, mechanical but hand-operated, the Swiss manufacturers also developed Schiffli ('shuttle') E. machines which were power-operated. The first steam-driven machine was produced by Rieter of Winterthur in 1865, and an improved model by Saurer of St Gall in 1876. This machine performed 35 stitches per min. Later developments have consisted principally in the progressive lengthening of the frame. The large output possible from power machines has made the use of hand machines uneconomic, and few of the 30,000 reported as in use in 1890 now remain in operation. A type of machine E. can be executed in the home with the aid of modern sewing-machines (q.v.) of which there are various types, e.g. swing needle. See also NEEDLEWORK; SAMPLER. See Elsie Mochrie, *Simple Embroidery*, 1947; Mary Thomas, *Dictionary of Embroidery Stitches*, 1948; Louisa E. E. Judd-Morris, *An Introduction to Embroidery Stitches*, 1948; Iris Hills and others, *Embroidery Stitches* (Needlework Development Scheme pamphlet), 1952;

Embrun, Fr. tn in the dept of Hautes-Alpes, on the Durance. It is a winter-sports centre, and has textile, flour-milling, and foodstuff industries. Pop. 2700.

Embryology, study of the development of the living organisms, or of the formation of a new individual or embryo from an ovum. As such it is a branch of the science of biology. For a hist. of the rise of the science of E. and for a general view of it, see BIOLOGY. In the higher plants and animals the cell (q.v.) is a highly complex structure, and the greatest complexity of functions and changes takes place in the *nucleus* of the cell. Within the cell of an animal and of certain plants is the *centrosome*, which is neither part of the protoplasm nor of the nucleus. This centrosome begins the process of cell div. by itself dividing into 2 parts. Afterwards the nucleus also splits, and then the whole cell divides. The nucleus contains a number of threads, the *chromosomes*, which become visible during cell div., and the number of these is constant for any given species. In the higher types of animals and plants the individual is composed of myriads of cells united together into tissues and organs and so into the organism. The original cell from which these were formed by successive divs. is described as the ovum or egg, and in the higher animals and plants this must be fertilised to enable it to develop. In the lower plants and animals, including some insects, the natural development of unfertilised ova is not infrequent, and in others a physical stimulus may initiate development (see EXPERIMENTAL EMBRYOLOGY). Such development is said to be parthenogenetic.

In the higher animals, some of the earliest cells formed by the div. of the ovum constitute the germ cells of the new animal. This fact led to the theory of the continuity of the germ plasma (see BIOLOGY), but this theory is not applicable to the germ cells of plants or of many lower animals. Germ cells of the female are ova; those of male animals are spermatozoa, and of plants spermatozooids (except those of flowering plants, which are non-motile male gametes, as described below). Fertilisation is the union of an ovum and sperm, and takes place in the body of the female of higher animals and in the ovules of plants. Most aquatic animals and plants, and even many fishes, liberate the ova and sperms in the water, where they unite. The eggs of frogs are fertilised externally, the male adding spermatozoa as the ova appear.

Spermatozoa are usually some of the smallest animal cells, and are very active. Each has a 'head' consisting of the nucleus surrounded by a thin film of cytoplasm and connected by a 'middle

piece' with the 'tail,' or flagellum, a fine hair-like part which by its movement propels the sperm along, tail first. The flowering plants, with the exception of some Gymnosperms, have no motile spermatozooids, and the function of these is performed by a nucleus and a small amount of cytoplasm formed in the pollen grain. This sends out a tube which penetrates the ovule and conveys the fertilising nucleus to the ovum.

Generally, compared with the sperms, and even with other cells of the organism, the ova are large and laden with food material, the yolk, but some organisms have small ova with the food supply deposited in cells around them.

In the formation of the ovum the mother cell, or oocyte, divides first into 2 unequal cells: the smaller of these is the first polar body, and is usually extruded. The other, the secondary oocyte, divides, forming the ovum and the second polar body, and this, too, is usually extruded. During the first div. the chromosome number is halved (see CELL) and fertilisation restores the full number of chromosomes. In parthenogenetic development, the full complement of chromosomes is sometimes gained by the fusion of an egg with a polar body, or by failure to reduce the number of chromosomes in the div. of the oocyte. The 'accidental' development of individuals with the single number of chromosomes usually results in abnormality, but single and multiple numbers can be normal in some plants and animals. The spermatozoa are developed from spermatocytes in the testis of the animal. Each spermatocyte divides twice, forming 4 spermatozoa, and the first div., like that of an oocyte, reduces the chromosome number to half. Although sometimes sev. sperms may enter the cytoplasm, the nucleus of only one fuses with that of the ovum. The 2 nuclei fuse completely, losing their individuality, and in the subsequent divs. each nucleus may be regarded as derived half from the nucleus of the sperm and half from that of the ovum. Soon after fertilisation has taken place the cell begins to subdivide. The methods of div. of the fertilised ovum of an animal depend upon the quantity and disposition of the yolk. Where there is only a small amount of yolk, as in amphioxus or manulans, the ovum divides to form a sphere of cells. In those cases where there is a large amount of yolk collected at one pole of the ovum, as in the frog, the cells form more quickly and are much smaller at the other pole, giving an unequal div. If the result of segmentation is a ball of cells, giving a hollow sphere, it is called a blastula; if it is a solid ball of cells, a morula; and if partial, so giving a disk of cells, it is known as a blastoderm. The next stage results in the formation of a gastrula. Usually the blastula becomes invaginated, one hemisphere sinking into the other, giving rise to a 2-walled sac with the opening known as a blastopore. In the higher animals a middle layer, the mesoderm, is formed between the outer layer (ectoderm) and the inner one

(endoderm). The ectoderm forms the epidermis, the nervous system, the lens of the eye, and certain glands; the endoderm lines the midgut and its outgrowths; and the mesoderm forms the muscle, the skeleton, most of the viscera, blood and lymph vessels, blood, connective tissue, and certain membranes. See also EXPERIMENTAL EMBRYOLOGY. For the further facts of recapitulation and continuity of germ plasma, and for bibliography, see BIOLOGY.

Emden, Ger. seaport in the *Land of Lower Saxony* (q.v.), 123 m. NW. by W. of Hanover (q.v.). It lies on the Dollart (see EMS) at the terminus of the Dortmund-Ems and Ems-Jade canals. In medieval times it was the cap. of a co. of E. Friesland (q.v.), and in 1595 became a free imperial city under Netherlands protection. In 1744 it went to Prussia. It was in Fr. hands 1810-14, then passed to Hanover, and became Prussian again in 1866. E. is Dutch in appearance, and is intersected by canals. Most of its important buildings were ruined in the Second World War. The shipping and shipbuilding industries are of great importance, and the tn has been known as a herring port for sev. centuries. Pop. 52,000.

'**Emden**,' Ger. raiding cruiser, which had a notable career during the First World War under the command of Capt. Müller. At the outbreak of the war the *Emden* was in E. waters, and within a few days joined Adm. von Spee's fleet at Tsingtau. At Müller's request she was given a roving commission. In order to obscure her identity the *Emden*, which had only 3 funnels, put up a dummy 4th funnel, which made her resemble, at a distance, a Brit. warship. She made towards Indian waters, reaching the Bay of Bengal in the 1st week of Sept. 1914. Her first capture was a Gk steamer, *Pontoporros*, carrying Indian coal to a Brit. port; this occurred on 10 Sept. Other successes came quickly, as many as 6 vessels being prepared for sinking at the same time. The procedure followed by Müller was to transfer from these ships to his own the articles he required, to tranship their personnel to the *Pontoporros* and then to sink their vessel. On 18 Sept. the *Emden* bombarded Madras and set fire to the oil tanks. Such a career could not be allowed to continue for long, and soon an organised search was made for the *Emden* by ships of Britain, France, Japan, and Russia. On 28 Oct. she sank a Russian cruiser in Penang harbour and also a Fr. ship which attacked her. She was eventually sunk off the Cocos Is. by the Australian cruiser *Sydney* on 9 Nov. 1914. There was nothing particularly brilliant in her career, for she generally hit unarmed ships or those which were no match for her armament, and when she did eventually meet a ship on more equal terms she was outclassed. Similar tactics were pursued by the Ger. pocket battleship *Graf Spee* (q.v.) in the Second World War, the ship being defeated by 3 small cruisers off Monte Video in Dec. 1939 and soon afterwards scuttled by its crew.

Emerald, a precious stone belonging to the beryl (q.v.) species, its green colour alone differentiating it from the other beryls. It occurs as 6-sided prismatic crystals of the hexagonal system, is transparent or translucent, has an uneven conchoidal fracture, a vitreous lustre, becomes much harder on exposure to air following extraction from the mine, and is rendered electric by friction. Oxide of chromium is supposed to give it its green colour. The E. is cut on a copper wheel with emery. The finest stones are found in Muzo, Colombia, and there are mines also in Siberia, at Henbachthal, and at Canjargum in India. The E. was greatly valued by the ancients, who invested it with talismanic and medicinal properties; it was supposed to be good for the eyes, and Nero, among others, wore E. eye-glasses. It ranks with the diamond as one of the choicest and costliest of stones.

Emerald Copper Ore, see DIOPHASE.

Emeritus, term applied, among the Romans, to a soldier who had served out his time; now extended to designate anyone (especially a prof.) who has retired from office on account of old age or infirmity.

Emerson, Ralph Waldo (1803-82), Amer. lecturer, essayist, and poet, *b.* Boston, son of a Unitarian minister. He was educ. at Boston Lat. School and Harvard Univ., and was ordained in 1829, but resigned 3 years later as a protest against the administration of the Lord's Supper. In 1833 he first visited Europe, and met Landor, Carlyle, and others. His friendship with Carlyle lasted all his life and resulted in an exchange of notable letters. The following year he began in real earnest his life of lecturer and writer, and at once estab. his position as a leader of the New England transcendentalists, although he disclaimed sympathy with their school of philosophy at large. He worked side by side with Bronson Alcott, Margaret Fuller, Channing, and Thoreau (qq.v.), but in a broader spirit; and with them he developed transcendentalism, particularly in its theological aspect, as a protest against dogmatic rationalism in religion. His attitude in philosophy was strongly influenced by Platonism, the Ger. idealisms of Hegel, Fichte, and Schelling, and the Fr. idealisms of Cousin and de Staël, resulting finally in an indefinite conception of the God-like nature of the human soul and the correlation of human and divine wisdom, which may be described as a vague but inspiring pantheism. Of his lectures, the courses delivered at Boston during 1835 and 1836 on *Representative Men* and *The Philosophy of History* were perhaps the most noteworthy. His prose works are for the most part extensions and revisions of his lectures, and show in an even more marked degree his truly transcendental lack of purely logical coherence, as might well be expected when his method of working is considered. E. was wholly an intuitionist, and recorded his impressions and flashes of inspiration as they occurred to him, subsequently synthesising them under such headings as seemed conveniently comprehensive. As a result of this, it

may be observed in his writings that thoughts and criticisms have been too often distorted, merely to fit their expression into an epigram. E. himself confessed that 'I do not know what arguments mean, in reference to any expression of a thought.' His writings betray a complete absence of that symphonic style which is indispensable to a philosophy pure and simple, and they are, moreover, full of self-contradictions. These contradictions are not the result of any

R. W. EMERSON

After a crayon drawing by Samuel Rowse

systematic evolution within the author's mind; they are rather the spontaneous interpretations, but in different moods, of the same mental experience. Each idea is complete in itself, rather than concatenated with its context. His work thus resolves itself into the expression of a personality which is governed by emotion, not by reason. And it is this predominant characteristic of E. which, however derogatory it may be to his work as pure philosophy, gives to it the charm of geniality, warmth, and confidence which is the secret of his undoubted attraction. As a theorist, devoted to the study of the higher instincts and their spiritual significance, and living out of touch with reality, he was an anomaly. For instance, he praised freedom, yet was slow to lend his support to a specific abolitionist movement against Amer. slavery. And he preached always the 'infinite of man'; he loved the 'human idea,' but his admiration for the unit, physical man, was by no means excessive. By reason of his elevation of character and sentiment, E. was essentially a poet.

It is in his poetry that the true E. is most clearly delineated; yet, in spite of his

eloquent pages on rhythm in *Poetry and Imagination*, it must be confessed that his verses are often far from musical. One can quarrel, however, only with his incomplete mastery of form and technique. Whatever the faults of his outward expression—the rough metre and forced simile of his poetry, or the inconsequence of his prose—the inner ideas of his writings are always lofty of conception, and in their own way frequently of rare beauty. E. was a real prose-poet of a high order, and by the beauty of his thoughts, the terse eloquence of their expression, and the broad spirit of optimism in his works has gained his wide recognition and popularity. E. has been recognised by Americans and by sound European critics as one of the greatest of the writers of his country. His essays have become American classics and have had a profound influence in their own country. In spite of some roughness of form, his poems have caused him to be recognised as one of the most original poetic voices of the U.S.A. Unlike Europeanised poets like Longfellow, he turned to his own country, its own fauna and flora, for subjects for his lyrics. His extended stay in England gave him the opportunity to write his *English Traits*, 1882, still one of the best books ever written on the subject. The Eng., according to E., concentrated all their attention on productivity—an observation which seems curiously topical to-day—but this exclusive attention to mechanical things, in E.'s opinion, had its drawbacks; for where 'the whole bias of the nation is a passion for utility,' man is sacrificed to the demands of the machine. Even worse was the apparent neglect of the higher things of life—the Eng., he says, are 'materialist, economical, mercantile' and 'their mind is in a state of arrested development.' Because of their preoccupation with money, E. concluded that the Eng. were its slaves and dupes. In spite of all this, E. had to admit that 'if there be one successful country in the universe for the millennium, that country is England.' All the world, he observed, imitated England, read its books, saw its plays, bought its newspapers and helplessly envied its luxury. Yet E. was aware that success did not necessarily lead to popularity; the national 'habit to brag' stood in the way, so that the Eng. traveller abroad, with his disdain of the rest of mankind, was a proverb for uncomfortable and offensive manners. To-day this portrait of the Eng. is hardly exact, even if it ever was; and indeed the characteristics which E. saw in the Victorians, and which, ironically enough, we see or fancy we see to-day in the Americans, are merely the externals of leadership or the cloak worn by the most wealthy, most envied, and most powerful nation in the world. His chief works are: *Nature*, 1836, *The American Scholar*, 1837, *Literary Ethics*, 1838, *Poems*, 1847, *Essays on Representative Man*, 1849, *The Conduct of Life*, 1860, *Society and Solitude*, 1870, *Journals*, 1912. His correspondence with Carlyle was ed. by C. E. Norton in 1883, and his *Letters* were ed. by R. L.

Rusk in 6 vols., 1939. See lives by J. E. Cabot, 1887, G. E. Woodberry, 1907, V. Wyck Brooks, 1932, H. Hawthorne, 1935, E. L. Masters, 1948; also B. Ferry, *Emerson To-day*, 1931.

Emerson, William (1701-82), b. Harworth, near Darlington; mathematician who, failing in an attempt to follow his father's profession of schoolmaster, lived in retirement, pursuing his favourite studies of mathematics and mechanics. He was eccentric, but possessed of rare intelligence and energy. His chief works are: *The Doctrine of Fluxions*, 1748, *The Projection of the Sphere, orthographic, stereographic, and gnomical*, 1749, *The Principles of Mechanics*, 1754, *A Treatise of Navigation*, 1755, *The Elements of Optics, in four books*, 1768.

Emery, Isabel Winifred Maud (Mrs Cyril Maude) (1862-1924), actress, b. Manchester, the daughter and granddaughter of actors. At 15 she appeared for the first time in London at the Princess's Theatre. In 1881 she became a member of Henry Irving's Lyceum company, understudying Ellen Terry and playing her own parts; she toured twice with this company in America. She married Cyril Maude in 1888. From 1896 to 1902 she played at the Haymarket. She appeared as Beatrice to Tree's Benedick, took *Olivia* on tour, and also played in H. A. Vachell's *Her Son*.

Emery, an impure variety of crystalline corundum (Al_2O_3), being mixed with oxides of iron and silica. It was originally obtained from Cape Emeri in the is. of Naxos, but is now largely worked in various parts of Asia Minor and near Philadelphia, U.S.A. E. is a purple-black solid, next in hardness to diamond, and is largely used as an abrasive and polishing agent, for cutting and grinding glass, metals, and certain gems. E. wheels are made by mixing the powdered E. with some binding material and subjecting the mixture to heat and pressure. E. paper and cloth are made by dusting the powder over the material which has been coated with glue. Pure corundum and the artificial 'carborundum' (SiC) are now largely prepared, and have superseded E. to a certain extent.

Emesa (Syria), see Homs.

Emetic, agent that produces vomiting. The origin of the word dates back to antiquity, and in the days of the Romans not only was it a regular accompaniment of a banquet but it was an intrinsic part of daily life. E.s are often replaced by the stomach tube or hypodermic syringe. The E.s most commonly in use are: copious draughts of warm water, mustard and water, or common salt and water; they are useful in cases of poisoning. Apomorphine (q.v.) is an E. which is given hypodermically. It acts directly on the vomiting centre in the medulla of the brain. Ipecacuanha (q.v.) is an E. drug which is given by mouth.

Emou, see EMU.

Emigration, the act of leaving one country in order to settle in another. In the early ages E. was carried on by whole nations, who, having exhausted the

fertility of their own lands, sought to acquire fresh ones by conquest. Nowadays it is more of an individual process, and is determined by the greater prospects of material benefit offered by life in the destined country. E., therefore, usually takes place from the older countries. It first assumed notable proportions in the 19th cent., when America was the chief goal. The greatest exodus was from Ireland, and the total number of emigrants from that country between 1851 and 1910 was 4,187,000, leaving the country far less thickly populated. In many European countries emigrants have been actuated by a desire to escape from tyrannical political institutions, notably the Huguenots who left France at the end of the 17th cent.; and Germans and Austrians, most of them Jews, who emigrated in the years preceding the Second World War.

At the close of the Napoleonic wars E. from Great Britain to the colonies overseas was promoted as a remedy for unemployment. Opinion was, however, divided. Wm Horton, who was under-secretary for war and the colonies in 1822, advocated state-aided and mass E. of able-bodied workers, who were to be given free passages and free grants of 100 ac. of land in the colonies, free farming implements, and a year's provisions. Edward Gibbon Wakefield (q.v.) held that the pauper emigrant was unsuited to conditions overseas, and he evolved a system of state-aided E. In 1823 and 1825 Horton induced parliament to try his scheme on a small scale. Later he secured an amendment of the Poor Law Act of 1834 to enable pars. to mortgage their poor rates so as to provide for their able-bodied paupers in the colonies; a number of emigrants were assisted under the Act. But this plan lacked the vision behind the ideas of Wakefield, whose system of colonisation formed the basis of the gov. policy of settlement in South Australia and New Zealand and generally thereafter. About 1832 the gov. adopted the policy of assisting the E. of women, mechanics and agric. labourers, and in 1834 an Act was passed embodying Wakefield's principles in the settlement of S. Australia. In 1845 the Brit. Gov. set up the Colonial Land and Emigration Board, the original purpose of which was to take over the work of the South Australian Commission appointed in 1835 for carrying out Wakefield's scheme. The Board's functions were extended to control the whole E. movement to the colonies and the sale in Great Britain of colonial land. Between 1840 and 1873 the Board granted free or reduced passages to over 352,000 settlers. But from 1850 onwards the general view began to gain ground that gov. supervision of E. was unnecessary. The colonists became self-governing, and assumed the control of their own lands; the prevalent opinion, led by the Manchester school, was that the home gov. need take no further interest in Brit. persons who left the home country, and gradually the duties of the Board were absorbed by the Board of Trade, the Colonial Office and the colonial legisla-

tures. From 1878 till the First World War the gov. took little part in E. beyond subsidising a small office known as the Emigrants' Information Office (see OVERSEA SETTLEMENT DEPARTMENT), estab. in 1886, which gave information to those wishing to emigrate whether to the colonies or to foreign countries. Their prin. destinations were Canada, U.S.A., Australia, New Zealand, and South Africa, in the order named. By 1912, however, attention began to be attracted to the importance of empire development and the need for a better distribution of the white pop. within the empire. The Brit. Gov., through the Overseas Settlement Committee, pursued a vigorous policy of E., through the medium of assisted passages to the Dominions, in the 12 years immediately following the First World War, but in the ensuing world economic depression E. declined, and in the next decade more people returned from the overseas empire to Britain than emigrated from Britain to the overseas empire. Australia made new immigration plans after the Second World War. The Federal Gov. held itself responsible for the recruiting, medical examination, and transportation of Brit. migrants under the assisted and free passage schemes, and for their employment. Brit. service personnel were encouraged to stay in Australia after their discharge—an opportunity later extended to members of the Brit. forces in India, the Middle East, and the Far East. New factors stimulating E. were high taxation and the reduced opportunities for enterprise and exceptional effort. Those not satisfied with the measures and the security of the welfare state sought opportunity in Australia, New Zealand, and, on a greater scale, in Canada. Parallel with this movement there was increased E. to the U.K. from Ireland and the West Indies. See COMMONWEALTH AND EMPIRE SETTLEMENT ACTS; EMIGRATION SOCIETIES. See also C. W. Baird, *History of the Huguenot Emigration to America*, 1885; J. W. Gregory, *Human Migration and the Future*, 1928.

Emigration Societies, organisations aiding persons to emigrate to Brit. dominions and colonies. The chief among them are: *Salvation Army* provides farm training for boys and finds situations overseas for boys, farm-workers, and others. *Church of England Council of Empire Settlement* represents the Church as a whole in all matters relating to empire settlement. *Young Men's Christian Association* co-operates with the Churches in Canada and Australia in settlement work. *The Society for the Oversea Settlement of British Women* acts as the Women's Branch of the Oversea Settlement Department and is an amalgamation of the prin. women's E. S. Other societies or agencies which are concerned, *inter alia*, with E. are the Brit. Dominions Emigration Society, Brit. Legion (q.v.), Dr Barnardo's Homes (q.v.), Catholic Emigration Society, Middlemore Emigration Homes (Birmingham), National Association of Boys' Clubs, Scottish Council for Women's Trades, the Fellowship of the Maple Leaf (for

teachers migrating to the W. provs. of Canada and to Australia), and the 1820 Memorial Settlers' Association (for migrants to South Africa). See EMIGRATION.

Émigrés, the name applied to those who, remaining faithful to the royal house, left France on account of the Revolution. On the fall of the Bastille, 14 July 1789, the princes of the royal family, followed by many nobles, officers, monks, and priests, quitted France, the princes with their close adherents forming a court at Coblenz, others settling in Germany, Belgium, Italy, Holland, and Switzerland. Numbers of the E. served in the Prussian Army against France. Their estates were forfeited and severe laws were passed against them. Many did not return to France till after Napoleon's downfall, though granted an amnesty when he became First Consul. They were not able to recover their possessions. The term is also applied to White Russians who found shelter in France after the Russian revolution.

Emilia-Romagna, region (*compartimento*) of N. Italy, comprising the provs. of Bologna, Ferrara, Forlì, Modena, Parma, Piacenza, Ravenna, and Reggio nell'Emilia (qq.v.). It is bounded N. by Lombardy and Veneto, SW. by Liguria, S. by Tuscany, and E. by the Adriatic (qq.v.). The Aemilian Way (q.v.) crosses the region NW.-SE.; N. of this highway is fertile plainland, and to the S. are ranges of the N. Apennines (q.v.). There are foodstuff industries, and cereals, vines, fruit, hemp, and sugar-beet are grown. The chief tn is Bologna. Area 8534 sq. m.; pop. 3,587,000. See ROMAGNA.

Emin Pasha (1840-92), name adopted by Eduard Isaac Schnitzer, scientist and administrator, b. Oppeln. His parents were Jews of Silesia, where his father was a merchant. He studied medicine at Breslau Univ. and graduated at Berlin. He then went to Turkey and received an appointment on the staff of Hakkı Pasha at Scutari, taking a Turkish name and adopting the dress and customs of the Turks in order to identify himself as closely as possible with those among whom he worked. In 1865 he became a convert to Islam. In 1875 he went to Egypt, where he worked under the name of Dr Emin Effendi. Gen. Gordon appointed him in 1878 medical officer and later governor-general of the Equatorial Prov. Gordon employed him on many diplomatic missions, his extraordinary power as a linguist, together with his wonderful tact, making his services invaluable. From the abandonment of the Sudan by Egypt until the arrival of Stanley's relief expedition (1899) he held and administered this dist. single-handed. He reluctantly left with Stanley, but later returned to Central Africa in the service of Germany. He was killed by Manyema Arabs. He abolished the slave trade in his prov., studied its flora and fauna, made route surveys of over 4000 m., pursued meteorological investigations which resulted in the estab. of Lado as the E. Equatorial standard, and made vocabularies of many African dialects. He found (according

to Stanley's record) that the use of mosquito netting of a certain mesh excluded the 'miasma' of malaria, and himself kept free of fever—20 years before Manson and Ross discovered that 'miasma' was the *Anopheles* mosquito carrying the germ of malaria. His diary, ed. by F. Stuhlmann, was pub. in 1916-23. See M. Jephson and H. M. Stanley, *In Darkest Africa: Quest and Rescue of Emin*, 1890; and lives by E. W. Fressler, 1925, A. Symons, 1928, and Olivia Manning, 1947.

Eminence, title conferred on cardinals by Pope Urban VIII (1631). They had previously been Most Illustrious.

Eminent Domain, the *dominium eminens* of the law, a phrase denoting the universal right in the public over property. In accordance with this law the gov. may compel a private individual to give up, on receipt of compensation, property required for the public good.

Eminescu, Mihail (1849-89), Rumanian poet. He ran away from home, and between 1864 and 1869 lived with travelling companies of actors. In 1869 he was sent to Vienna to study and from there sent his first poems, *Convorbiri literare*. He went to Berlin but did not complete his doctorate. On his return, 1874, he was made director of the library at Jassy and then a school inspector. From 1876 he lived in increasing poverty as a journalist. In 1883 he went into a lunatic asylum and was discharged cured, but he had a relapse in 1889. He was murdered by a fellow patient. Himself a collector of folk poetry, he was influenced by it, and also by Ger. and Fr. romanticism. Sometimes he is a Schopenhauerian pessimist, sometimes a vigorous conservative satirist. (He saw the nobles and the peasants as the only true Rumanians and the middle classes as foreigners. For him liberalism was the ruin of a nation.) Sometimes he wrote love poetry with a deceptive appearance of facility. An Eng. trans. of selected *Poems* was pub. in 1930. See F. Long, *Eminescu als Dichter und Denker*, 1928.

Emir, Ameer, Amir (Arabic *amir*, one in command), commander of an army, or a governor, and applied to the sons of the caliph, so coming to mean prince. Umar, the 2nd caliph, took the title *amir al-muminin*, commander of the believers, which was thus appropriated to the head of the Muslim world. Some rulers took the less grandiloquent title *amir al-muslimin*, commander of the Muslims. For a time the caliphs of Baghdad were dominated by ministers called *amir al-umara* (cf. Turkish *beglerbeg*), commander of commanders. Till recently the ruler of Afghanistan was content with the title *amir*.

Emir al Mumenin, see COMMANDER OF THE FAITHFUL.

Emmanuel, see IMMANUEL.

Emmanuel College, Cambridge, was founded in 1584 by Sir Walter Mildmay in support of the Protestant cause. It stands on the site of the former Dominican house: its hall was the friar's chapel. The college chapel and its cloister are the work of Sir Christopher Wren (1677). The

famous Amer. univ. is named after John Harvard who was one of a considerable number of E. men who migrated to New England to create a society there which, as a dissident minority, they saw they could not create in England. Of its most famous son, the traveller Gulliver, the college has no record.

Emmaus, vil. of Judea, not identical with the present E., but possibly situated in the valley of the Urtas, 7 m. from Jerusalem, where remains of important baths have been discovered. Josephus says that E. means 'warm bath.' Hero Jesus appeared to 2 disciples on Easter Day (Luke xxiv). The site may be the present Kubebe, or Amwas.

Emmendingen, Ger. tn in the *Land* of Baden-Württemberg (q.v.), 75 m. SW. of Stuttgart (q.v.). It has an auct. castle and other old buildings. In the vicinity are 2 ruined fortresses. Pop. 15,000.

Emmental, valley of the R. Emment, one of the finest of Switzerland, in the canton of Bern. Famous for its cheese. Gottlieb (q.v.), the famous Swiss novelist, was pastor of the vil. of Lützelfüh, in the Upper Emmental, 1832-54.

Emmerich, Ger. tn in the *Land* of North Rhine-Westphalia (q.v.), 49 m. NNW. of Düsseldorf (q.v.). It is on the r. b. of the Rhine (q.v.) near the Dutch frontier. St Willibrord (q.v.) is said to have founded a church here in 697. During the Second World War, in the operations of Mar. 1945 for crossing the Rhine, the Canadian troops held the line of the Rhine and Maas (see MEUSE) from E. westward to the sea to ensure the security of the bridgehead over the Rhine at Nijmegen and to guard the Scheldt estuary (see WESTERN FRONT IN SECOND WORLD WAR). The tn, which is very Dutch in appearance, was severely damaged by bombing and in the fighting. There are manufs. of oils, paper, and foodstuffs. Pop. 14,000.

Emmet, Robert (1778-1803), Irish patriot, b. Dublin. He distinguished himself at Trinity College, Dublin, by his brilliant oratory. As a protest against the visitation of Lord Clare and Dr Duigenan in 1798 to investigate the political tendencies of the students, he withdrew his name from the books. Like his brother, Thomas Addis E., he was an enthusiastic United Irishman (see UNITED IRISHMEN), and after a visit to Paris in 1802, where he interviewed Napoleon and Talleyrand, he engineered a rising in Ireland. The idea was to seize Dublin Castle, and to hold the lord-lieutenant as a hostage; but the insurrection was ill-planned. Only a small body of revolutionaries assembled, and these committed such crimes of violence that E., broken-hearted, fled. He was captured, tried, found guilty, and hanged. The poignant story of his love for Sarah Curran has been told by John Brophy in his novel *Sarah*, 1948. See IRELAND, *History*.

Emmet, see ANT.

Emmich, Otto A. T. von (1848-1915), Ger. gen., was early prominent in the First World War through being in command of the force that successfully besieged Liège in Belgium. In 1915 he went

to the E. Front as a corps commander, and took a successful part in the battles of the Dunajec (q.v.) and the San. His corps was situated on the right of Mackensen's Eleventh Army; it distinguished itself particularly during the operations of 2-5 May 1915, when Mackensen broke through the Russian line between Gorlice and Tarnow.

Emmius, Ubbo (1547-1625), Dutch historian and chronologist, prof. of Greek and of hist. at Liers, E. Friesland. He is best known as the author of *Vetus Grecia Illustrata*.

Emona, see LJUBLJANA.

Emotion, term used in psychology. We may say that the states of the mind may be classified under *knowing*, *feeling*, or *willing*. The 1st term includes such facts as perceiving, remembering, and reasoning, and they may further be said to be *intellectual* operations. The 2nd term would include all pleasurable and painful conditions of the mind, whether simple, such as the distress of hunger, or complex, such as love; and it is in this class of mental states that the *emotions* are included. The 3rd term covers all active mental operations, e.g. walking, speaking, and also efforts to do things, active impulses, and resolutions.

Feeling marks any state of consciousness which is pleasurable or painful. Those effects which depend merely upon nerve stimulation, such as the pains of hunger and thirst, and their corresponding pleasures, and which are commonly marked as *sensations*, are included under the term *feeling*, as well as those effects which depend upon some amount of mental activity, such as fear, hope, regret, etc., which are known as E.s.

The correlation between the states of feeling and their physical accompaniments illustrates the close connection between mind and body. Facial movements, gestures, modifications of voice, and even internal organic effects are well known to accompany feeling. All feeling involves an excitation of nerve-centres, and diffuses itself over the nervous system in a circle of effects. The development and continuance of a feeling depend upon this cycle of effects. Expressive movements are partly instinctive and appear early in life—e.g. crying, frowning, etc.—and partly acquired. Imitation plays a big part, and it is easy to see how in this way we acquire actions expressive of ennui, moral displeasure, etc. Sev. theories have been advanced to explain these movements. It is generally agreed that all feeling tends to produce certain bodily effects which are proportionate in strength and range to the intensity and persistence of the feeling. Spencer pointed out that, as the feeling becomes more intense, so larger muscles are called into play, e.g. twitching of fingers, then movement of the arms, and so on as agitation increases. Wundt amplified this by saying that the motor centres of attention are involved, and the due regulation of thought disturbed. Violent E. of any kind illustrates this well. To account for the distinctive movements attached to the

various feelings. Bain suggested that pleasure is connected with an increase, and pain with a decrease, in the vital energies, and so the expression of pleasure would have greater vigour of action than the expression of pain. But Sully showed that strong and violent feelings, whether pleasurable or painful, have very like results, and that the strong contrast in energy between certain feelings, say anger and fear, does not coincide with a contrast of pleasure and pain. Therefore he suggests that it is connected with the feeling as energetic in character, or depressing and paralysing.

Feelings may be divided into 2 divs., those arising directly from a process of nervous stimulation or the excitation of sensory nerves, and those depending on some manner of mental activity. The first, which may be termed bodily feelings, involve processes in the outlying parts of the organism, and may be called *sense feelings*. The second, being connected with central nerve forces (the brain), may be called E.s. There is also a close correspondence between the instincts and the E.s. Thus the instinct of self-preservation gives rise to the E. of fear (e.g. in battle or when crossing a main road) and the instinct of self-perpetuation or reproduction gives rise to the E. of love.

Sense-feelings may arise from disturbances of some part of the organism, as in hunger, thirst, heat, and cold sensations, etc., and pleasures or pains connected with the excitation of special senses, and the pleasures or pains of muscular sensation, etc. The latter class are much more easy to distinguish and localise than the former.

The general laws which apply to mental development also apply to the development of the E.s. They are deepened by exercise, and there is a progress from simple feelings to complex E.s. The growth of the E.s cannot be fully explained as the result of individual experience. They arise uniformly when the appropriate circumstances occur, usually early in life, e.g. the child has a disposition to feel anger when he is annoyed or injured. On the other hand, an instinctive element enters into feelings which may be shown to be largely the result of individual experience. It may be noted that this instinctive capacity for any particular E. is not the same in all cases. These instinctive emotional tendencies can be explained by referring them to ancestral experience and allowing that there are transmitted associations.

The study of the development of the E.s enables us to divide them roughly into 3 groups or orders, giving successive stages in the progress of the emotional life. First we get *individual or personal E.s* which are confined to the individual and depend upon a more or less distinct personal reference. These grow up around self and self-activities, the pleasures of hope, success, reputation, etc., or they attach themselves to objects having a special personal relation, as in the child's love of his mother. Secondly, we have *sympathetic E.s*, which involve participa-

tion in other people's experiences. They presuppose a certain amount of personal emotional experience, and are non-personal and common in direct contrast to individual E.s. Thirdly, we have the highly complex E.s. derived from *sentiments*, viz. patriotism, love of humanity, etc. These sentiments may be subdivided into 3 classes: (a) *intellectual*, or the attachment to truth; (b) *aesthetic*, or admiration of the beautiful; and (c) *moral*, or reverence for *duty*, which includes love of humanity and the worship of moral excellence. See H. Spencer, *Principles of Psychology*, 1855; A. Bain, *The Emotions and the Will*, 1859; C. Darwin, *Expression of the Emotions in Man and Animals*, 1872; J. Sully, *Outlines of Psychology*, with *Special Reference to Education*, 1884; C. G. Jung, *Psychological Types*, 1923; J. Macmurray, *Reason and Emotion*, 1935. See also CHILD STUDY; PHILOSOPHY; PSYCHOLOGY.

Empecinado, Don Juan Martin Diaz, El (1775-1825), Sp. patriot, a guerilla chief who harried the Fr. during the Peninsular War. He became field-marshal in the regular army, but, involving himself later in the rebellions of the Constitutionalists, he was hanged. He incorporated his sobriquet *el empecinado* ('the pitch-coloured') with his name.

Empedocle, Porto, see AGRIGENTO.

Empedocles (b. c. 490 BC), Gk philosopher, law-giver, physician, poet, and high priest of Agrigentum in Sicily. He is said to have committed suicide by throwing himself into the crater of Mt Etna. E. analysed the universe into the *four elements*, fire, air, earth, and water, fire being the essence of life, the other elements forming the basis of matter. His system is founded on this theory together with another which supposes 2 opposing forces, Love and Hate. The world began when the elements, which had been torn asunder by the force of Hate, tended to come together again under the influence of Love. The different species arose out of the different minglings of the elements. The importance of E. lies mainly, however, in his biological theories of perception and thought, i.e. in his reassertion against Parmenides of the validity of the senses. Fragments of 2 works, *On Nature and Purifications*, have survived. See J. Burnet, *Early Greek Philosophy* (4th ed.), 1948; W. Jaeger, *Theology of the Early Greek Philosophers*, 1947.

Emperor. Among the Romans, *emperor* or *imperator* was originally the title borne by the commander of an army, then by the governors of provs., then by the head of the Rom. empire. In modern times it became the highest title of dignity and was assumed by sev. European sovereigns who ruled over a vast ter. where dwelt people of more than one nationality. The rulers of Russia, Austria-Hungary, and Germany before the First World War were called *emperor*. Queen Victoria assumed the title of *empress of India* in 1876, but it lapsed with the passing of the Indian Independence Act in 1947.

Emperor Moth, name given to *Saturnia pavonia*, a species of Lepidoptera, and

also applied to the whole family of *Saturniidae*. *S. pavonia* is common in England, though rare in Scotland, and in the heather dists. the bright-green larvae, studded with red or yellow warts, may often be observed. Their general colour is greyish with purple and orange tinges, and they are remarkable for the eyespot common to both wings of both sexes.

Emphysema, an inflation; an abnormal presence of air. Medically, it consists of an enlargement of air vesicles of the lungs, which are the terminations of air passages. It occurs in bronchitis and other conditions where there is excessive coughing. It causes lessening of the aerating surface of the lung and shortness of breath. In older persons with chronic bronchitis the chest becomes enlarged and barrel-shaped. Increased work is thrown on the heart to drive the blood through the inflated lung; in time it fails to drive sufficient blood through, so that the heart's action is embarrassed, and the badly aerated blood causes the sufferer to look blue.

Surgical emphysema is due to air in the general connective tissues of the body, from injury of some air-passage or wound of the chest-wall. When the swelling of surgical E. is palpated with the fingers it gives a curious sensation like the crackling of paper, known as *crepitus*.

Emphyteusis (Gk 'a planting in'), or **Jus Emphyteuticarium**, in anct. Rom. law, the right of enjoying all the fruits, and disposing at pleasure, of the *praedium* (estate) of another, subject to the payment of a yearly rent (*pensio* or *canon*) to the owner. Both lands and buildings could be subject to E. Though the *emphyteuta*, or person who enjoyed the right, could dispose of his right as he pleased, the *dominus*, or owner of the land or building itself, had a right of pre-emption. The old right relating to *agrovectigales*—leases of lands held of the Rom. people, of municipalities, or of the college of priests, i.e. short or long lettings by the state—was, about the time of Justinian, united with that of E. The J. E., though based on an institution of the civil law, only assumed its peculiar character in the time of the Lower Empire, whereas other and equally characteristic *servitudes* owed their existence to the praetors.

Empire, British, see BRITISH COMMONWEALTH AND EMPIRE.

Empire, Eastern, see BYZANTINE EMPIRE.

Empire Day, the celebration, throughout the Brit. Empire, of the anniversary of Queen Victoria's birthday, 24 May. It has been officially recognised since 1902, when the earl of Meath inaugurated the festival as a means of training school children in good citizenship.

Empire Marketing Board, official executive body formed in 1926 for the purpose of developing trade with the Empire. The Board assisted financially estab. scientific institutions on the advice of various gov. organisations at home or overseas, and by advertisements, exhibitions, lectures, films, and posters sought to stimulate interest in the Empire. It was dissolved in 1933.

Empire Music Hall, formerly one of the chief London music halls, in Leicester Square, W., estab. in 1887. Originally a theatre, it was later converted into a cinema. The Empire was particularly noted for its ballets and revues.

'Empire News', Brit. national Sunday paper and largest selling newspaper of the Kemsley group, with a circulation of more than 2,500,000. Its general appeal is that of a popular family newspaper with particular emphasis on features and sport. Founded in 1884 as the *Umpire*, its title was changed in 1917 to the *E. N.* and in 1944 to the *Sunday E. N.* In 1954 it began to print special Welsh and W. of England eds. in Cardiff—the only Sunday paper to print in Wales. In 1955 it incorporated the *Sunday Chronicle* (q.v.).

Empire Settlement Acts, see COMMONWEALTH AND EMPIRE SETTLEMENT ACTS.

Empire State, see NEW YORK.

Empire State of the South, see GEORGIA.

Empire Style, see ARCHITECTURE, VIII.

Empirical Formula, in chemistry, the simplest formula for a substance in which the atoms of the various elements in the compound are shown in the correct ratio but not necessarily the correct numbers. Thus the E. F. for grape-sugar is $\text{C}_6\text{H}_{12}\text{O}_6$ but its true formula is $\text{C}_6\text{H}_{10}\text{O}_5$. In the case of most solids only the E. formulae are known, the true formulae being indeterminate.

Empiricism (Gk *empeiria*, trial, experience), philosophical term signifying a belief that actual sense-experience is the source of all ideas and excluding all possibility of *a priori* knowledge or conceptions. This view arose out of the system of Heraclitus, rejected by Socrates and Plato. It maintains that the mind at first is a *tabula rasa* (clean slate) upon which experience must write all impressions. The sophists of antiquity were empiricists. The scholastics taught that the mind can attain to true intellectual apprehension not by innate ideas but by concepts derived from sense-experience. Descartes's philosophy estab. a compromise, one part of knowledge being considered innate, another empirical or derived from outside. (See INNATE IDEAS.) Many Eng. thinkers have held empiricist views (Locke, Hume, John Stuart Mill). Locke made experience the basis of all knowledge, sensation, and reflection, while Berkeley and Hume developed this philosophy on different lines. This E. formed a strong contrast to the Cartesian 'rationalism' of the Continent. Its chief fault is perhaps that it gives a wrong account of experience, representing it as piece-meal, whereas the 2 elements of knowledge (*a posteriori* facts of experience, and *a priori* facts) are essentially and inseparably united, as was recognised by Kant. In medicine, the term empiric was applied to those who (in opposition to the Dogmatici and Methodici) drew their rules of practice from personal experience, disregarding the more scientific methods of inference and deduction and all philosophical theory. Hence the word came to mean an untrained practitioner, one who prescribed solely on individual observation and

experiment, a quack-doctor. Empirical laws are those adopted merely because found (or supposed) to be beneficial and successful in practice, without any reason authorising them (as distinguished from 'causal' laws).

Employers' Liability, see **WORKMEN'S COMPENSATION**; **INSURANCE**.

Employment Exchanges. These are local offices, at first called Labour Exchanges by the Labour Exchanges Act, 1909, estab. for the purpose of mobilising labour, gathering information as to employers requiring workpeople, and, conversely, as to workpeople seeking employment, and, generally, enabling applicants for labour to obtain it. They are an antidote to unemployment borrowed from Germany, and in view of the success attending the experiment in that country, it is remarkable that they were not estab. in England before, though in this connection considerable good had been done by local distress committees under the Unemployed Workmen Act, 1905. The Act of 1909 empowers the Ministry of Labour (to which department the duties were transferred in 1917 from the Board of Trade) to set up and maintain E. E. wherever they think fit, and to assist any E. E. maintained by other authorities. The Ministry of Labour was empowered to make general regulations with respect to the management of E. E., and the expenses incidental to administering the Act are payable out of moneys provided by Parliament. The duties of E. E. were considerably increased when they were extended to the scheme of unemployment insurance (q.v.) instituted in 1912. The trades which benefited most by these institutions were building, transport, metal, machine and implement industries, agriculture, textiles, and general commerce. Vacancies filled by women workers include those in domestic work, clothing industries, agriculture, and food and drink trades, while juvenile employment is also widely covered.

The Second World War had a marked effect in solving the intractable unemployment problem which had been so marked a feature of the inter-war decades. In the post-war period the E. E. lost much of their original importance as means of putting unemployed people into touch with employers seeking workers. The numbers of registered unemployed fell to a quarter of a million or less (1 per cent of the working pop.); and the dominant problem in the labour market was changed from unemployment to overfull employment, the notified vacancies sometimes exceeding the number of registered unemployed. For statistics of unemployment in later years, see the monthly issues in the *Ministry of Labour Gazette*. See also **UNEMPLOYMENT**.

Empoli, lt. tn, in Tuscany (q.v.), on the Arno (q.v.), 15 m. W. of Florence. It was severely damaged during the Second World War; among the anc't buildings which suffered was the 11th-cent. Collegiate church (now rebuilt) which has a noteworthy marble façade and contains many works of art. Textiles, pottery,

glassware, and straw goods are manufactured, and there is a large trade in grain. Pop. (tn) 17,300; (com.) 29,100.

Emporeium, see **AMPURIAS**.

Emporia, city of Kansas, U.S.A., cap. of Lyon co., 53 m. SW. of Topeka. It has railway shops, flour mills, a cheese factory, and is the commercial centre for a large agric. and stock raising region. It is the seat of the Kansas State Teachers' College and of the College of Emporia (Presbyterian). Pop. 15,669.

Emporiae, see **AMPURIAS**.

Empson (or **Emson**), Sir Richard (d. 1510), lawyer, son of a wealthy citizen of Towcester, Northants. Like Sir Edmund Dudley he was the unpopular agent of Henry VII, and was employed in exacting taxes and penalties due to the crown. He shared with Dudley a reputation for harshness and tyranny in his exactions. In 1491 he became speaker of the House of Commons, and in 1504 chancellor of the duchy of Lancaster. In the 2nd year of Henry VIII's reign he and Dudley were both convicted of tyranny and constructive treason, and were beheaded on Tower Hill.

EMU

Empyæma (literally 'pus in'; meaning pus in the cavity of the pleura). This occurs in a late stage of pleurisy (q.v.), pleurisy itself being inflammation of the pleura, which is the lining of the chest-wall and the covering of the lung. Pleurisy and E. commence in the pleura, or extend from the chest-wall, as in growths or injuries, or from the lung, as in tubercle or pneumonia.

Empyrean (Gk *pur*, fire). According to the old metaphysical philosophers, the E. was the highest and purest of the 4 celestial spheres, the region of the most rarefied elements of fire. Poetically, it is the source of light and the abode of the blessed.

Emrys, see **AMBROSIUS AURELIANUS**.

Ems, or **Bad Ems** (anc't *Amisia*), Ger. spa in the *Land of Rhineland-Palatinate* (q.v.), 33 m. NW. of Mainz (q.v.). It is on the Lahn (q.v.). It is famous as the meeting place of William I of Prussia and

the Fr. ambas. Benedetti, and as the place whence William I. despatched the telegram to Bismarck (q.v.) which precipitated the Franco-Prussian war of 1870-1. Pop. 10,000.

Ems, riv. of NW. Germany. It rises in the Teutoburger Wald (q.v.), and flows NW. across North Rhine-Westphalia and Lower Saxony to an inlet of the North Sea called the Dollart. Its great importance as a waterway is increased by its connection with sev. canals, notably the Dortmund-E. canal (q.v.). Length 205 m.

Emsdetten, tn. of North Rhine-Westphalia, near the R. Ems, 15 m. NNW. of Münster, formerly in Prussian Westphalia. E. is a centre for jute manuf. and textiles. Pop. 21,750.

Emu, or **Emeu**, a ratite bird in the family Dromæidae. Like the cassowary, to which it is allied, it is native to Australia, where it is a protected bird. It stands about 5 or 6 ft high and is second in size only to the ostrich. It differs from the cassowary in having a broad beak, no helmet, short feathers on the head and neck and no wattles on the neck, no spines on the wing, and the claws of all

3 toes are almost equal to one another. The wings are rudimentary, but the powerful legs are well adapted for running, and are capable of giving dangerous kicks when the bird is attacked. There is only 1 living species, *Dromæus novae-hollandiae*, the common E. It is monogamous, and the male wholly or partially incubates the eggs. Its diet is strictly vegetarian.

Emulsin, or **Synaptase**, a neutral substance contained in almonds with the power of acting as a ferment converting the amygdalin of almonds into oil of bitter almonds, hydrocyanic acid, and a sugar. In its pure form it is an odourless and tasteless white powder, which is soluble in water.

Emulsion (a suspension, that is, an even diffusion, which does not separate on standing, of a heavier substance in a lighter medium), a medical preparation in which the drugs neither rise nor fall on standing. Thus oil, a heavier substance, is suspended by yolk of egg in water, which is lighter. Amongst other drugs, olive oil and petroleum are frequently given as E.s.
